In field culture, the cabbage tribe may be planted in March, or in May and June, the plants in the former case being the produce of seeds sown in the previous autumn, and in the latter case they may be from seeds sown in February or March immediately preceding. The young plants should be dibbled in on the top of drills prepared in the same manner as is usually done for turnips, with the addition of a slight rolling, to level or smooth down the tops; the drills may be made at the distance of two feet, and the plants placed at the distance of fifteen or eighteen inches in the row, increasing or diminishing the width and distance, according to the size and habit of growth of the variety (at the distance of two feet by one and a half, 14,500 to 15,000 plants will be required for an imperial acre). The after culture of hoeing and weeding is the same as is required in other drilled green crops. The Cow Cabbage, Kale, and other open-headed varieties, will yield a regular supply of leaves from the time when the plants are from one to two feet in height, which are obtained by stripping off the under tiers successively, until the entire crop be taken; but in the case of the other cabbages, stripping off the leaves, if at all attempted, should be done with more caution, otherwise the swelling and firming of the heads will be materially checked. These last should be all off the ground before the winter sets in with severity, otherwise the outer leaves are apt to become injured, in which case they, as well as decayed leaves at any period, should never be given to milch cows, as they impart a disagreeable taste to their produce. The open-headed sorts, however, may be allowed to remain on the ground with less danger of being injured, until they show symptoms of running to seed, after which period they, together with all the Brassicae, become very exhausting to the soil, a disadvantage which, in rather a considerable degree, is said, and seemingly not without good cause, to attend the Cow Cabbage, and some of the other large varieties, at all periods of their growth.

KENT.—MR. PALMER'S PUBLIC RAM LETTING.—On Friday, July 1, the public ram letting of Mr. John Palmer, Herne-common, took place, and attracted a large number of gentlemen connected with agriculture and grazing from various parts, West Kent contributed its quota on the occasion. There were present T. T. Hodges, Esq., M.P., R. Etwall, Esq., M.P. for Andover, &c. A spacious awning was erected in the paddock, where about one hundred gentlemen sat down to a cold collation that had been prepared for the occasion, consisting of every delicacy the season affords, with a profusion of choice wines. Mr. Harrison, of Dover, acted as auctioneer, and performed his duty admirably. The successful competitor for the two best rams was Mr. Hodges, at 12l and 14l. All the sheep were greatly admired for their symmetry, condition, and the fine texture of the wool. On the health of the wool buyers being proposed, Mr. Homersham rose, and after returning thanks for the compliment, offered Mr. Palmer 22l a pack for his wool, which was considered a fair price and accepted. Several other sales were also made varying in price. On the health of Mr. Palmer being given, that gentleman returned thanks for the compliment that had been paid him, at the same time he must disclaim any credit to himself in the perfection to which his rams and ewes had been brought; to Mr. Goord was due the credit, for that gentleman was the original breeder and feeder of the class of sheep. Mr. Hodges, Mr. Etwall, and several other gentlemen addressed the party, upon topics connected with agriculture; and at eleven o'clock the whole dispersed highly gratified with the day's proceedings.

## ON THE BETTERING OF THE LOWER CLASSES.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—As your useful magazine is so universally circulated through the class of farmers, and read by many others who take interest in the above subject, I have taken the liberty of addressing this letter to you, hoping that, being a promoter of happiness and content, you will allow me a small space in your valuable columns.

In general the poor are now very discontented at they know not what—I mean by the poor, the class of labourers. They complain of their masters without cause—they cry out against the times for being bad, and in short they are always finding fault and complaining. Now, what does this arise from? real want?—No. There are two things which occasion it: first, Beer-houses; next, Idleness. When a man gets a few halfpence, he leaves his work and goes to the public house, where for a penny he not only gets half a pint of beer, but an hour's gossip. This of course promotes idleness, and both being combined, cause discontent and murmuring.

Drunkenness is one of the worst faults man can be guilty of. In the first place, it is so selfish. A man, instead of taking his money home to his wife and children, spends it on beer, which only gratifies himself. He does not carry the beer home—his beer would have no relish, if it was not for the gossip which attends it. This is the principal cause of so much idleness, and idleness is the root of all evil. Many a man when brought to the gallows, has confessed that idleness was the cause of it. The Devil always flies to the idle first, because they are most easily tempted into wickedness.

How is all this to be prevented? Nothing will tend to prevent this more than the principal inhabitants in the parish endeavouring to make them what may be called little farmers—let them have a piece of ground at a moderate rent, and let them till this themselves.

Some people might suggest the plan of the gentry subscribing and letting them have it rent free. But no, for then they would not take the trouble to cultivate it. Let them pay a moderate rent; for instance, from fifteen shillings to one pound per acre. This will enable them to grow some meat for the pig, or horse, or cow. Another good preventative against the evil I have spoken of, is the circulation of books concerning agriculture, and also books on religious topics; for unless they have God's grace in their hearts, they will try but in vain to succeed in their undertakings.

I will conclude my letter by hoping, Sir, that I have not taken up your valuable time more than it is possible, and wishing that my plan may be thought of and adopted by those who wish for the interests of the poor,  
I remain your most obdt. servt.

D.

CURIOUS PLANT.—In the island of Cuba there is a plant which emits such an intense perfume as to be perceived at the distance of two or three miles. It is of the species *Tetracera*, and remarkable for bearing leaves so hard that they are used by the native cabinet-makers, and other mechanics, for various kinds of work. It is a climbing plant, which reaches the tops of the loftiest trees of the forests, then spreads far around, and in the rainy season is covered with innumerable bunches of sweet smelling flowers, which, however, dispense their perfume during the night only, and are almost without scent in the day-time.

**FUNGUS HÆMATODES IN A POINTER.**

By Mr. R. ADAM, Beaufort, Invernesshire.

(From the Veterinarian.)

In the month of March last, a valuable pointer dog was sent to me, quite emaciated, with total loss of appetite, and with a large fungus hæmatodes about the middle of the right side of his neck. It had begun to appear about five months before, and was not at first larger than a pea. I gave him ʒiiss of Barb. aloes, followed soon afterwards by ʒi of castor oil, which caused the discharge of a great deal of fetid matter from the intestines, after which there was a marked amendment in the system.

At the end of three days, I removed the tumour with the knife: there was a full discharge of healthy matter from the wound; and during the period of its healing, the animal had a diet of soup and rabbit-meat, and tonics of iron, &c.

In a little more than three weeks, the wound had completely filled up by granulation; and he was sent home, to all appearance quite well.

At the expiration of three months, another tumour made its appearance near the former one, growing fast; and by three days from its being first seen it had attained to near the size of the former one. I removed it immediately, ordering a change of food, and tonics: it appeared at first to go on favourably towards healing; but five days after the removal of the second one, another tumour made its appearance, near the seat of the former ones.

I removed that also; but at the expiration of another five days, the animal was sent up to my house quite unable to walk, with very laborious breathing, and cold extremities. I gave him a cathartic, and bandaged the legs; but during this time the wounds made no progress towards healing, and at the end of three days he died.

In exposing the cavity of the thorax, the lungs were almost covered with variously shaped tumours, from the size of a pigeon's egg to that of a small pea; the intercostal muscles had a great many of these adhering to them, and a few small ones were adhering to the heart. There were three of these on the diaphragm, in the centre of one of which matter was formed. The blood-vessels, kidneys, &c. were free from disease, as also the brain, and the animal retained his senses to the last.

These tumours were white, or nearly so; pretty hard, and of a glandular substance. The external ones were softer, redder, and almost destitute of blood-vessels, except the first, which bled considerably. There was dropsy of the abdomen.

**SALE OF DOGS BELONGING TO THE LATE DUKE OF GORDON.**

On Thursday, July 7, the kennel of dogs belonging to the late Duke of Gordon was sold by public auction, by Messrs. Tattersall. The value of a race-horse, a hunter, or roadster, is ascertained by their respective performances on the turf, the field, or the road; and a pack of hounds is valued by the character they have obtained in the country they have hunted. The miscellaneous collection in this instance offered to the public were brought without reserve, or previous preparation, to the hammer, having only arrived from Scotland by steamer at 12 o'clock on Tuesday night, and we believe the prices they produced are unprecedented. The following correct account will be interesting to our sport-

ing readers. The whole of the arrangements connected with the sale were under the superintendance of Mr. Burgess, a friend of the late Duke of Gordon.

30, 31, 35, are the property of the Duke of Gordon's old trainer, Edward Cox, and will be sold after the Duke's dogs.

## RETROSPECT OF THE WOOLLEN TRADE.

LEEDS, JULY 14.—The mercantile operations of this district during the last two months have afforded little matter for novelty in the way of general comment. Our mills and manufacturers continue in full activity, and if a complaint be heard from that quarter it is only that workmen are difficult to procure, or difficult to manage when procured. This inconvenience is felt more in some sorts of employment than in others, perhaps most in the weaving of certain descriptions of low goods for Continental consumption, and the circumstance may prove a useful lesson for the future, if rightly interpreted; for of all the various branches of industry employed in the woollen manufacture, this one has perhaps in comparison been least adequately rewarded at any time, and yet it is just the one which has suffered most by reductions in wages during the last half dozen years. The natural consequence has ensued: these weavers have been driven to seek employment in other branches so often as opportunity offered, and few new hands have been taught; so that now, when work is plentiful in other kinds of weaving, the manufacturers of these particular goods find themselves deserted, and cannot get their work out. Manufacturers who are so prompt to seize upon every casual opportunity for depressing wages, not from actual necessity, but simply because the opportunity offers, may thus find out that such a proceeding is not less opposed to the dictates of justice and humanity than it is to their own permanent interest.

The necessity of meeting foreign competition is the plea usually urged in extenuation of this practice, but it is merely a pretext; for if foreigners really want our goods they will pay for them, whether our workmen earn a comfortable subsistence or starve upon a miserable pittance; and if they do not want them, they will not be induced to become purchasers by a mere sacrifice of the difference. Moderate stability of price is the main thing to aim at for ensuring a steady foreign demand: it relieves the importer from all apprehension of loss by sudden fluctuations; and nothing is more calculated to maintain such stability than a resolute endeavour to keep up a fair rate of remuneration to the workman for his labour. But the very parties who are thus prone to reduce wages, are ready enough to launch out in moments of undue excitement, and encourage a local advance in the price of the raw material which no reasonable man will venture to regard with confidence. The real competition which produces these opposite effects is that which exists among English manufacturers themselves, stimulating each individual to supplant his rival neighbour by forestalling him and underselling him. First, profits are lowered, and more business must be done to produce the same amount of return at the year's end; then, wages are attacked, and the labourer must perform more work for the same amount of necessary remuneration. Hence an extraordinary demand for raw material which raises its price, and a production of goods which glut every market. No one is benefited; and in the end a convulsion takes place by which all suffer.

The same plea by which this pernicious system is encouraged, serves also as a pretext to justify the abuse of infant labour. Foreign competition, again, is the hughbear, and we are required to believe that if we do not use our children as mere animated machines, and extract from them the work of adults without regard to their moral and physical development, then is the glory of manufacturing England departed.

They are lying impostors who profess to act upon this motive; their hearts are in their breeches' pockets, and they are supported by men whose heads are so crammed with theories that no room is left for facts. Their political economy is akin to that of the South-Sea Islanders described by Mr. Earl, who used formerly to kill the major part of their female children and eat them; but after European ships began to visit them, they found it more profitable to let their female children grow up. The Germans seem likely to become our most formidable competitors abroad; but no people upon the face of the earth have a more tender regard for their offspring than the Germans have; they would no more think of sacrificing their children for profit than they would think of killing and eating them.

The last generation of workmen committed themselves by opposing the introduction of machinery: they insisted upon continuing to perform operations which machines were found to perform better, and quicker, and cheaper. They fancied they were called upon to yield up their means of existence, and could not be persuaded that the demand for labour, on the contrary, would actually increase beyond all calculation as it has done. This was their fatal error; and if the manufacturers of the present generation were brought to regard the men, and women, and children in their employ merely as so many machines, their error would not be less fatal. There is no limit to the application of machinery; if one machine can be made to do the work of twenty men, experience shews that the very improvement opens out fresh sources of adequate employment for human labour. But nature herself has imposed a limit upon human endurance, and will not suffer her laws to be violated with impunity: the law of expediency which requires child or adult to perform the work of two for the wages of one, is the law of the strong against the weak, by which any species of iniquity may be justified. Such laws fail even of their professed object: competition is not diminished, but is released only from the natural restraint of justice and humanity which might otherwise keep it within reasonable bounds; and in the end it is found that all the sacrifice has been made to the prejudice of the labourer without one farthing of advantage to the employer.

The transactions in our Cloth-Halls would afford a very inadequate criterion of the activity which now prevails. In the earlier months of the year public markets were brisk, but during the last two months the demand has fallen off considerably. There is nothing extraordinary in this: it is but the usual trade of the place subject to the usual ebb and flow, as seasons come round and markets get supplied. Yet there is no indication of any accumulation of stock in the Cloth-Halls; on the contrary, the manufacturers have no lack of orders for as many goods as they choose to undertake for private delivery. The source of this unwonted demand is the supply of the United States and China, to the markets of both which countries shippers have been made all the year to an extent wholly unprecedented. How far the real effective demand for consumption in those countries may prove adequate to absorb these extensive supplies remains to be seen; for it is by no means to be inferred that the latter are founded upon legitimate evidence of the former, or that there is any real connection between the two in the relation of cause and effect. The trade to these countries is now done almost entirely through the medium of consignment agents who have no identity of interest with the consigning party and share none of the risks. All that can be said with certainty at a period when extensive operations are going on is,

that the consignment-drummers have been successful amongst the manufacturers, and that they have secured to themselves a plentiful harvest of commissions, which is all they have to care about. A period of unusual excitement is their sunshine: the manufacturer yields to the pleasing influence, looks around him with complacency, regards the scene of activity with confidence, and becomes an easy dupe: with the deluding consignment-drummer on one hand, the seducing *fury-sheep-parcain* wool-dealer on the other, and the liberal joint-stock banker in his rear, he cannot hesitate to follow the example set before him, and away he jumps—just as one sheep jumps after another even into the butcher's shop. The results of such experiments are tolerably uniform even in ordinary times: the commission-agent pockets his handsome per centage, and the consigner loses his money. It might naturally be thought that the agent who thus plucks his victim must soon find himself in the situation of the boy who killed the goose that laid the golden eggs. But we live in a wide world, where geese are very numerous, and very pretty geese they are too.

The American trade was once principally an order trade, and yet has thus fallen into the monopolising hands of consignment-agents; for no importer who honestly buys his goods and honestly pays for them can ever stand up against such sales as these vampires make. The China trade is altogether new; a mere experiment how far we may be able to establish a simple, unreserved commercial intercourse with the most artificial, reserved, and obstinate people in existence. Whatever may be the event, it is quite certain that thus far we are going entirely upon speculation, and that some length of time must even yet elapse ere we can know whether we are doing well or ill. Whether it be wisdom or folly to enter upon such a speculation to such an extent, and under such circumstances, is a preliminary question about which there may possibly be two opinions.

One thing, at all events, is satisfactory as far as it goes. The Leeds manufacturers are not the speculators in this case: they supply the goods to order; and therefore, unless their terms of credit should be unusually long, they cannot be much affected by the result of the speculation, whichever way it turn.

Goods for the China market are made chiefly of English wool, the price of which, consequently, remains very high. Foreign wool has experienced no fluctuations worthy of particular note, and the supplies this year have been abundant. The quantities ordered for consumption up to the end of May, this year and last, are as follow:

	1836. lbs.	1835. lbs.	Increase in 1836.
Bristol.....	114,110	112,129	1,981
London—Spanish.....	1,016,890	675,116	341,774
Australian.....	649,461	654,720	.....
Other Sorts.....	8,210,302	4,516,651	3,693,651
Hull.....	6,813,054	2,297,975	4,515,079
Increase in 1836.....	.....	.....	8,452,485
Decrease in Australian.....	.....	.....	5,229
Total.....	16,803,817	8,356,591	8,447,226

This, therefore, may be regarded as the state of things up to the advent of the new clips, which are both plentiful and good. That of New South Wales is estimated at one-third more than the clip of last year, and is greatly improved in condition and quality.

The result of the German wool fairs has been highly satisfactory. First in order of time and in importance stands the fair of Breslau, respecting which we quote Mr. Sigmund Hess, a respectable wool-broker, whose

circular report is dated 3rd June. His opening snacks of the age of German chivalry; probably he had been reading the *Zauber-Ring* :—

“After the skirmish in the last October fair, when however, it is well known that no heroic blood was spilt but only such as lacked capacity for battle and resistance, the wool trade soon resumed a firm position. Those who took advantage of this flatness by purchasing on moderate terms, saw their operations crowned with the best result; others who had courage to hold out found themselves richly rewarded; for the previously despised stocks were soon diligently sought up, and higher prices were bid for them. At the same period more favourable accounts were received from England: extensive supplies for the Spanish army raised the prices of the lower wools, and much of this description, of which the stocks were largest, went at higher prices to that great market of the world. The demand for fine and middle wool was not less on the increase. Some English merchants of consideration, who had passed nearly the whole of Autumn here, made extensive purchases with the best result; and in the month of January our warehouses were cleared out of Silesian wools, whilst the stocks of good Polish hog wool remained also of little consequence and met ready sale.

“This sound and solid progress of the trade could not fail to direct the attention of speculators to the ensuing clip. So it came to pass that by the month of March nearly 15,000 cwt. of Silesian wool was already disposed of, partly to hands whose circumstances do not compel them to offer it over again. At a later period the growers raised their demands, and contracts sustained a check, which was confirmed by fiat accounts from England. Up to April, for instance, the imports into London had been 6,565 bags, and into Hull 5,121 bags, of which 3,015 bags were from Germany, and prices suffered some depression. In Hamburg things were equally still; the fairs of Frankfort O. M. and Leipzig did not turn out well for the wool trade, and over sanguine hopes began to waver.

“In Austria almost every large lot, Prince Esterhazy's amongst the rest, had been early contracted for at high prices. In Poland, also, and in other wool growing countries, large quantities of wool were disposed of on the sheep's backs, partly at prices which left small chance remaining. Our speculators in Silesian wool had, however, gone carefully to work; and, from the universal reputation enjoyed by this produce, they could regard the approach of the fair with calmness.

“The fair began this time somewhat later than usual, and supplies came in sparingly; so that up to the 25th May they did not amount to more than 5000 cwt, half the entire quantity being the usual proportion offered for sale by that time. By the 30th May about 5000 cwt had been sold to Hamburg houses and inland manufacturers. The English wool dealers held back, the state of trade in their influential markets not permitting them to give prices so high. Bad weather, also, kept many buyers away, and most of the wool came in a wet state which gave it a somewhat unfavourable appearance. Yet many flocks which have become favourites in consequence of their quality and good management were sold soon after their arrival at eight to twelve dollars advance upon last year's prices. Some of the best bred flocks did not yet meet their merited appreciation. Silesian wethers were a very favourite article, and were almost entirely cleared off at high prices. Good Silesian middle hogs up to 92 dollars were also much in request: one large spinning establishment bought them very freely if they possessed any thing like the requisite properties. Fine wools above 105 dollars, and mid-fine at 100 dollars were considered too high in proportion, and were less in demand.

“The 1st of June was a very busy day, when nearly 10,000 cwt. changed hands: the growers moderated their demands and freely accepted offers which they had previously refused.

“The quantity shorn was twelve to fifteen per cent. less than last year. Prices, on the average, were five to six dollars higher than in the last fair, but the wool was

almost universally so well washed, and so light, that these advanced prices are neither an advantage to the farmer nor a disadvantage to the manufacturer.

"The washing and management of the Silesian and Polish wools, notwithstanding the unfavourable weather, were exceedingly good, and did full credit to our active sheep breeders. There certainly remains at this moment a moderate quantity unsold; but the greater part, with somewhat of a moderation in tone, will in all probability yet find purchasers, and the result of the fair may be considered fully satisfactory."

The prices given in this circular range from 65 to 70 dollars for the lowest sort, to 135 to 150 dollars for Silesian Electoral. We hardly know what to make of the "supplies for the Spanish army" from England, the report of which, it appears, formed one of the elements for getting up the steam in Germany early in the year. We presume the "army" meant must be that most respectable body of men the foreign mercenary legion: they have a uniform, certainly, and it is buff; but it is not made of German wool. These speculators are cunning fellows at a pinch, but really that pinch is a hard one sometimes.

We have drawn thus largely upon Mr. Hess, because the Breslau fair takes the initiative, and in a great measure rules the succeeding fairs. For us and our translation we say nothing: we are no Austin—we speak not of a wool-man, but of a Lady—and even she might be puzzled what to make of "Dominal-Ausschuss" and "Schweis-Wolle." With the remaining reports before us we must deal more comprehensively:—

LANDSBERG.—"By the 9th June about 16,000 cwt. of wool had arrived, all of which was disposed of at the prices wished for by the sellers. In consequence of the unusually large assemblage of buyers from England, France, and Germany, sales were concluded with great rapidity. The most extensive purchases were made by houses from Leipzig, Eisenach, Langensalza, Berlin, Magdeburg, Bradford, &c.; and by the 9th June, when according to the almanack the fair ought to begin, it was already over."

STETTIN, June 15.—"Up to yesterday noon there was great activity, and much was done. From that time downwards the transactions became weaker and flatter. What remained this morning, but little only, had to be offered at lower prices than had been previously insisted on, or is now destined for the Berlin fair. The advance in price since last year has been confined to wools which were particularly well washed, and of this description, unfortunately, the proportion was not large. In general, and on the average, these wools cannot be quoted over three to five dollars advance for all middle and fine sorts. Very low and ill-bred wools were rather lower than last year."

BERLIN, June 24.—"The quantity brought to this year's fair, including 2000 cwt. left over from last year, was about 48,000 cwt. The washing and general treatment of the wool were quite satisfactory. The principal purchases were made on the 20th, 21st, and 22d. There was no lack of buyers: the number was greater than last year: from England, France, Austria, the Netherlands, and Saxony, in addition to the inland merchants and manufacturers. Of the quantity sold, about half might be taken for inland, and the other half for foreign destination. The most favourite qualities were the fine-middle and middle, which fetched two to five dollars per cwt. more than last year. The extra-fine and fine sorts experienced a small advance more rarely: great part of them were sold at last year's prices, and even lower. The same may be said of good ordinary. Ordinary went off mostly at two to four dollars per cwt. lower than last year. The stock remaining on hand this day is 8,000 to 10,000 cwt., almost all in second hands, of which, however, the smallest portion consists of fine middle and middle wools. Although the fair may be considered pretty well at an end, much traffic may yet be expected which has hitherto been put off by the unfavourable weather."

We now give a statement of the quantities brought to the principal fairs, comparing them, as far as we possess the means, with the corresponding quantities in the two preceding years:—

	Quantities in cwts.		
	1836	1835	1934
Breslau—from Silesia .....	30,000	35,797	32,748
The Duchy of Posen .....	9,000		
Kingdom of Poland .....	4,000	15,301	11,588
Austria and Bohemia .....	1,500		
Total, about .....	44,500	51,102	44,336
Berlin .....	48,000	40,000	35,000
Stettin .....	24,000	20,453	24,000
Landsberg .....	16,000		
Warsaw .....	10,000	15,000	
Leipzig .....	6,833	6,627	
Gotha .....	1,200	1,600	315

For a comparison of prices we take the report of the Berlin fair, which, coming three weeks later than the Breslau fair, has the test of experience to recommend it:—

	Rix-Dollars per cwt.			
	1836	1835	1834	1833
Ordinary .....	26 to 48	40 to 50	42 to 47	47 1/2
Good Ordinary .....	53	75 to 60	75	62 to 73 1/2
Middle .....	80	95 to 82 1/2	95	85 to 92 1/2
Fine Middle .....	96	100 to 92	96	92 1/2 to 95 1/4
Fine .....	105	110 to 100	105, 105	112
Extra Fine .....	115	120 to 115	125 to 130	140
Some very superior parcels	135	140 to 150	170 to 150	160

Three Rix-Dollars per cwt. are about equivalent to 1d per lb.

Taking into consideration the improved condition of the wools this year, we think it would require a very sharp eye to discover any sign of real advance in these accounts. Perhaps the powers of the microscope might even detect a decline. We regret that it is yet out of our power to announce any further progress in the application of that instrument to the investigation of wool. Beyond a querulous allusion at a public meeting, nothing, absolutely nothing, we grieve to say, has been effected. But we trust the Philosopher has not altogether laid aside his hobby in despair. Perhaps the newly discovered "Sapphires" might prove serviceable. But the colour may be objectionable: nasty colour, that blue; and *pour comble de malheur*, the discoverer is blue too. Yet we hope the Philosopher will bestir his Pegasus again:

"And when he next doth ride abroad,  
May we be there to see."

The wool trade in Leeds continues to maintain the same progressive character. The Anglo-German migratory tribe of dealers are still on the increase, and it were in vain now to think of counting them even by noses. The settlers and "natural-born" of the other creed regard the irruption with much philosophy: they beslime the children of Israel with civility to their faces, and abuse them like Turks behind their backs. The Synagogue opposite the Court-House in Park-row must be enlarged, the Carpenter is already at work.

Two months ago we gave a tabular view of the progress of the foreign wool trade and of our exports of woollen goods for some years past. We are prepared to find that our exports of woollens this year will exhibit a further increase at least equal to that of last year over the year preceding, and shall be happy to find the amount of profit in the same proportion.

THE WOOLLEN TRADE.

The usual annual returns of the various branches of our wool trade and woollen manufacture were on Monday delivered to members of the House of Commons. On a comparison of these returns with simi-

lar accounts for former years, they present a very gratifying record of the growth and prosperity of this important branch of national industry, of which, we think, it may be both advantageous and interesting to offer a distinct analysis.

The total quantity of wool imported into the United Kingdom, in the year 1835, was by weight 42,208,949 pounds, which is rather more than 4,000,000 pounds under the importation of 1834; but on 5th of January 1835, 6,494,266 pounds remained warehoused under bond; whereas, on the 5th of January, 1836, there were no more than 2,846,014 pounds so locked up. This is an important difference of stock on hand, which, no doubt, has tended, and will tend to keep up the price of the article. The country from which we import the greatest quantity of wool is Germany. In 1835 the amount was nearly 24,000,000 pounds weight. From Russia, to which our exports of manufactured woollens is comparatively small, we imported upwards of 4,000,000 pounds; from New South Wales and Van Diemen's Land, taken together, about 200,000 pounds weight more than from Russia. The next largest importations are from Spain, Turkey, and Italy, which, taken together, supply us with nearly 4,000,000 pounds. Portugal furnishes 683,000 pounds; Holland, 301,000 pounds; and Belgium, 231,000 pounds. Of the foreign wool which we have imported, we re-exported in its unmanufactured state 4,101,700 pounds during 1835. And of the total quantity imported in 1835, we retained for manufacture 41,718,514 pounds. This is nearly 1,000,000 pounds more than was taken up by the manufacturers in the preceding year.

The whole amount of British wool exported in 1835 was 4,642,604 pounds, and of this 3,000,000 pounds were sent to Belgium, and 1,500,000 to France.

In the year 1835 the "declared value" (which, be it observed, is a real thing, and very different from the "official value," which is of no use except as an indication of quantity),—the total declared value was 6,840,511*l.*; and of this amount upwards of 2,600,000*l.* worth of woollen goods went to the United States alone. Next after the United States in the scale of our customers for woollens comes the East Indies and China. To these we send the value of upwards of 800,000*l.*; to our North American colonies the value of 418,000*l.*, and to the West Indies 114,200*l.* worth.

In Europe, our best customer is Germany, which, in 1835, took 631,000*l.* worth. Besides the more fully manufactured goods, Germany took from us in the same year 1,191,000 pounds weight of woollen yarn. Of European customers, next after Germany comes Portugal, which took, in 1835, to the amount of 363,000*l.*; Holland, 245,629*l.*; Italy, 243,382*l.*; Belgium, 123,727*l.* Russia took only 93,025*l.* worth of woollen goods. The South American States begin to be good customers; Brazil took, in 1835, 337,788*l.* worth, and Mexico and the other States, 356,700*l.* worth.

Looking at the aggregate, the export of 1835 was fully a million sterling in value above that of 1834; but as the price was higher in 1835, this is no certain guide to the proportion of increase in quantity. In the year 1835 we exported to France only 68,000*l.* worth of woollen manufactures!

We have already stated the exports of woollen goods to the South American States in 1835, the import of unmanufactured wool from these States in the same year, was 2,176,000 pounds, from France it was 101,000 pounds.

We have only to add, as fiscal information connected with the foregoing analysis, that of the wool

imported in 1835, 26,877,730 pounds paid to the revenue a duty of a penny per pound; 10,198,526 pounds paid one half-penny per pound; and 6,397 pounds of "red wool" paid six-pence per pound.

The wool imported from British possessions does not pay duty. Of that there were in 1835, 4,635,811 pounds imported.—*Herald.*

THE GERMAN WOOL FAIRS at Stettin and Berlin appear to have gone off very briskly, nearly all the wool shown being sold, and at prices fully as high and even higher than those realized at Breslau and Dessau. The following are extracts of letters received by mercantile houses in this town, in reference to the fairs of Stettin and Berlin:—

*Stettin, 15th June, 1836.*

About seven-eighths of the wool shown at this fair was sold, but the English were not considered very large buyers. The prices obtained were full as high as those realized at Breslau, viz. about 3d per lb advance upon those of last year; being chiefly in consequence of the numerous contracts made previous to the fair, before the shearing commenced.

*Berlin, 20th June, 1836.*

The result of the Stettin wool fair was, if any thing, still more favourable to the grower than the Breslau fair, for the prices were not only fully maintained, (though the wool was not quite so well washed), but they were higher by about 1d per lb, and almost all the wool which came to the market was sold, except such flocks as were very greasy. The quantity in Stettin was 25,302 cwt. of which one-eighth is unsold. The Berlin fair was a full harvest for the farmers and speculators: not only were the highest prices given there, but you may also add that all the wool which was brought to the market was sold; and those dealers who took their purchases from the Breslau to the Berlin fair disposed of them very quickly, and to a good profit. The quantity in Berlin was 40,000 cwt., of which one-sixth was sold on the 16th, though the fair only begins on the 20th. The prices in Berlin were higher than those at Breslau or Stettin by 1½d. per lb. In the smaller markets, such as New Brandeburg, Lubeck, Magdeburg, Dessau, &c., great competition, particularly amongst the English buyers, was perceivable, for they kept back in the two first fairs, (which are the principal ones), and at last were obliged to go with the stream, or be without wool. There is still the Gasterow fair to come on, but you may depend that the price will be no lower. There has been no year in which less speculative business has been carried on by the English than in the present, and the buyers have all been very cautious.

CANADA.—We congratulate the Farmers of the Townships on the prospects of a permanent cash market for Wool. The B. A. L. Company, offer 2s per lb. for all the native wool of average quality, that may be offered them the present season.—Although the above price is not quite so high as wool now bears in the United States, yet even at that wool growing may be made the most profitable of any branch of farming. But the quality of wool may easily be improved 50 per cent. and the quantity increased in a like ratio, by crossing with improved breeds from England. We doubt not the Land Company will lend their assistance in introducing some from the best breeds of England, suited to this climate. We trust we shall no more hear of flocks of sheep being sold to be slaughtered for their pelts in Vermont.—*Farmer's Advocate.*

## HORSEMANSHIP.

## THE MANEGE.

Adams, a professed teacher of the manege system of horsemanship, describes it in the following words:—"The airs of the manege are certain figures, actions, graces, attitudes, and exertions, drawn from the horse by the art and ingenuity of the master, and may fitly be compared to the figures, steps, graces, attitudes, and exertions of the stage dancers." Which means, in plain English, that the natural paces of the most elegant quadruped in nature are set aside or supplanted for artificial positions and grotesque antics, which strain his tendons and his loins, destroy his speed, and render him incapable of all the useful and superior purposes of life. The manege system of riding is completely useless; yet the professed teachers of the art would have us believe that the positions of the horse and rider are ornamental and graceful in the highest degree: now, any thing so constrained as the airs of the manege can never be consistent with the true and sublime beauty of nature. I have many times endeavoured, but always unsuccessfully, to discover something that would bear the test of examination in it; and I am free to confess, that the antics of a monkey are to me much more interesting, and quite as nearly allied to the sublime and the beautiful, as the cruelly painful and unnatural positions of the horse in the airs of the manege.

However, let it not be supposed, that I am utterly insensible to the gracefulness and beauty of the paces of the horse; on the contrary, what can be so light and elegant as that deer-like action which has been derived in the superlative degree from their Arabian progenitors by our superior horses.

The stiff and nearly perpendicular position, so much and so strongly recommended by riding-masters, is precisely that which is adapted for the manege, but utterly unfit for the ordinary purposes of life, for the hunting-field, or the race-course. In the manege the horse is continually straining unnaturally on his haunches and loins—the weight is all thrown upon these parts. Let us look at the *pesade*, (a manege air), in which the horse gathers his haunches so far under him, that he raises his fore feet and sits or balances himself upon his hocks and hind feet. The rider's position must correspond; and here the toe in a long stirrup, and the stiff perpendicular seat (if indeed seat it can be called) are in unison with the unnatural posture which the horse has been compelled to assume; but how can such positions be applied to any useful purpose? In fact, it is only by a lengthened system of positive torture that the horse can be compelled to perform "*the graceful airs of the manege!*"

Having already observed that a "*high-dressed maneged horse*" is rendered utterly unfit for any other purpose, so it may be remarked of the professors of the manege, that they cannot ride beyond the walls of their schools. In the manege the rider is prepared for the performance of the horse, and whether it be the *pesade*, the *balotade*, or the *capriole*, aware of the very motion which the horse is going to make, he prepares for it accord-

ingly. The *capriole* is the most dexterous and exalted caper that can be drawn from the horse: in this, the animal springs from the ground perpendicularly, and kicks out with his hind feet—this is called *graceful*, a term very often most arbitrarily applied: in the act of leaping (a gate for instance) there may be something graceful, the horse goes at it as willingly as his rider, and often more so, and in the operation calls into action nothing but his own natural and beautiful motions: whereas, in the *capriole*, the horse always goes to work with reluctance, he is forced into the most unnatural action, and indeed nothing but torture can draw the feat from him.—The professors of the manege system admit that such is the exertion (being constrained and unnatural) required in the manege, that the horse becomes completely exhausted in ten minutes.—Here it is abundantly evident that the manege is ruinous to the horse and worse than useless to the rider; yet I shall describe it, in order to enable the reader to form an opinion for himself, and to render this work as complete as possible.

In describing the airs of the manege it will be necessary to commence with the walk, which, in the language of the school, is a relaxation of animation and exertion, lower than the slow disunited trot, while it retains an union which prevents its descending to the action and beats of the natural walk. The legs therefore are lifted as in the trot, or passage; the union, action, and beats constitute the difference. The legs being lifted as in the trot, are, in consequence of union, without animation, taken up gently and put down softly, so that the time is slower than the trot, and the beats flat; a horse cannot lift his legs in the action and time of the natural walk or trot, without advancing over ground proportionable to the length of step, or quickness of action; but in the action of the manege walk, passage, or *piaffe*, he can move his legs in the action, and his feet beat the correct time of either of the airs, without his advancing, which results from the union, which constitutes the difference of position, action, time, &c.

The difference between the manege walk and the passage, is less animation and union, which produces a lower action and languid step, and causes the beats to be flat by the feet not striking the ground so sharp as in animated action. The excellence or perfection of the manege walk consists in a lofty action, where the step and animation are languid, and the regular slow beats of one, two.

A horse must be worked and united to a considerable height before he is put to the manege walk; and when the horse becomes so perfect in the extreme union as to walk the passage air to its greatest height, if you relinquish animation without suffering the horse to disunite himself, you will let the action down to the manege walk.

## THE PASSAGE.

Working a horse sideways from right to left, and left to right, is called *Passaging*; and as the horse cannot do this in an animated style, without uniting himself more than in the trot—whereby the action is raised before and lowered behind, the time slower, and the beats not so sharp—this position,

action, and time, in which the horse works, is called the passage, whether it is worked sideways or straightforward. The position of the passage may be thus expressed:—the fore hand raised, the shoulders out, the croup in, the neck bending a little inward, and the nose a little turned from the perpendicular; the inner side (that to which he is working) is advanced or leads the same as in the gallop; but the feet are raised as in the trot, only lifted higher before than behind. The fore feet being raised higher and retained in hand make a shorter step and slower time, and the action not being so rapid as in the trot, the beats are not so sharp.

To work a horse straightforward in the passage is much more difficult than sideways, as the attitude of the horse is much better calculated for working sideways.

The following are the instructions to the rider for working the passage:—Commence to the right, with a snaffle bridle; collect and separate the reins, turn the horse's head to the wall, bring your right hand down to your body, letting your wrist steadily rest against it, the little finger being of a parallel height with the elbow. This hand supports the position or attitude of the horse, and is never to move but with the body, while you work the horse to the right. The left hand, having the rein of equal length, will be somewhat advanced, to admit the small bend of the neck and turn of the nose. The right being fixed to the body to support the position, the left may be detached, the hand and elbow raised to a parallel with the shoulder. In this situation it operates in the same direction from the horse's mouth as the right, only higher, for the purpose of raising the fore hand, and by those delicate sensations of the fingers, inseparable from a good hand, enlivens the mouth, lightens the appui, animates the horse, and causes the action. The rider's right hip a little advanced, the thigh turned inwards, body leaning a little to the right, stretching the right leg down, your eye always traversing the ground on which the horse works.

The instant you assume this position, the reins being properly collected, with the requisite animations, the horse should be united, supported, and completely balanced in your hands; you work him along the wall, letting the shoulder lead a little.

#### THE PIAFFE.

The position of the horse in the piaffe has little, if any, bend; the horse works straight, and the feet describe only two threads. The piaffe is distinguished from the passage by a more lofty action before, and a dancing of the haunches. The action being higher, and retained longer in the air, the beats are slower, and not so sharp, as in the passage.

Riding the piaffe requires the position to correspond to the motion of the horse, quite upright, the balance true, and the reins so collected as to support the horse in a straight position, and the aids given to support the action with the greatest caution, that you may not alter the position of the horse by throwing his croup off the line: the retention of the fingers will keep the horse on his ground, give him liberty to advance, or make him retire at your discretion.

There is another kind of piaffe, in which the horse plies his haunches, raises the fore foot high, springs from the two feet on the ground, before the others reach it, so that he bounds or darts forward, meeting the ground with a straight knee. The horse advances a little at every bound; the action is abrupt and unpleasant.

#### THE PESADE.

This air is derived from the passage when worked up to its extreme height, so that nearly the whole weight of the horse is thrown upon his haunches, the invitation of the hand, accompanied by the animation of the tongue, pressing him farther, induces the horse to rise forward, and gathering his fore-feet in to his chest, he is balanced on his bent haunches, in which position he will pause for the space of about five seconds; the hind feet, though scarcely raised from the ground, mark the time or beats, as if working the passage. The pesade must not be required of the horse till united himself in the passage, so as to be able deliberately to raise himself completely balanced, otherwise he will be in danger of falling. The horse should not be compelled to perform more than two or three pesades at one time, or he will be very likely to rebel.

#### THE TERRE-A-TERRE

Is galloping sideways, with the head to the wall or otherwise. The terre-a-terre is a shortened gallop with the croup in, and the haunches following in quick and close succession. The fact is, the horse is united or compressed, so as to produce a very cramped gallop, where the weight of course is thrown upon the haunches.

#### THE MEZAIR.

This is a side movement of the horse, in an action derived from the gallop, as the fore feet follow each other, and then the hind feet in like manner. The mezaire is worked sideways on two lines forming a right angle with the body, with a very close union, very lofty action before, and very low behind, wherein the beats of the fore feet follow close to each other, while the hind feet, lifted but little from the ground, glide along, rapidly accompanying the fore feet to keep the position, at the finish of every cadence, true upon their lines.

To render this more intelligible, it may be observed, that in the side movements of the horse in the terre-a-terre, he preserves his position on his lines in the midst of the cadence of the action working the shoulders and croup together; but in the mezaire, the action of the fore feet throws the horse out of position till the hind feet finish the cadence, and place him true again.

#### CURVETS

May be compared to the mezaire in a similar manner as the piaffe to the passage: it is a similar action of the legs, but in a straight or forward direction, which enables the horse to raise his fore feet exactly together, of equal height and projection, and coming to the ground in like manner, they make only one beat, the hind legs accompanying them make another beat. All airs derived from the action of the trot, beat the time of one, two, al-

ternately, without space or intermission between the beats; the beats are marked by two feet at cross corners, and are distinguished by quick, slow, sharp, or flat beats; but the action of the curvet is derived from the gallop, inasmuch as the fore feet meet the ground without the intervention of a hind foot, and though the action derived from the gallop is generally distinguished by four beats in the cadence, yet this air only makes two, the fore feet making one, and the hind feet the other: the beats are sharp, though a space appears between the cadence of each curvet.

#### THE PEROUETTE.

In this air, the horse goes about in the gallop completely on his hind feet; that is, his inner hind foot becomes a centre on which he turns, and the excellence of it is, to go about in one cadence of the air, which is the complete perouette.

#### THE STEP AND LEAP.

The step is, the horse uniting himself previous to the leap, and the leap terminates the air; so that to perform it a second time, he recommences with the step and finishes with the leap. It is performed on the ground upon which the horse stands, and he should not advance with the leap, but alight on the same spot from which he rose.

The action of the step is derived from the passage or piaffe, being the near fore foot, and off hind foot working together, and the off fore foot in like manner, the action lofty before and therefore low behind. The difference of the step from the passage or piaffe is the irresolute and weak efforts made by the horse to raise the fore foot which is on the ground, while the other is in the air, or before its return to the ground. This constitutes what is called the step; and when the horse has raised both his fore feet from the ground he makes a leap from his hind feet, and alights on all four feet at the same time, and disunited.

#### THE CROUPEADE.

This is produced in a similar manner to the preceding, but in an air of greater animation and higher action, and consequently requires greater exertion. The horse raises himself very high before with his fore feet bent to his chest (which is a pesade) and then springing from his hind feet, he draws them up near to his belly, which is called the croupade.

#### THE BALOTADE.

In this the horse springs higher than in the croupade; and while in the air he presents his hind feet, showing his shoes as though he were going to strike out.

#### THE CAPRIOLE.

In this, as also in the balotade, the horse collects or unites his powers to spring in an action derived from the gallop, by the alternate working of the fore and hind feet, similarly to what a horse gives force to his spring, by two or three peculiar strokes in the gallop before he takes a flying jump. In the balotade and capriole, he unites his powers by the alternate action of his shoulders and croup, without advancing one inch: the action of the legs like the mezzair, only higher behind, and after two or three cadences, he springs into the air, and lashing out his hind feet, completes the capriole. If

the feet should not be lashed out to their full extent, it becomes an air between the balotade and the capriole, and is called a demi-capriole.

The capriole is the loftiest air of the manege, and requires the greatest exertion which can be drawn from the horse.

From a perusal of the preceding sections of the manege, the reader will perceive, that what I stated in my introductory observations to the present article, viz., that the horse is constantly on his haunches, and in consequence is necessitated to endure a continued strain, which renders him incapable of any useful purpose, is perfectly correct; nor can anything be more absurd, ignorant, and ridiculous, than the following expression of Mr. John Allen, riding master, Seymour Place, Bryanstone Square:—"The manege system applied to practice on the road, the field, and the course." Now, as we know there are many tricks of trade, I cannot help suspecting the book in the title page of which "John Allen" appears, as one of them. I am of opinion there is no such person as "John Allen, Riding Master, Seymour Place, Bryanstone Square," and that it is merely a *nom de guerre*. Let it be kept in mind, that whoever huddled "John Allen's" publication together, was no riding master—or at least the scribbler knows just as much about horsemanship as he does of the avocation followed by the man in the moon; further, the book is *absolutely copied* from Adams, only that the changes are rung upon it, as it were; that is, there is some transposition of paragraphs, and this done so ignorantly, that what was plain enough in Adams's\* is, in "Allen," rendered unintelligible. If any person, in the least acquainted with the subject, will take the trouble just to glance at the plates on leaping which appear in "Allen's" book, and particularly the "*hunting leap*," he will be abundantly convinced of "Allen's" profound and genuine ignorance of the art upon which he thus professes to give instruction!

As the manege system requires the horse to revert the order of nature, his education becomes a task of some trouble, during which he is compelled to endure a course of drilling which amounts, in many parts of it, to positive torture.

What is called by manege riders (THE SHOULDER WITHIN) may be considered as the first lesson:—it is to bend, supple, and retain the horse's shoulders: it is first performed on circles. The horse being bent with his head towards the centre retains the inner shoulder, and advances the outer, which throws the croup out, and the hind legs describe a larger circle than the fore legs.

As soon as the lesson is perfected on the circle to both hands, it is to be practised along the walls of the riding house, in which the rider's position varies in a trifling degree, namely, rather less inclination of the body. When a horse works on a circle, he inclines his body to it, and the rider must consequently assume a corresponding position in order to preserve his balance. But when this lesson is performed along the wall, or on a straight

\* Adams understood the manege and military system of horsemanship,—but nothing more; and he lost many pupils in consequence of his obstinate adherence to them.

line, the position will be more upright. Adams observes upon "*the shoulder within*:" "This lesson, and all constrained lessons are *particularly distressing to the horse*, and should not be continued too long at a time, and in that short time should be frequently changed. The working twice round the riding house to one hand is sufficient; then change and work the contrary hand."

We then come to

#### HEAD AND CROUP TO THE WALL,

Which amounts to *passaging*, which I have already noticed, and to which I refer the reader. I will, however, introduce an extract from the practical instructions for attaining perfection in this air, and give it in the jargon of the school:—"Begin to work your horse's head to the wall, to the right; when you arrive at the corner, observe the turning of the corner. If you suffer the shoulder to go round too soon, the corner would not be filled, and discovers that the hand permits the horse to break ground, which all horses will do with inattentive hands. On the other hand, if you work too close, the shoulders would not have room to turn, and you would be locked up. Therefore, stop the haunches in time, that the shoulders may have just room to turn.

"If you have your horse properly united and balanced in your hands, the gradual turn of your body, desisting at the same time from aiding with the leg, will lead the shoulders round. And, as the shoulders advance to their proper situation on the new lines, the body and leg resume their former positions, and work both shoulders and croup together.

"When arrived at the corner B, in like manner, lead the shoulders round till they are properly situated to work on the diagonal lines which cross the school, and work to the corner D; if you bring the horse properly to this corner, the horse will be situated, by only the change of your position, to work on the lines to the left; carefully observing to turn and fill the corner C, work to the point E. Here stay the croup while you lead the shoulders round to station them on the intended demi-volt; then forming with your eye as true a half circle as you can, correctly work thereon."

To prepare or qualify the horse for the manege airs, a staff, six or seven feet long, is provided, to the upper end of which is affixed a strap, with a buckle to fasten it to the outside eye of the snaffle; the length of strap, from the extreme end of the staff to the snaffle, should be about six or eight inches. Long hempen lines, about the thickness of a clock-line, but twisted loose, that they may be soft and pliable, must be procured. The line should be from twenty-four to thirty feet in length, which is formed into reins, each end of which is to pass through the eye of the snaffle, then through the ring suspended from the head-stall of the bridle, and buckled to the loops of the saddle or surcingle. These reins you hold as you would the reins of a horse you were driving, at such a length as will place you in security from the heels of the horse. A whip with a long handle and long thong, for the purpose of animating the horse; or, in other words, compelling him to perform what you wish. Your assistant must have his staff

buckled to the eye of the snaffle next the wall, and must place himself at a convenient distance before the horse: his business is to prevent the horse departing from the wall, as well as to prevent the horse getting his head down.

Lead the horse to the wall, and let him advance slowly at first; then request him to unite himself; if he does not obey, he will bear on the bit, and endeavour to advance too rapidly; when the person with the staff can raise the head, and thereby bring the horse to obedience, and a light appui. The person holding the lines will moderately feel the mouth, the inner rein acting in unison with the staff rein, causes a little bend, and the appui is to be light, permitting the horse to advance slowly, the whip presented to keep the croup to the wall, and to stimulate and keep up the action. As the horse advances, the person with the staff retires. Thus, by practice, you are to procure as much union and action as the horse can endure; but this can seldom be accomplished without placing the horse between fixed pillars, passing the lines through rings fixed to the pillars at about the elevation of the horse's head, by which means the horse is compelled to work upon his own ground; and the operation is so extremely distressing that the animal cannot endure it many seconds without a rest. The horse in this manner, is at length worked up to extreme union, which is the foundation of all the airs of the manege; and as he at first performs them without a rider, he is ultimately able to go through them when mounted.

How far I am borne out in calling this a system of torture, I leave the reader to judge: I think he will perceive that the horse is forced, by the severity of coercion, into all possible contortions of limbs and body, for the purpose of producing what are called the airs of the manege; and although in these operations the beauty of nature is outraged in every possible form, yet, by a strange perversity of taste, and a paradox upon common sense, they are called *graceful*! but admitted to be useless by their most strenuous advocates!

#### MILITARY RIDING.

As I do not understand military evolutions, it may appear presumptuous to speak of military horsemanship; my observations, therefore, will be short, and indeed what I have to say on the subject will be confined principally to the seat or position of the rider.

It is the custom of the military, and has been particularly the practice of late years, to ride with long stirrups. I have observed in the preceding pages, that the stirrup should be of that precise length, which, without compelling the rider to bear the whole weight of his body on the fork, will, on the contrary, enable him to press his thighs to the saddle, grasp firmly with his knees and the calves of his legs—in fact, such a length of stirrup as will give him hold from the top of his thighs to the lower part of the legs, and particularly to grasp firmly with the knee—the grasp of the knee being the strongest hold that can be taken: for the rider to do this in the best possible manner, he must have sufficient bearing in the stirrup to enable him to compress the muscles of his limbs, as if they are elongated or stretched by the length of the stirrup,

they must lose their compressive force, or power of adhesion.

The seat just described is, beyond all question, that which gives a person the greatest strength or power on horseback, by which he is best able to support his horse, and maintain his situation on sudden emergencies, and all critical and difficult situations: I therefore am of opinion that it would be found more advantageous to the military, and would, unquestionably, be much less liable to cause or produce rupture, than the system at present in use. I was informed by a dragoon officer, that the privates will shorten the stirrup, for the purpose of acquiring an easier seat, whenever a convenient opportunity occurs: for which, however, they are punished, if detected, by extra drills, &c.

The soldier having to attack his enemy and defend himself, to act singly or in the ranks or squad, will require a horse with a delicate mouth, to which should be added the firmest seat; and the question is, whether the seat I have just described, or that where a longer stirrup is used, by which the muscles are stretched and must consequently lose much of their compressive power, is to be preferred.

Fashion may have had considerable influence in the introduction of the present military system of horsemanship. Like the manege, it appears to be of foreign extraction; whatever may be its merit in a military point of view, it is not calculated for any other purpose; I do not profess, however, to give instructions upon military riding, and therefore close the subject.

In conversing upon this subject with an officer, who had served in the dragoons, he very candidly admitted, that, for military service, the short stirrup was very far preferable to the length which our soldiers are compelled to use. By way of elucidation, he said, the natives of India used short stirrups; and in consequence they were not only much stronger on horseback than our troops, but could reach their enemy a foot farther.

#### LADIES'S RIDING.

In many parts of continental Europe, the ladies adopt the masculine method of riding, which is unquestionably the most secure; but the British fair, as they are incomparably beautiful, so are they equally delicate and modest, and have adopted a style of riding in unison with their feelings, elegant and graceful in the highest degree.

Much of a lady's ease and elegance in riding depends on the side saddle being properly formed, and well fitted to the horse. The head, which is the part that receives the right knee should be six or eight inches high, which will prevent the knee from being disturbed by any little unexpected roughness, and of course conduces very much to the security of the seat. The head should lay over a little to the off side, by which a lady is enabled to keep the centre of the saddle. The head and indeed almost every part of a lady's saddle should be stuffed, in order to render it as comfortable as possible.

The stirrup should be a slipper, the leather of which should hang over the off head of the saddle, the buckle under the head, so that it can be altered without disturbing her.

The horse is an important consideration in any department of riding, but particularly as regards the fair sex. In the year 1829, in the month of November, I rode with Sir J. L. Kaye from his residence, Swithland Hall, near Loughbro', to meet the hounds of Lord Anson at Kirby, and Lady Kaye accompanied us for a mile or two. Her ladyship was mounted on a charming little bay, nearly thorough bred, if not quite, perfect at his business. Sir John informed me that he purchased him (at four years old, if I mistake not) for the purpose of carrying Lady Kaye, and he therefore undertook the education of the horse himself. He taught him to canter in very beautiful style, made his mouth as light as a feather, and rode him with the bridle reins on his neck over rough and uneven ground, and continued these lessons till the horse was completely taught to take care of himself without the least assistance from the rider:—in this way, the horse acquired the method of raising his feet in such a manner as to render coming down next to an impossibility. Further, Sir John Kaye rendered him so steady that the horse would neither start, nor move out of his pace, whatever might occur. By Sir John's request, I galloped past her ladyship, cracking my hunting whip, which the charming little pad regarded with the most perfect indifference. Yet, he attended to every request of Lady Kaye with alacrity and good temper, proud of the elegant and lovely charge which he bore safely along.

A lady should never be placed on a horse which is not the safest possible goer, and immoveably steady to every kind of noise and every kind of interruption. A lady's pad should be accustomed to the firing of guns, the beating of drums, and indeed to every thing tending to create alarm. His mouth should be light and pleasant, and he should be taught to lead with the right leg. The canter is the pace best calculated for ladies' riding, which they can easily extend to the gallop, if they think proper.

In placing a lady on horseback, let the assistant adjust the reins of the bit (curb) taking them up within the bridoon (snaffle) rein; and, dividing the reins with the fore finger of his left hand, the lady will receive them from him with her right hand immediately before the pommel of the saddle, (the whip being also held in it and hanging over on the off side) placing her fore finger between the reins, letting them slide gently till her hand rests upon, and takes hold of, the near crutch of the pommel of the saddle; having placed herself close to the horse, with her face rather obliquely forward, the assistant must place himself before her, intersecting the fingers of each hand, and thus receive her left foot. The lady then places her left hand on his right shoulder, by which and her hold on the crutch of the saddle, she steadies herself, bearing all her weight on the assistant's hands, straightening the left knee and keeping it firm. The assistant raises the lady, seats her in the saddle, and places her left foot in the stirrup. She then removes her right hand from the near crutch to the off crutch, adjusts her habit with the help of the assistant, and places her right knee in the crutch on the pommel of the saddle.

The lady's dress being properly adjusted, a

strong pin may be placed under the narrow part of the right foot next the heel, care being taken that the pin confines the under as well as the upper side not only of the skirts of the habit, but also of the cloaths, to prevent them rising and rendering the seat uncomfortable. The skirt may also be pinned behind in boisterous weather; though these precautions will seldom be requisite when a female has become acquainted with the art of riding; nor indeed are they absolutely called for in the school, since the teacher is always at hand to assist in the re-adjustment of the lady's dress and indeed for any thing else. Lead placed in the skirts of the habit is convenient, and will prevent it rising.

In dismounting, the lady must remove the reins to the right hand, and take hold of the off crutch with it, when the pins (if any have been used) should be removed by the assistant, he also clearing her cloaths from the pommel of the saddle as she raises her knee over: he then takes the stirrup from her foot, while the lady shifts her right hand to the near crutch of the saddle. She leans forward and is received by the assistant or gentleman with a hand under each arm, and she descends lightly to the ground. If the lady be very active, she may place her right hand in the left hand of the gentleman, and making a spring just sufficient to clear the saddle, she must be received with the gentleman's right hand under her left arm, and thus alight very gracefully.

Should it be requisite for a female to dismount without assistance, she must clear herself of the crutch, stirrup, &c., turn to the right so that she can take hold with her left hand of a lock of the horse's mane, holding with the other hand the near crutch; she will then spring from the horse and alight on the balls of the feet, the knees a little bent, and not relinquishing her hold till she perceives herself quite secure.

A lady's position should be upright, the left foot placed horizontally and bearing a little in the stirrup, the right knee in the crutch, which it grasps, the leg back and close to the flap of the saddle. The body being upright, the lady looking directly to the front, her weight should rest on the centre of the saddle, neither bearing to the right nor the left; and, in fact, to acquire the true seat should be the first grand object, nor should a lady attempt to ride beyond the walk till she has acquired confidence, a true balance, and correct position.

The lady's first lessons should be in a circle, a rein fixed to a cavison or the bridoon, by which the teacher will direct the horse; which should be very steady and one that has been well trained for the business. Practice without the stirrup, and without any assistance from the reins is highly advisable, in order to acquire a good balance and an easy, elegant, and graceful, but firm and steady, seat. The eye should be directed to the horse's nose; and ladies should be chiefly practised to the right to divest them of the propensity of inclining to the near side of the horse.

Ladies should be practised in the walk till they have acquired confidence, when the horse may be put to a slow trot, increasing the pace by degrees according to the progress made by the pupil.

When the lady has acquired the freedom of leaning to the right, in a smart trot, so that she can

observe the feet of the horse on the off side, her position and seat may be considered as tolerably correct.

It is not to be supposed that a lady will be able to manage the reins with the strength and dexterity of a man; and therefore, as I have before observed, ladies should always be mounted upon horses well trained for the purpose, like the pad belonging to Lady Kaye. However, what has been stated on the HAND, &c., in the instructions for gentlemen is applicable also to ladies: it should be explained to them by the teacher, and they can study it at their leisure. A lady can aid or animate the horse by the whip on the off side, applied behind the girth according to the required degree.

The whip should be held in the hand in a somewhat similar manner to a pen, the lash downward, but not so as to touch or tickle the hind quarters or flanks of the horse.

A lady who wishes to become accomplished in riding, should study whatever has been said on the subject, in preceding numbers, as applicable to the opposite sex—the back a little hollow, the breast raised, the seat firm, yet easy, elegant, and graceful.

As soon as a lady has acquired the correct method and style of trotting, and of rising in the stirrup, she must be mindful not to twist her body, nor rise to the left side; she must keep her right shoulder back, and raise her body in a line to the horse's right ear. The action of the horse will inform her when to rise, when her body must be inclined a little forward. In this operation a great portion of her weight will be received on the right knee, by which and a pressure in the stirrup, she will ease her return to the saddle.

The canter and gallop will succeed the trot, which will be very easily acquired, and needs no further instruction in this place. The canter is the most graceful and the best pace for ladies's riding: I cannot persuade myself to think that a lady appears to advantage in the trot.

The last lesson is the bar; in leaping, the lady must take as firm a hold as possible with the right knee, and for any further instruction upon the subject the reader is referred to preceding numbers.

I have frequently observed gentlemen take hold of the cantle of the saddle; I have noticed ladies take hold of the crutch: they are both bad habits.

I am not aware of any picture more beautiful than an elegant female on horseback; Lady Grosvenor is a striking exemplification, whom I have repeatedly seen at the fixtures for the Cheshire hounds; I never observed her cross the country. Her ladyship's presence at the fixture was highly gratifying; it gave a degree of interest to the scene which could not have been derived from any other source. Amidst the busy jocularly of such a meeting, there might indeed be seen the homage which high birth and distinguished rank paid to loveliness and beauty. Lady Grosvenor remains to witness the finding of the fox; and if when he goes away, he happens to take a direction that will enable her to see the run, she rides along the lanes, crosses inclosures where gates or openings happen to be convenient, and continues in this way as long as she can. I think I once observed her up

London Published by Chapman, August 1. 1836

Drawn by W. Parker

at the death of the fox.—Lady Grosvenor is an elegant rider.

Lady Helen Lowther is the boldest female rider I ever saw. This lady appears in the field in scarlet, completely equipped for the chase. She meets the Earl of Lonsdale's fox hounds, mounted upon steady superb steeds, and rides uncommonly well. Upon one occasion, when the fixture was Little Daulby, three miles from Melton, I saw Lady Lowther put her beautiful bay horse along with uncommon spirit.

It is no uncommon circumstance for ladies to attend the fixture for the purpose of witnessing the find, though few attempt to follow the hounds. I have seen considerable numbers of elegant ladies attend the fixture of the Quorndon hounds the first Monday of November, (the commencement of the season) for the purpose of seeing the fox go away.

When a lady and gentleman ride in company, the lady rides on his left.

### TOUCHSTONE.—(PLATE.)

The splendid animal, whose portrait forms our present embellishment, has appeared many times on the course; and, notwithstanding his numerous contests, has continued to train on, as has been strikingly exemplified by the manner in which he won the late Ascot Cup. A portrait of Touchstone was published in 1834, immediately after he had won the Great Doncaster St. Leger of that year; but, as the horse, when left to the genuine operations of nature does not attain maturity till he has completed his seventh year; a three years' old must be seen under every disadvantage; like most other quadrupeds, at an early period of life, he will appear leggy; he cannot be half furnished in any respect, and consequently must be seen under every disadvantage, particularly as far as relates to a pictorial representation. Under such circumstances, therefore, it was thought an impressive and highly-finished likeness of a horse (in a state of maturity) who has come out so often, ran so successfully, and won some of the most important stakes in the country, would be considered very acceptable to our readers. Having observed that the horse does not attain maturity till he has completed his seventh year, when left to the genuine operations of nature, it becomes requisite on the present occasion further to state, that the physiology of the horse, like that of most other animals, is very susceptible of the influence of art; or, in other words, man has devised various means by which he contrives to produce a premature or precocious maturity in those animals which he has reduced to a state of subjection; for instance, the racer, abundantly supplied with nourishment and food from the moment it breathes the vital air, placed in training at an early period, sweated, physicked, and bled, reaches the meridian of its existence (or acquires its greatest strength) two years

earlier than it would attain by the ordinary process of nature: thus, Touchstone, having received every physiological acceleration which the art or ingenuity of man could devise, presents, in the sixth year of his age, that fulness and rotundity; in fact, all that consummate perfection of form or animal organization of which he is susceptible. Consequently, the portrait which forms the frontispiece of our present number, will present to the eye a very different figure from the likeness taken two years earlier, though the one and the other may have been executed with the utmost fidelity of delineation. As the reader will be able to form an opinion for himself, we shall merely remark, that, as the horse in question is remarkable for the great strength of his thighs, and particularly for the lateral development of the muscle immediately above the hock, so the artist has contrived to give to these parts that degree of prominence so forcibly exhibited in the original.

Touchstone (a beautiful brown in colour) is by Camel, out of Banter by Master Henry; grandam Boadicea (sister to Bucephalus) by Alexander; great grandam by Brunette, by Aramantus, out of Mayfly, by Matchem, Amadis, Starling, Grasshopper, Sir M. Newtown's Arabian, Pert, &c.; Camel by Whalebone, dam by Selim, out of Maiden, by Sir Peter, &c.

Touchstone came first to the starting post in 1833 at Lichfield for the Produce Stakes of 50 sovs. each for two-years' old (3 subs) but meeting no competitor, walked over.

He came out again the same year at Holywell for the Champagne Stakes of 50 sovs. each, h ft., for two-years old (9 subs.) in which he ran third, the stakes being won by Mr. Mostyn's Queen Bess.

In the month of May of the following year (1834) he came out at Chester for the Dee Stakes of 50 sovs. each, h ft. for three-years old, which he won very cleverly, beating Queen Bess and two others.

At the same Meeting he appeared for and won the Palatine Stakes of 50 sovs. each, h ft. for three-years old, again beating Queen Bess and four others.

At the Liverpool July Meeting (Aintree Course) same year (1834) he came to the post for the St. Leger Stakes of 25 sovs. each, with 100 sovs. added, for three-years old, and ran second to Sir J. Boswell's *ch c* General Chasse.

Two months afterwards (September 1834) he won the Doncaster St. Leger, beating Bran, General Chasse, Shillelagh, Worlaby Baylock, Loudon, Lady le Gros, Bubastes, Valparaiso, Plenipotentiary, and *c f* by Partisan. Run in three minutes and sixteen seconds.

In the latter end of the same season (1834) he won 50 sovs. at Wrexham, and 100 sovs. at Holywell.

In 1835, Touchstone came out in the month

of May at Chester, and walked over for the Stand Cup.

The following week he came to the post (Liverpool Craven Meeting) for the Trade Cup, which was won by General Chasse; Touchstone not placed.

In September of the same year he won the Gold Candelabrum at Doncaster, value 300 sovs., with 50 sovs. added, beating Hornsea, General Chasse, Shillelagh, and Bella.

On Wednesday, September 23rd of the same year (1835) Touchstone won at Heaton Park a Piece of Gold Plate, presented by Count Matuschevitz, with 330 sovs., and on the following day, at the same place, walked over for a Gold Cup, value 100 sovs., with a Sweepstakes of 10 sovs. each (16 subs).

At Holywell, on the 13th of October of the same year (1835), he won a Sweepstakes of 50 sovs. each, (4 subs.,) beating Sister to Mona's Pride; on the same day he ran second to Mr. Mostyn's Usury for the Mostyn Stakes of 10 sovs each, (26 subs.,); and on the following day, at the same place, he walked over for a Port Sweepstakes of 100 sovs. each, h ft, (3 subs).

On Thursday, June 2, 1836, Touchstone won at Ascot a Gold Cup, value 300 sovs., with 200 sovs. added, beating Rockingham, Lucifer, and Aurelius.

In addition to which, it may be stated, that in 1835, Touchstone challenged the kingdom (8st 10lb), and his challenge continued unaccepted.

Touchstone is the property of the Most Noble the Marquis of Westminster, who traces his descent in the male line to an illustrious house which flourished in Normandy about a century and a half before the conquest of England by William I. The family of the Marquis of Westminster obtained its surname (Grosvenor) from having held the high and powerful office in that principality of Le Grosvenour. The founder of the family, Gilbert Le Grosvenour, came to England in the train of the Conqueror, and was nephew to Hugh Lupus, Count of Avranches, and, subsequently, Earl of Chester, uncle of the victorious monarch.

His Lordship succeeded to the family honours, as second Earl Grosvenor, upon the demise of his father, June 2, 1802, and was created Marquis of Westminster in 1831.

---

On Wednesday was shot, at Knightsbridge barracks, poor old Jack, the only remaining horse in the Second Regiment of Life Guards at the battle of Waterloo. Jack carried his master through the perils of that day safely, and escaped safely himself without wound or cut. At every commemoration Jack was dressed in laurels and paraded proudly in front. On the 18th of this month he was again honoured; but, alas! it was destined to be his last glory. Age was fast coming on him, his legs swelled, his eyes got dim: but we are perfectly sure he was quite aware when the 18th of June returned, and why he was adorned with laurels. It was a pity to shoot him; it might be to save him from the infirmities of age, or to save others the trouble of attending him.

## MR. BLACKER ON THE CLAIMS OF THE LANDED INTEREST TO LEGISLATIVE PROTECTION.

Our attention has been directed to a publication from the pen of Mr. Blacker, who is already well known as the author of "An Essay on the Improvement to be made in the Cultivation of Small Farms." His exertions to improve the system of husbandry in Ireland, and the success which has attended those exertions, has, most deservedly, acquired for him the thanks of the Proprietors of some large estates, of which he has the management, and the gratitude of the tenantry, who are so fortunate as to enjoy the advantage of his advice and direction. The work to which we allude is entitled "The Claims of the Landed Interest to Legislative Protection Considered." From the very short space of time which this publication has been before us, we have not been enabled to read it with that attention which a hasty perusal sufficiently satisfies us that it deserves. But we are unwilling to postpone a notice of it from the conviction that it cannot be too speedily submitted to the examination of all those who take an interest in the cause of agriculture. The work is divided into sixteen chapters, each treating separately upon some distinct head. It can scarcely be expected that, even in a work of limited extent, there should not be some positions taken which will be viewed in different lights by different persons, of the same class, and having the same interest at heart, and we feel persuaded that a very considerable difference of opinion will exist as to the correctness of many of the propositions laid down by Mr. Blacker, especially when we take into account, according to his own statement, that he would not legislate for the benefit of a *class*, but for the whole *community*. Time will not serve us at the present moment, to go into a minute examination of the principles which he lays down; we shall however embrace an early opportunity of submitting them to a more strict scrutiny. His mode of exemplification is simple and striking, and eminently qualified to lead the reader to the conclusion the writer desires, when perhaps, there may be some lurking fallacy wholly concealed from view. The subject of the 8th chapter is, "The present System of the Corn Laws Considered." The following extract is intended to show the relative positions of the British and Foreign Agriculturist.

"But as an example shows the nature of the case in a clearer point of view than any general statement, allow me to compare the farmers at home and abroad, thus contending for the supply of Great Britain, to an opposition between two rival coach establishments, contending for a monopoly of the passengers on any particular road,—this is a matter of common occurrence, in which, whoever can continue the contest longest, ruins his adversary and effects his object— which, it is well known, is neither more nor less than to raise the *price of the fare*. This is so notoriously the case, that I may venture to assert, the public always considers itself interested in keeping up the opposition, for the avowed purpose of keeping down the fares. If the two establishments start on equal terms, and are conducted with equal economy, ability, &c., and have each an equal share of public favor, the heaviest purse generally carries the day;

but if one is liable to a heavy toll, and the other is not, it is then quite clear, that whilst one may be daily *losing*, the other may be carrying on a *saving*, or even a *beneficial* business,—and it is easy to see, the establishment which pays the toll must give up. Now this comparison is by no means what is termed ‘far fetched,’ for we are all passengers through life, and our subsistence is the *fare* for which these rival establishments are contending; it is therefore quite clear that the public who are the passengers, have a direct interest in supporting the weaker party in the struggle, and by some subscription in his favor, to place him upon an equal footing with his antagonist; for the express purpose of preventing the fare being raised by his ruin, which is a thing often carried into practice with the greatest public advantage. In this example it is evident, the establishment or copartnership, *subject to the toll*, is the *agricultural classes of Great Britain*, and if the public allow their rivals, the *continental farmers*, to ruin them and render them unable to carry on the competition, *their fare*, viz. the *fare of the public*, will be raised upon them—or, in other words, the price of grain will be advanced. The remedy proposed then, is the same which I have stated to have frequently been resorted to, and to have proved effectual in the example alluded to; that is, for those interested in supporting the opposition, to subscribe among themselves to assist the weaker party. But the British public is the party interested in the present case, and the subscription which they are called upon to make, is to lay on such a toll upon the competitor coming from abroad, as their countrymen are subjected to at home, and to be content to place the home grower upon an equal footing with his rival—in order to enable him to continue the contest, and secure to themselves a *permanent supply on fair terms*—rather than be seduced by the temptation of a *transient advantage* in dealing with his competitor, which will leave them at his mercy hereafter, when the home grower is ruined.”

Mr. Blacker is fully alive to the annually increasing amount of Agricultural produce grown in Ireland, and its effect upon the English markets, and he plainly states, that by an improved system of cropping and management, the quantity may be yet increased to an immense extent. In order therefore to prevent the disastrous consequences likely to result from such competition in the article of grain, he suggests the following remedial measure.

“I think it will appear that an efficient protection in butter, flax, and tallow, respecting the production of which there can be no dispute, would have the effect of withdrawing so much ground from the cultivation of *grain* crops in Ireland, as would for several years, at least, obviate all fears that might be entertained of any redundancy arising from the export of *that article* from this country: to ascertain which, let us see what quantity of land might thus be diverted to the produce of flax and butter, so as to estimate as near as possible to what extent relief might thereby be expected. We have already seen, page 168, that it would require 278,000 acres under flax, to supply the quantity of that article required, if the foreign article was shut out; now the reduction in the extent of land applied to grain culture would not be limited, as would at first sight appear, to this quantity, but would extend much farther. Flax leaves nothing towards manure, and where it would be cultivated, the manure made on the farm must be proportionably reduced; therefore, under the very *best* system of tillage, the quantity of land devoted to the cultivation of grain crops between

what was actually employed in the growth of flax, and what must of necessity be applied to pasture from the deficiency of manure, might fairly be taken at 500,000 acres. Let us next consider what land might be required to supply the extra quantity of butter which would be required if foreign importation was done away with, as the import of grain now is.—In the calculation I have given in an Essay on the Improvement to be made in the Cultivation of small Farms in Ireland, I have shown that the small farmer acting on the four course rotation, may feed three cows upon the produce of two acres of land. To maintain them however, where flax is largely cultivated, much more land must be allowed, for as manure falls short, not only pasture but hay and other crops, that will grow with less manure than turnips, but do not produce the same quantity of food, must be resorted to; in supplying, therefore, the extra quantity of butter required, if foreign importation was prohibited, and flax cultivated, we may take on the lowest computation that two acres to each cow for summer and winter feeding would be required, and that about one cwt. of butter would be the full average produce of each cow; therefore the ground required would be at least double the number of cwts. of butter imported, viz. 135,864 cwts., which at two acres to each cwt., would make in all 270,728 acres; the production of butter, therefore, would appear fully adequate to the advantageous occupation of all the land calculated to be thrown out of grain cultivation, by the cultivation of flax. In forming the foregoing estimate of 500,000 acres, and taking their produce at four and a half quarters of grain of all kinds, it would be tantamount to a reduction in the total export from Ireland, of about 2,250,000 quarters, which taken from the exports of Ireland, would be greatly felt in the English market. In this calculation no notice is taken of what hemp or tobacco might occupy, or what the rise on tallow might throw into pasture, and rearing stock, the enormous quantity likely to be devoted to flax and butter being quite sufficient for my argument, and that a little protection would have the effect of turning the corn land of Ireland to the cultivation of flax, is abundantly proved, by the fact that a little advance in price this last season, is now turning to the growth of flax almost the entire of the manured land of the north of this kingdom. This rise in price has been occasioned by the failure of the flax crop on the Continent, and most probably the poor people who are now speculating on the continuance of those prices, will suffer severely by the fall that probably will take place, when the abundant continental crop of this season shall get to market. The only chance the Irish farmer has of success in the cultivation of this article, appears to me to be, that by the erection of flax spinning mills in the neighbourhood of Belfast, the market for the article is brought nearer to him, and farther from his continental competitor, than it has heretofore been, when the flax spinning business was principally confined to the east coast of Scotland. The cost from importing flax from Riga to Dundee is as little as from the country markets in Ireland, and to bring it from Holland is actually less; so that the produce of Russia and Holland, in this article, directly competes in every respect with the produce of the United Kingdom.”

It cannot for an instant be doubted, that the dedication of 500,000 acres of land to another purpose than that of growing Corn, must reduce the supplies sent to market, very considerably, and produce a comparative effect on prices. There is, however, one very material point to be attended to in the

growth of flax, hemp, &c. which is the effect produced upon the soil. In neighbourhoods where an ample supply of manure, as sea-weed, &c. can be obtained, such a system may be beneficially adopted, but we entertain more than doubt, whether it would be possible to cultivate flax on ordinary soils, to any extent, and at the same time maintain the farm, even in a moderate state of cultivation. These are practical details, and at the present period, when it is admitted upon all hands, that Great Britain possesses powers of production more ample than her consumption requires, are well deserving the attention of land-owners and occupiers, and as such, we commend them to their notice.

**COST OF GROWING WHEAT.**—A rise in the prices of Agricultural produce, but particularly of Wheat being called for by some parties, it becomes desirable to ascertain as correctly as we are enabled, the price at which it can be grown with a remunerating profit to the farmer. Scarcely two farmers can be found who will agree upon the rate, each individual making his calculations upon *data*, applicable to his own particular case. The following answer of Mr. Sturge of Birmingham, to a question put to him by Mr. Cayley, as given in the second report of the evidence before the Committee of the House of Commons on the State of Agriculture, is appropos to the question. "You have only taken the cost of bringing Wheat here; can you estimate the price at which a farmer can grow Wheat?—I suppose the most practical agriculturist cannot; for they said formerly that it could not be grown at less than 10s a bushel, and afterwards 8s; and a member of this committee told me, the other day, he should be glad to compromise it for 7s. I conceive that the cost of the production of the Wheat depends very much upon the value of the necessaries of life; and it is upon that ground that I conclude (and it is the result of a good deal of observation), that the English farmer pays more in the cost for production than he can get benefit from any of the laws of monopoly; at the same time I am perfectly convinced that it checks the consumption of the better kind of food, which it is mostly more profitable to the farmer to produce. As to what Corn can be grown at, I find farmers, for the last ten or fifteen years, so various in their opinions, that it is impossible to say. Perhaps I may be allowed to mention a conversation I had with an individual two or three months ago. I was travelling with a farmer who has very much lessened his property. He told me that he had lost 15,000*l.* by agriculture since he had been in it, besides a considerable sum in purchasing land; but in the course of conversation, which afterwards took a different turn, he mentioned a farm that was to let in his neighbourhood, which he appeared to be considering whether he should take; and he said he could afford to grow Wheat upon it at 15s a bag, or 40s a quarter. This was the opinion of a man who had suffered very much from the depression of prices; but it seems he had learnt from it how to grow corn cheap."

At Munster, Prussia, on the 30th ult., a race took place of horses matched against reindeer. The latter had to contend against seven horses who had already gained prizes at different horse races; but a five-year old stallion, belonging to a peasant at Amelsburen, arrived at the winning post before the reindeer.

## TO THE EDITOR OF THE LINCOLN-SHIRE CHRONICLE.

SIR,—I should not have departed from my hitherto unvaried practice by noticing any remarks, which as a public journalist you were fully entitled to make, upon my parliamentary conduct, had you not in your last Chronicle quoted an incorrect report of my speech upon Sir Charles Knightly's motion. I am reported to have said, "that the repeal of the duty on soap would not give any great relief to the farmer." Now, what I did say was, "that the reduction of the duty on soap would not give any relief to the farmer," and I added, "if I thought it would, the proposition of the honourable baronet should have my support, and claim credit for the sincerity of the avowal, because honourable members on both sides of the house will bear testimony that I have never allowed political predilections to bias my vote when the interests of agriculture were involved."—There is an old remark, that there is an M in Macedonia and an M in Monmouth, and about an equal degree of affinity as effects the agriculturists exists between the motion of Sir Charles Knightly and that which you allude to my having introduced at an earlier period of the session.—The terms of my motion were, "to repeal the excise duties on soap, and increase the custom's duties upon foreign tallow." My object was to relieve the grazier, not certainly by a repeal of the soap duties, but by imposing an additional protection upon tallow of home growth; but, knowing that I should fail in carrying the latter proposition without providing an equivalent to the public for the tax which it would impose, more especially upon candles, I suggested the repeal of the soap duties as a compensation, the consumers of both being the same,—while the manufacturer would be altogether relieved from the trammels of the excise (which Sir C. Knightly's motion would have left as obnoxious as ever), and the Exchequer freed from the cost of collection, and remunerated in a great measure for the loss by the increased duties upon Russia tallow.

Sir C. Knightly wholly omitted that portion of my motion which, in my view, would alone have benefited the graziers, and adopted, as a boon to the agriculturist, that which I proposed merely as a compensation to the consumer; or, in the words of my speech, "took the husk and left the kernel!" For what was his proposition? "that the duty on hard soap should be reduced from three-halfpence to one penny, and on soft soap from a penny to one farthing." First, as to hard soap—out of 155,000 tons of tallow, the average quantity annually produced or imported into this country, 25,000 tons only are used in the manufacture of soap. Lord Althorp reduced the duties from threepence to three-halfpence per lb. Has the consumption of tallow increased? *It has not, but the importation of the Gallipoli and Palm oils has nearly doubled.* And why? because at their present reduced rate of duty they form the basis of all the cheaper soaps, to the exclusion of tallow!—What reason then is there to believe that the additional reduction of one halfpenny by Sir C. Knightly would have a contrary effect to the reduction of three-halfpence by Lord Althorp? But Sir C. Knightly proposed a still greater reduction in the duties upon soft soap—namely, "from a penny to one farthing;" in other he reduces hard soap one-third, but soft soap three-fourths! How then can he reconcile this proposal with his special object of relieving agriculture? for if Sir C. Knightly took the trouble to acquaint himself with the nature of the subject on which he proposed to legislate, and which I am bound to presume he did, he would learn that in the *manufacture of soft soap, no tallow whatever is used.* Thus much for the agricultural bearings of the question. Sir C. Knightly might conceive he was rendering a service to the agriculturists by embarrassing the government, but in this he had no right to expect my co-operation; and I only hope, whenever Parliament may claim our gratitude for a measure of relief to the farmer, it will be of a more substantial character than than proposed by Sir Charles Knightly.

With reference to the comparative advantages to the

public between a reduction of the respective duties on newspapers or on soap, I shall only add, that though I have stated in my place in Parliament, that the former is *not* the tax of all others I should select for remission, yet, in the choice offered me, I give it the preference, because it will put a stop to a systematic violation of the law, without any ultimate loss to the revenue; while the latter, taken with relation to the population, would barely effect a saving of threepence halfpenny per head per annum; a poor equivalent, in my opinion, for an annual loss to the Exchequer of from 2 to 300,000*l.* without any diminution in the cost or trouble of collecting the remainder, and without any relaxation to the manufacturer of the vexatious restrictions of the excise.

I am, Sir, your obedient servant,  
HENRY HANDLEY.

### SIR CHARLES KNIGHTLY'S "BOON" TO THE AGRICULTURISTS.

(FROM THE SPECTATOR.)

Let us see what Sir Charles Knightly would actually have accomplished, had his plan succeeded. Mr. Chas. Barclay, the brewer, who seconded the motion, calculated that the proposed reduction of the soap duty would amount to 244,000*l.* This 244,000*l.* divided among the English population of fifteen millions, would give each a sum of 3½*d.* per annum. The agriculturists, we suppose, do not use more soap than the mechanics—probably not so much. They would at any rate only have an equal share with other classes in the benefit of the reduction; and that share would be 3½*d.* a head. Behold the great boon to the suffering agricultural interests! Mr. John Brickwell, a Buckinghamshire farmer, was examined before the agricultural committee of the House of Commons. He rents 700 acres of land; and he told the committee, that by the abolition of the malt-tax of five millions and a half, he would only have gained 2*l.* a-year; and now it is proposed to *relieve* this man by taking off a tax of less than a quarter of a million. If the abolition of the malt-tax would only put 2*l.* a-year in Mr. Brickwell's pocket, the proposed reduction of the soap-tax would give less than one pound a-year! Look at the calculation in another way. Sir Charles Knightly proposed to take a halfpenny off the tax on hard soap: supposed Mr. Brickwell consumed 480*lbs.* a-year of soap, still this reduction would only relieve him to the amount of 1*d.* But what farmer consumes 480 pounds of soap in his household, now that the practice of boarding his labourers is put and end to? Mr. Goulburn says that each person on an average uses 6½ pounds of soap a-year. Suppose that a farmer has ten persons under his roof, his consumption of soap would be 65 pounds; and his saving by Sir Charles Knightly's scheme of relief, would therefore be two shillings and eightpence halfpenny per annum! What a relief to the suffering agriculturists! The quantity of wheat raised in England is not less than twelve millions of quarters: suppose that the price of wheat on Monday last had risen sixpence a quarter—three farthings a bushel—in Mark Lane: would any farmer's friend have admitted that the rise had given great relief to the agricultural interest? Yet sixpence a quarter on twelve millions, amounts to 300,000*l.*; that is 56 thousand pounds more than is produced by that portion of the soap-tax sought to be repealed. Even if the whole benefit of the remission were to be engrossed by the agriculturists, still an advance of less than a penny a bushel on wheat would be the greater advantage to the agricultural interest. Let us suppose that a farmer pays 500*l.* a-year rent and tithes. The "agricultural interest is suffering" in spite of the Corn-laws, and he applies for a lowering of his rent: would he thank his landlord for a reduction of one per cent.? Scarcely, we should imagine, yet, on the supposition that his family consisted of ten persons, even that paltry reduction of rent would be about 38 times as large a "boon" as that which Sir Charles Knightly

proposes to give him. The fact is, that the only class of persons who reap any material saving by the reduction of a halfpenny a pound on soap would be the laundresses; and Sir Charles Knightly should have proposed it as a boon to washerwomen.

Such being the real state of this question, what is the proper name for the Standard's pretence, that "the remission of the soap-tax would afford great relief to the suffering agriculturists?" The friends of the farmer treat them as if they were stupid dolts, who could not put two and two together, to make four. Any farmer who has had the benefit of Sunday School teaching, can calculate at once, that the remission of a halfpenny a pound on soap, would give no relief worth mentioning to any large "interest." But the reduction of the tax would stimulate production: possibly, a very small additional quantity of tallow might be required. Tallow, however, comes from Russia, as well as from the English grazing districts; and it must be remembered, that the illicit manufacturer supplies a large quantity of the present consumption. A reduction of the duty might bring more soap "to charge" yet we question whether the demand is not already satisfied by the fair dealer, and the smuggler together. At any rate, the indirect advantage to the English farmer is uncertain, and so minute as not to be tangible.

SHEERNESS.—SHEEP SHEARING.—On Monday se'night, a shearing match took place at Minster in a field at the foot of Minster-hill, under the auspices of the Isle of Sheppy Agricultural Society; there were seventeen competitors, each of whom had a pen of three sheep, and prizes were given to a certain number of the best shearers. The judges, (Mr. Gascoyne, of Pappchild, Mr. Goord, of Milton, and Mr. Smith, of the Isle of Grain) pronounced the whole of the shearing to be very excellent, and as doing great credit to the graziers of Sheppy and their servants. Besides the farmers and graziers of the island, there were present several gentlemen from the neighbourhoods of Faversham, Milton, &c. After the shearing, the gentlemen composing the Isle of Sheppy Agricultural Society, and their friends, to the number of sixty-five, sat down to dinner at the Waterloo Inn, Minister, D. Banks, Esq., to whom the sheep that were sheared belonged, presided on the occasion, and the evening was passed away with many a bumper.

PORTFOLIO.—CIVILIZATION IN EGYPT.—Civilization and taxation have long been considered as proceeding hand in hand. The virtues of a simple people, we are every day told, are not to be expected in our complicated state. That complication which we consider as a portion of civilization, those who have seen and studied the East in its present state of transition, feel to be an unhappy aberration of the Western mind, which is now spreading to the East and is there attended with all the worst symptoms which we consider as incident to civilization. There these symptoms are now making progress enormously rapid, in consequence of the fiscal regulations not taking two or three centuries for their establishment, as they have done in Europe, but being the growth of a month or year, and enforced by the great instrument of despotism hitherto unknown in the East, and now imported from the West, viz. standing armies. The dependence of the Arab on the date-tree has been the theme of every traveller in Egypt, Africa, and Arabia. In Egypt, the soil upon which the date-tree stands is taxed. The tree is taxed; the fruit is taxed; the branch which holds the fruit is taxed; the Lift made from it is taxed; the branches are taxed; the fibre of the trunk is taxed; the cutting of the branches is an excise; the leaves of the branches are taxed; the makers of Lift are taxed; the makers of Couflan are taxed; the makers of the date-rope are taxed; the makers of date-baskets are taxed; the baskets ropes, &c. on exportation pay duty.

## THE SHEEP.—No. III.

IMPROVEMENT OF THE BREEDS.

*(From the Dumfries Herald.)*

The subject of our present paper requires, for its due consideration, some slight attainments in anatomy and physiology, but as such attainments, slight though they may be, are as rarely met with as required among the bulk of mankind, so the want of them may be the less regretted, seeing it is in our power to render even the intricacies of the subject plain and simple, by an appeal to facts of every-day occurrence, which, having attracted the notice of the most unthinking, will serve as hooks on which we shall try to hang the better part of an interesting study.

From the time of Jacob the possibility of determining the nature of the offspring, by impressions on the parents, has been apparent to all, and the best means of perpetuating a good quality or removing a bad one have, from time to time, occupied the attention of patriotic individuals.

As much appears to have been known about sheep two thousand years ago as at present; so true is it that nothing new is to be met with, yet that does not rob our modern improvers of their merits, for though they deserve little as inventors, yet are they to be admired for that strength of mind and determined perseverance which enabled them to rouse their fellows from a lethargic slumber, and compel them to become in turn benefactors of their country and themselves. The signs of a good ram are concisely laid down by Varro, by Virgil in his third *Georgic*, and by Columella; and though the Spanish nobility were looked upon with wonder (till eclipsed by our own extravagance) in giving two hundred ducats, or fifty pounds, for a ram; yet Strabo assures us that in his day (under Tiberius) they gave more than three times that sum for one of the breed of the Coraxi, a Pontic nation, believed to have the finest sheep in the world.

There cannot be a more certain sign of the rapid advances of a people in civilization and prosperity than increasing attention to the improvement of live stock. It tells of a population limited in regard to soil, and using every effort to remedy the want, by an economical doubling of the return for the usual outlay, for while a tribe wanders at large, remaining at a particular place only so long as provender holds out, and striking the tent departs for some far off field, so long will their flocks be suffered to roam neglected, and flourish or decay as chance directs.

The greatest recorded improvers of the sheep in ancient times were Lucius, Junius, Moderatus, Columella, and his uncle Marcus Columella, Spaniards of distinction, who removed to Rome in the reign of Tiberius, and made agriculture the study and business of their lives. The former commenced his celebrated treatise on husbandry during the reigns of Tiberius and Caligula, and appears to have finished it Anno Domini 55. It is a work that may be read with advantage even at present, as it abounds with much that is valuable, and is accessible to all through its English translation.

The first in modern times who arrived at any thing like eminence by his attention to this department was Joseph Allom of Clifton, who raised himself, by dint of industry, from a plough boy, and for a long time contrived to keep his methods secret, being supposed to have bought his ewes in Lincolnshire at the very time he was constantly bringing them from the Melton quarter of Leicestershire. Though possessing talent, he does not appear to have

had education enough to avail himself of it, and accordingly never gained the extensive popularity which fell to the lot of Bakewell. This latter gentleman, who may be said to have created a variety, considered that a tendency to acquire fat was the first quality to be looked to in an animal destined for the food of man, and on this, with him a fundamental principle, were based the whole of his proceedings. This variety, named the Dishley or New Leicester, from the residence of Mr. Robert Bakewell, has already received from us the outline of a description, and will, with the merinos, occupy the most of our attention in this paper, as tending materially, by their history, to elucidate some of the most important points connected with the influence of place and circumstances on the animal in general. Mr. Bakewell succeeded in bringing his sheep to great perfection, as regards form and rapidity of fattening, by breeding in the same family for a great many years; but it has been attended with considerable deterioration in the quality of the wool (it being a rule that the poorer the sheep are the more prolific; and the finer does the fleece become,) a circumstance which met with a check, some years after the introduction of the merino, in 1788, which is well known in all its crossings principally to affect that part of the animal.

Merino sheep, so called from a peculiar reddish hue of the countenance, are supposed to have come originally from Africa; at least Marcus Columella, having seen a strange variety from that country exhibited at Rome during some public games or shows, took them to his farm, and having crossed them with other breeds, sent the offspring to Spain, in which country they thrive remarkably, attracting the attention of other nations, to whom, from time to time, they were exported, and at present may be found in almost every part of the world. They were at one time in much request in various countries, from a supposition that they would speedily supplant other breeds; but this has never been the case, as it would appear the animal soon degenerates when out of Spain, and is only valuable so far as giving rise to varieties by crossing, which are equal, if not superior, to itself.

The most remarkable feature in their history was their being sent some time during last year from New South Wales to the Cape of Good Hope along with Saxon sheep,—a circumstance the more to be wondered at, when we consider the wide difference of the colonies in regard to age, the former having been established only 47 years, while the latter has existed no less than 160.

Merinos were brought to England for the first time in 1788, but attracted little attention till the commencement of his Majesty's sales in 1804. Lord Somerville, in 1801, went to Portugal for the sole purpose of selecting such animals as appeared valuable, from uniting a good carcass with a superior fleece, and he succeeded, notwithstanding the disturbed state of the country, in obtaining specimens which called forth the praises of the shepherds, through whose travelling flocks they passed.

Their distribution over this country was accomplished by the formation of the principal landed proprietors and eminent breeders into a Merino Society in 1811.

The merinos had much prejudice to encounter, but gained some powerful advocates, as is well known by the high prices they brought at the annual sales. The first sale took place in 1804, when the average price of the rams was 19*l.* 1*s.*, and of ewes 8*l.* 15*s.* 6*d.* each. At the second sale in August 1805, seventeen rams and twenty-one ewes sold on an average

at rather more than 30*l.* each. In 1808, the average price of rams was 33*l.* 10*s.*; and that of ewes 23*l.* 12*s.* 6*d.* In 1810, thirty-three rams sold on an average at more than 53*l.* each, so that up to this period they appear to have been steadily progressing in public favour; yet strange though it may appear, all those advantages were at once destroyed on the establishment of the Merino Society, and we may perhaps account for it on the supposition that the institution of local committees, which immediately followed, allowed the enemies of the change in distant parts of the kingdom ample opportunity of striking at the scheme, now that it was entrusted, in many instances, to persons ill qualified for the task either of making converts, or retaining the advantages they had gained. Even if unopposed, they must gradually have sunk into neglect, as the gain, by means of the wool, was reduced to a trifle, when the loss of weight and fineness in the carcass was taken into account. Mr. Hose of Melton Mowbray, put a certain number of Leicester ewes to a ram of the same breed, and an equal number to a merino ram. The result was, that the Leicester fleece weighed 7*l*bs., and that from the cross with the merino 8*l*bs.; and that the former brought in the market 1*s.* per *lb.*, and the latter 1*s.* 6*d.*, being a gain of 5*s.* on the fleece. The carcass of the former, however, weighed 27*l*bs. per quarter, the latter only 25*l*bs., being a loss 8*l*bs. on mutton. There are few flocks of the pure merinos now existing, and little trace of any good they have done can now be discovered even in Ireland, though ten thousand were sent into that country in 1810 by Sir James Stuart.

Much advantage may, however, be expected from our crosses with the Saxon merino, which is in every respect well suited to our notions of a fine animal, as it yields a fine wool, and is little inferior in carcass to some of our best breeds.

The best form for a ram is thus described by Mr. Culley, in his excellent work on Live stock. "His head should be fine and small; his nostrils wide and expanded; his eyes prominent, and rather bold or daring; ears thin; his collar full from his breast and shoulders, but tapering gradually all the way to where the neck and head join, which should be very fine and graceful, being perfectly free from any coarse leather hanging down; the shoulders broad and full which must at the same time join so easy to the collar forward and chine backward, as to leave not the least hollow in either place; the mutton upon his arm or fore-thigh must come quite to the knee; his legs upright with a clean fine bone, being equally clear from superfluous skin and coarse hairy wool from the knee and hough downwards; the breast broad and well forward, which will keep his fore legs at a proper wideness; his girth or chest full and deep, and instead of a hollow behind the shoulders, that part by some called the fore-flank, should be quite full; the back and loins broad, flat, and straight, from which the ribs must rise in a fine circular arch; his belly straight; the quarters long and full, with the mutton quite down to the hough, which should neither stand in nor out; his twist deep, wide, and full, which, with the broad breast, will keep his fore legs open and upright; the whole body covered with a thin pelt, and that with bright soft wool. The nearer any breed comes up to the above description, the nearer they approach towards excellence of form."

As an amusing contrast to the above well-drawn picture, we give an extract from the work of our ancient agriculturist Columella.

"Therefore, the way to judge and approve of a ram, is not only that of observing if he is clothed

with a white fleece, but also if his palate and tongue are of the same colour with his wool; for when these parts of his body are black or spotted, there arises a black or speckled offspring. And this, among other things, the same poet I mentioned above, (Virgil, Georg. Lib. iii.) has excellently pointed out in such numbers as these."

"Reject him tho' the ram himself be white,  
Under whose ousy palate lies concealed  
A black or spotted tongue; for with black spots  
He'll stain the fleeces of his future race."

After some amusing remarks on the same subject, delivered in a very quaint way, he concludes his description with the mention of "twisted horns,"—"not because this last is more useful, (for a ram without horns is better,) but because horns that are twisted and bended inwards are not at all so hurtful as those that are set upright and expanded. Nevertheless, in some countries where the climate is wet and windy, we would wish for he-goats and rams even with the very largest horns; because when they are high and extended, they defend the greatest part of the head from the storm."

It is thus that among some of his beautiful remarks, we have generally a something occurring which upsets the gravity of the whole by its childish absurdity.

Though there are several methods pursued by breeders for the improvement of flocks, the one most in vogue is that of choosing individuals of the same family, and breeding *in* and *in*; but it is generally allowed to be a plan, requiring for the safety of the flock either very great skill in selecting the males and females, or only to be followed to a very limited extent. The object in breeding *in* and *in* is to strengthen good qualities, and get rid of bad ones as speedily as possible; and it is plain, that, if we happen to select animals with slight imperfections, these imperfections will become hereditary, and will go on assuming a worse and worse type, till the breed is destroyed. Culley, however, is of opinion, that crossing with a different stock is not necessary to keep up size, hardiness, &c., and instances the wild cattle in Chillingham Park, in the county of Northumberland, which having been confined for several hundred years without intermixture, must have bred from the nearest affinities, and yet are just as they were five hundred years since.

In spite, however, of such insulated conclusions to the contrary, the system of breeding *in* and *in* where the slightest defect exists, proves as destructive to flocks, as marriages of near relations to the human kind. We would not witness an every day entailment of diseases, if people would forego their unnatural love of money, and cease their endeavours to keep it in the family by forming matrimonial alliances with those who are near of kin. The law of God forbids us to wed those who stand in certain degrees of propinquity; but if we avail ourselves of the limits of this law, and marry on its verge, we and our descendants a certain number of times, misery must infallibly be the lot even of the tenth generation, and instead of being the fathers of a mighty people, few and full of sorrow will be the days of our children; while, in place of retaining in their possession our darling wealth, it will e'er long pass into the hand of the stranger.

Our position, however, will be strengthened by drawing attention to insulated portions of our race, where the effects of such a system are exhibited on a considerable scale. The members of the Society of Friends were at one time supposed to be, of all others, the least subject to insanity; but the very

reverse is the case, being, from the limited nature of their sect, driven to frequent intermarriages, and to a consequent deterioration of the most active part of the human frame—the brain; and it is for the same reason that almost every royal family contains a large proportion of idiots, or, at the best, persons of very weak understanding; and such will continue to occur, till legislators fall on some plan of striking at the groundwork of the mischief.

If the laws of God and man define to us so clearly the evils of intermarriage; and if, as all animals are constructed on one grand plan, we admit the proximity of the sheep to the human race, it follows, that what is destructive in this respect to the one, is destructive to the other, and that we should seek, by a nearly similar, if not wider range of rules, to obviate many of those diseases of which, when under our protection, they are so frequently the subjects.

The preferable and most common practice is to breed from different families of the same race, the males of which are interchanged after they have had shades of difference impressed on them by the influence of various soils and treatment, so that the defects of each family are gradually lost, and their valuable properties are gradually heightened.

Mr. Culley for many years hired his rams from Mr. Bakewell, at a time when other breeders were paying a liberal price for the use of his own. Much good has been done by making the rearing of superior rams a separate pursuit, and letting them out to distant parts of the country, in this manner diffusing some of the most valuable points of particular breeds, and leading to a spirit of competition. The practice has been reprobated, but we presume, rather in a hasty manner; for, with all its attendant evils, such as leading to deception by what is termed the *making up* of rams, it possesses excellencies which will, we hope, lead to its continuance.

The only other method of improving a breed is by crossing two distinct races, one of which possesses the properties it is desirable to acquire, and wants the defects we wish to remove. This, however, is a measure not to be recommended, and only to be resorted to when neither of the others will do, for it is scarcely possible to obtain the desirable properties, without at the same time imparting qualities sufficient to neutralize them, and with which, in fact, we would rather dispense. To cross, as Mr. Cleghorn remarks, any mountain breed with Leicester rams, with a view to obtain a propensity to fatten at an early age, would be attended with an enlargement of size, which the mountain pasture could not support, and the progeny would be a mongrel race not suited to the pastures of either of the parent breeds.

Whenever we attempt crossing, we should select well-formed parents, and if enlargement of the carcass is wanted, the progeny should be better fed than its originators, the size of which should not be much disproportioned at first, as nature in every case abhors sudden extremes, and does every thing in the most gradual manner. It is much better when some increase has been produced to bring the breed to the required size by one or two crossings.

No animal varies more than the sheep, and no one so speedily adapts itself to soil and situation; it would almost appear that nature, convinced of the exceeding utility of the animal, had given it a constitution of so pliant a nature as to enable it to accommodate itself to any climate, for though its natural situation, like that of man, appears to be the wine countries, yet with him it has spread to every quarter of the globe, becoming impressed at every change with some peculiarity, alterable only by a change of situation, varying, we might almost affirm,

with the weather, for where the temperature is equal, there does the animal preserve unchanged an atmospheric stamp, and defies our efforts to alter the breed; while, under a fluctuating sky, we can model it at will, and with common care secure them for years in one undeviating course. These changes, incident to climate, are called, in philosophical language, acclimation or the working of a power inherent in most animals and vegetables, by which they are suited, within certain limits, for bearing up against removal from their ordinary localities, and assuming a different cast as the place of their exile may differ in degree from that which they have left.

This may be rendered very plain by a sketch of what has occurred in Galloway within the limits of our ordinary writings, which are unluckily “few and far between.” (Consult Chalmers' Caledonia.)

The native sheep of the Highlands of that district is supposed to have been a small handsome white-faced breed, at least so thinks John MacLellan, who wrote an account of Galloway in 1650, from the wool being much praised and eagerly bought up by the merchants, which would not have been the case if taken from the black-faced animal; yet how happens it that at present the native breed exists only in the lower parts of Kirkcudbrightshire, the high country exhibits black-faced sheep, which, after every trial, have been found best adapted to the climate and pasture of the moors and highlands, while Chalmers owns that it has not been ascertained when or whence this hardy breed were brought to their present locality? Why, it is tolerably plain that though the white-faced sheep might be placed there originally, yet they would speedily lose every trace of their origin when placed on a hilly country, and subjected to the slow but certain influence of peculiar food and climate.

Chalmers remarks that the black-faced sheep superseded the goats, which were a source of wealth to the farmers, and more saleable than the latter; and it is exceedingly probable that, as the old white-faces began to change their appearance and became gradually able to stand the rigours of a mountain fare and winter under a dun skin and short rough wool, in like manner would they recommend themselves as the best of all stock to the hard driven agriculturist.

Several breeds of the English flocks were introduced about 1810 into the lowlands of Galloway, and a Spanish breed was at the same time sent thither by the wool society, for the purpose of experiment, but it appears that the sheep of the district were fully equal to any of these foreigners.

Mountain sheep seldom admit of much alteration, even of a temporary nature, their habits being of that quiet kind which renders them hostile to anything like restraint, and are altogether less under the guiding influence of man; it is for these reasons that, when once a flock attaches itself to a range of hills and becomes suited to the soil, it preserves itself for ages apart from neighbouring varieties, and presents, after a long series of years, those qualities in their native purity for which they were noted by the earliest observers.

The reason of a race of animals occasionally thriving so well in a country to which they may be removed appears to lie in their being suited, we may say accidentally, by peculiar conformation to the soil, food, and temperature to which they are subjected. There are some happy climates where, bred from what animals you will, no matter how stunted, the offspring will prove large, vigorous, and every way worthy of being placed at the head of its species. Witness what Mr. Dawson, the manager of the Australian Agricultural Company, says in his journal,

"Both the climate and the soil appear by nature intended to produce fine wool and fine animals too, even from the worst beginnings. The latter seems a paradox. The extensive range afforded to every animal keeps it in good condition, and perhaps the native grasses may have more of good in them than their appearance indicates. However this may be, the climate clearly has a wonderful effect on the size of all animals, even upon man, who is almost universally tall here though born of diminutive parents. From this I am led to believe that the climate governs chiefly, and thus every breeding animal introduced here will attain a size not known in Europe."

Climate is certainly an all-powerful agent, and works wonderful changes, which are well illustrated by the Portuguese, who, after a residence of three hundred years in India, are said to be almost as black as Caffres, and Bishop Heber in speaking of India says, "It is remarkable to observe how surely all these classes of men, (whites—Persians, Greeks, Tartars, Turks, and Arabians,) in a few generations, even without any intermarriage with the Hindoos, assume the deep olive tint, little less dark than a negro which seems natural to the climate." This, however, you may affirm is not to the point, as only embracing theories in regard to peculiar changes in an animal different to sheep, but such is not the case, as what will affect colour in mankind will lead to changes of even a more wonderful nature in it, such as alterations in shade and wool, and as we have seen even in form and texture.

To illustrate the changes that may be occasioned in animals by circumstances even of less apparent importance than that last mentioned, we may adduce the differences that exist between different ranks in almost all countries. Buffon says, that in France you may distinguish by their aspect not only the nobility from the peasantry, but the superior orders of nobility from the inferior,—these from citizens,—and citizens from peasants. The African field slaves in America are extremely different from the domestic servants of the former nation, retaining, as they do, their original peculiarities, from poor living and degraded duties; while the latter have nearly approached to the habits and modes of thinking of their masters, from living with and being well treated under the same roof.

"The South Sea Islanders," says Dr. Elliotson, "who appear to be all of one family, vary according to their degree of cultivation. The New Zealanders, for example, are savages, and chiefly black; the New Hollanders half civilized, and chiefly tawny; the Friendly Islanders are more advanced, and not quite so dark, several are lighter than olive colour, and hundreds of European faces are found among them."

Indeed, the examples are endless which we could readily bring forward to aid our explanations; but these it would be needless to give, seeing it is in the power of every one to study the differences, in form and features, of the classes of society in our own island, and, by so doing, understand the influence of otherwise unimportant and trivial circumstances on an animal at all times so easily moulded to situation as the sheep.

Changes occasioned by climate are always limited to the fleece, horns, and fat, and never extend to those parts, on the unaltered persistence of which the animal depends for its station in the scale of being, as the feet, teeth, and digestive organs; and as most wonder is apt to be occasioned by bony prominences being subjected with as great certainty to the modelling hand of climate and cultivation as softer parts, we give the following extract:—

"One of the most curious modifications (Gardens and Menagerie of the Zoological Society delineated,) produced by cultivation in the domesticated sheep, consists in the augmentation of the number of its horns; two, three, or even four supplementary appendages of this description being occasionally produced in addition to the normal number. Under these circumstances the additional horns usually occupy the upper and fore part of the head, and are of a more slender shape, and take a more upright direction than the others, thus approaching in character to those of the goats, while the true horns retain more or less of the spiral curve that distinguishes those of the sheep. There exists a strong tendency to the propagation of this monstrosity, which is extremely frequent in the Asiatic races, but is also met with in a breed that is common in the north of Europe, and is said to have been originally derived from Iceland and the Feroe Islands. In the latter case it is unconnected with any other anomaly, but in the flocks of the nomad hordes of Tartary it is usually combined with an enlargement of the tail and adjacent parts, by the deposition of fat frequently to an enormous extent."

Of the numerous breeds at present in our island, some three or four are indispensably necessary for the continuance of its prosperity. A very long-wooled sheep, as the Lincolnshire or Teeswater, for the richest grass lands and finest worsted manufactures. The new Leicestershire for less fertile grass land, and for rich enclosed arable land on which the fold is not used, and for coarser worsteds, stockings, coarse cloths, blankets, and carpets. A middle-wooled breed, as the Wiltshire, the Norfolk, or the Southdown, for arable lands on which folding is practised, and for cloths of middle qualities. A fine woolled, as the Ryeland, for the finest cloths, and a hardy race for heathy mountains.—(Marshall on the Midland Counties.)

For choosing a breed we should adopt that which affords the greatest quantity of market produce in return for the food consumed. It was owing to a peculiar view taken of this maxim that so enormous sums were asked and given for the hire of rams at the time Mr. Bakevell brought the new Leicester to perfection.

That gentleman would never have obtained 1200 guineas for the hire of three rams if the speculators had not intended to procure nearly similar prices for the use of the offspring of these animals, and it may be pretty safely affirmed that this traffic, owing to the extent to which it prevailed, was ultimately the cause of much mischief to the breed in question, as inducing many to speculate on what was likely to prove a fashionable article, without caring much for the endurance of the really valuable points.

The tendency to become fat at an early age, though a valuable one in some points is not so in others, as premature decay is always the result, and shews with certainty that a healthy action has not been going on during the life of the animal. Marshall remarks that fat, like charity, covers a multitude of faults, and he is right, for an ill-shaped animal if well fed, has all its angles speedily filled up, and if its ugliness has not amounted to absolute deformity, it acquires that roundness of contour so pleasing to the eye and so apt to mislead us. An animal when loaded with fat cannot be looked upon otherwise than as in a diseased condition, and liable to diseases of many organs, especially of the heart and brain, sudden death on any hurried exertion being far from rare, at the same time that life, from the difficulty of enjoying it is rendered any thing but desirable.

In the valuable work of Meg Dodds, you will see that "Fashion and luxury have lately introduced stall-fed oxen and overgrown sheep, which are better fitted for the tallow-chandler than the cook. They are indeed good for nothing, save to obtain premiums at cattle shows, and deluge dripping pans with liquid fat." And in this every one will agree, excepting always boarding-school cooks and others who depend for their principal perquisites on the over-roasting of oily meat.

The Dishley sheep are admirably adapted to the soil and situation where they were called into existence, and their crosses are now spread over most parts of the country, principally the corn districts, as they are supposed to be the most profitable kind on farms where the best tillage crops are combined with the fattening of live stock; but Marshall supposes they will only continue profitable so long as other breeds of long-wooled sheep remain with thin chins and loose mutton, or in other words, that there are plenty of kinds which would prove equal, if not superior, to the present, if they only received a little well-timed attention.

In breeding and rearing rams, two divisions of these animals are recognized—ram-getters and wether-getters—the former, from their fineness being kept for the procreation of animals like themselves, while the latter from their coarseness, are set aside as fitted only for parent stock for graziers' sheep, the mere grazier liking a ram no worse for having massiveness of frame, and being less scrupulous about his form than the ram breeder, whose grand object is fineness, and who trusts to the ewes for giving the offspring size and substance.

The principal ram-breeders are guided in the choice of their ram-lambs more by blood or parentage than by form, on which, at so early an age, little dependence can be placed; and in the case of the Dishleys, allow them every indulgence from the time of weaning till that of shearing, as they push them forward for the show, and let most of them the first season, while yet yearlings; and it is this early arrival at maturity which, in addition to that formerly mentioned, with justice supposed by some to occasion their early falling off, for, by a law of the animal economy, premature adult age is always succeeded by premature decay, life appearing to be dated from the time the animal enters on the fulfilment of the ends for which it was created.

The quality of the flesh, which can be ascertained only when the animal is in moderately good condition, is a subject more worthy of attention than the early acquiring of fat, seeing it is more difficult to determine peculiarities of this kind at will, and requires long experience to enable a person to pronounce with confidence the state of the muscular parts from the inspection of a living animal. The flesh of different specimens of the same animal varies not so much from breed or descent, as from age, feeding, and exercise; thus, that of the young is soft and gelatinous, the fibres being small, weak, and much interspersed with a substance, termed, from its loose nature, cellular tissue, which exhibits in the spaces between the muscles small masses or layers of delicate fat—the greater bulk of the latter being situated immediately beneath the skin, and occasioning that beautiful rotundity so much admired in children; while, as the animal advances in life, the fibres become firmer, larger, and more approximated, the cellular tissue to a great extent disappearing, and the fat changing from the outward to the inward parts, displays boldly the outline of the muscles, but gives, at the same time to the figure, that portly symptom of good keeping, so unpleasant to the sight when carried

to the extent of aldermanic dignity. All these are, however, varied by exercise, which tends, in a marked degree, to increase the muscular or fleshy parts at the expense of the fat,—the former becoming, when employed within proper limits, large, unyielding to the touch, and in every way opposed to their small flabby contrasts, the results of inactivity, while the colour is heightened from a pale or purple hue to the bright vermilion so justly relied upon by housewives, as a guarantee for the superior qualities of the article. The wild horses in South America, which form the principal part of Indian diet, are said by these epicures to be much improved for the table by gentle labour, and to be quite on a par, when thus cared for, with some of our best beef. This system is only, however, pursued for the purpose of rendering the flesh of their horses moderately firm; but where an opposite effect is wished, it is readily, though cruelly, produced, by putting the animal to a lingering death, examples of which are to be with in the annals of most half civilized nations—as the Spanish mode of whipping pigs, and English custom of baiting bulls, both tending to the same end by so exhausting the vital contractility, as to prevent its last and faint display in the stiffening of the carcass.

Diet, as most people are aware, has a powerful influence on the constituents of the body; thus a rank succulent pasture taints the flesh, or renders it insipid and unpleasant, while a dry aromatic herbage communicates a delightful flavour, and enables people versed in the pleasures of the table easily to discriminate between turnip-fed and grass-fed mutton, and again between the latter and that which has spent its existence on the hills. In Touchwood's Syllabus of Culinary Lectures, attached to the commencement of the Cook and Housewives' Manual, by Mistress Dodds, we are briefly informed, that "mutton is not good under three years old. The best is above five, but is seldom to be got in the market of that age. The black-faced or *short-sheep* are best for the table, though more depends on the pasture than on the breed." More, in fact, depending on feeding and management than on the variety of the animal, though this, of course, is not to be neglected.

Marshall, who touches very slightly on the subject, says, "The flesh of sheep when slaughtered is well known to be of various qualities. Some is composed of large coarse grains, interspersed with wide empty pores like a sponge; others of large grains, with wide pores filled with fat; others of fine close grains, with smaller pores filled with fat; and a fourth of close grains, without any intermixture of fatness. The flesh of sheep when dressed is equally well known to possess a variety of qualities:—Some mutton is coarse, dry and insipid,—a dry sponge affording little or no gravy of any colour. Another sort is somewhat firmer, imparting a light-coloured gravy only. A third plump, short, and palatable, affording a mixture of white and red gravy. A fourth likewise plump, and well-flavoured, but discharging red gravy only, and this in various quantities. It is likewise observable, that some mutton, when dressed, appears covered with a thick, tough, parchment-like integument; others with a membrane comparatively fine and flexible."

*Looseness* is reckoned a bad quality of the flesh of sheep when living, as indicating a coarse-grained porous mutton, and as equally exceptionable with that of *hardness*: while *melowness* and *firmness* are qualities much to be desired, as forming a bappy mixture, deemed by some the point of perfection. The modern or new Leicester breed is particularly distinguished by the lightness of the offal, the bones being one-half smaller than in some other breeds,

and the meat proportionably thicker; while the pelt is thin, and the head small—a thing of some consequence in most parts of England, where that Scottish luxury sheep-head broth is so cordially despised; but what may not be reckoned offal in the slaughter-house, will speedily shew itself as such in the kitchen, by the waste of fat during the cooking process, even in England, where fat meat is so much admired; and it is surely absurd to pay the price of good mutton for tallow, when, if the latter was wanted, it could be procured at a cheaper rate by itself, than when forming the better part of a dear commodity.

The only way in which overly-fat meat can at all be reckoned profitable, is in its application to the wants of the working-classes, whose bodily labour enables them to enjoy rewards which would to others prove displeasing in the extreme, and to digest and assimilate with ease food which, to the sons of sloth, would prove a poison. So far as these wants have been supplied, the attempt of Bakewell has been attended with the happiest results, as he and his disciples have placed, by their well-timed exertions, much good animal food within the reach of the poorer classes, which they must otherwise have gone without; while, in many instances, it has driven bacon from the market, being a cheaper and more palatable commodity, which cannot but contribute to the health of the people, seeing the continued use of salted food is calculated to injure the body, and render it liable to many diseases, especially of the skin. The rapidity is various with which animals acquire fat, much depending on hereditary predisposition and the nature of the food, and much also on the state of the atmosphere, and quiet habits; rest, and a moist, rather warm air, tending greatly to the advancement of the process; some birds becoming fat in twenty-hours of wet weather, and losing it as rapidly. Children that have been emaciated by diseases often resume their original state in a few days; and animals that have been famished, as hogs, afterwards fatten very rapidly. Moderate and repeated bleedings, mild mealy diet, and emasculation conjoined tend to the repletion of the body, and to the rapid deposition of fat; it would appear, that when acquired in this speedy manner, it never possesses the value, in a culinary point of view, that is yielded to such as has been formed slowly, when, as one may say, the worthless particles have had time to be removed, and the remaining part to become really and truly a firm healthy deposit; and it is partly owing to this that animals are never at their best when forced to take on fat at an early age, but are most esteemed by the gourmand when they, as in the sheep, have lived from three to four years.

A disposition to early obesity, as well as a gradual tendency towards that form which indicates a propensity to fatten, is materially promoted by rich food while the young animal is in a growing state, but care is taken that they are never placed suddenly on food much superior in feeding qualities to what they have left: thus very lean sheep are never put to full turnips in winter, nor to rich pastures in summer, they are prepared for turnips on good grass lands, and kept on second year's leys, and afterwards a moderate allowance of turnips, if they are to be fatted on pastures. It is an invariable rule with all good managers never to allow this, or any other animal reared solely for the shambles, ever to lose flesh from its earliest age till it is sent to the butcher, as more food is required to bring them to a certain condition, than to keep them at it; and in the case of the Dishleys, it is customary to keep all in a state of fatness, except those intended for

breeding, and after full feeding on turnips during winter and spring, to finish them on the first year's clovers early in summer, when the prices of meat are usually the highest, so that this variety is always fit for market at eighteen months, while the Highland breeds, though prepared by means of turnips a year at least sooner than in former times, do not usually go to the shambles till from three to four years old.—(*Cleghorn on Agriculture.*)

The influence of sex on the nature of the offspring has long occupied the attention of scientific individuals, and is a subject which, though mysterious in some respects, is yet plain in others, and these, from their interesting nature and the valuable aid they afford the breeder, cannot but be highly acceptable when laid in a simple form before the agriculturist.

Many qualities and diseases are known to be hereditary; of the former we may instance peculiarities in walking and writing, a passion for intoxicating liquors and other habits too trivial for mention; and of the latter, gout and pulmonary consumption, which are well known to harass a family for many generations.

Features and complexion, in like manner, may remain for ages of the same undeviating cast and colour; thus the Jews of to-day are the very counterparts of the Jews of three thousand years back, and in all likelihood will so remain till the end of time. The same may be said of many other nations,—but of this no more, as objects of a more pressing nature demand attention.

In general the qualities of the male and female parents are visible to an equal extent in the offspring as is well exemplified among horses, in the mixture of the blood and the cart breed, where the great difference in form and character is nicely blended, but occasionally the peculiarities of the male or female are visible only on some particular part of the offspring, as in the crossing of the merino ram with the Ryeland ewe, when the former affects the fleece, and the latter the carcass, nor do the impressions of one or other, especially of the male, cease on the birth of the fruits of a connection, for though he may have no further meeting with that female, yet her succeeding offspring tinged with his peculiar colour, or modelled after his form, a circumstance well illustrated by what came under the notice of the Earl of Morton. His lordship bred from a male quagga and a mare of seven-eighths Arabian blood, a female hybrid, displaying in form and colour her mixed origin. The mare was then given to Sir Gore Ouseley, who bred from her first a filly and afterwards a colt, by a fine black Arabian horse, but both these, in their colour and the hair of their manes, strongly resembled the quagga. This isolated fact would be, however but of small value if unsupported by others, which are luckily now of common occurrence, among which the following tends strongly to its corroboration:—In the Philosophical Transactions for 1824, Dr. Wollaston relates that D. Giles, Esq., had a sow of the black and white kind, which after littering by a chesnut boar of the wild breed, was put some time after the death of this, to boars of quite a different variety, yet the offspring were covered with chesnut marks so as closely to resemble the long departed animal.

The progeny of most domesticated animals often bear a striking resemblance to the grandmother or grandfather, and it is well known that the desired changes cannot be effected on a breed, or that the desired breed cannot be produced, till the third, fourth, or even the fifth crossing, so that the importance of having few defects in a stock will be readily admitted, seeing their debasing consequences are

carried through whole generations, and that though absent in one remove, yet that they may appear in the next. Both sire and dam should be chosen as free from defects as possible, a thing often neglected in rearing domestic animals, especially horses, where the erroneous opinion is in vogue, that no matter how debilitated and worn out may be the dam, yet that if coupled with a young and perfect sire, a healthy handsome offspring will be the issue; than which idea nothing can be more absurd, as such animals, if left to nature, would seldom or never come in contact, owing to the one party never attaining a decrepit age, but perishing on its verge.

The sex of the progeny is supposed to be the result of the relative ages of the parents: thus issue from a young male and an old female will in general be feminine, while that from an old male and a young female will generally be masculine; and it has been proposed to turn this, apparently a law of nature, to account, in the management of flocks, as it must often be of consequence, to obtain, at will, a considerable increase of the sex most wanted. On this subject there will be found an interesting paper in the first number of the Quarterly Journal of Agriculture, entitled "A method of obtaining a greater number of One Sex at the option of the proprietor, in the Breeding of Live Stock," and from this we extract the following:—

"In the *Annales de l'Agriculture Française*, vols. xxxvii. and xxxviii., some very interesting experiments are recorded, which have lately been made in France, on the Breeding of Live Stock. M. Charles Girou de Buzareingues proposed, at a meeting of the Agricultural Society of Séverac, on the 3d of July 1826, to divide a flock of sheep into two equal parts so that a greater number of males or females, at the choice of the proprietor, should be produced from them. Two of the members of the society offered their flocks to become the subjects of his experiments, and the results have now been communicated, which are in accordance with the author's expectations.

"The first experiment was conducted in the following manner:—He recommended very young rams to be put to the flock of ewes from which the proprietor wished the greater number of females in their offspring; and also, that during the season when the rams were with ewes, they should have more abundant pasture than the other; while to the flock from which the proprietor wished to obtain male lambs chiefly, he recommended him to put strong and vigorous rams, four or five years old. The following tabular view contains the result of his experiment:—

Flock for female lambs.			Flock for male lambs.		
Age of the mothers.	Sex of the lambs.		Age of the mothers.	Sex of the lambs.	
	Males	Fem		Males	Fem.
Two years,	14	26	Two years,	7	3
Three years,	16	29	Three years,	15	14
Four years,	5	21	Four years,	33	14
	—	—		—	—
Total,	35	76	Total,	55	31
Five years and older,	18	8	Five years and older,	25	24
	—	—		—	—
Total,	53	84	Total,	80	55

N.B.—There were three twin-births in this flock. Two rams served it; one fifteen months, the other nearly two years old.

N.B.—There were no twin-births in this flock. Two strong rams; one four the other five years old, served it.

"The general law, as far as we are able to detect

it, seems to be, that when animals are in good condition, plentifully supplied with food, and kept from breeding as fast as they might do, they are most likely to produce females. Or, in other words, when a race of animals is in circumstances favourable for its increase, Nature produces the greatest number of that sex which, in animals that do not pair, is most efficient for increasing the number of the race. But if they are in a bad climate, or on a stinted pasture, or if they have already given birth to a numerous offspring, then Nature, setting limits to the increase of the race, produces more males than females. Yet, perhaps, it may be premature to attempt to deduce any law from experiments which have not yet been sufficiently extended. M. Girou is disposed to ascribe much of the effect to the age of the ram, independent of the condition of the ewe."

The point of most importance in breeding is the being trained to the discovery of an animal's defects, and to the right appreciation of such qualities in an opposite sex, as may be able to neutralize them; for it is only by care and a proper application of the faculties which have been bestowed upon us, that we can hope at the present day either for the attainment or the keeping together of money or its representatives.

## ON THE WEED IN HORSES.

BY A COUNTRY BLACKSMITH.

(From the Veterinarian.)

MESSEURS EDITORS,—Being a constant reader of the Veterinarian, and also, when the fancy strikes me, an occasional contributor, I am often amused at the various views, treatment, and claims to being the first who have pointed out the characteristic symptoms of certain diseases. On perusing a late number of your journal, I find a paper on *Weed*, by Mr. Anderson, of Leicester, wherein he states that the disease is not described in any prior number of the Veterinarian. Why, thinks I, this at least must be a new discovery, as that work now treats upon all diseases; but as I am not in the practice of pinning my faith on any man's sleeve, I must look as I proceed. Accordingly, the volumes of the Veterinarian are unshelved, and carefully examined; and after an hour or two's search, Mr. Anderson appears to be right. What does this mean, thinks I. A common disease, known to every blacksmith and farrier in Scotland these hundred years and more, never published before! I must examine the old authors. After half a day's search, the case was bad as ever; the more modern and post rate—the inestimable *Blaine and Percivall*, and "*The Horse?*"—worse and worse; not such a thing as *Weed* in them all! At last I stumbled upon an insignificant volume of about 300 pages, by Robt. Thomson, of Auchterarder, now of Beith, published eight or nine years ago, where I find *Weed*, inflammation of the Absorbents. I read the Essay, and was astonished at the coincidence of the two, "Aha, aha! Mr. Anderson," exclaimed I, "you have been pirating;" and I strongly suspect Mr. Thompson has been pirating also, from the Lectures of Professor Dick. However, as it is the common established doctrine of the country blacksmiths of Scotland, I will copy it verbatim for the amusement of your readers.

"INFLAMMATION OF THE ABSORBENTS (*WEED*).—The absorbent vessels are of a thin pellucid appearance: they are, perhaps, as numerous as the blood-vessels, and, like the veins, are furnished with valves. They exist in all the vascular parts of the

system, their office being to take up lymph from the cavities, the chyle from the intestines, and substances that are applied to the surface of the body. Absorbents are divided into two classes, *lacteals* and *lymphatics*; the mouths of the first being placed upon the internal coat of the intestines, and whose office is to absorb the nutritious parts of the food; the last being to absorb lymph and serum from the different parts of the system; and both to be mixed with the blood for the support and renovation of the body. They prevent dropsies from taking place, by removing the superfluous secretion; they also remove the worn-out parts of the body into the circulation, either to invigorate other parts of the system, or to be thrown off as excrementitious.

"The disease called *weed*, or by farriers *shots of grease*, is inflammation of the absorbents and their glands. The class of absorbents that are principally affected in this disease, are the superficial and deep-seated lymphatics of the hind extremities; the first having their origin in the skin and cutaneous cellular membrane, where they form numerous ramifications running along with the superficial veins: a very large branch may be distinctly felt, when distended, by the side of the saphena major vein of the thigh. The deep-seated take their origin from the feet, and descend along with the corresponding blood-vessels. Both the superficial and deep-seated form a beautiful anastomotic net-work, and all assemble in the superficial and deep-seated glands of the groin—the *inguinal*—there they enter and form a plexus, from whence several large branches proceed to their common termination, the thoracic duct. In this disease the glands of the groin become inflamed, swelled, and tender. The fluid passing upwards in the vessels is thereby checked, and the vessel in consequence becomes distended, as far down as the next valve, and so on to the next downwards. The whole vessels are thereby soon distended; the leg becomes enormously swollen, and large quantities of lymph and serum are thrown out from the arteries and absorbents into the surrounding cellular membrane, which, in some cases, it takes the whole of after-life to remove.

"Weed generally commences with a shivering fit, and all the other appearances of fever. If the finger be placed upon the groin, the absorbent glands will be found firm and painful, and the animal snatches up his leg when pressure is applied. The principal absorbent vessels along the thigh are fully distended, and from their being in the course of the vein are often mistaken for the veins themselves. The leg begins to swell from above downward, in consequence of the channels being obliterated in the glands, until the vessels become loaded to their minutest ramifications. This causes excessive irritation, and the action of the arteries becomes increased in consequence of the pain. The absorbent vessels are now blocked up, and unable to relieve themselves. The consequence of which is, that large quantities of blood, lymph, and serum are thrown out into the surrounding cellular membrane in a few hours, so as often to enlarge the leg to twice its natural thickness. The effusion may also at times extend to the sheath, belly, and udder. In some rare cases suppuration has taken place, and sometimes, still more rarely, in mortification of the limb, and death.

"There is considerable resemblance betwixt this disease and dropsical swelling of the legs; also farcy, and water-farcy: they may, however, be easily distinguished. Weed begins with swelling and tenderness in the groin, which fall downwards, and are generally confined to one leg. It comes on suddenly, generally in a few hours, the animal being

otherwise in good health previous to the attack. Dropsy, again, appears first in the extremities of the legs, and the swelling proceeds upwards. The swelling attendant on farcy is most common in the fore-legs, and is accompanied with farcy-buds in the course of the lymphatics. The swellings attendant on water-farcy are often very great, two or all of the legs being affected; and often the swelling extends to the breast and belly: watery blotches break out in various parts, and when the joint becomes affected, there is excessive lameness.

"The causes said to produce this disease are sudden changes of diet, as from hard to green food, cold and moisture, overloaded stomach, and want of accustomed exercise. There is something remarkable in these, as it is found in general that those hard-working horses that have been attacked with weed are most frequently so on the first days of the week, or any other days when the animal is not receiving his accustomed daily exercise, while food has been given in immoderate quantities, and soft in quality. Horses once affected, are more subject to it than others.

"The cure for this disease is much the same as for other inflammatory affections. As soon as observed, a large quantity of blood should be drawn from the system, and a brisk purge immediately given. If the physic does not operate in the usual time, more ought to be given. When the swelling is very large, much relief will be given by puncturing the large absorbent vessel, which will be felt by the side of the vein; and more punctures may be made in different places, where the effusion has taken place, which will greatly reduce the swelling. It is a common practice with farriers to bleed in the toe, with a view to take off the bad blood. In this they are mistaken, as it may be said they begin at the wrong end for doing much benefit. If blood can be drawn from the thigh, or any other part, in sufficient quantity, it will be more certain, and have a better effect. Rowels are also much used in the thigh, but are not of much benefit; as before they can operate, the disease is generally checked by the efforts of nature. Frequent bathing with hot water is an excellent remedy, and wrapping up the legs in bandages of flannel, bay, or straw, supports the distended absorbents, and enables them to relieve themselves. Diuretic medicine may be given every day, or every other day, when the inflammatory action has ceased; and stimulants of turpentine may be used externally with advantage in the latter stages, to arouse the action of the absorbents anew, and to cause absorption of the effused lymph.

"When active remedies are not employed in the very commencement of this complaint, the swelling often remains, and resists every remedy; where rowels and bleeding in the toe are rather injurious than otherwise when they alone are depended upon as cures, as they persuade the proprietor that nothing else is necessary to be done, and by this delay the time for removing the swelling is lost. Exercise at the beginning of the disease is also dangerous; for most cases that end in death are owing to this cause. The disease is seldom fatal when properly managed.

A COUNTRY BLACKSMITH AND FARRIER.

The Russian exports for the year 1835 appear to be 5,012,217 ro. less in amount than those of 1834, and the imports 4,777,827 ro. less. The want of grain and raw produce in the interior, in consequence of a failure in the crops, has thus had a very material influence on the business connected with articles of export, and also on the importation of foreign goods.

## HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

The stated half-yearly general meeting of this Society was held in their Hall, on Monday, June 27, at which there was a full attendance of the members, including the Marquis of Tweeddale, the Marquis of Lothian, Viscount Arbuthnot, Lord Greenock, Hon. General Stuart, commanding the forces, Sir John S. Forbes, Sir John Campbell, Sir John Hope, Sir James Foulis, Sir William Seton, Sir David Maxwell, and Sir A. C. Maitland Gibson, Barts., and a numerous list of gentlemen extensively connected with every district of Scotland. The Directors and Officers of the Society appeared in deep mourning for the Duke of Gordon, who held the office of President when he died,—and in taking the chair the Marquis of Lothian, the Vice-President, as the organ of the Society, made a most appropriate and feeling address on the occasion.

The SECRETARY reported the proceedings of the Directors since the general meeting in January, and the premiums offered by them for the current year. He referred the members to the printed list of those premiums, distributed in the room, a volume of no inconsiderable size, extending to 68 pages, and which includes premiums for Essays and Reports under 25 different classes or subjects, for information by means of which rewards are offered to the liberal amount of 367*l.* Again, under the general head of Experiments and Improvements, comprehending the minor sub-divisions of waste lands, crops and culture, pastures, exhibitions of the various descriptions of domestic live stock at numerous local competitions, the products of the dairy, woods and plantations, cottages, &c., premiums are offered to the amount of 803*l.*;—add to these the great general show of live stock to which the different divisions of the country most liberally contribute by much the larger portion, and including the premiums fixed for competition in future years, there is a very handsome aggregate in the present premium list.

Mr. MURRAY, of Murrayshall, reported the state of the arrangements for the general show of live stock and agricultural meeting, which is to be held at Perth on the 7th of October. They are nearly completed. At their meeting, on the 30th of April, the four counties of Perth, Forfar Fife, and Kinross, had named members to form the General Committee of Superintendence; and under the arrangement of Lord Kinnaird, the convener of the committee, and Mr. Richardson, the deputy-convener, what remained to be completed was in satisfactory progress. Through the good offices of Mr. Maule, the member of Parliament for the county of Perth, the Board of Ordnance have very readily given their consent to the use of the depot for the show-yard, which, from the facilities it affords, will occasion a comparatively small expense in fitting up. On this occasion, various improved regulations for these great meetings, which experience has enabled the society to mature, will come into operation for the first time; such are those which prescribe that no animals in the classes of neat cattle shall be shown in the competing classes at an age exceeding four off,—that stock from any part of the United Kingdom may compete—that breeders as well as the exhibitors of prize animals shall be noticed, and in the classes for bulls, rewarded with honorary medals. It is intended to have a sale within the show-yard on the day immediately following the meeting, open to the stock of all who have been exhibitors in any class, and the Judges are to remain over that day, so that the benefit of their opinion will be obtained by those members and agricul-

turists who desire it. The premiums for the best samples of wools are to be decided on the 12th of July, the day of the Perth wool fair, and the prize specimens will be retained and exhibited at the show. Finally, the arrangements for the dinner are in satisfactory progress; it is understood the Committee would wish to accommodate 1000, if they can manage it. The progress of all details was quite satisfactory to the society.

The Marquis of TWEEDDALE made some valuable practical suggestions on the rules which should guide the decision of the premiums for sheep and wool; and, on motion of his Lordship, seconded by Lord Arbuthnot, a numerous deputation of Directors was named to give their attendance and co-operation at Perth, along with the Vice-Presidents of the Society, and the Committee of Superintendence, the Marquis of Douglas and Clydesdale, one of the Extraordinary Directors, to be Preses of the deputation, a duty which his Lordship had readily agreed to discharge.

Professor Low said that, in the absence of Mr. Robison, Chairman, the duty had devolved upon him of reporting the proceedings of the committee on machinery since the last general meeting; and he had pleasure in stating that within this short period several useful machines and many interesting communications had been under the consideration of the committee. The first of these was an elegant model of a machine for compressing peat, transmitted by Lord Willoughby de Eresby, and made after a design by his Lordship; and not only had Lord Willoughby presented the model, but he had offered to transmit a full-sized machine to Edinburgh, that it might be tried in the presence of the committee. This offer, he need not say, had been accepted of; and the committee recommended that the thanks of the society be voted to Lord Willoughby for his liberal attention and useful communications. A machine by Mr. Leckie, of Haddington, might be termed a seed-sifter. In this machine Mr. Leckie had the merit of applying a known principle to a new purpose. It consists of a series of horizontal sieves of fine wire, moved by cranks, and is designed to clean the seeds of the smaller grasses more perfectly than is effected by the common fanners. This instrument had been used with success; and the Directors had voted their thanks to Mr. Leckie, with a sum for his model. The next subject to be noticed was Mr. Maule's chain plough. The improvement here consists in the application of a chain to the posterior part of the beam of the common plough, the conducting it through a ring to the end of the beam, and attaching to it the point of draught. The effect of this mode of attachment is to give steadiness to the action of the plough on principles which can be easily explained. The committee proposed that the silver medal should be voted to Mr. Maule, and that an early account should be given in the transactions of his useful improvement. But, besides the ordinary subjects of mechanical improvement, there was one of yet higher interest and more extended application, which had been brought under the consideration of the Directors. This was the possible application of the power of steam to the purposes of tillage; and what might but a few years ago have been looked upon as a dream, was now placed within the limits of reasonable calculation. The contrivances by which the powers of the steam engine had been multiplied and augmented, as exemplified in those beautiful locomotive engines which speed along our railways, showed that this stupendous power was now to have a more extended application to the purposes of life than once could have been conceived. Its application to the uses of tillage was now the

subject of eager experiment. The most extensive of those experiments, which had been carrying on for several years, and at great expense, were by Mr. Heathcoat, M. P., who had covered his rights of invention by several patents. The engines used by Mr. Heathcoat are of great power, and so formed that, while they moved over a short space, the tilling instruments moved with comparative velocity. Mr. Upton, of London, too, had pursued the same object, and by means calculated, perhaps, to be made more generally available to the farmer, for his endeavours had been directed to the construction of locomotive engines suited to the common purposes of the farm. But, by whatever means the object was to be attained, we could scarcely doubt of the ultimate triumph of mechanical invention over all difficulties; and it had appeared to the Directors that the time has come when this society might with effect come forward to call the attention of agriculturists and ingenious mechanics to the subject. With this view he had now to propose that the Directors be empowered to offer a premium of 500*l.*, for the first successful application of steam to the purposes of tillage. After some discussion this was agreed to.

### BRASSICA—TURNIPS.

[The subjoined valuable account of the different varieties of turnips, is extracted from the "AGRICULTURISTS' MANUAL," a work recently published by Lawson and Son, of Edinburgh, seedsmen to the Highland Agricultural Society. The work is such as we should have expected from gentlemen possessing such knowledge, industry, and zeal, as the Messrs. Lawson. The agriculturists are much indebted to them for this valuable addition to the stock of practical agricultural works, and will we are persuaded readily evince their approbation by possessing themselves of a publication embracing a complete history of all the varieties of grain, pulse, roots, and grasses, worthy of being cultivated by the British Farmer.—Ed. F. M.]

### BRASSICA CAPESTRIS RUTABAGA.

(RUTABAGA OR SWEDISH TURNIP.)

In its specific characters the Rutabaga, or Swedish Turnip, differs from those of the Summer rape, of which it is only a variety, in having larger fleshy swollen globular or subrotund roots, while those of the rape are small, fusiform, and hard.

The Swedish turnip is harder than any of the common sorts (varieties of *B. rapa*), and in addition to its being more esteemed as food for horses throughout the turnip season, is better adapted for spring feeding generally. It, however, requires a somewhat stronger and superior class of soils, together with a greater allowance of manure, but may, upon the whole, be considered equally if not more deserving of attention than the others, notwithstanding which its cultivation has hitherto been comparatively little attended to in some districts of Scotland. Swedish turnips are generally sown from about the middle to the end of May, and 2 to 2½ lb. of seed per imperial acre, is, under ordinary circumstances, considered sufficient. They possess an advantage over the others in being easily transplanted, so that blanks in the rows either of the Swedes or other sorts (when they occur), are by that means easily filled up.

The varieties are as follow:—

1. RED OR PURPLE-TOP YELLOW SWEDE.—Upper part of the root of a dull reddish colour; under yellowish. This is held in great esteem by the generality of cultivators. Of it there are several sub-varieties, which have been obtained by a repeated judicious selection of the roots from which the seed-stock has been saved, of these the next two may be mentioned.

2. BALLANTYNE'S NEW IMPROVED PURPLE-TOP.—So named from being originally brought into notice by Mr. Ballantyne, nursery and seedsman, Dalkeith. This is an improved stock of the last, and is more remarkable for its smallness of neck, uniform deep purple colour, and symmetry of shape and equality, than for the size of its roots.

3. COX'S NEW IMPERIAL.—This variety may be considered intermediate in colour between the purple and green-top sorts; its roots often acquire a large size, but are rather irregular, and of a somewhat coarse-like quality. Such sub-varieties are frequently of short duration, being liable to degenerate when the careful selection of the roots to be grown for seed is not attended to, and they often only retain the name for such time as their seed-stocks are grown by the parties with whom they originated, and it occasionally happens that stocks procured in different parts by the same means, and known under different names, may yet be the same in other respects.

4. GREEN-TOP SWEDE.—Upper part of root dull green; under yellow.

This variety is of longer standing than the purple-top (No. 1.), since the introduction of which less attention has been bestowed by cultivators (in Scotland at least) towards procuring improved stocks of the green-top Swede, which has on that account fallen somewhat in the estimation of growers. But when the same care is taken in selecting the roots grown for seed, the green-top may be considered as being equal in merit to the purple.

5. WHITE SWEDE.—Roots irregularly shaped, being often divided or branched; white under the surface of the ground, and greenish above.

The white Swede may be considered as the most inferior and unimproved variety; it is at present scarcely in cultivation, and when it appears amongst others, is considered as the effects of degeneracy, or as arising from a bad stock of seed. With the white Swede, the following generally admitted distinct species may, from its apparent unimportance be compared.\*

6. BRASSICA OLERACEA RAPA, BRASSICA NAPO-BRASSICA, TURNIP-ROOTED CABBAGE.—Continental writers seem generally to agree in recommending the cultivation of the turnip-rooted cabbage, from its roots, in addition to their being naturally hardy, growing under, or almost under, the surface of the ground, whereby they are enabled to resist the severest winters; but it does not seem to deserve the attention of British agriculturists, as the Swedish turnip, which is evidently much superior, is sufficiently hardy to withstand the generality of the most rigorous winters to which this country is subjected; and as on those parts of the Continent

\* A variety of Swede which was introduced a few years since to England from Sweden by Mr. Hilliard, to which he has given the name of Thorpland Swede, is said to be superior to any of the above, but as neither seeds nor roots have as yet been obtained for the Museum, an opportunity has not been afforded of comparing this sort with the others.

where the other is generally cultivated, the Swedish turnip has not yet, or is only recently fairly introduced, it is very probable that, when the superior merits of the latter become more fully known and appreciated, the culture of the turnip-rooted cabbage may by it be entirely superseded.

Several varieties of turnip-rooted cabbage which were grown in the nursery at Meadowbank, from seeds procured from various parts of the Continent, differed little from the white, or what is generally termed a very bad Swedish turnip, except in their leaves, which very much resembled those of some common varieties of kale.

## II. BRASSICA RAPA—(VAR. COMMON TURNIP.)

The common turnip bears the same relation to the annual turnip rape, that the Swedish turnip does to the summer rape.

The varieties of the common turnip are a great deal more numerous than those of the Swedish, compared with which they are also in general of much finer symmetry, as well as of a larger size, differences which may be partly accounted for from the common turnip having been longer in, and received a more extended cultivation. One circumstance, however, peculiar to the Swedes, is, that the larger the size to which they grow, a given weight of roots is found to contain a greater portion of nutritious matter, while the common turnips, on the contrary, after attaining to beyond a certain size, lose a proportionate quantity of that most valuable part of their composition (see *Hortus Gramineus Woburnensis*); which circumstances tend to show the necessity for, and the advantages to be derived from, devoting more attention to the procuring of large and well-formed varieties of Swedes, and also to the procuring of hybrid varieties between the Swedes and common turnip, which may be found to combine the size and symmetry of the best varieties of the latter, with the above-mentioned valuable properties peculiar to the Swedes. Common turnips are divided into two important classes, viz. the white and the yellow rooted. The former, comprehending those which are most tender, and arrive soonest at maturity, and which are best fitted for using during the earlier part of the season; and the latter, with very trifling exceptions, such as, from their hardness, and period of arriving at perfection, are intermediate between the white sorts and the Swedes. The period of sowing common turnip should be regulated according to the length of time that the variety to be grown requires to arrive at maturity; for when allowed to remain on the ground in what may be termed growing weather, or before winter sets in, after they attain to full size, they become soft, spongy, and inferior in quality; a general rule, however, is to commence sowing the yellow sorts about a fortnight after the Swedes, or about the beginning of June, and to follow with the white sorts from the middle till towards the end of that month. The same quantity of seed will suffice as in the case of the Swedes (2 to 2½ lb per imp. acre), under ordinary circumstances, but some cultivators recommend sowing about ¼ lb. more, to provide against the attacks of the turnip-fly, and other casualties, to which they are more liable than the others, while at the same time the advantage of filling up the blanks by transplanting, is in the case of common turnips scarcely practicable.

\* *Yellow Turnips, varieties of BRASSICA RAPA, which are more particularly suited for field culture. Those marked thus\* are also grown as garden turnips for the table.*

7. DALE'S TURNIP, OR DALE'S HYBRID TURNIP.—From the circumstance of this variety being a mule or hybrid between the green-top Swede and white globe, procured by repeated impregnation, it may be presumed that it might with equal propriety have been included amongst the varieties of *Brassica campestris rutabaga*, or Swedish turnip. It, however, bears a much greater affinity to those of *B. rapa*, inasmuch as its leaves are also rough, and of a vivid green (not glaucous) colour, and in its roots being somewhat similar in form and texture. It has received the name of Dale's Hybrid, from being first raised and brought into notice by Mr. Robert Dale, an intelligent farmer at Libberton West Mains, near Edinburgh, who having in 1822 or 1823, received a few ounces of seed of a new hybrid variety of turnip from the late James Shirreff, Esq., of Bastleridge, Berwickshire, sowed the same, the produce he found very much to resemble the Swedish in shape, and from which by repeated selection and impregnation, he at length obtained this esteemed variety, the distinguishing characteristics of which are—foliage strong and luxuriant; roots of a large size, oblong shape, and of a lightish yellow colour, with light green top, having also a small neck and tap-root. The shape of the root, however, although generally oblong, is rather apt to vary, being sometimes almost globular, but its more material characteristics of large size and luxuriance of growth are uniformly the same. Compared with any other of the common yellow field sorts, it is found to arrive sooner at maturity, and consequently may be sown at a later period of the season; while at the same time it is equally hardy, or at least has been found sufficiently so to withstand the severest winters which have occurred since its introduction. (For farther information concerning this variety, see a paper by Mr. C. Lawson, in the *Quarterly Journal of Agriculture*, vol. ii.)

8. NEW PURPLE-TOP HYBRID TURNIP.—In its general appearance this variety seems nearer in relation to the Swede than Dale's Hybrid; like it, however, it has the rough vivid green root foliage by which the varieties of *B. rapa* are so easily distinguished. Judging from specimens of roots sent to the Museum by Andrew Longmore, Esq., Ratter, and which were raised by him from seed grown by Grant Duff, Esq., of Eden, Banff, this seems likely to become a very useful turnip for using in the spring months. Most of these roots were of a slightly oblong shape, of a greenish-purple colour on the top, and light yellow or almost white on the under surface. They were all remarkably firm in texture, and rather late in beginning to shoot.

9. LARGE LAURENCEKIRK YELLOW TANKARD.\*—So named from having been originally selected and brought into the notice of cultivators by Mr. Robert Scott, Laurencekirk. At first sight this may be mistaken for Dale's Hybrid, like which it grows a good deal out of the ground, but is distinguished by its more oblong and more uniformly shaped roots. It is a valuable acquisition, being also, like that variety, early in arriving at maturity, but generally considered rather less hardy, and like it also yields a bulky crop.

\* Tankard is a name applied to such common field turnips as are of an oblong shape, and the roots of which in general grow a good deal above the surface of the ground. Such oblong varieties, however, as approach nearest to a round or globular form are sometimes termed decanter, or decanter-shaped turnips.

10. **LONG CAMBRIDGESHIRE YELLOW TANKARD.**—This variety, which is scarcely known in Scotland, is grown to a pretty considerable extent in Cambridgeshire and Suffolk, where it is also sometimes known by the name of Pudding Swede, which name it seems to have acquired more on account of its hardness of texture than from any other resemblance which it bears to any of the true Swedish turnips. Its roots are much longer in shape than those of any other yellow field turnip, of a lightish yellow colour with green top, and in general grow more than half under ground.

11. **PURPLE-TOP YELLOW TANKARD.**—Root bright yellow with a purple-top, of a somewhat irregular long or tankard shape. This variety was formerly grown in some districts chiefly in England, but is now nearly out of cultivation; nor does it seem entitled to any particular share of attention, being altogether a coarse-like inferior sort, and not capable of yielding near such a bulky crop as either of the three last.

12. **COMMON OR OLD RED, OR PURPLE-TOP YELLOW BULLOCK, PURPLE-TOP ABERDEEN.**—Leaves comparatively short, spreading, of a dark colour, and collected into a small neck at their base; root globular or somewhat flattened, of a reddish purple colour above, and deep yellow under the surface of the ground, of medium size; tap-root very small. This is an old and very deservedly esteemed variety, and of those commonly cultivated is considered by some to come nearest the Swedes in hardness and solidity of texture.

13. **BERWICKSHIRE BORDER IMPERIAL PURPLE-TOP YELLOW.**—This, which may be considered as a superior or improved variety of the last, was first introduced by Mr. R. Hogg, Nursery and Seedsman, Dunse, Berwickshire; its principal distinguishing characters are, roots somewhat large, flesh and under part of the skin deep yellow, and top of a bright red or purple colour, firmer in texture and harder than the last.

14. **SKIRVING'S IMPROVED PURPLE-TOP YELLOW.**—This is also an improved variety of the old purple-top yellow bullock, and grown to a considerable extent in some of the north-west districts of England. It acquires its name from having been first brought into notice by Mr. Wm. Skirving, nursery and seedsman, Liverpool.

15. **YELLOW ABERDEEN BULLOCK, OR GREFN-TOP YELLOW BULLOCK.**—In the size and shape of its roots this old and deservedly esteemed sort resembles the Purple-top Yellow Bullock (No. 12), but differs in the colour of its top, which is bright green.

16. **OLD SCOTCH YELLOW.**—In size and quality is about equal to the last variety, but its roots are considerably more flattened, and grow deeper, or seem more buried in the ground, and have, from that circumstance, a smaller proportion of green-coloured top, which is also of a lighter shade.

17. **HOOD'S NEW LARGE YELLOW** is a very superior large globular shaped hardy turnip, remarkably perfect in symmetry, and has rather a lightish green top. Introduced by Charles Hood, Esq., an eminent farmer at Inverbrora, Sutherlandshire, a gentleman who has devoted much attention to the cultivation and improvement of field turnips generally.

18. **GORDON'S YELLOW**, is a name under which a very superior variety is known in some of the north-eastern districts of Scotland, and which was originally introduced by Mr. Gordon, an eminent cultivator in Aberdeenshire. It is of a rather ob-

long shape, deep green colour on the top, generally very slightly tinged with red, and appears about equal in merit to the last.

19. **\* ALTRINGHAM YELLOW.**—Compared with the generality of yellow field turnips, this is rather under the medium size, the root however, is of a fine globular shape, and possessed of considerable solidity, with a light greenish top, very small neck, and tap-root.

20. **JONES' YELLOW.**—This variety originated in the neighbourhood of Stirling, where it is still cultivated to some extent; it bears a considerable resemblance to the last, but grows to a larger size, and the yellow colour both of the skin and flesh is deeper.

21. **\* YELLOW GLOBE.**—Roots of medium size; globular, and always nearly under the surface of the ground; top greenish, leaves rather small and spreading. This is a superior turnip both for field and garden culture.

22. **\* YELLOW STONE.**—This variety differs from the last in growing more out of the ground, and having a greener top; in other respects they are pretty similar. As a garden turnip, this is one of the most esteemed sorts.

*\*\* Yellow sorts more particularly suited for garden culture.*

23. **YELLOW MALTA, OR MALTESE GOLDEN TURNIP.**—Roots very small, slightly flattened above, and concave or much hollowed on the under side towards the tap-root, which, as well as the neck, is remarkably small, skin very smooth, and of a bright orange-yellow colour; leaves also very small. For summer and autumn crops this is the most esteemed of all the yellows, but is rather tender and incapable of withstanding frost.

24. **YELLOW PRESTON, OR LIVERPOOL YELLOW.**—This is also an early sort, and bears a considerable resemblance to the last, but grows to a larger size, has longer foliage, and is less hollowed towards the tap-root.

25. **YELLOW DUTCH.**—Roots small and globular, of a pale yellow colour throughout, or very slightly tinged with green on the top, particularly when much exposed to the sun and weather. This is a much esteemed early sort, being of excellent flavour, and very well adapted for using in summer and autumn.

26. **LARGE LONG GARDEN YELLOW.**—Roots about one-fourth part above ground, which is of a greener colour, while that below the surface is of a deep yellow. This is a hardy and rather superior sort, hitherto little known in this country, but grown pretty extensively on the Continent.

27. **SMALL LONG YELLOW, Le Navet de Meaux Jaune, Fr.**—Leaves very small and spreading; root generally entirely under ground, small, and of an oblong or a carrot shape, terminating abruptly at the point; colour light yellow.

At present this variety is little known in Britain. About a century ago, however, either it or the white (No. 45) was more in esteem; they are both of excellent flavour and grown to a considerable extent in some parts of the Continent, particularly in France and Holland, from whence they used to be imported for the London market, their under ground habit of growth protects them in a great measure from frost, and they succeed best on sandy soils.

*\*\*\* White Varieties adapted to Field Culture.*

28. **LAWTON HYBRID.**—This variety, which was raised by James Wright, Esq., of Lawton, Strathmore, may be considered as bearing the same relation to the Swede as *Dale's Hybrid* (No. 7.) Its

leaves are darkish green, rather small and smoothish; roots roundish, or somewhat heart-shaped, being often tapered on the under side; white below, and green above the surface of the ground. They are possessed of more solidity and firmness of texture than most of the white sorts. From its being first brought into notice so lately as 1834, a more extensive cultivation is yet necessary before any thing definite can be said of its merits.

29. LEWISHAM GREEN-TOP OX-HEART.—This is an excellent variety, grown in some of the southern districts of England and in Scotland, has acquired this name from having been first introduced by Messrs. Willmott and Co., Seedsmen, Lewisham; in colour and shape it very much resembles the Lawton Hybrid, but is somewhat softer in texture, and has larger and lighter green coloured leaves.

30. GREEN GLOBE, OR GREEN-TOP WHITE GLOBE.—Roots of a fine globular shape, with a small neck, and tap-root; very white under, and green above the surface of the ground; of medium size, hardy, and firm in texture, but scarcely so much so as the green round (No. 36), than which it arrives at maturity rather earlier. A very fine sub-variety of this is known in some parts under the name of HUNGARIAN GREEN-TOP GLOBE; it is larger and softer than the common sort; also of a fine regular shape, and was first introduced by Adam Ferguson, Esq. of Woodhill, who received its seeds from Hungary.

31. WHITE GLOBE, COMMON WHITE GLOBE.—Roots globular; skin smooth and perfectly white; neck and tap-root small. Although the above description embraces the principal characters of the white globe turnip, yet there is a considerable variety in those to which this name is applied, arising from the degree of care and attention bestowed by growers in selecting their seed roots; and the shape is often not a little affected by the kind and state of the soil in which they are grown. Thus globes of any kind, and particularly the variety here mentioned, when grown on a very superior rich soil, may be said to be forced beyond their natural size, and thereby acquire somewhat of a monstrous or overgrown appearance, losing in a great measure their natural symmetry of shape.

32. POMERANIAN GLOBE.—This variety was introduced some years since from Pomerania, and may be considered as the most perfect globe turnip in shape, as well as the most regular or uniform grower. Its skin is of a smooth white and somewhat shining or transparent-like appearance; leaves smoothish, of a dark green colour, with whitish nerves.

In the Perthshire Agricultural Report for October 1834, the Pomeranian globe is mentioned as being less affected by mildew than most others, a disease which was very prevalent in some districts that season. A rather small variety, but in other respects resembling the Pomeranian, is known in some places under the name of CRYSTAL GLOBE.

33. STONE GLOBE.—This is considered as being the hardest of all the entire white globe turnips. It grows naturally deeper in the soil than the others, and has stronger darker green foliage.

34. RED GLOBE.—Roots medium sized, globular shaped, and firm in texture. This is an old, and in some districts pretty extensively cultivated variety. It is medium early, and generally allowed to be particularly well suited for light soils, and exposed elevated situations.

35. AUTUMN STURBLE, OR SIX WEEKS TURNIP.—Roots much above ground; rather large, of an

irregular globular shape, or in form somewhat between the White Globe (No. 31) and White Norfolk (No. 37), and rather soft. This sort arrives sooner at maturity than any of the others, the Tankard Turnips (Nos. 39, 40, 41) excepted, and from its natural softness of texture should always be sown late, and used before the severe frosts set in. As descriptive of its earliness, it has received the above names, it being suited for sowing in early situations in autumn after the corn crop has been removed, and is also valuable for making up blanks in turnip fields, where the first sowing may have partially failed.

36. GREEN NORFOLK,\* GREEN ROUND OR COMMON GREEN TOP WHITE.—The Norfolk turnips are all of a peculiar flattish shape, rather hollowed towards their neck, as also on their under side, and when grown to a large size they become more or less of an irregular round or cornered shape.

The green top variety possesses these characters in a less degree than the next; and is generally of a pretty regular round shape, flattened, but not much hollowed on the upper and under surface; the former of which is of a green colour and the latter white. It is also harder than the next two.

37. WHITE NORFOLK OR WHITE ROUND.—This is the largest rooted variety of Norfolk, and at the same time softest and most irregular in shape. It is generally hollowed towards the neck, and being so, it is apt to be injured by retaining moisture, which renders it unfit for using except in the beginning of the winter season.

38. RED NORFOLK.—In size this sort is inferior to the last, but rather firmer in texture, and more regular in shape. It should also be used in the early part of the season, and is at once distinguished from all the other round flattened varieties by its bright reddish top, and from the red globe (No. 34) by its flat shape.

39. GREEN TANKARD.—Roots more than half above ground; oblong or tankard shaped; of a greenish colour, except on the under surface which is white.

The Tankards, like the Norfolks, are unsuitable for winter feeding, not so much on account of their softness as from their standing mostly above ground, and being thereby much exposed to frost. They are also generally earlier in arriving at maturity than the others.

40. WHITE TANKARD.—Roots longer, and in general larger, also softer in texture than those of the green tankard; often bent or crooked; leaves large and luxuriant; the earliest maturing of any, but will not stand the frost.

41. RED TANKARD.—In size, shape, and texture, this variety may be considered as occupying an intermediate place between the green and white tankard. It is of a bright red colour on the upper surface, and white on the under.

\*\*\*\* *White sorts more particularly suited for garden culture.*

42. WHITE DUTCH.—This is the most esteemed

\* Norfolk being the county into which the culture of field turnips was first introduced, the original and consequently unimproved sorts, when grown in other places, were known by the name of Norfolk turnips. This name is still retained and applied to a class of turnips which, as far as regards symmetry of shape, are to be considered inferior, and apparently only slightly improved from the first cultivated varieties. The name has no reference to the sorts at present cultivated in Norfolk, which are at least equal to those in any other district of Britain.

sort for early crops. It is juicy and of excellent quality when young, but soft, spongy, and inferior when full grown at which period it becomes of an irregular round and much flattened shape. Its culture in the field has been recommended when late sowing is necessary, but in such a case the autumn or six weeks (No. 35), and the tankards (Nos. 39, 40, and 41), are decidedly preferable.

43. **RED DUTCH or EARLY GARDEN RED.**—The roots of this are very similar in shape to those of the last variety, but differ in colour, being bright red above ground, and also in having smaller and darker coloured foliage. This is a very excellent variety, but little known in this country.

44. **WHITE GARDEN or EARLY STONE TURNIP.**—This is a common and well known garden turnip, of a rounder shape, firmer texture, with stronger foliage than the white Dutch, it is not, however, so well adapted for early spring sowing, being more apt run to seed, and has acquired the name of Early from the circumstance of its arriving soon at maturity when sown at a later period of the season. A carefully selected and improved variety of this is known in some parts of England by the name of Mouse-tail turnip.

45. **SMALL LONG WHITE, *Le Navet de Meaux blanc*, Fr.**—This variety differs from the small long yellow, which see (No. 27), in little except in colour.

46. **SMALL VERY LONG, or MALTESE LONG WHITE, *Le Navet de Clair Fontain*, Fr.**—This differs from the preceding in being generally partly above ground, which part is of a greenish colour; also much longer and tapering more gradually towards the point.

\*\*\*\* *Sorts not included in any of the preceding divisions.*

47. **ROUND BLACK TURNIP.**—Leaves small, few and smoothish; roots almost or altogether under ground, of an irregular roundish shape, often divided or terminating in thick branches at its lower extremity; skins very rough and of a black colour; flesh white.

This and the next three sorts have a hottish somewhat radish-like taste, for which they are esteemed and cultivated in some parts of the Continent.

48. **ROUND BROWN TURNIP.**—This differs from the last in little except in colour, which is dull brown or earthy-like.

49. **LONG BLACK TURNIP.**—This differs from the round black (No. 47) in little except the form of its root, which is of a long carrot shape, and also mostly under ground.

50. **LONG BROWN TURNIP.**—This variety bears the same relation to the round brown, as the last does to the round black turnip.

51. **SMALL BERLIN or TELTAU TURNIP.**—This is remarkable as being the smallest of all the turnips. It is of an oblong or carrot shape, about three inches in length, and at the thickest part seldom above an inch in diameter; of a dull transparent-like white, or very light lead colour, and is possessed of a peculiar slightly hot taste.

**EXTRAORDINARY RHUBARB.**—On Saturday last, we had a specimen of the giant rhubarb exhibited to us, grown by Mr. Joseph Marshall, of Rothwell Haigh, near this town, and supposed to be the largest ever seen in the Leeds market, and proved, when used, as tender as the ordinary sized rhubarb. The owner realised from twenty-seven roots no less than *thirty stones and a half*, some of the leaves of which, with the stem, measured about *eighteen feet*.

## FAILURE IN THE POTATOE CROP.

As to the failure of the potatoe crop, I dare scarcely give an opinion. When we take into view that the method of keeping the seed, of making the manure, and mode of planting, have all been conducted and managed nearly in the same manner for the last fifty years, and no failures have occurred worth mentioning till within the last three or four years, and unless it can be shown that the drought has been more severe in the early part of the last three or four seasons, than it has ever been any other year during the course of the last fifty, the drought alone being the reason, must go for nothing. To show the inexplicableness, last year I bought a few bolls of seed potatoes from a Strathaven dealer; they were planted on a piece of hard clay land; the whole came up, and produced as good a crop as could be expected. The same dealer informed me, that he had supplied other three farmers with a good many bolls each from the same pit, one of the three had a good crop, and no failures, the other two was nearly a total failure, and one whose seed failed had them planted on land admirably adapted for growing potatoes. So, of the four who got seed from the same pit, two had a good crop, and two had almost none. To talk of the manure being the cause is altogether futile, for what kind of manure was ever generally used for planting potatoes other than what is in use at the present time; and it can easily be shown that manure taken from the same dunghill, and from the same cart, part of the seed has failed, and part has grown.

It is true that potatoes have failed most upon heavy unpulverized clay soils; but it is also true that they have failed on the very finest of soils, even upon the baulks of Clyde they have failed, and that, I am told, to a considerable extent.

Near Hamilton, 30th June, 1836.

The more the potatoe crop is examined, the more it is found to be deficient in plant. There is a remarkable failure even on those pieces of ground let by farmers to villagers which are manured from their own store, and planted by the spade. In a great many instances the farmers have been obliged to re-plough them and sow turnips. It is pretty evident there will not be a third of an average crop.

In the upper ward of Renfrewshire, the failure of the potatoe sets has been more general this year than at any former period, and though no satisfactory reason has yet been discovered for their not standing the same free treatment as formerly, yet several subsidiary causes of failure are quite apparent. In all cases where the drills after being planted, were most exposed to drought, the failure has been most general, and where they were well protected from the sun, or where the ground was damp, then there has been little failure. The exposure of the ground to the sun, so as to dry it severely, appears likewise to have had great influence in destroying the sets. One farmer in the neighbourhood of Paisley, in planting a field of potatoes this year, had to drive his dung from a distance, so that some part of the dung in the same drills was laid on in the morning, and other parts in the afternoon, the whole having been covered up towards evening; and the result is, that in those parts where the dung was laid on in the morning and thoroughly drilled, the potatoes are nearly a total failure; where the dung was laid on at mid day or thereby, the failure is more partial; and where it was laid on in the afternoon and the drills closed up immediately after, the crop is excellent and no failure whatever. We have conversed with an intelligent farmer in the parish of Inchinnan, who suffered severely last year by the failure of his potatoe sets, and he assures us

that he found the same course of procedure, as we have just described, to have been attended with the same consequences; and having made these observations last year, he has been careful this season to avoid, as much as possible, the exposure of his potatoe sets, or dung to the sun's rays, and from this course, combined with a change of seed, he has an excellent braird of potatoe, without the failure of a single plant, whilst his neighbours in all directions are in a very different situation. The same gentleman has made repeated experiments of the setting of whole potatoe, of a smallish size, in places where there was risk to the seed, and these experiments he has always found successful, both in preserving the seed from rot, and in raising an excellent crop. In the district to which this notice refers, the wheat in early situations has been shot for the last eight days, and the hay cutting is expected to commence next week, with a crop greatly improved by the late seasonable rain.—*Glasgow Evening Post.*

As for potatoe in general, a deluge of rain, equal to the falls of the Niagara, accompanied with the heat of the Torrid Zone, we grieve to write it, would never resuscitate the rotten masses which lie buried in thousands of drills in this county. The state of this species of crop over a very large extent of Ayre-shire, is truly alarming—and our fears, we deeply regret to say, are too well founded, that potatoe will be potatoe when the time of raising the insignificant return of this year's planting comes round. For many miles round Ayre in various directions—towards Girvan, especially by the shore road—towards Kilmarnock, as far as that town—and towards many of the inland districts—the appearance of those fields planted in the ordinary manner, is indeed melancholy, both for the skilful and painstaking farmer, and that unfortunate portion of our population, who now chiefly depend upon the potatoe for their very existence. In some fields, of the very best land on several farms, you will observe a few patches or half drills, here and there, or along the head-rigs, while the great breadth of the carefully prepared area, looks no better than red land. In many instances, farmers have resorted to the expedient of planting fresh seed, but, in most cases, turnips have been substituted in lieu of the decayed potatoe. The lazybed system appears to have succeeded better than the drill, in those situations, both around the town and at a great distance from it, which we have had an opportunity of observing. The potatoe crop has proved equally defective in Ireland, and here a fresh source of uneasiness presents itself; for, with the countless throng of its destitute inhabitants, what can be done, when it is found that the crop has indeed failed; why, nothing remains, but to do as has been done before—provide for their pressing wants by means of a national subscription in England and Scotland. Fact first—in a farmer's field to the eastward of this town, a number of people have in the usual way set their own potatoe, each employing such sort of manure as he could obtain; some used horse or cow dung in a damp condition; others used ashes from coals in a dryish state: the potatoe planted on the damp dung, almost all rotted, while those planted on the dry ashes, almost uniformly sent up strong stems, and are now thriving admirably. Fact second—a respectable farmer whose farm is situated three or four miles south-west from town, planted his potatoe with two kinds of horse dung; the one kind he obtained from a dog kennel in his neighbourhood, and consisted of the contents of the intestines of the dead horses which had been employed in feeding the hounds for some months previous, and having been

thrown into an open space in the yard of the kennel, was as dry as newly milled oatmeal, when applied to the potatoe; the other sort which he used on the remaining portion of the same field, was taken from the dung-stead, on his own farm, and was fresh and sappy:—the seed planted on the dry manure from the kennel, vegetated regularly and produced a good crop, but that set on the strong moist dung from the farm steading, proved a total failure. The conclusion at which our informants in both the above cases have arrived is—that the potatoe plant has now become so weak, as to be unable to resist the strong stimulating qualities of manure when in a state of active fermentation, and therefore a dry light kind of dung ought to be used till the root regains its pristine vigour.—*Ayr Observer.*

The very general failure in the potatoe crop, in situations where no failure had in former years been experienced, with various descriptions of seed, and under different systems of cultivation, seems to fix, beyond a doubt, the cause of the deficiency in the degeneracy of the seed. Failure may with more propriety be said to be general than partial—half fields, on excellent land, where no failure had hitherto been experienced, having been re-sown with turnip. We have heard innumerable instances where the failures are of so singular and anomalous character, that, unless vouched by persons of unimpeachable veracity, and proved but too strongly by the evidence they have to exhibit, they would stagger belief.—*Ayr Advertiser.*

#### MR. HEATHCOAT'S STEAM PLOUGH.

The following are the remarks, by an able Correspondent, on Mr. Heathcoat's invention, to which allusion has already been made. We do not consider ourselves pledged to all his economical opinions; but they are well worthy of the attention of our readers.

“We have been favoured by Mr. Handley, M.P. for South Lincolnshire, with a brief, but highly-interesting account, of Mr. Heathcoat's invention for applying steam to bog-cultivation, drawn up on the part of himself and some other gentlemen who accompanied him to witness an exhibition of it. We insert it with the greatest pleasure, considering this invention as fraught with consequences of incalculable value to the British empire.

The practical application of steam power to agriculture opens an almost boundless field of fresh demand for human labour, and for the creation, as well as the employment of capital. The consequences of this invention can scarcely be foreseen, much less predicted. Franklin and Davy long since speculated on the probable use of steam and machinery for augmenting the productiveness of the soil, without perhaps imagining the early realisation of their speculations. The most immediate and important results of Mr. Heathcoat's invention will arise from its invaluable application to the culture of after the barren bog wastes of Ireland. A Commission has been issued to survey the extent of these wastes, and to ascertain their fitness to receive agricultural improvement, and become permanently productive soil. That they are almost all become reclaimable is a fact not only established by these reports, but confirmed by committee after committee of the House of Commons. The Irish poor law commissioners give a similar opinion; and whilst corroborating the state-

ment that there are five millions of acres of uncultivated land in Ireland, they announce the appalling fact that 'they cannot estimate the number of persons in Ireland out of work and in distress during thirty weeks of the year at less than 585,000, nor the number of persons dependent upon them at less than 1,800,000, making in the whole 2,385,000.' Emigration and the reclamation of the waste lands are two of the many remedial measures forcibly insisted on by the commissioners as requisite for the amelioration of the distress of the Irish poor. They say, 'there is not in Ireland the division of labour that exists in Great Britain; the body of the labouring class look to agricultural employment, and to it only, for support; the supply of agricultural labour is thus so considerable as greatly to exceed the demand for it; hence come small earnings and wide-spread misery.'

"Of these two propositions it is undeniable that emigration is an evil in itself; that to be of any effectual relief it must be attended with an immense sacrifice of money and strength of population; and that it ought to be resorted to, as a national measure, only after all other expedients have failed. Of the propriety of encouraging agricultural improvement, on the other hand, there can be but one opinion, and so far as relates to the reclamation of a great portion of the waste lands, viz. three millions of acres of bog, it seems that a cheap, efficient agent of power has at length been discovered, and proved to be applicable—a power, too, provided by the bogs themselves, which furnish the elements of steam in fuel and water.

"It would require more space and reflection than we can at this moment devote to the subject, to inquire how it can have happened that so large a portion as one-sixth of the area of Ireland should remain at the present time in a state of sterility. We know that many legislative enactments have been made to facilitate the reclamation of bogs. These have all notoriously failed, and the poor-law commissioners have proposed others, the efficacy of which for attaining the desired end are also questions of controversy.

The history of ancient as well as modern times teaches us a lesson by which we ought to profit; it shows that the best system of colonization is that of cultivating, of *colonizing* (if we may so term it) the wastes of our own country, before we expatriate our countrymen, in whose numbers and well-being we are further taught to believe the chief wealth of a nation consists. Without pausing to quote the practice of more ancient times, we will refer to the history of France, in which country, during the reign of Henry IV., it was declared by law that all waste lands capable of agricultural improvement ought, for the interest of the State, to be cultivated. It was then ordained by law, and since recognised in the *Code Napoleon*, that if any man would contract to reclaim a waste, or drain a marsh, he should be let into possession of it (unless the proprietors would themselves undertake the work), reserving to the owners an interest in the soil equal to its full value as waste or unreclaimed land. Into the details of this law we cannot now enter, but the justice of its great principle has never been called in question in France, and in practice it has worked undoubted benefit to the country. We are aware that some persons have contended that the national purse ought to be opened to effect in Ireland what individuals have hitherto refrained from undertaking; but we are no advocates for the application of public money to such purposes. It may have happened, so far as relates to the vast extent of the Irish bogs, that the difficulties

and consequent expenses of reclamation arising from the nature of the soil, and costly employment of horse power, have had an influence in deterring enterprising and monied men from investing capital in their cultivation. Mr. Heathcoat's invention has annihilated this obstacle. Let then Parliament facilitate its use by throwing the bogs open to public competition, unless the landlords will undertake the work. The starving Irish peasantry have a natural claim to be employed in cultivating land, which is not only useless to the owner, but injurious to the climate.

"'Instruct, employ—don't hang them,' says an intelligent writer on the state of the Irish poor: we will add, let us not expatriate them so long as an acre of waste land remains unappropriated and infertile; let us rather expend the capital which would be sacrificed in furthering emigration, in increasing the productive area of the island; a capital which would more than suffice for cultivating the three millions of acres of bog, and for locating starving and wandering masses of people. We should then find the 'wide-spread misery' cease, and the 'small earnings' rise into reasonable and sufficient wages. On the supposition that reclaimed bog would be worth only 15s per acre rent, the result would be the investment and the creation of capital to the amount of £50,000,000. The superabundant population of certain parts of the country would be drawn off to colonize the new regions. The evil of small 'holdings' of that miserable system of farming two or three acres, would be much abated, as many occupiers, miscalled in Ireland 'farmers,' would be rejoiced to remove and to occupy on the reclaimed bogs, thereby giving room to their neighbours to augment their own farms, and obtain a living which the present wretched system of such small holdings denies both to farmer and labourer. We anticipate from this extraordinary invention political consequences of great moment and immediate action. The application of Mr. Heathcoat's patent should be encouraged by the country without delay."

## ANIMAL PATHOLOGY,

BY MR. YOUATT.

### NEUROTOMY.

(From the *Veterinarian*.)

The division of the nerve, as a remedy for intense pain in any part of the frame, was known, or at least was hinted at, more than fifteen centuries ago: it does not, however, appear to have been systematically practised until the middle of the last century, and was then confined, or nearly so, to inflammation or disease of the sensitive nerves of the face. It was a remedy for *neuralgia*—pain in the nerve—from whatever cause it might arise, and generally bidding defiance to the power of medicine.

**SIMPLE DIVISION OF THE NERVE.**—The pain being clearly referrible to a particular spot, and not to be traced to any local inflammation or mechanical cause, an incision was made in the known direction of the nerve, and between the immediate seat of torture and the brain. The result of this was usually instantaneous relief, but too often of a temporary nature: the divided edges of the nerve again united, and with that re-union the communication between the diseased part and the brain was again established, and the former agony returned; or, in some instances, the pain was

translated to another place, generally a neighbouring, but occasionally a distant one.

**EXTIRPATION OF A PORTION OF THE NERVE.**—When that grand improvement on neurotomy, the extirpation of a portion of the nerve, took place, I am not sufficiently versed in medical literature to be able to tell you; but there is a very interesting account of the operation given in Majendie's *Journal of Physiology*. A French soldier was wounded in the leg in the battle of Wagram, in 1809. The ball was extracted, and the wound healed; but the man was subject to very extraordinary nervous paroxysms in the part, and convulsions, commencing from the cicatrix, spread over the whole body, and gave him the most dreadful pain. A surgeon who was consulted advised that the external popliteal nerve should not only be divided, but that a tolerably large portion of it should be cut out. Eighteen lines of the nerve were excised. The patient, to whom sleep had been almost a stranger, sunk into repose, and said, when he awoke, that a thorough revolution had taken place in him, and that he was no longer the same man. The spasms occasionally returned for awhile, but in another place, and with less intensity; the interval between them gradually increased: and, at length, they disappeared altogether. This is the first case of which I am aware of the excision of a portion of the trunk of a nerve in the human being for the relief of pain.

**MR. MOORCROFT STUDIES THE FOOT OF THE HORSE.**—There are records, however, of its earlier introduction in veterinary practice. Mr. Moorcroft, for awhile the colleague of Professor Coleman at the Royal Veterinary College after the death of St. Bel, was devoting his powerful energies to the discovery of the causes and cure of lameness in the fore foot of the horse. It was a subject worthy of him: it involved the interest of the proprietor, and the comfort of the slave. He found that, partly from the faulty construction of the shoe, but more from the premature and cruel exaction of labour, the horse was subject to a variety of diseases of the foot, all of them accompanied by a greater or less degree of pain, often of a very intense nature, and ceasing only with the life of the patient.

**CONTRACTION.**—He studied the nature, and cause, and consequences of contraction—usually the effect of other injury or disease; but when existing in a great degree increasing, if not perpetuating, all other mischief. He thought, however, that he was approaching towards some improvement in practice, for he was able to remove the contraction of the feet in many cases; and in all he could say, with tolerable certainty, whether he should succeed or fail.

**NAVICULAR DISEASE.**—He found a more formidable foe in what was then improperly called coffin-joint lameness. The coffin-joint, or that between the os pedis and lower pastern, was never primarily, and with very few exceptions not at all, involved. Mr. Sewell afterwards called it "joint-capsule lameness," a term still more objectionable from its being so indefinite. Mr. James Turner first gave it its proper name, "navicular joint disease," and likewise gave the first satisfactory explanation of its precise seat and character. It is inflammation of the synovial membrane, either of the flexor tendon or the navicular bone, or both, where the tendon plays over that bone; and it is accompanied by pain, abrasion, and gradual destruction of these parts. In his attempts

to remove or even alleviate this disease, Mr. Moorcroft was almost invariably foiled, although he adopted every mechanical contrivance which could be suggested, and every variety of temperature, and every soothing and stimulating application.

**TYING THE METACARPAL ARTERY.**—He then had recourse to the cutting off of the supply of blood. He imagined that he should thus lessen the degree of inflammation, and give a better chance to other means and appliances. First he tied one of the metacarpal arteries, but without alleviating the pain. He then—having a little while before tied both the carotids, and successfully, in another horse labouring under inflammation of the brain—passed ligatures round both the external and internal metacarpal arteries. In no instance, however, was the horse benefited; on the contrary, contraction of the foot seemed to be hastened thereby, and the lameness proportionably increased.

**DIVIDING THE NERVE OF THE LEG.**—He at length turned his thoughts to another way of subduing the increased sensibility of the part, viz. by diminishing the proportion of nerve naturally distributed on the foot. He laid bare, he does not say whether one of the metacarpal or the plantar nerves, and cut it with a pair of scissors. There was "immediate and decided lessening of lameness," and sometimes the horse rose perfectly sound; but this happy result was not always permanent; for the lameness returned after the lapse of a few weeks, and often after very slight exertion. It was supposed that the divided ends of the nerve had re-united; and therefore, in order to prevent this, about a quarter of an inch of the nerve was excised. The reproduction of nervous substance was not at that time dreamed of. If nervous influence was subsequently restored, it was supposed to be in some roundabout way, or a mere accidental affair, and not to be effected in the line from which a portion of nerve had been extracted. By this operation considerable relief was usually given; but the lameness was not quite removed in every case, and in too many it speedily returned.

**THE DIVISION OF BOTH THE NERVES.**—He now tried a bolder experiment. He determined to excise a portion of both the outer and inner metacarpal, and thus to destroy the whole sensibility of the foot. It was a noble experiment. He selected for this purpose a mare that had been operated on by the division of the nerve on one side with evident advantage, but who had relapsed. I will give you the history of this experiment in Mr. Moorcroft's own words. I make no apology for the length of the story. It is the history of the first case of complete neurotomy—excision of the nerve on both sides of the leg—that was ever performed. "The animal on rising, trotted boldly and without lameness, but now and then stumbled with the foot operated on. The wounds healed in a few days, and the patient was put to grass. Some weeks afterwards a favourable account was received of her soundness; but she was soon brought again to us, on account of a large sore on the bottom of the foot operated on, and extending from the point of the frog to the middle and back part of the pastern. The mare, in galloping over some broken glass bottles, had set her foot full upon a fragment of the bottom of one of them, and which had cut its way through the frog and tendon into the joint, and stuck fast in the joint for some seconds, while the animal continued its course, apparently regardless of injury. The

wound bled profusely, but the mare was not lame. Many days had elapsed before I saw her, and large masses of loose flesh were cut from the edges of the wound without the animal showing the slightest sign of suffering pain. The processes usually attending sores went on with the same appearances that took place in sores of parts not deprived of sensibility. Such extensive injury, however, had been done to the joint, as rendered the preservation of free motion in it very improbable, even were the opening to close, which was a matter of doubt, and therefore she was destroyed. It appeared clearly from this, that, *by the destruction of sensibility the repairing powers of the part were not injured*; but that the natural guard against injury being taken away by the division of both the nerves, an accident was rendered destructive, which, in the usual condition of the foot, might have been less injurious.

"I do not recollect the number of horses operated upon by me successfully after this, although it was somewhat considerable. Some of them were worked by myself; but the general impressions on my mind are that horses so operated upon, when they did not again become lame, were more apt to stumble with the limb operated upon than with the other, and that this mode of treatment is more likely to be usefully applied to carriage horses than to those intended for single harness or for the saddle."

**NEUROTOMY ABUSED AND GETTING INTO DISREPUTE.**—Soon after this, and before the beautiful operation of neurotomy had become sufficiently known and established in public estimation, and it had been ascertained in what particular states and diseases of the foot it would be beneficial or would aggravate the evil, Mr. Moorcroft departed for far distant climes. It had also unfortunately happened, that, without the slightest disparagement to his judgment, he had originally adopted it as a remedy for that disease of the foot in which there was not only the possibility but the probability of its hastening or producing a fatal result. It was impossible for any practitioner to determine, in a case of navicular disease, to what extent the cartilaginous or the ossific portion of the navicular bone might have been corroded, or the flexor tendon abraded—how soon in the *natural action* of the horse the one would be fractured or the other ruptured—and how far it would happen as a matter of certainty that, when the stress upon them and the concussion were so much increased by the altered action of the horse, the sensibility of the parts being destroyed, one or both must give way. This could not be ascertained, even in cases that were not of very long standing; and the operation was often performed by incautious persons when the lameness had been of considerable duration, and when it ought to have been supposed that the internal mischief was of a serious character. It consequently happened, that, while the horse generally rose relieved to a great degree, or apparently sound, there were annoying cases in which he almost immediately broke down and became useless for life.

**INCONSIDERATE OPERATIONS.**—Such an operation could not long be confined to one disease of the foot, but was hastily and at hap-hazard adopted for every kind of lameness. It was resorted to in partial ankylosis of the coffin or pastern joints; and with good effect, for the bold and, occasionally, violent action which was superinduced was calculated to give greater play to the joint. In cases of ringbone it would in the same way, and for the

same reason, be beneficial. In cases of contraction it would call into something like their natural action the beautiful mechanism of the foot to oppose or to obviate the narrowing of the heels. In cases of obscure disease, where there evidently was little inflammation, and no ulceration, it might have good effect. In chronic founder, its use might be questionable, yet if everything else had failed, the trial of neurotomy might be permitted; for the former inflammation might not again be set up, and the natural action of various parts of the foot might be restored. But when there is evident, and, perhaps, considerable inflammation—a state for which rest, and the absence of every internal and external stimulus, afford the only direct means of cure—in which there is nothing so prejudicial as the natural action of the limb—nothing so destructive as its early or violent use—when, by the very circumstance of relieving pain, the action of every part of the foot and the concussion and the pressure are almost beyond comparison increased—the operation of neurotomy must be certain destruction. The animal feels no pain, but the inflammation proceeds with increased rapidity, and is attended by consequences of the most fearful character. So if the feet had been previously bruised or ulcerated; or if there had been bad corn, or canker, or quitor, the inevitable destruction of the horse must follow the operation of neurotomy. In case of much ulceration or under-running, how much mischief will one day's hard work effect, even although the horse bears as lightly as he can on the painful part, and permits no concussion that he can possibly avoid! What would become of the pumiced foot if sensibility were withdrawn? With his present careful way of placing his feet, and all the protection that we can afford to the attenuated and projecting sole, we are in daily fear lest it should fail to support the weight that is thrown upon it. Alter the action of the horse, and let his foot come with that power and force to the ground, which the concave and healthy sole will hardly bear, and what will become of the pumiced foot?

Few lessons having been given upon these points, and little about them being generally understood, is it to be wondered at that this operation should have been abused—that instead of increased usefulness it should be followed by fearful inflammation, rapidly spreading ulceration, and loss of the hoof, and inevitable death?

**PREJUDICE AGAINST IT.**—In addition to these things, it had to encounter the prejudices of the ignorant, and the determined opposition of those who would allow no need of praise to any improvements that emanated not from themselves. The true theory of the nervous system was then altogether unknown. That the nutrition of every part depended on nervous influence was then as now believed; but no master mind had arranged this wondrous system according to the distinct and important functions which it exercises; and to destroy the nerve of the leg, was supposed, of necessity, to destroy the nutrition and life of the part. When the hoof occasionally dropped off, a plain and palpable proof was affirmed to be given of the folly of these would-be improvers. You may judge, gentlemen, what was then said of the absurdity of this new operation when you listen to the following remarks on it, proceeding—strangely proceeding—from a Professor in a foreign school. "Far from believing them unconcerned with nutrition, we think that the nerves composing the axillary and lumbar plexuses pre-

side equally over the sensibility, and the nutritive, and the secretory actions of the parts on which they terminate; and we ask, if the nutrition of the foot depends on the influence of any other nerves than the plantar, why should the division of these be followed by the loss of the hoof? \*” Stranger still is the language of a very superior writer of our own country, a man of humanity too. He is speaking of those who refuse to adopt, and he thinks unfairly and illiberally oppose certain notions and imagined discoveries of his: “and, what is worse, when the truth in clearest evidence lies before them, instead of embracing it joyfully, they have tried every way of stifling her, by wilful misrepresentations and abuse of those who had espoused her cause. And, next to these miserable courses, they have added a barbarity surpassing in refined cruelty even the unsoling or any other cruelty ever proposed by the old farriers, that of nerving the horse's legs when they were not relieved by their injudicious measures, and so destroyed the very fundamental properties of the foot, instead of pursuing the natural and most obvious means of prevention and relief from the evil. Seeing and deeply feeling the very great injury done to the animals as well as to the public and ourselves, we cannot on such an occasion but express warmly our natural and we believe just indignation at such conduct.†” I can only say of a passage like this, that, instead of being compelled to record it, I wish that I could blot it out for ever.

MR. SEWELL ADVOCATES THE CAUSE OF NEUROTOMY.—Well, gentlemen, this noble operation (which I have no hesitation in predicting will be practised and valued in proportion as veterinary science progresses, and interest and humanity, here inseparably combined, operate on the mind of the horse-owner) for awhile fell into disesteem and disuse. It could never have been lost to the world—but its triumph might have been delayed and impaired. It however fortunately happened that Mr. Sewell, very soon after his appointment as Assistant Professor at the Veterinary College, hesitated not to avail himself of every opportunity to put it to the test, and expressed his firm conviction of its value. He at once adopted the plan of *excision* of a portion of the nerve. He made a variety of experiments on the states and diseases of the foot in which it would be beneficial or in-

\* M. M. Dupuy and Prince, Journ. Prat. Oct. 1830.

I think that a very promising and talented young veterinarian will, upon consideration, a little modify the language which he adopted in the discussion on the nervous system on the 2d of last February. “Referring to the function of secretion as dependant upon the brain and nerves, he at once allowed of the closeness of the link; and in reply to the objection raised, that secretion goes on in the horse's foot after an excision of a portion of the nerves which lead to it, he stated that *there are yet filaments which have not been divided*; and even if these were, the bloodvessels are pervaded with nervous tissue *sufficient (!)* to carry on secretion.” Is the theory of the nervous system taught at the Royal Veterinary College so loose and unsatisfactory, that even one of the rising luminaries of our profession should thus express himself? He is to be forgiven when a veterinary professor uses the language quoted in the text—but such times ought to be passing away with us.

† Mr. Bracy Clark on the Foot of the Horse, p. 56.

jurious; and those in which its important effects would be best promoted, and the usefulness of the horse most effectually secured by *diminishing*, or for awhile *destroying*, the sensibility of the foot, or, in other words, by the operation below or above the fetlock; and, as being really and mainly instrumental in establishing the credit and high value of the operation, he deserves much commendation. If to Mr. Moorcroft it is to be yielded the first adoption of the practice, the praise of having rescued it from neglect and disgrace belongs to Mr. Sewell.

And now, regarding the operation of neurotomy as one of the most signal triumphs of our profession, and with full confidence anticipating the near approach of that period, when, if it is not extended to other diseases of the horse—and of this I do not quite despair—it will at least be made the means of alleviating the sufferings of other patients, I make no apology for this introductory history of it. We must, however, proceed to take a brief survey of the anatomy of the parts on which we are to operate.

(To be continued.)

ZOOLOGICAL SOCIETY. — At the monthly meeting held on Thursday afternoon, June 30, Viscount Gage in the chair, the usual reports were read. The following notes of a paper, lately read, on the economy of an insect destructive to turnips, by Mr. Yarell, are applicable at the present season. This time last year the yellow fly was seen upon the young turnips. It was remembered by some farmers that this was the fly which prevailed in 1818, and which was followed by the caterpillars known by the name of the blacks. The eggs being deposited by the perfect insect in the leaf of the plant, the black caterpillar, or turnip-pest, speedily makes its appearance, feeding on the soft portions of the leaves of the turnips, and leaving the fibres untouched; and, finally, casting its black skin, and assuming one of a more slaty or gray colour, it buries itself in the earth. Lodged there, it forms for itself from the soil, a strong oval cocoon; from which some of the earlier broods pass almost immediately into the perfect state, filled with *ova*, and ready quickly to supply another generation of destroyers. So complete and so rapid was the destruction in some instances last July, that a whole field was found, in two or three days, to present only an assemblage of skeletonized leaves; and this, too, when the turnips had attained a considerable size. The insect, whose proceedings have been thus briefly noticed, belongs to the *Hymenopterous* family *Tenthredinida*; it is the *Athalia centifolia*, a species first noticed by Panzer. By their repeated broods the devastation was continued for so long a time, that even the third sowing did not, in all cases, escape destruction: the turnip became pithy and of little value, and it was necessary to import the root largely from the Continent to supply the deficiency of the home crop. The remedial measures adopted on a former visitation were, the turning into the infested fields of a large number of ducks, who greedily devoured the caterpillars as they were brushed from the leaves by a boy with a long pole; the passing of a heavy roller over the ground at night, when the caterpillars were at their feed, and the strewing of quick lime by broad cast over the fields, renewing it as often as it was dispersed by the wind. The latter mode was generally considered as the most effectual preservative.

WOOL FAIRS.

CHELMSFORD WOOL FAIR.—JUNE 21.

It is impossible to describe the gratification expressed by the Wool Growers, at the success which attended the anniversary of the Wool Fair held in this town. The fair in 1835 was encouraging, but the buyers were not, on that occasion, sufficiently numerous to remove those doubts which were entertained of ultimate success.

The quantity of wool exhibited on this occasion surpassed all expectation. The Market-place in the Shire-Hall was completely filled, and a great deal which arrived at a later period of the day, necessarily remained upon the waggons, there not being sufficient room to pitch it. Owing to the present great demand for wool, the growers were anxiously on the look out for some new faces as buyers; and the movements of several strangers, who were observed to be minutely inspecting the fleeces before the commencement of business, brightened up the countenances of the producers, whose physiognomies, owing to the unpropitious state of the weather, appeared at first rather elongated. They were not disappointed, for a competition, previously unknown in this county, was excited by the attendance of some spirited London buyers, who, kindling a similar spirit among those dealers more locally known in the county, raised the price a penny, and in some instances, two-pence per pound. About 10,000 fleeces were in the market, and, we understand, were all sold, greatly to the satisfaction of the seller. The principal buyers on the present occasion were Messrs. Legg and Son, woolstaplers from Bermondsey, who proved themselves to be the real "Farmers' Friends." Those gentlemen are supposed to have purchased to the amount of about £5,000, and they will probably be entitled to the prize cup.

Messrs. Legg and Son continued their purchases the following morning, and visited Felix Hall, to inspect Lord Western's clip; they also visited various flock-masters in this neighbourhood for the like purpose.

The business did not conclude until the Wednesday evening, when we learnt that 7,940 fleeces had been weighed in the Market-house alone, and were purchased of thirty-two growers, chiefly by Messrs. Legg and Son, by whom they were sent off for town on three heavily-laden waggons. The above quantity is exclusive of what was purchased by Messrs. Johns, Unwin, Oram, and other gentlemen in the trade. Last year not more than 52 cwt was weighed in the Market-house; on the present occasion nearly five times that quantity passed through the scale.

STOCK.

The Prizes for Stock were (it will be seen below) well contested, and the sheep-shearing, which, owing to the rain, was witnessed under rather unfavorable circumstances, formed, as usual, an interesting part of the proceedings. We subjoin a statement of the prizes awarded, supplied from the books of the Secretary, to whom and to the acting Committee the public thanks are due for the judicious arrangements of the day.

SHEEP—(Shown in the Wool.)

	£.	s.	d.
DOWN RAMS.			
Mr. George Ellis, Hatfield Peverel, for the best Down ram . . . . .	2	2	0
E. G. Bernard, Esq., M.P., second-best ditto, a Down teg . . . . .	1	1	0
LONG-WOOL RAMS.			
Mr. Wm. Fisher Hobbs, Marks Hall, for the best, a tup, improved Leicester . . . . .	2	2	0

Mr. Henry Cleeve, Rettendon, second ditto, £ s. d.  
a long wool teg . . . . . 1 1 0

DOWN HOGGETTS.

E. G. Barnard, Esq., for the best pen of Down tegs . . . . . 2 2 0  
T. W. Bramston, Esq., for the second best ditto, Down hoggetts . . . . . 1 1 0

LONG WOOL HOGGETTS.

Mr. Henry Hobbs, Bocking, for the best pen of Four . . . . . 2 2 0  
Mr. Wm. F. Hobbs, Bocking, for the second ditto,—improved Leicesters . . . . . 1 1 0

WOOL.

T. W. Bramston, Esq., for the best fleece of Down wool . . . . . 1 1 0  
Mr. T. Crooks for the best ditto, of long wool . . . . . 1 1 0  
Shorn in the presence of the meeting; quality and weight the criterion.

SHEEP SHEARERS.

Wm. Neale, certificate signed by Mr. Crooks, as the best shearer . . . . . 1 1 0  
Richard Jarvis, ditto, ditto, as the second best, ditto . . . . . 0 10 6  
Samuel Carter, jun., ditto, by George Matson, third best, ditto . . . . . 0 5 0

The shearing of the lad Jarvis under twelve years of age, was highly commended by the judges, and at their recommendation a reward of 5s. was given to him as an encouragement.

THE DINNER.

At half-past three o'clock, about 120 gentlemen sat down to an excellent dinner, served up by Mr. Lake, at the Saracen's Head Inn. The Honourable J. J. Strutt, in the absence of Sir J. T. Tyrell, the President, presided, supported by J. Round, Esq., J. Disney, Esq., O. Hanbury, Esq., the Rev. G. Price, Captain Kortright, P. Honeywood,—Roche, C. Coynyns Parker, T. F. Wilson, Esqrs., and various other gentlemen of the county. Mr. Kemp officiated as Vice-President. The room was filled to an overflow.

CHIPPENHAM WOOL MARKET.

The first of the Chippenham Wool Markets was held on Friday, July 1, and was far more numerously attended, both by buyers and sellers, than could reasonably have been expected. The very large quantity of 205 bags of wool was exhibited for sale, and the greater part of it was readily sold. The average prices may be stated as follow:—Ewe from 40s to 42s; Regular Flocks, with a full proportion of Tegs, 43s to 46s; Whole Tegs from 43s to 49s per tod. One sample, under particular circumstances, obtained 50s; but the above are the correct average prices. In the afternoon, nearly 150 farmers, dealers, manufacturers, and others, partook of a most excellent dinner, provided by Mr. Lawes, in the Assembly-room, at a very moderate price. Mr. Neeld presided at one table, and Mr. Budd at another; and Mr. Little of Biddesden, and Mr. Salter of Malmesbury, officiated as Vice-Presidents. The arrangements altogether were excellent, and did great credit to Mr. Lawes. The very polite and affable conduct of Mr. Neeld commanded the esteem of all present. After the usual toasts,

The CHAIRMAN said he would next propose "Success to the Wool Trade, as connected with the N. N. W. of Wiltshire." He gave the toast in those words, because he thought the establishment of a wool market in Chippenham, would tend to the convenience and advantage of persons connected with the Wool Trade throughout that district. Before the toast was drank, however, he begged to congratulate the company on the successful results of this their first

meeting. Whether he looked to the quantity of wool exhibited,—to the number of respectable and influential dealers and growers in attendance,—to the sales effected, or prices given—he confessed his most sanguine expectations had been exceeded. This was no false meeting, got up by extra exertions. Every pack of wool exhibited in the market, had been brought there *spontaneously* by its owner. No solicitations had been made to dealers; but those gentlemen had voluntarily attended from different parts, and he would do them the justice to say had purchased freely and liberally; those who had sold too, derived, he believed, an inward satisfaction from their sales. It was all fair, he supposed, to grumble a little—it was in the nature of John Bull. One party *ought* to have a trifle more for the article he sold, and the other *ought* to have given a trifle less for that which he bought; but he had a strong suspicion that the dealer would not buy, unless he thought he could advantage himself by the purchase: nor would the holder sell, unless he was persuaded that he had the full market price. It was well known that there had existed a prejudice against the establishment of wool markets; but that prejudice, he was happy to say, had been overcome, and it was now universally acknowledged, that the holding of those markets at particular and stated periods, would be a general convenience:—to the owner it was assuredly desirable to know that by bringing his wool to a certain place, he was sure of finding a purchaser at the price of the day; and not less desirable he should imagine to the dealer, to know that by attending a certain place, he would meet with the article he wanted. Instead of any feeling of jealousy, he was highly gratified to find that the example of Chippenham had been followed: gratified, that their activity and exertions had in a measure roused their neighbours from their supineness. The greater the quantity of wool exhibited, the greater the tendency to bring together an increased number of factors. He would again congratulate them on that day's market—it might already be said to be established. His exertions, however, should not cease. If, in the progress of the market, further buildings should be required, further buildings should be erected; and if either buyers or sellers could throw out any suggestions for their convenience, he trusted they would make the Committee acquainted with them, and whatever the Committee recommended, he would most strenuously support.—Mr. Neeld then sat down, amidst the loudest applause, and the toast was drank with three times three.

Mr. BUDD having obtained permission to give a toast, said he was certain there was not an individual present, but would fill his glass to the brim, and drink the toast he was about to propose with enthusiasm. It was the health of their worthy chairman. [The applause which followed the announcement of this toast shook the room, and it was some time before Mr. Budd could proceed. As soon as silence was obtained, he continued]—it would require a far more able person than he was to do justice to the character of that gentleman. As a landlord, he sought every opportunity to mix with his tenants, and attend to their wants; he was indeed characterized by liberality, and afforded a bright example to other landlords. As a sincere friend and neighbour and as a true country gentleman, his munificence towards the town of Chippenham bore ample testimony. He was no less the friend of the manufacturing than the agricultural interest—it appeared to be the study of his life to unite all parties and all classes. Addressing himself to the company, Mr. Budd said, he had heard a great deal about agricul-

tural distress; but very few of them knew what distress was—they had never been cast on a lee-shore. They might during the last two or three years, have experienced a heavy gale, but in his opinion they had weathered the storm. With the vessel full rigged, the flag flying at the main, every man at his gun—(not like the ships in Portsmouth harbour, 100 less than the regular number, but with the full complement)—and having the excellent chairman for a commander, there was no difficulty but they might overcome. There must, however, be no flagging; every man must, if possible, redouble his energies, and attend to his duty; and then by pulling all one way—by liberality on the part of landlords towards their tenants; and by kindness on the part of tenants towards their labourers—Agriculture would again flourish. Mr. Budd passed a few more complimentary observations on Mr. Neeld, and the toast was indeed drank with enthusiasm.

In acknowledging the honor, Mr. NEELD said, although Mr. Budd had passed far higher compliments upon him, than he was entitled to, yet in one respect he had but done him justice, and that was when he said, that he (Mr. Neeld) was desirous of uniting all classes and all parties. He was, most desirous of effecting that object. When his attention was first directed to the market at Chippenham, he was governed by the simple desire to benefit the inhabitants. He afterwards saw that his sphere of usefulness might be extended; and from the successful results of the Cheese and Cattle Markets, he was of opinion that the establishment of a Wool Market, in the town, would benefit the whole of that part of the county; and the proceedings of the day confirmed him in that opinion. He was a great friend to agricultural meetings;—besides promoting a degree of sociability, they led to many useful purposes, and he intended to be present at them more frequently. In what he had done at Chippenham, he trusted he should not be misunderstood; he disclaimed all political feeling; he knew no man by his politics; he considered that every one in that room had assembled for a general good, with which politics had nothing to do.—Although he had his own political opinions he should never quarrel with any one for differing from him; he followed the dictates of his own conscience, and he hoped every person would do the same. As a man of honor, and accountable for every word he uttered, he declared that his sole object in interesting himself about the market at Chippenham, was the benefit of the town, of the neighbourhood, and of the public, without the slightest reference to politics. Mr. Neeld again thanked the company, and sat down amid repeated bursts of applause.

Mr. JOHN NEELD said, it was well known that all classes depended upon each other for support. The success of the Chippenham Wool Market, however, more particularly depended upon the attendance of the Manufacturers. He therefore begged to propose as a toast, the *Manufacturing Interest*, and with it he would identify the name of one of the influential manufacturers who had come some distance to be present at the first market—he meant Mr. Stancombe.—The toast was drank with applause.

Mr. STANCOMBE, after returning thanks, said, in the course of some observations, that the Manufacturers were in full work,—and in a very prosperous state. Indeed, without reference to politics, he would say, that Great Britain generally, was more healthy than she had been for many years past. In allusion to agricultural affairs, and speaking of the desirableness of cultivating a good feeling between landlord and tenant, Mr. Stancombe said, "Live and let Live" was his motto; and although he was but a small

landlord, he assured the company that a tenant of his had, in the course of a few years, made 3000 guineas from his estate. (*Cheers.*)

The CHAIRMAN then proposed the healths of the other Factors who had honored the market with their presence.—Messrs. Salter, Cunningham, Everett, Bailey, Ellen, &c.—drank with three times three.

Mr. SALTER returned thanks, and in allusion to the Market, said, he certainly did not expect to see so large a quantity of wool exhibited as had been that day. With regard to the samples, some certainly were very good, whilst others were indifferent. Then as to price, as far as he was concerned, he feared he had gone beyond the mark, and given too much. Hitherto he had been in the habit of going round to his friends' houses, buying their wool, and then taking pot-luck with them. Sometimes a couple of ducks were provided, and at other times a bit of lamb. Now as he was in future to be deprived of this good fare at his friends' houses, he thought they should sell their wool at Chippenham at such a moderate price as to enable him and his brother dealers to provide a bit of lamb or a couple of ducks at home. (*Laughter and cheers.*)

Mr. LITTLE proposed the health of Mr. John Neeld, the Member for Chricklade, on whom Mr. Little passed a high eulogium—(Drank with 3 times 3, and the one cheer more.)

Mr. JOHN NEELD returned his cordial thanks for the honor done him. Connected as he was with that part of the county, he felt more than ordinary interest in the success of the Chippenham Wool Market; as he did not for a moment conceive that its benefits would be confined to the town or its immediate neighbourhood; but that at each succeeding Market, its operations would be more extended, and be felt throughout the whole of the northern part of the county. He was gratified to see several of his agricultural constituents present; he trusted that they had derived some advantage by their attendance, which would be the means of inducing others to be present at the next market. No body of men could excel the British agriculturists—None more honest, more loyal, or more independent. True to their King—true to their country—most true to the Established Church—the British Agriculturists were the men he wished to have the honour of representing in the House of Commons. (*Loud cheering.*)

Mr. RAY (a gentleman of the legal profession from Gloucestershire) begged to be allowed to give a toast. He had no connection, he said, with Wool, or the Wool Trade; and he believed he was unknown to all present, although he had frequently rode over the grounds of some of the company. He had seen the advertisement in which it was stated that Mr. Neeld would preside at the ordinary on the opening of the Chippenham Market; and he was so much pleased with the idea of a great and rich landlord going out of his way to mix with his tenants and other farmers, that he came from Gloucester purposely to shew his respect for him. It would be well done for country, if the noble example set by Mr. Neeld, was followed by other landlords. The toast, however, he was about to propose was the Duke of Beaufort and his fox-hounds. [The manner in which this toast was drunk, at once shewed the esteem of the company for the noble Duke, and their love of fox-hunting.]

The health of Mr. Little was drunk with three times three distinct rounds of applause; and Mr. Little, in a very appropriate speech, acknowledged the compliment.

Other toasts were drunk, and the evening was passed in the most social and convivial manner.

## PERTH WOOL FAIR.

The fears which were at one time entertained that this newly established Fair would not be sufficiently supported to be maintained as a leading market for the purchase and sale of the wool produce of the central Highlands and Counties of Scotland, must have been entirely removed by the result of the meeting on Tuesday the 12th July. On this occasion there was an improved attendance of both buyers and sellers—the former consisting of some of the leading wool staplers of York and Leicestershires, and the woolen manufacturers of Kilmarnock, Bannockburn, and the adjoining counties to the south and west; and the latter included the sheep farmers of the Perthshire Highlands, and the principal stock growers from Strathmore, Strathearn, and the adjoining districts of the neighbouring counties. The stockholders attended to the suggestions made them last year by the English buyers in bringing sufficient samples of their wool, and the average quality was highly spoken of, particularly of the Leicester. Mr. Clarke from that county acknowledging that the samples shown fully equalled any he had ever purchased in England. The result of these two markets would seem to show that the produce of the finer wools from the low country, and of the native sorts from the Highland districts, offered at this meeting, will always be sufficiently great to command a large attendance of the principal dealers; and that this channel of communication between the growers in the adjoining counties and the south country staplers will be the more resorted to, as its advantages are experienced.

The first business of the day was the determination of the Premiums offered by the Highland Society of Scotland, for the best descriptions of wool grown in the district. The fleeces were exhibited in the Council Room, and a number of competitors appeared for each class. The Judges appointed by the Deputation of the Highland Society were, Mr. Clarke, woolstapler, Leicester; Mr. Wilson, manufacturer, Bannockburn; and Mr. Gibson, from Messrs. Peace's House, Yorkshire. All these gentlemen expressed themselves in high terms of the quality of the various sorts exhibited; and the object of the Society in offering the Premiums was well answered, not only in the quality exposed, but in the extent of country from which the competitors appeared—a very considerable proportion of the largest holders being from Forfar and Kincardineshires, to the very head of Strathmore.

The premiums were adjudged as follow:

For the best seven fleeces of Combing Wool, Capt. Hunter of Auchterarder.

For the best seven fleeces of Short Wool, of the Cheviot Breed, Mr. Jn. Welsh, Glencleck, Brechin.

For the best seven fleeces of Wool, of the Black-faced Breed, Mr. John Bennet, Perth.

During the forenoon, little business was effected, as is usual on such occasions. The short supply in the manufacturers' hands, and the deficiency in this year's clip, amounting to nearly one-fourth, encouraged the holders to stand out for a considerable advance; and although the staplers offered in the first instance fully 3s a-stone above the prices of last year, the holders would not come to terms. After dinner, however, parties came to a better understanding. The finer wools were first disposed of. Pure Leicester, entire hog, of first quality, brought 42s; half hog, ditto, 37s to 40s; some inferior, the produce of crosses between the Leicester, Black-faced, and Cheviot, from 30s to 35s all per stone of 24 Imperial lbs. In the Black-faced Wool, which formed the staple of the Highland sheep farmers, some very extensive sales were made; those which regulated the prices were two of nearly 10,000 fleeces each, which were disposed of at 28s the double stone; in some cases, with a reference of 1s extra, in case the result of the Inverness market should be higher than the Perth. Some parcels of White Highland Laid Washed brought 18s the single stone. Prices of Highland Wool, on the whole, may be stated at an advance of fully 4s a double stone above those of last year.

Although at the above rates some very extensive sales were made, a number of farmers, who had long been

accustomed to sell with reference to the London market, hung back in expectation of a greater rise there, and which there is every probability will be realized. Accounts of the firm appearance of the market here were dispatched north by express that night, and as these would precede the south country dealers, there is every reason to believe the advance here will be fully maintained. The stock holders are all in great spirits, as the present prices will remunerate for the loss by the severity of the last spring. About 150 gentlemen sat down to an excellent dinner in the Salutation Hall at 3 o'clock. John Richardson, Esq. of Pitfour, was in the chair. The Lord Provost, Mr. Watson of Keillour, and Bailie Keay, were occupiers. On the right of the chair there were John Hay, Esq. of Letham, John Millar, Esq. of Balumbie, Patrick Kinnear, Esq. of Lochton, Jas. Miln, Esq. of Woodhill; and on the left, Captain Hunter, Mr. Clark, woolstapler, from Leicester, &c. &c.

### IPSWICH WOOL FAIR.

On Tuesday July 19, the above fair was held in the Assembly Room, in this town. The attendance, though far from numerous, did not impede the progress of business, there being a briskness in the demand, which shewed a very great improvement over the last year. The right hon. the Earl of Stradbroke filled the chair, and was supported by R. N. Shawe, Esq.; J. Moseley, Esq.; Joshua Rodwell, Esq.; Fuller, Esq.; and W. Rodwell, Esq., of Ipswich. Among the buyers were—Messrs. J. Burch, Tuddenham; Revans, Yoxford; Churchyard, Halifax; Pymar, Norwich; Etheridge; Roberts, Yoxford; Candler; Blake, Norwich; Buck, Beccles; and others. Among the growers were—H. Edwards, Esq.; Sutton; F. Hale, Esq.; Mr. Barthropp, Mr. Collett, Mr. W. Wasp, Mr. T. Crisp, Mr. J. Codd, G. Bates, Esq., Mr. Phear, Mr. G. Sargent, Mr. J. Churchyard, Mr. Gebbett, Mr. Diggins, Mr. Dewing, and Mr. Freeman.

The noble chairman, immediately on the removal of the cloth, gave the usual loyal toasts.

The CHAIRMAN opened the business of the meeting, by referring to the cordiality which existed between both the buyers and the sellers of wool, and the improved prospects of the market. In the course of the evening the meeting would probably have an opportunity of hearing some remarks relative to the breed of sheep, and the establishment of a woollen yarn manufactory. The question would also be submitted, whether it would not be expedient, to give rewards to such shepherds as deserved them, at future meetings. As regarded the selling of his own wool, Mr. Revans had bought on other previous occasions, though not last year, and he hoped that he would become a purchaser this year. He should puff his wool a little. It was not so good as that of Mr. Arcedeckne, but still it was equal in quality to most flocks. He offered the hogget wool at 56s and the ewe at 43s per tod. (*Cheers.*)

Mr. REVANS said that it was with great satisfaction that he could advert to the active and steady state of the market. The only way to keep them in that condition was by the grower offering his material to the buyer on such terms as would induce him to buy. If offered at high prices, it created an undue depression. That, however would not be the case there to-day and he congratulated the meeting upon it. As regarded the offer of the noble chairman, he was quite ready to admit the high quality of his flock. He considered the price which he had put upon his hoggets too high. He should be happy to take his wool at 42s for the flock, and 55s for the hogget.

The CHAIRMAN observed, that after the remarks made by Mr. Revans, and to promote the sale of all

other gentlemen in the room, he would accept his offer.

Toast, "Prosperity to the Suffolk Wool Fair."

J. MOSELEY, Esq., said that Mr. Revans, having very frequently purchased the wool he had for sale, he should offer it him again this year. It had been observed that Mr. Arcedeckne's wool was said to be the best, but, as it was said, that after dinner a man's courage rose, and in proportion his modesty declined, he would not say much about that in reference to his own. He offered the flock at 45s per tod, and the hogget at 56s per tod.

Mr. REVANS observed, that he had hoped there would have been no obstacles to the progress of business. He thought that Mr. Moseley's wool was very good, but not so good as to fairly demand the price he had put on it. There was only a single instance at the Thetford wool fair, that of Mr. Coke's where 45s was obtained for flock wool. That wool was considered to be the best in the county of Norfolk, yet it was considered that that price was three shillings per tod more than ought to have been given.

Mr. MOSELEY said, that as it regarded Mr. Coke's flock, he (Mr. Moseley) had lived twenty-three years in Norfolk, and he therefore knew what the quality of that flock was. He had offered a wager of fifty guineas that his own was as good. He never had considered that Mr. Coke's wool was the best in Norfolk. There were other wools besides those of that gentleman which sold for 45s.

After some conversation, Mr. MOSELEY said, that he thought it would make Mr. Revans a better customer to him, if he lost his wools for a year. (*A laugh.*)

Mr. REVANS hoped in that case Mr. Moseley would keep it.

Mr. MOSELEY again observed that there could only be a difference of one shilling per tod between them, and perhaps Mr. Revans would consider the proposition.

A conversation here took place on the relative superiority of different breeds of sheep, as connected with the produce of wool.

Mr. REVANS thought the pure Sussex as good as the cross by the Hampshire.

Mr. MOSELEY enquired if Mr. Revans did not recommend the cross.

Mr. REVANS observed that he thought the cross did not add to the value of the fleece.

Mr. MOSELEY said that he could obtain more money from the cross.

Mr. REVANS observed that that related to the buyers. He considered that the pure Sussex was as good as the cross with the Hampshire.

Mr. MOSELEY did not think so. He thought the quantity of chalk in the soil of Sussex got into the fleece of the animal, and rendered it hard. The soil of Norfolk being softer, so were the fleeces of the flocks, and they would therefore obtain better prices. In answer to other questions put by Mr. Moseley to Mr. Revans, that gentleman observed that he had no particular knowledge of the Sussex breed—he only spoke relatively, as it were between the Sussex and the Hampshire cross.

R. N. SHAWE, Esq. said that he should offer his wool to Mr. J. Burch, (Tuddenham.) As his friend Mr. Moseley did not puff his goods, why he should. His flock had been Norfolk, and now it was part half-bred and South-down. Part of his flock had come from Mr. Arcedeckne, though he must say that he wished that he had stuck to the Norfolk. He should offer to Mr. Burch at 42s for the flock, and

52s for hoggett. The hoggetts were Down and Norfolk.

Mr. Burch observed, that as Mr. Shawe had puffed his wool, he should add another puff, and puff all the Norfolk away. He accepted Mr. Shawe's offer, but hoped that he would do without the Norfolk on future occasions.

Toast, "The Members for the County."

The CHAIRMAN said, that there was a gentleman in the company, who as he was not generally known to this part of the country, he should be glad to introduce to their notice, for many reasons. If he had not sold his wool, or should wish to offer it, the present was the time to do business. The gentleman to whom he alluded was Mr. Amos, of Rickenhall, he knew that his flocks were of the first character.

Mr. AMOS said, that he felt great pleasure in attending the meeting, not only on account of business, but because he found friends both on the right and left. He attended the fair at Thetford but did not sell; his wool was therefore to dispose of, and he would offer it to Mr. Pymar. He would offer it that gentleman at 56s for hoggetts, and 45s for flock. He well knew the quality of his wool, and he trusted that there would therefore, be no difference between them as to price. There was an advantage between the prices of that day and those of Thetford Fair. If, however, he had intended to have taken that advantage to himself, he should have asked a higher one. (*A laugh.*)

Mr. PYMAR said, that he would give 44s and 56s.

Mr. AMOS observed, that Mr. Pymar had on past occasions, testified that his wool was as good as any in Norfolk. He had introduced Mr. Pymar as an independent buyer, and he had bought his wool last year and paid for it, and he hoped he would become a purchaser this year also. He trusted also that he would give him the price obtained by Mr. Coke at Thetford, for his flock was quite as good. He begged to inform the meeting, that he had a number of famous tupps to let, and he should be happy of having an opportunity of showing his sheep. He did not expect to obtain a premium for them, but he meant that he should be glad to offer them to the notice of any gentleman.

Mr. PYMAR accepted Mr. Amos's price of 45s for flock, and 56s for hoggetts.

Mr. MOSELEY said, now that Mr. Amos had obtained his price, he thought that he was at liberty to ask the decision of Mr. Revans.

Mr. REVANS declined.

Mr. MOSELEY offered his wool at 56s for hoggetts, and 45s for flock.

Mr. REVANS still declined.

Toast—"The Bishop and Clergy of the Diocese."

JOSHUA RODWELL, Esq., observed that in offering wool for sale that day, they were doing so under the advantage of knowing the prices which had been obtained at Thetford Fair. They had held that if this meeting were appointed to take place after the fair at Thetford, that it would be of great advantage in facilitating the course of business. He thought that it had been found so. He would offer his wool to Mr. J. Burch; that gentleman had seen it, and he knew it to be clean. He would offer it at 44s for flock, and 55s for hogget. He would not puff his wool.

Mr. BURCH said that he was obliged to Mr. Rodwell for advertising to the prices at Thetford. He thought that there they were 42s for flock, and 54s for hoggetts. Mr. Rodwell had said that he had not puffed his wool—(*Mr. Rodwell: Yes*)—then a puff was necessary—to puff the sand out of it. He thought that if gentlemen would get their wool washed twice, they would find a considerable advantage accrue to

them. The county of Suffolk was evidently improving in the quality of its wool. He had collected upwards of 23,000 fleeces this year, and he thought that they were better than he had seen them before. He thought that the Suffolk wool was as good as the Norfolk. As regarded the breed of sheep, he surmised that the Hampshire cross was perhaps better than any other, but still he did not think that it exceeded the pure Sussex. If Mr. Rodwell would come to the level of the times, he should have no objection to treat with him. (*A laugh.*) The buyers were ready to meet the sellers in a spirit of justice. He was a buyer at Norfolk, and he should be glad to purchase at Ipswich also.

Mr. MOSELEY observed in reference to the sand getting into the fleece, that he had seen 3 lbs. weight of sand beaten out of fleeces, on the hurdle. He had endeavoured to discern how it was that the sand got so deeply into the wool, and he thought it must be by the animal rubbing itself against the sides of sand pits, and the sand crumbling into its fleece. He thought that although there was half a pound allowed in the weight of the tod in Norfolk, that the advantage was destroyed by the buyer getting that weight in sand, and not wool. Respecting the double washing of the fleece, he should be glad to know from any gentleman the proper time that it could be done with advantage. He had tried the plan at various times, but he did not know if he had done it at the best possible juncture.

Mr. AMOS, in reference to the mode of weighing in Norfolk, observed that the clean tod was weighed, and then an allowance was made of half a pound.

Mr. BURCH said, that Mr. Amos was quite correct; for every tod, the weight of half a pound was given to the buyer.

Toast—Prosperity to Agriculture.

The CHAIRMAN observed that if an end had been made to the bargains, he should be glad to hear Mr. Chapman offer Sir W. Middleton's wool, if he had any to dispose of.

Mr. CHAPMAN (Steward to Sir W. Middleton) said, that he would offer at 44s per tod for flock, and 56s for hoggetts, and he hoped to obtain that price, for it was a fair one. Sir W. Middleton had written to him desiring him to sell at a fair price, else he (Mr. Chapman) should have stated a higher sum. (*Much laughter.*)

Mr. BURCH said, that he had seen the wool, and the flock of Sir W. Middleton was, he was glad to say, much improved. As the noble chairman had set the meeting a good example, he hoped that Mr. Chapman would follow it, and take 55s for the hogget, and 43s for the flock.

Mr. CHAPMAN: I cannot take it.

Mr. BURCH said, that Mr. Coke's flock was considered the best in England, and that fetched 43s and 56s. He considered Mr. Chapman's flock improved, and as he had shown a disposition to do what was fair, and enter into the spirit of the meeting, (*A laugh.*) he would give 43s for the flock, and 56s for the hogget.

Mr. CHAPMAN said, if Mr. Burch would give the price for the hogget, that he should have the flock at his own price.—The bargain was not concluded.

Mr. REVANS said that he would make Mr. Moseley an offer for his wool which he thought he could not refuse. He would give 43s for the flock and 56s for the hogget, but that price was purely to promote the good spirit of the meeting.

Mr. MOSELEY said, that he could not go below 44s and 56s.

Mr. REVANS objected. In offering 43s per tod for

the flock, he did so in order to promote the disposition of the day.

Mr. MOSELEY still refused.

Mr. REVANS said that the price was still 1s per tod too high.

The CHAIRMAN proposed the health of Mr. Revans, and the other buyers in the room.

Mr. BURCH, addressing Mr. Chapman, said, that if he would make him the same allowance as others on the weight of the wool, he would take the wool he had to sell.

Mr. CHAPMAN said, that he would allow Mr. Burch half-a-pound on each tod, at 4s for flock and 5s for hogget.

Mr. REVANS briefly returned thanks for the honour of proposing his health. He had always endeavoured to promote the interest of the Meeting.

The CHAIRMAN said that Mr. Blake of Norwich, who was present, would address the meeting relative to the Norwich Yarn Company.

Mr. BLAKE then rose and observed that the Norwich Yarn Company now employed 700 hands in the manufacture of yarn, at good wages, and that such was the prosperity of the trade that it was their intention to enlarge their establishment. The existence of a market for the purchase of wool was of the greatest importance to the wool growers—a market that would take off the wool from the hands of the farmer without the intervention of the agent. There was another important consideration in the establishment of a new manufactory of this kind—that it would employ the surplus labour. How far it may be considered of advantage to establish a manufactory of this kind in Ipswich it was not for him to speak; the county of Suffolk was once famous for the spinning and culture of hemp, and as far as his own opinion went, he thought it would be found more profitable to spin hemp and flax than worsted. He hoped that attention would be turned to the spinning of hemp and not worsted, as it was a legitimate employment of Suffolk. Norfolk was the consumer of Woollen Yarn, and it would be of great advantage to the growers of wool, that they should have a market for their produce. He felt proud for the introduction he had received into the county of Suffolk, and he should feel happy to shew what they were doing in Norwich, to any gentleman who paid a visit to that city. At present the company had only two looms at work, but their business was increasing so rapidly that they were obtaining more power with all possible expedition. The manufacture was important to this part of the country, as it would be the means of employing the population. He was glad to say that in the North the people were all employed. If a manufactory similar to the Norwich Yarn Company were established in Ipswich, he should be glad to render it any assistance that was in his power.

Mr. MOSELEY said, in reference to the manufacture of hemp in the county of Suffolk, that it did prevail to a considerable extent, but the Russian hemp being thought of better quality, the duty had shut out Suffolk from the trade. That manufactories would permanently benefit the condition of the poor he could not subscribe to. True it was that they found employment in the manufacturing districts, but when from any cause the prosperity declined, they came back and became a burden to their parishes. This had been the case with many towns in Suffolk, where manufactories had once been established and had now left them, and he quoted Hadleigh and Glemsford as examples. Manufactories were certainly increased, but if produce got higher in price, what would be the consequence? As the establishment of Joint Stock Banks extended themselves, he thought that prices

would rise, and if so, they could not compete with foreigners.—Mr Moseley enquired what description of wool was preferable to the purpose of yarn spinning?

Mr. BLAKE said the half-bred down and Leicester hogget—but they could use all descriptions of wool which would comb well.

W. RODWELL, Esq., observed, that with regard to what had been said relative to the incumbrance of parishes, after a species of manufacture had declined in the town or neighbourhood, that he thought the evil had arisen under the bad system of the old law of settlement. Under the new regulations he thought it never could occur. He would just mention in passing, though not in reference to any remark that fell from Mr. Moseley, that he knew of no man who could complain of any banker in this part of the country not being liberal in his business. As to the establishment of a Yarn Company in Ipswich, he hoped that he should not be thought inopportune if he offered a new company of that description to the notice of the meeting, to be established in that town. Although that species of manufacture was flourishing to a great extent in Norwich, yet he thought if a manufactory of that nature took root in Ipswich, it would prosper beyond any in that part of the county. There were various advantages possessed by Ipswich which Norwich did not possess. The former town possessed a facility of navigation to the sea which the other did not. As regarded the present capability of Norwich to consume the wool of the county, he would observe that if railroads were established, Ipswich would be able to supply that city with yarn. If his yarn was not too long he would state some particulars respecting the proposed company. Mr. Rodwell then went on to observe, that it was intended the company should be established in shares of 100l each. Its objects were to produce a home market for wool, and a safe and profitable investment of capital. There were at present a great number of hands employed in Ipswich in the manufacture of stays, but such was the lowness of remuneration, that they could not earn more than four shillings per week each. The establishment of the Ipswich Yarn Company would create a large market for labour in the town, and absorb superabundant labour. He thought that the remark made with reference to those places in the county which had once been the seat of manufactures, did not exactly apply. Hadleigh, he knew from his own knowledge, possessed larger eleemosynary endowments than any other place in the county, and that in order to take advantage of the funds arising from them, a great number of false settlements were made by the paupers. That was under the old system. He could say that the expenses of maintaining the poor in that parish, though not an incorporated one, was reduced in the ratio of from 18,000l to below 12,000l. The rates had fallen from 14s on the acre of land, to 7s, and were in progress of reduction beyond that. In a short time it might be hoped that the produce of the charities would alone be sufficient to support the poor, without a charge upon the land. With respect to Lavenham he could say, and he hoped he should be contradicted if not correct in his statement, that the land, from a state bordering on no value whatever, was now of very considerable value, and was selling high. He believed that the present system of jurisprudence would remove the entire evils of the poor laws, and prevent their recurrence.

Mr. MOSELEY observed, that there were many circumstances to be taken into consideration relative to the amount of relief obtained through the new Poor Laws, and one was the present low price of corn. There were also many expenses paid out of the old

rate which were rejected in the new, though still forming a portion of the parochial charges.

Mr. RODWELL observed, that it was not certainly for him to enter into a discussion on the matter. Respecting the portion not allowed, as mentioned by Mr. Moseley, the amount could not belong to the poor rate.

R. N. SHAWE, Esq., gave the health of the chairman, the Earl of Stradbroke. It was not necessary that he should say anything in favour of their noble president. He had long been known to them, and was the staunch friend of agriculture. The toast was drank with three times three, and one cheer more.

The Earl of STRADBROKE returned thanks. He observed, that he was at all times ready to render his assistance in promoting the general good of the country. Nothing afforded him greater satisfaction than being employed for the advantage of these around him. In return, he begged to drink the health of all present.

R. N. SHAWE, Esq., said, that as Mr. J. Rodwell was the only person who he believed had not sold his wool, he asked, and he wished to know if it were not possible to bring him and Mr. Burch together in their bargain.

Mr. BURCH said, that it was no fault of his. If Mr. J. Rodwell would set his wool at times' price, he would be glad to meet him.

Mr. J. RODWELL said, that his flock was very good. Mr. BURCH said, that it might be better; the wool was weak.

Mr. J. RODWELL asked what price Mr. Burch offered?

Mr. BURCH said, that the times' price was 40s a tod for the ewes, but to promote the harmony of the meeting, he would give 41s, and he would not take the allowance of  $\frac{1}{2}$ -lb per tod.

Mr. RODWELL.—Can't you give another shilling?

Mr. BURCH.—Why the chairman sold at 42s, and his was very clean. Your's is not dirty, but I hope it will be better next year.

Mr. MOSELEY observed, that having talked about sand getting into the wool, he feared that he had prejudiced the sale of Mr. Rodwell's wool. He should be happy if he could go between him and Mr. Burch, and adjust the difference.

We understood that the bargain was eventually concluded between Mr. Rodwell and Mr. Burch.

The question was not put with regard to the convenience of the time of meeting, but from the activity which appeared to pervade the fair, it was supposed, that being held a week after the Thetford Wool Fair was in entire accordance with the wishes both of buyers and sellers.

The chairman after the last toast, immediately left the chair, and the meeting separated.

## THETFORD WOOL FAIR,

FRIDAY, JULY 15,

Was attended by a large body of the gentlemen and agriculturists of this and the adjoining counties. The veteran Founder and President of the Fair, Mr. COKE, paid his never failing visit, and appeared in excellent health and spirits. A large marquee was erected on the paddock of Mr. Gill, where a table was spread for 250 persons. Mr. Coke presided, and was supported by the High Sheriff, (A. Hammond, Esq.) Sir Wm. Folkes, M. P., Sir C. M. Clarke, E. R. Pratt, Esq., H. S. Part-ridge, Esq., Wyrley Birch, Esq., and Captain Fitzroy, and amongst those present were Messrs. Abbott, Blyth, Beck, Blomfield, Cooper, Cobon,

Culley, Ellman (Sussex), Freeman, Garwood, Hudson, Hastings, Kendle, Layton, Milnes, Overman, Reeve, Read, Swan, Adams, Bryant, Bidwell, Cooper, Chambers, Denton, Dobito, Edwards, Fyson, Garnham, Kersey, King, Lugar, Lanchester, Muskett, Phillips, Payne, Reed, Stedman, Simpson, Tubbs, Wigson, Webb, and other principal flock-masters of Norfolk, Suffolk, and Cambridgeshire; and as buyers, Messrs. Waller, Fison, Gardiner, Baldry (Halifax), Martin, (Bradford), Moyse, Mumford, Head, Revans, Sheppard, Pymar, Burch, Scott, Drage, Jeffrey, Tetley, Sherringham, Churchyard, Turner, and Blake, and Lord for the Norwich Yarn Company.

After the usual toasts were given,

The CHAIRMAN expressed his satisfaction at seeing so numerous and respectable a meeting, exceeding any previous one since the establishment of the fair. He would now offer his wool to Mr. Waller, who had so frequently bought it. From the attention which he had paid to his flock, he flattered himself that for uniformity of staple and goodness of quality it was equal to any in the county, and he was inclined to think that he was entitled to the best prices. He was sorry still to see so many inferior flocks in the county of Norfolk; he believed that the improvement of which many were capable would be sufficient to pay the rent of the owner. With respect to his own flock he believed that the Hampshire cross had put a good deal of money into his pocket, and if Mr. Ellman would try it, he thought he would be of his opinion. He should ask what some might think a high price for his wool; for the Hogget he should ask no more than last year, but for the Ewe he should ask considerably more. He did not think the pure Down so valuable as the Hampshire cross, and should therefore ask 3s more than he thought the Southdown was likely to sell for. He should offer his Hogget wool to Mr. Waller at 56s, and his Ewe and Wether at 45s.

Mr. WALLER said undoubtedly Mr. Coke had laid 3s more on his Ewe wool than he could have expected; but the manner in which it was taken care of, and the cross of the breed, made it far better than the clothing wools of the pure Down. Clothing wools were not so much in demand as this on account of the great quantity of combing wool that it would yield. Mr. Coke was at least 3s out of the way as to the Ewe wool, but as he had kept the price of the Hogget very steady, and as he could get more combing wool out of it, though not of equal fineness, he would accede to his terms.

The CHAIRMAN then gave the health of a gentleman of Thetford whom every one respected—his worthy friend Mr. Fison.

Mr. FISON returned thanks, and congratulated the company on the numerous attendance and the auspicious circumstances under which they met, especially considering that these were the gloomy days of agricultural distress. They must at least be good days for the wool trade to produce so many cheerful faces. The disposition of the buyers to do business must be met by a corresponding spirit in the sellers. In the state of trade there was every congratulation; but it might be clouded by an advance for the raw material. He was convinced that the prosperity of our manufactures depended upon a reasonable price being maintained for the raw material. Last spring the price rose too high and the consequence was that it went back immediately; there were so many other materials which bore on the price of wool that it was

not allowed to get above a certain point. It had since about recovered the price which it then lost, but if they tried to get it up higher, the trade would in his opinion go back as it did before.

Mr. COKE said Mr. Fison had spoken exactly his sentiments; he believed that trade was never in a more wholesome state; but that by asking out of the way prices they would do injury, and would produce a bad effect upon the fair, now one of the most thriving and respectable in the kingdom. He then gave "the Bishop of Norwich."

Mr. BRYANT said he thought Mr. Coke was in error as to the value of Southdown wool; he did not think he had asked more than Southdown price.

Mr. ELLMAN said that from the best information he could gain he believed that 20d per lb was about the price in Sussex, taking all the wool together, but it was not the practice there to shear the lambs.

Mr. MUSKETT rose to offer the Duke of Norfolk's wool, amounting altogether to nearly 2000 fleeces. The fat sheep had been fed in the yard, some of them tied up in stalls, which gave a superiority to the wool over those which were fed on the turnips. He could not give way to Mr. Coke's opinion as to the superiority of the Hampshire cross. Though he admitted that that gentleman's flock was brought to great perfection, he must still think the pure Down superior. He begged to offer the Duke of Norfolk's wool to Mr. Fison, the Hog wool at 56s, the Ewe and Fat Sheep at 45s.

Mr. Fison said there were two points in the Duke of Norfolk's wool which ought to be mentioned. There were upwards of 16 score of the fat sheep, which from the length of staple, owing to their being housed, were of rather more value; and the flock had been twice washed, a plan which he had known to be pursued with great success in several cases, and he had no doubt if generally adopted would amply remunerate the growers for the additional trouble. The first washing appeared to give a kind of impetus to the growth of the wool, and to produce a superior quality. He thought the price asked was too much, but wishing to meet the growers in a liberal spirit he would give 56s for the Hog wool, and 44s for the Ewe and fat sheep.

Mr. COKE asked for information as to washing the sheep twice, a practice which he had never heard of before.

Mr. MUSKETT said the fact was that the sheep were so badly washed in his absence (the shepherds having got drunk) that he made them wash the sheep over again two days after.

Mr. COKE said that no doubt the housing of the sheep gave the fleece an additional value; in the countries where fine wool was produced, they were all housed at night; but though the Duke of Norfolk might have conveniences for this purpose, farmers in general had not.

Mr. MUSKETT said he was not inclined to abate from his price. Mr. Head had shown a sample of the wool to dealers in London, who considered it so superior that they would not believe it to be Southdown.

Mr. Fison said he would give 45s for the fat sheep and 44s for the ewe; Mr. Muskett accepted it and then offered his own wool (part of it half-Leicester) at 54s and 42s. It was eventually taken by Mr. Head at that price.

Sir C. CLARKE offered his small quantity of half-Leicester Hog wool, about six score fleeces, very good and clean, to Mr. Waller at 56s. With re-

spect to what had been stated as to the effect of housing sheep, it stood to reason that any animal which was kept quiet and well-fed should produce a larger quantity of wool or hair, than those which were subject to the wear and tear of searching for their food.

Mr. WALLER accepted Sir C. Clarke's wool, and also Captain Fitzroy's at the same price.

Business now proceeded briskly, and the following sales were made in the room:—

	Hoggets.	Ewe.
Lord Berners's, (Hants cross) to Mr. Pymmer .....	56s	44s
Sir W. Folkes's, to Mr. Sherringham ....	56s	42s
Mr. Pratt, to Mr. Waller .....	56s	45s
Mr. Cully, (half Leicester) to Mr. Waller ..	56s	—
Mr. Blyth, to Mr. Baldry .....	56s	45s
Mr. Gill Steadman, to Mr. Head .....	56s	44s
Mr. Reeve, Buckenham, to Mr. Gardiner ..	56s	43s
Mr. Wrightup, Ashill, to ditto .....	56s	44s
Mr. Cook, Livermere .....	56s	44s
Mr. Bryant, Exning .....	54s	44s
Mr. S. K. Gayford, to Mr. Culham .....	54s	43s
Mr. Thompson, Mundford .....	56s	42s
Mr. Rodwell, Livermere .....	53s	42s 6d
Mr. Shillito, to Mr. Fison .....	54s	43s
Mr. Flowers, to Mr. Pyman .....	54s	42s
Mr. Swann, Hockham, to Mr. Culham ..	—	43s
Mr. Stephen Head, to Mr. Culham .....	—	43s
Col. Ray, to Mr. Turner .....	(Net) 54s	42s
Col Rushbrooke, to ditto .....	ditto	—
Mr. Sparke, Pakenham .....	—	44s

Mr. Cooper (Roundham) offered his wool to Mr. Culham at 56s and 43s.

Mr. Culham bid 54s and 42s. Not taken.

Mr. Abbott offered his at 58s and 46s; but it was not taken. (Mr. Coke's tenants in general did not offer.)

Mr. G. Gayford asked 56s and 43s of Mr. Fison and was offered 54s and 42s.

The CHAIRMAN proposed to drink "Prosperity to the Norfolk and Norwich Yarn Company."

Mr. DODSHON BLAKE returned thanks, and observed that last year they had the pleasure of making a dress of Mr. Coke's wool for Lady Ann Coke: he now begged to request her Ladyship's acceptance of a shawl, which he trusted would show that Norwich was not behind other places in ingenuity. He was happy to say that the business of the Yarn Company had greatly increased. Last year they were employing 2000 spindles; they had now increased to 5000; their consumption of wool had increased from 200 to 500 tods per week, and if the arrangements which were now contemplated should be carried into effect, he hoped the present amount of business would be doubled next year.

Mr. COKE said he was sure that Lady Anne would be most gratified in accepting the shawl. The shawl was then exhibited to the company. It was splendidly flowered on a black ground, and appeared to be of beautiful texture, made by Messrs. Shickle, Towler, and Campin.

Sir C. CLARKE proposed the health of Lady Anne Coke, when the rule not to cheer, which had been laid down at the beginning of the afternoon by the chairman, was broken through with three times three, and three more.

Mr. COKE returned thanks for the compliment paid to one who had contributed very greatly to his happiness.

Mr. WALKER afterwards gave the health of the Heir of Holkham. Mr. W. exhibited an excellent piece of Norfolk manufacture, called "Norfolk Merino" made by Messrs. Willett, from Southdown

wool grown in this county and manufactured at Norwich.

After expressing his gratification at the quantity of business done, which was greater than he had ever known, Mr. Coke retired. A great many other sales were effected.

**DEVIZES WOOL MARKET.**—The first of our wool markets was as might have been expected from the number of large flock-masters and dealers by whom we are surrounded, was remarkably well attended. Upwards of 200 bags of wool, by far the greater part samples, were exhibited for sale, and by half past 12 o'clock nearly two-thirds of it had changed hands. The large room at Mr. Hazeland's, commodious as it was thought it would be for the purpose, was crowded, and some inconvenience was experienced in consequence. The prices varied but little from those of late fairs.—Ewe wool from 42s to 44s; mixed flocks, from 44s to 49s; tegs from 47s to 51s.

Observations of Mr. Ellman and Mr. Benett at the dinner.

Mr. THOS. ELLMAN wished to remark upon the quality of the sheep exhibited this year, which was superior to those exhibited last, although the numbers were not so great. He could not account for the deficiency, unless it arose from fear on the part of those who have been in the habit of competing at the show in former years. He urged on the Wiltshire farmers to competition the next year, as that alone would give a stimulus to improvement; he also recommended the breeders of Southdown sheep to persevere in growing *fine* fleeces of wool, and not altogether to lose quality for quantity. The preference to quantity, both in meat as well as wool, was already too apparent, either for the benefit of the grower or the consumer, inasmuch as a less valuable commodity was grown with additional expense. The late improvements in machinery increased the value of all fine wool grown in this country. A short time since, the whole of the Southdown wool was used for clothing purposes; now the greater part was *combed*, and used to more advantage. He would state that the finest wool (provided of sufficient length to comb), was worth the most money, because that description would supersede the use of any other. Indeed the Southdown wool of the finest quality could now be used in making goods more valuable than could be made from any longer and coarser description of wool. The reason was this, that the longer and coarser wool could not be so nicely united to make a fine thread as was the case with the finer description, which latter sort was capable of producing the finest thread of the greatest length. So much for the skill of the manufacturers, to whom we are ever indebted for their enterprise. Another reason which induced him to pay attention to the growth of fine wool was, that the better the quality of wool, the better the flesh of the animal; and indeed a fine close coat was a better protection against the inclemency of the weather than one of a looser and coarser sort, although the latter be somewhat heavier. Mr. Ellman also noticed the subject of shearing the sheep, as closely connected with the former question. He observed that dispatch and neatness of work were highly desirable.—It frequently occurred that a shearer, from want of practice, was either too tedious to satisfy himself, or too bad when his performance was hurried, to give satisfaction to his employer; therefore a man might be able to shear a sheep tolerably well when too much time was allowed for either his or his employer's benefit, but not be able to make himself generally useful. In Sussex, the time allowed to every man for shearing of one sheep, was half an hour, and the number shorn was six sheep; at all

events, two hours appeared to him quite time enough to be allowed for shearing of three sheep. If the Wiltshire sheep-shearers were not so expert as the Sussex men then more time might be given to them—they would do well to run the race a little faster—in fact, they required better training. Mr. E. again referred to the subject of wool, and highly recommended the breeders of Southdown sheep in Wiltshire to pay equal attention to the quality of the wool and to the quality of the flesh, being persuaded that in the long run this course would best answer their purpose. Mr. E. apologised for having detained the company so long, again thanked them for the honour conferred upon him, and begged to drink all their good healths.

Mr. BENETT said that Mr. Ellman had been playing into his hand remarkably well, for he was one of the very few persons in the country who had any merinos, and he had no doubt after what had been said, he should receive a great many applications. Mr. Legge, an excellent judge in these matters, had bought his wool for the last two years; and it was but a fortnight ago, that he strongly recommended him (Mr. Benett) never to give up his fine wool; it had been lately discovered, that any number of fine threads might be united and twisted together like a rope. He knew that Lord Western's lambs were purchased for 4 and 5 guineas each to be sent abroad.

**ISLESLEY WOOL FAIR.**—PRIZES APPOINTED FOR NEXT YEAR.—At the Islesley wool fair Mr. Ireland, (a wool buyer,) said as long as he could get remunerating prices as a manufacturer, he should be with the growers; and as some inducement to them, he would give for competition at the annual fair next year, a five-guinea cup to the farmer who shall produce not less than 100 of the finest and cleanest Southdown ewe fleeces, appropriate to manufacturing purposes, the growth of ewes shorn on his farm. Mr. Bailey of Calne, in proposing the health of the Farmers of Berkshire, said, as a farther inducement, he would give a silver cup, value 10 guineas, to the Berkshire farmer who shall produce at the next Islesley wool fair, the best and cleanest Southdown teg wool (not less than 100 fleeces) of his own growth, and the entire of such growth to be brought in the bulk. The lambs to have been bred in the county of Berks, and to have been in the possession of the claimants six months before the fair day, of which satisfactory proof must be given to the judges.—A subscription cup, value 20 guineas, will also be presented to the largest purchaser of wool at the fair, on the first Wednesday in July,—and a second prize of 10 guineas to be given to the person purchasing the second largest quantity at the same fair.

**BEDFORD ANNUAL WOOL FAIR** took place on Wednesday, and a large party dined at the Swan Inn, F. Pym, Esq. in the chair. About 130 sat down to dinner, amongst whom were Mr. Crawley, T. C. and W. Higgins, Esqrs. and the leading agriculturists of the county. There were more samples shown and more business done at good prices than has been known at Bedford for many years. The prices appeared to be from 45s to 48s.

**NORTHAMPTON WOOL FAIR.**—The following is an account of the sales which were effected:—

Owner.	Buyer.	Flees.	Ewes.	Tegs.	Price.
W. B. Potterton	Osborne	368	91	277	46s.
R. Rogers, Cooknoe	Bunting	461*	204	269	41s.
N. Potterton	Do.	450	more than half hog		41s.
Hillyard	Gurney	200	120	80	42s.
Tunnell	Bunting	363	102	261	41s.
R. Heygate	Peach	299	204	82	41s.

\* Mr. Rogers' Sheep were crossed by the Down.

Several other lots were offered but were not disposed of.

The ANNUAL LEICESTER WOOL FAIR has gone off well. Buyers and sellers were numerous,

and much business was done. The quantity of wool was, lots, 54; fleeces, 6515; of which there were sold 6048. The average price was 43s, half and half. The silver cup presented to the largest buyer was carried by a Mr. Jacques, who bought 465 tod.

At CHURCH STRETTON the quantity of Wool was less than usual, and bought up at an advance of 2d per lb beyond last year's prices. Longmynd wool 18d to 20d; fine Southdown 21d to 22d. All the large lots usually brought to this fair, were, (as we are informed by a respectable correspondent) bought up a few days before.

PETERBOROUGH.—The second annual meeting for the sale of wool was held on the 12th, but the buyers are not disposed to encourage the establishment of an *open market* for this article; therefore but a few bargains were made. The prices varied from 41s to 42s per tod, according to the proportion of hog and wether fleeces.

BUCKINGHAM WOOL FAIR.—The quantity pitched was not near so large as on previous years. Prices averaged from 44s to 48s per tod; some of the best tegs fetched 51s.

AYLESBURY WOOL FAIR.—Quantity brought to the fair—25,328 fleeces; sold, 22,000 do. Prices from 40s to 51s per tod. The cup was awarded to Mr. Payne, of Thane, who purchased 11,000 fleeces.

SHREWSBURY.—Wool: very little was brought either to the corn market or to Howard-street. Prices varied from 17d to 19d per lb; some lots 20d. Lambs, wool, 14d to 15½d per lb. All was sold.

KENMARE.—A few parcels of wool were brought forward, which were mostly bought for country purposes; laid, 10s to 12s per 22lbs; scoured, about 19s; English wool, 20s per do. The 'clip' is, we are sorry to hear from all hands, to be very deficient this season. Not to reckon the damage sustained by the loss of so many of the sheep, in the bygone winter and spring, the quantity will be "fleece for fleece" about a fourth or fifth short, and also of an inferior quality, owing to the leanness of the cattle.

DUNSE.—In the Wool Market a good deal of business was done, there being a number of buyers in attendance, and prices for each kind were from 1s to 2s 6d above those of last year. Bred wool hog, entire, sold at from 43s to 44s; ewe from 32s to 33s; grey-faced hog from 32s to 33s. Only one parcel of laid Cheviot that we could learn was disposed of, the price of which was 24s; but from 24s to 25s was offered for this description, Black-faced wool sold at 14s 6d per stone.

BERLIN, June 28th.—Our wool-markets are now drawing to a close one after another. The general result to be deduced from the collected reports is, that as yet, no diminution of buyers from England is to be observed, the same number of customers has been counted at Breslau, at Stettin, and at this place; nor have the prices of the better sorts been lower; nay, in some cases, the extra fine wools have fetched higher prices than in 1835. Indeed, it is rather doubtful whether England will be a gainer by taking less of our raw wools, even if, by the increased production of her colonies, she should in future be able to dispense with us. For, let me ask you, what would be the immediate consequence? Germany, instead of selling her wools, would soon compete with you in selling her *woollen manufactures*.

NEW BRANDENBURG.—At the fair held here on the 16th, 17th, and 18th June there were 4,400 cwts. of wool, all which were sold on the first day, excepting a few parcels, and these met with purchasers the day following. The earlier washed wools

left much to be desired, but the later were better, and by far the greater part might be called superior in that particular. There was a general complaint that the wool was badly shorn. The traffic was brisk, and handsome prices have been realized, mostly 1 to 1½ dollars higher than last year. Some individual growers got half a dollar advance only, but others got two dollars and upwards. Of the quantity sold, more than three-fourths has fallen into the hands of foreign speculators: those from England, Hamburg, Hanover, and Sweden, were the greatest buyers. Generally speaking the demand was brisk, and the buyers were numerous, and they, as well as the growers, have left our fair satisfied.

GOPPINGEN, June 30th.—In the course of yesterday and to-day every thing remaining has been cleared off except a few parcels for which too high prices were asked. Wools at 130 to 135 florins, and lower sorts at 115 to 128 florins, as well as good bastard-wools at 100 to 110 florins, went off very smartly, and of those at 80 to 98 florins, the quantity was hardly equal to the demand. Good country-wools fetched 50 to 60 florins. The total quantity brought to the fair exceeded 4000 cwt.

HEILBRONN, July 2.—The supplies to this wool-fair are extensive. With the exception of a few parcels of fine wools every thing is sold at very good prices.

July 4.—There is yet unsold a little wool, the prices of which were fixed too high. It is to be regretted that larger quantities have not been sent, as many buyers have been able to supply themselves only partially, or even to go away without purchasing; whence, also, it has followed that prices here have been some per cents higher than in Kirchein and Goppingen.

PESTH, June 12.—In consequence of the had weather, the clips in Hungary, as in other countries, have been retarded, and it therefore cannot yet be accurately determined what proportion the produce will bear to that of last year. It would appear, however, that in consequence of the deficiency of fodder the quantity will be by no means augmented.

The buyers were very numerous, but their operations were checked at first, as well by the bad quality of many of the wools brought hither, as by the extravagant demands of the farmers. After a while the two parties came to an approximation, and clean wool fetched an advance of 10 florins the cwt higher than last year; wools not so well washed, on the other hand, were sold at the prices of 1835. In this way there will have been above 30,000 cwt disposed of. What is left consists chiefly of heavy, sandy wools, the owners of which are too proud to accept for their bad article, offers which in our opinion are not bad, and therefore hold out for the smaller fair which takes place at the end of June, when they expect higher prices.

HANOVER, July 8.—1630 cwts. of wool were brought to this fair which ended yesterday, and 1625 cwts. were sold. The demand was beyond comparison greater than last year, and the number of buyers was so large that two-thirds of the entire quantity were sold on the first day, at prices which reached two to six dollars per cwt. higher than last year. Fine wools 80 to 105 dollars; middle-fine 60 to 70 dollars; middle country wool 40 to 52 dollars; ordinary wools from the Weser, the Alle, and the

Leine 29 to 32 dollars per cwt. of 117½ lbs. Cologne weight. The total amount of wool sold is 80,000 to 90,000 dollars.

CASSEL, June 29.—The quantity brought to this fair is less than last year's supply, but sales have gone off with spirit from the very first opening, and at high prices. The finer and mid-fine wools have fetched on the average 10 dollars the cwt. more than last year. The lower country-wools have also advanced in price, though they have not been so much sought after. The buyers were very numerous.

## HOPS.

TO THE EDITOR OF THE NORWICH MERCURY.

Dear Sir,—When last I had the pleasure of seeing you here I think I intimated to you my intention of again visiting the hop districts of Kent, in order to ascertain the relative state of those gardens with my own, as to their forwardness, strength of bine, colour of foliage, and general health. I have just returned from a very delightful and most satisfactory journey; but before I proceed further I must thank you for the very flattering manner in which you took notice of my hop-growing speculation in your paper of the 18th ult.

The great interest you have shewn from the very commencement of my new undertaking, I beg you will accept as my apology in again troubling you for a space in your paper, to lay before the spirited and intelligent agriculturists of this county the result of my late investigation, which is shortly—

That I visited and walked into many thousand acres of hop grounds in the best parts of Kent, and that I did not see 50 acres of hops in the whole extent, of such strength of bine, such size and colour of foliage, or of such general power and health, as the two acres now growing at Honingham; and this I assert, leaving the age of all the gardens out of the calculation. The two acres on this estate are now only fifteen months old, one of which was planted with cuttings that had travelled 150 miles in a drying East wind, the other with badly-reared plants—while the thousands of acres I visited in Kent, and many of those belonging to the largest and best cultivators in that county, were all of them, old established grounds. Should the truth of this assertion be doubted, the hop garden at Honingham is not locked up in an iron safe, nor are those of Kent quite out of reach. I have said before, and I repeat it, that I court enquiry upon this subject, and shall be happy to see at any time practically-experienced persons, or novices wishing to commence this interesting and beautiful cultivation. I may now be asked how has this rapid and powerful growth been obtained? I reply—first, by superiority of soil; secondly, by deeply trenching the whole land to be planted; and thirdly, by a very different mode of planting and general management of the plant afterwards than that which is now adopted in any of the hop counties, the principles of which I will readily communicate to any person, and which I think in no small degree have tended to the production of the enormous and unexampled power I have obtained in the infant growth of fifteen months! We are all aware that so uncertain is the hop crop, that until the produce is in the bag it is not safe. Indeed, while I am writing, a violent S.W. wind is doing infinite mischief, but to this, and even greater miseries, we are

no more liable than the growers of Kent and other hop districts; nor as yet does it appear that our eastern exposure has presented any impediment whatever to the introduction of the hop plant into this county, which has now passed one of the most to be dreaded and most dangerous stages of cultivation, when the aphid frequently destroys all prospect of a full crop. At present there is not a destructive insect of any kind to be found upon the foliage of the plant, and up to this date a fairer promise was never seen than the little garden in this parish now presents; but whatever be the result of the year's work, you may rely on a correct and true statement of the weight and quality of the crop, which I shall again have to thank you for inserting in your valuable columns. In the interim,

I remain, dear Sir, your's, very truly,  
RICHD. CRAWSHAY.

Honingham Hall, July 19, 1836.

P. S.—I have great pleasure in saying, that the young plantation of eight acres here; Mr. Tompson's, of Witchingham; Mr. Toll's, of Keswick; and Mr. Ward's, of Dereham, are all doing remarkably well, notwithstanding the great check given to many of the hills by the early ravages of the wire-worm.

## TRIFOLIUM INCARNATUM.

TO THE EDITOR.—Having experienced the value of the Trifolium, and understanding that some persons have been disappointed in obtaining a plant this year, which I cannot help thinking must have arisen generally from mismanagement, I take the liberty of offering a few observations upon its cultivation. In September, 1834, I sowed three small pieces of light land: one piece I mowed green for horses, and certainly never had the same quantity per acre of either tares or lucerne; all stock are fond of it, and thrive astonishingly upon it—another piece was mown for stover and made the best of hay—the third piece stood for seed, and produced about twelve bushels per acre.

In September, 1835, I sowed two pieces of wheat stubble where the clover layer had entirely failed before the wheat crop, and a piece of barley stubble which had tired of clover, and succeeded in obtaining a good plant upon each. Many of our clover layers this year proved a failure. My mode of cultivation was, first to use Finlayson's harrow to raise a mould, then level it with small harrows twice over, and finish with a heavy two-horse roller, as the land cannot be made too solid. Two other pieces, having hog-grass upon them, I was induced, unwillingly, to plough before sowing; in both instances the Trifolium entirely failed.

I can further testify that several of my neighbours who sowed the Trifolium were completely successful, and where, by way of experiment, the land was ploughed, they were equally disappointed.

I therefore feel justified in concluding that, by raising a mould without ploughing, and by sowing the Trifolium in August or September, a good plant of the best food that can be given to stock may be obtained without risk.

A CONSTANT READER.

Tending Hundred, July 22, 1836.

P. S. I would recommend a peck and a quarter of seed per acre.

## AGRICULTURAL REPORTS.

## BIRMINGHAM, 7th MONTH, 7th, 1836.

Since our last we have experienced a succession of fine showers, and although much more rain was wanted, yet the quantity that has fallen proved quite sufficient favourably to affect the growing Wheat, and upon the whole we think there is at present a prospect of a good yield in proportion to the straw, but it will be seen from the annexed extracts from letters of our correspondents, which are confirmed by verbal communications with our farmers, that there is a general belief the crop will not prove an average one except on the best and well cultivated farms, and if it be true, as commonly stated, that the breadth planted is much below an average, it is highly probable this year's crop will be unequal to the consumption. The Ports for one district in France having been opened for the admission of Foreign Corn, this circumstance, together with orders from England, has considerably affected the prices in the shipping ports of the Baltic, notwithstanding the stocks in most of them are very heavy, and the supplies from Poland into the Black Sea expected to be large this Summer. The late account of crops in Italy notice their improved appearance, and prices were receding in consequence. Sales of Irish Red Old Wheat have been effected at 5s 3d to 5s 10d per 60lbs. at Gloucester during the last month, which is about its present value. English is now worth 6s 4d to 6s 8d for Red, and 6s 8d to 7s for 62lbs. at Birmingham for White Wheat.

The late rains will prove most serviceable for the Barley, which crop had previously an unpromising aspect, and but for this timely supply of moisture, would have been a failure. It is still suffering for want of wet, particularly on the light soils, and there is reason to suppose it will yet fall far below an average produce. Last year's crop, though very large, seems almost entirely cleared off, and we anticipate a scarcity for feeding purposes when the season commences, and many are of opinion that Malting will open high compared with many previous years. It is now worth 36s to 39s per imperial quarter, and Grinding 31s to 33s per 392lbs. at Birmingham.

The early sown Oats took well, and though short in the Straw the head is good. There has been a more liberal supply into Gloucester lately, but as the stocks on hand are still light, we do not expect them to give way much in price. Light sell slowly at 22s 6d to 23s 6d; Heavy, 23s 6d to 24s. Welsh Black, 23s 6d per 312lb. at Gloucester.

Beans, although short in the stalk, are on the good lands generally pretty well podded, but cannot be a productive crop without more rain. They are in fair demand at 17s per 196lbs. or 45s 4d per quarter here. The expected liberation of Foreign will probably prevent any further advance for the present.

The early Peas will be a good crop, and the late ones are promising. There are none now offering on our market.

We have considerable enquiry for coarse Flour, and good qualities are saleable at 22s per 280lbs. at Gloucester.

We remain respectfully,  
JOSEPH and CHARLES STURGE.

CORNWALL, LOOE, July 2.—In compliance with your request, I beg to say, our corn crops, (particularly

wheat) have risen thin. One field which I have inspected, seems much affected with the honey speck. I will not take upon myself, as yet, to say it prevails generally, though my present impression is, that it does so more or less. Of Barley we have no more left than will suffice for local consumption. Under the most favourable circumstances, it is not likely harvest will become general before the middle of August.

BUDE, July 2.—In reply to your inquiries, the wheat in this district has generally looked well during the winter, although it has risen thin. Should the yield be good, it is sufficiently thick to produce about an average crop. If the season be unfavourable for the kerning, it must be considerably short. In the best land and climate it is generally in bloom and will not be very late; but in the great proportion of this district it will be very late. The spring crops suffered very much at first from drought; it has improved, and is fast improving daily. I rather question whether we may not have a fair crop. Potatoes have generally grown well this season. A very large tillage of turnips is prepared. Grass is very short, and has been through the spring.

BARNSTAPLE, July 1.—This part suffered much by the long drought, but since the rain, every vegetable matter has improved in a very considerable degree; yet, when this is acknowledged, wheat in almost every situation will be extremely thin. This complaint also applies to barley and oats, except such as was early sown, which is now looking well; and as the weather is at last become hot, the kerning may be good, as most of our early sown wheats are getting into blossom. The shares of clover and eiver are lighter in every situation than we have known for many years. A great number of fields of this sort are to be found with not a cart load of hay per acre. Meadow grass, though deficient, will be a better share, but it will come very late to cutting, as the farmers in general were obliged to stock such land with cattle until a late period, as they had no other food for them to eat for many weeks of the late protracted and severe spring.

SOUTH WALES, NARBETH, July 4.—In compliance with the request in your favour of the 30th ult. I beg to inform you that the growing crops of wheat, barley, and oats in our neighbourhood are in a thriving condition, and we expect a full average crop of each, provided we have favourable weather from this out. Our harvest will be later than usual. In the month of May we expected there would be a complete failure; since which we have had sufficient rain, and the change appears almost miraculous. This is the general opinion amongst all the farmers we have conversed with on the subject.

HAVERFORDWEST, July 2.—Agreeably to your request, I beg to say, that from all the inquiries I have made of the farmers respecting the growing crops, I find Wheat is likely to be a thin crop. Barley and Oats promising well.

FOREST OF DEAN, July 2.—The Wheat crops are generally very thin and light, and I think will be one-fifth below an average. Barley is very irregular. Beans have greatly improved, and on the whole look well, though short in the straw.

WHITMINSTER, GLOUCESTERSHIRE, July 2.—The wheat is generally thin upon the ground, except on the strong and best cultivated land. There are some fields of good barley, but the greatest part is irregular, and cannot prove a good sample. Beans mostly look well, and probably will be a fair crop.

DURSLEY, 7th month, 5th.—The crops in general look well. Wheat, barley, and beans, with few exceptions, promise a fair crop, though in some situations it will be short in the straw.

COTSWOLD, July 5.—The wheat crops are irregular in some situations. There is a prospect of a fair

crop, but to a great extent they are thin, and on the whole, the crops cannot be nearly so good as last year. Barley also appears likely to prove a very variable crop. Some fields good—others thin and light in straw. Beans generally look well, and a fair crop of this grain may be expected. The oats grown in this quarter are likely to prove a light crop.

BEWDLEY, 7th month, 5th.—Agreeably to your request, we now give you the best information we can get respecting the crops in this neighbourhood. The wheat, by every farmer we have spoken to, is said to be thin on the ground, and many say they have not had so poor a prospect for many years. We are satisfied it will be deficient in straw, but the yield may be productive. The barley is generally looking well, but on light soils, except where there was a good crop of turnips, will certainly be less than the last two years. But several parties, who do not farm very light soils, say it will be their best crop. So little of any other grain grown near, we do not notice them.

WORCESTER, July 2.—In this neighbourhood, particularly on the Herefordshire side of the county, much less rain has fallen than in most parts of the kingdom, consequently, all kinds of sprung corn are suffering for want of wet; and unless rain comes very shortly, barley on the ryelands will not be half an average crop; but in some of the well farmed heavy soils, it is still promising and very healthy. Beans, except winter ones will be deficient. Peas, to all appearances, will prove generally a good and abundant crop. Oats will be generally short in the straw, but unless when late sown, are heading well. The present dry weather is in favour of wheat, but it is so thin on the ground that it cannot turn out an average produce, and in some of the shallow soils rain would improve it. The drops of grass mostly very short, but are being secured in fine condition.

NEAR STROUD, July 2.—Wheat is greatly improved, but will be thin, except on the best lands. Barley is quite irregular, and cannot prove equal to last year either in quantity or quality. Beans generally look well, and promise a fair crop, though short in straw.

CLEOBURY, SALOP, July 6.—I am sorry to say I have a worse opinion of the crops generally than when I last saw you. The grass comes down exceedingly light, and I am afraid it will be found so with all other crops, when cut. My opinion still is, that wheat is decidedly the best crop—I should say nearly an average. Oats and peas the next in quantity of holm and straw. Barley, beans, and all other crops very light, and our barley that I was speaking well of is fallen off, and does not seem to ear out kindly at all, I conclude for want of rain.

BARNSTAPLE.—This part suffered much by the long drought, but since the rain, every vegetable matter has improved in a very considerable degree; yet, when this is acknowledged, wheat in almost every situation will be extremely thin. This complaint also applies to barley and oats, except such as was early sown, which is now looking well; and as the weather is at last become hot, the kerning may be good, as most of our early sown wheats are getting into blossom. The shares of clover and civer are lighter in every situation than we have known for many years. A great number of fields of this sort are to be found with not a cart load of hay per acre. Meadow grass, though deficient, will be a better share, but it will come very late to cutting, as the farmers in general were obliged to stock such land with cattle until a late period, having had no other food for them to eat for many weeks of the late protracted and severe spring.

SOMERSETSHIRE and WEST of DORSET, 7th month, 3d.—There is certainly a great improvement in the appearance of the growing wheat, which is acknowledged on all hands, and the deficiency, according to present appearance, will be much less than was expected in the spring; but still, taking into consideration a less quantity having been sown, it will be very considerable. On good land I should say the crop will be an average one. The report of the bean crop is,

that it is short, but well podded. On good land there is a prospect of an excellent crop of this article, and I think more than a usual quantity has been sown. Oats do not promise well. There are very good accounts of barley; as on good land the dry weather will not affect it, but on poor land there may be a short crop should there be no rain for some time. Flax is various; but on the whole very deficient to the produce of the past year.

SHREWSBURY and SALOP, 7th Month 4th.—The wheat round here, and in the adjoining counties of Flint, Denbigh, Montgomeryshire, is much improved in appearance these last six weeks. On good soils an average crop is expected; but on cold land not more than two-thirds, even should the weather prove favourable. Good wheat sold last market day at 8s to 8s 3d per 75 lbs, with a fair supply. Barley is likely to be good; the oats generally very middling, and hay very deficient; not half the usual quantity.

GLOUCESTER, 7th month, 6th.—After considerable observation and many inquiries, I am led to conclude that the wheat crops on strong and highly cultivated lands will be likely to prove an average crop, if the present very fine weather should continue; while on thin, weak, and cold wet lands, it will be very deficient of last year's, probably to the extent of  $\frac{1}{2}$  and  $\frac{1}{3}$ , while it is allowed that the breadth of land, under what, is much less than in the two or three last years. Barley appears likely to be a very variable crop. On some lands it is good—on others, to a great extent, middling, or very bad. There will, probably, be a great difference in the samples next year. Beans appear likely to produce a good crop, though rather short in straw. The blossom has been remarkably fine. The few pease planted are likely also to yield a crop. Oats are but little cultivated; the appearance very variable; on the whole there will not be a good crop.

#### BEDFORDSHIRE.

We have now arrived at that period of the year when every thing relating to agriculture, possesses the highest interest; not merely to the husbandman, but to all who wish well to the country at large. For whatever nostrums may prevail among political economists, as to whether this or that soil should be cultivated, the expense is now incurred, the seed is sown, the cultivation has been bestowed, and therefore whatever the earth produces, must be so much real value created, and in which the consumer has scarcely a less interest than they who have been the immediate instruments employed. Holding such sentiments then, we have much pleasure in reporting every circumstance which can be favourable to the general weal, and we have not a moment's hesitation in saying that during the last month the crops generally made very great progress, and have improved much more than appeared at all probable at the end of the previous month; and from the atmosphere being for the last two or three weeks rather unusually hot, the harvest will not be so backward as was previously expected; indeed, should the present hot weather continue, in the forward districts of the county, we should not be surprised if wheat were cut before the termination of the present month, while the general harvest will probably commence in about four weeks from the present date. The wheat crop, after all the improvement it has made will still be deficient, and much lighter than the three last years, and unless it should yield unusually well from the flail must be below the average of years. As to the barley, we cannot speak with so much confidence; our own opinion is that there is pretty nearly an average bulk, and certainly more acres sown than usual, which is the exact reverse of wheat. The early sown barley, upon the strong soils, and the better descriptions of convertible land, is very fine,

while the late sown clay barley is bad enough, and on the southern side of the county the season has been too dry throughout, to secure a heavy crop. Peas bid fair to be an unusually good crop; and the beans, where they were early set, and under good cultivation, there is nothing amiss; but the later crops will be short in the straw, and mean altogether. The oats promise well as far as they are cultivated here, which, however is but on a very limited scale. The pastures are drying up very fast, and unless rain should come shortly, the drought will soon be severely felt. For the same reasons the turnips progress but very slowly, upon all but the very best turnip soils. All those sown previous to the 12th of June, except a few very early fields, have been dreadfully worried by the fly, some of which have been re-sown, and other fields look most unsightly. The hay is a very light crop, clover in particular, but nearly all will be well got up, so that the quality will be unusually good. The price of wheat has again retrograded and, it seems that low prices must still be the order of the day. Wool however, is an exception to the general rule, and is selling pretty freely at good prices. Best Leicester tegs make 50s; ewe from 40s to 42s per tod. Average clips about 4s to 45s. These are prices not to be complained of, and if the price of corn was at all upon the same scale, things would go on better. Labourers are pretty generally employed, more particularly adjacent to the new rail roads, which take up an immense number of hands, while the improved system of poor laws have acted most beneficially upon the whole prodigal part of our population, so that rates are somewhat reduced, and at the same time, deserving labourers obtain better wages. The comfort of the farm labourers, however, will never be fairly attended to, while they are deprived of a wholesome untaxed beverage in the farm house and in their own dwellings, by which means the great bulk of them are now driven to the tempting demoralising beer-houses. Surely, when the two committees on the state of agriculture shall have made their report, parliament can no longer continue a cent per cent tax, at any rate, upon the poor labourer while he sows, and mows, and thrashes out the raw material on which the tax is laid, or upon the grower of that barley, when it is turned to the most profitable account of feeding the stock of the farm. Your reporter holds the tax on barley in any form to be an impolitic and an unjust tax, but as it bears upon the parties just alluded to, we denounce it as a decided cruelty to the labourer, and a direct violation of the Levitical Law which declares, "Thou shalt not muzzle the ox that treadeth out the corn."—*July 8.*

#### BERKS.

A considerable part of the month of June was cloudy, cold, and unkind, and on several mornings there was a white frost, and also several thunder storms and showers of rain, but during the last week it was clear, hot, dry, and seasonable weather. The haymaking was much delayed at first, but it is now getting on very fast, and in a few days more it will be nearly all done in this county. Some of the ray-grass, hop-clover, and early-cut sainfoin received considerable damage from the showers, but all that has been cut within the last ten days have made most beautiful hay. The quantity of hay throughout the hilly parts of this county is, we think, far less than usual, and scarcely any sorts of grass but young sainfoin that has produced an average crop, but on the low lands the meadow grass has much improved, and the clover turns out better than we expected. Most of the turnip land is now sown, and numbers of acres the second time, but still there is at present

but a poor prospect of a crop; the early-sown turnips came up and looked well for a time, but the cold nights retarded their growth, and the fly being very numerous there was not one acre in fifty that escaped the ravages of this voracious but diminutive insect. A large number of acres were again sown during the showery weather, and they quickly came up and looked uncommonly well, and some few acres on good soils are grown out of danger, but the weather having again set in dry, and the fly being uncommonly numerous, we are fearful that most of them will be devoured, and the farmer again disappointed. The turnip ground, has, altogether, worked well, and if it was not for the depredations of this insect, there is every prospect of a good crop. The winter vetches of late have much improved, and sheep keep at the present time is tolerably plentiful, but sheep have done worse than usual at the vetches, and the shepherds ascribe it to their being blighted and unwholesome. If the weather continues hot and dry, there will be scarcely any second crop of clover, and in some fields it is now drying up and getting less, but the spring vetches and rape are going on well, and seem likely to afford an abundance of keep. The crop of beans is likely to be a good one, and almost everywhere they seem to be podded well. The peas crop also promised very favourably until within a few days, being stout in the straw, broad in the leaf, and long in the pod, but they now begin to droop down, and on inspection it is discovered that every drooping head is filled with the green dolphin, and all but the early sorts will be most seriously damaged or entirely destroyed, except there should be a heavy thunder storm to beat down those insects and destroy them. It is really wonderful how such a number of insects can be produced in so short a time, and the rapidity with which they grow, and the short time they take to suck all the juice out of the plant is truly surprising. A good history of the habits, transformations, and propagation of the turnip fly, the green dolphin, the black, the wireworm, the black maggot, the sheep fly, the hopper, the bacon bug, and many other insects so injurious to the farmer, would be a most excellent publication, and in some instances would most likely afford him such knowledge as might enable him in some measure to check their propagation, and prevent their ravages. Oats are by no means likely to be a great crop, and barley on the light soils has been so much injured by the wireworm, and is so thin on the ground, that on such soils there is scarcely half a crop; on the deep strong heavy land it is looking better, but even there it is backward, and comes into ear very uneven. During the early part of the month of June the wheat got on most sadly, and came out in ear at different times, and grew to different heights, and altogether had a most deplorable appearance, but the moderate showers and the recent warm weather has unexpectedly drawn it out to a greater length in the straw, and somewhat improved its appearance, and it is now in a more forward state than we ever at one time expected, and if the weather continues hot and dry the harvest will certainly be a week or ten days earlier than we anticipated, and some of it will be probably ready for the sickle in about five weeks; at the present time nothing can be said of the produce as all must depend on the yield, but we seem certain that the crop cannot be a very productive one, as there is not bulk enough of straw for that purpose, it is expected that the sample will be a very uneven one, for about a third of the wheat in most of the fields is very small in the straw, and not more than about two feet high, while the rest of it is from that to four and a half high, and this uneven state of the wheat is pretty

general throughout this country, and as most of these underling ears are some days later in blooming, they will probably never arrive at perfection, but produce shrivelled grains that will be only fit for the chickens; such small ears being also tied up in the middle of the sheaf will not be dried by the sun, and will separate bad from the straw, and cause a deal of trouble to the thrasher. The appearance of the crops of corn looks much more favourable when riding and walking along roads and headlands than it does on a more minute and close examination, and we believe that many of the farmers are this year deceived, and think their wheat is far better than it will prove to be when it comes to be cut; but, nevertheless, we acknowledge an improvement has taken place of late, and we are in great hopes that the crop will be good enough to supply the consumption, and keep the average low enough to exclude all foreign, and prevent the money from being sent out of the country. The clip of wool is in most places deficient, and in the parts of the country where they usually had turnips, but were obliged to winter the sheep without, there will be full one-tenth short of weight this season on the very same sort and description of stock, and where the wool has peeled off the loss will be still greater. Oak bark is uncommonly good in quality, but it has not been so low in price for these 40 years; it is selling at 12l per load of 45 cwts. Pigs are selling rather higher in price, horses and cows at about the same; sheep, owing to the short quantity of hay and middling prospect of turnips, are not worth quite so much money.—July 4.

We have just been informed that the yellow fly, which produced the black maggot that eat all the turnips last season, has made its appearance in some places of this county, but we do not at present feel much alarm at this circumstance, for it appears that the eggs of this insect are deposited on the leaf of the turnip in the open fields without any protection, and our opinion is, that the least fall of rain, or even fog or dew, or rough winds or cold, will destroy the eggs, and make them abortive; and it is probable that this fly, nearly unobserved, has always made its appearance, but that it is only perhaps one season in 20 or 30 that our variable climate will permit the eggs to come to perfection; last year there was no wind, rain, or dew, just at the time as the fly was about busy depositing its eggs, but we do not apprehend much danger while we have such storms of rain and thunder as we had during the whole of last night.—July 6.

#### NORTH DEVON.

The rain at the commencement of the past month, and the copious showers since, have improved the crops beyond the expectation formed at the period of our last report, though, at present, the appearance is very different from that witnessed for several years past. Wheat now looks healthy in every situation, yet (with few exceptions) is extremely thin; the early sown on good land is mostly in blossom, some part in a more forward state, and as the weather is hot and dry the kerning is expected will be good. The wheats on clay soils and moorlands have been checked by the cold and frosty nights, which prevailed during the greater part of the month, and are now only breaking into ear; these also suffered much by the wireworm and ungenial weather in May, on many parts it is not calculated the produce will be more than five to seven bushels per acre. At the time the wheat broke into ear, it was not above half the height usual when this operation of nature takes place, which induced many to think it would be defective; this, however, is not now likely, as it looks well in every respect, except its thinness in the ground. The early sown barley (of which there is not much) has continued to look well, and is now mostly in ear; the remainder is of very unequal

growth, and consequently cannot produce an even and good sample; in fact our spring tillage was so late, that a considerable portion of the grain then sown, is not now sufficiently high to cover the ground; the early sown oats on good land look healthy and promising, but those on coarse moorlands (which is the greater portion) is thin and short, though the late rain has given them a more healthy appearance, yet the general state of the crops, leaves no reason to think the harvest will be so early as last year, by three weeks at least. Our markets are become dull for every sort of grain, as the farmers in whose hands it lies, are not disposed to give way in price. Wheat is offered freely, but at prices too high, unless for home consumption; barley is scarce, with an advancing price; oats are not plenty in the hands of the growers, and therefore they obtain high rates for the small lots sold. The cutting of clover commenced about a fortnight since, and a considerable portion is housed in good condition; the shares are much lighter than for many years past, a number of fields not having produced above a cart load of hay per acre, in some fields the quantity is less; in the meadow grass there is not so much to complain of, as it has improved since the rain beyond the most sanguine expectation, but it will be late before a considerable portion is fit to cut. Complaints are again made of numerous failures in the potatoe crop, in many places they have been planted a second time. The early sowing of turnips proceeded favourably, and such are now in their natural leaves, looking strong and healthy, though in many situations where the seed has been recently sown, the fly is proving very destructive. We are likely to suffer the entire want of grass on our hilly and thin lands during the summer, as they are now so much burnt, that a long continuance of rain will be necessary to produce any vegetable matter on them; should the turnip crop fail, most of the farmers will be more deficient of fodder the ensuing winter, than for many years past. Good-conditioned fat bullocks are scarce, and are worth 10s to 10s 6d per score; those grass-fed may be purchased at 9s 6d, but few of this sort are sufficiently fat for the butchers; fat sheep are from 5½d to 5½d per lb; lambs are worth 6d, and calves 15d per lb; fat pigs, 7s 3d per score. The clip of wools in general reported to be good.—July 12.

#### LINCOLNSHIRE.

At the close of the last month some fine showers fell in various parts highly beneficial to the turnip plants, after which ten days of extreme heat prevailed, and never in so short a period has the pasture land been so completely burned up. The wheat which came bold into ear, had proceeded towards ripening at a most rapid pace, and seemed likely to regain its lost time and be ready to cut much earlier than expected with an improved appearance of an average crop. Barley progressed in an equal degree. Oats, which are short and stunted in growth, throw out very little corn in the bell, and cannot be improved by any change of weather. Beans are still a doubtful crop, the weather having changed on St. Swtwin's day to rain, which with little intermission has fallen ever since and seems likely to continue. This will entirely alter the whole state of our prospects. The grass land having got well saturated has already much improved. The clovers will yield an abundant second crop, and the meadows an excellent latter mow. The hay in many parts is laying in the swathe, and some of the clover not carried; these will receive damage; and the harvest retarded, for so long as the corn is kept moist at the root it ripens slowly. Turnips are an universal good crop, except in a few instances where the black caterpillar (which has not appeared for near thirty years) has attacked them; on the whole we have a much improved prospect of Winter food, particularly for sheep. Since the change of weather the meat markets have improved in price, and the beasts which must have

been sold half fat will be held longer on the land, and consequently reduce the present supply. Fat sheep are plentiful, and will fill the markets for some time.

Wool is rather improving, both in price and briskness of sale; our clips in bulk are selling from 38s to 42s per tod of 28 pounds. The wheat trade has been drowsy during the hot weather; but it will receive a new impulse from the present change, and may be expected dearer if wet should continue. The present price now rules at about 50s per qr. for red, say eighteen stone the sack of 4 bushels, at 14 lbs. per stone. Oats a shilling per stone, and Beans about 40s per qr.—July 23.

#### EAST RIDING OF YORKSHIRE.

Hay-making has become general in the East Riding, and a great quantity now lies exposed to the alternating weather. The crop of grass varies exceedingly in quality and bulk; in some rich soils it is fine and abundant, in others of an opposite kind it is rather thin and light. Should we be visited with a recurrence of dry weather, much fine hay will be secured before the end of the present week. From the total absence of moisture during the month of May, the ground had become parched to aridity, and a very great deficiency in the crop of grass was anticipated, but the season has undergone a complete revolution; the plentiful rains, and a succession of warm weather, during the month of June, has been as beneficial to the crops as the most sanguine wishes of the farmers could have imagined. Never do we recollect so rapid an improvement in meadows, pastures, spring corn, &c. Barley and oats are much improved by the late rains. Beans have suffered much from the cold and unseasonable weather during the spring quarter, and are not looking well. The wheats have assumed a more promising appearance, but are thin in some places, and though still a fortnight in arrear, compared with the state of the growth of the corresponding period of the last year, yet if a few more genial showers fall, and the average temperature be warm and seasonable, the crops, which still continue backward, would advance with rapid strides, and the harvest be more early and abundant than could have been anticipated from the previous aspect of the fields. As great gain or loss depends upon successful hay-making, or the contrary, the following meteorological remarks may be useful. I would recommend farmers to remember the old proverb, "Make hay while the sun shines." If the wind should settle three or four days in the north, dry weather is an invariable concomitant, and hay may therefore be made and carried in good condition. The first quarter of the moon occurs on the 21st, and will cause rain, and probably thunder. From the 23d to the 25th, there are symptoms of thunder and hail. Towards the 26th, the wind will veer to the south. I expect a deal of moisture in the air, and several days of rain, from the 27th to the end of the month. There are several important aspects, which are *apertio portarum* to rain towards the conclusion of the month. The usual temperature of the air will be warm, even during rainy days. If it be deemed of more consequence to secure goodness of quality than to wait for increase of bulk, I would recommend farmers to attend to these hints, as it remains with agriculturists to determine whether bulk of crop spoiled, or seriously injured, can be placed in competition with even two-thirds of a full average, cut, made, and carried in perfect condition.—*Howden, July 12.*

#### NORTHUMBERLAND.

The weather since our last report has been very changeable, and unfavourable for the crops until about the middle of last month, since then we have had frequent rains and fine warm weather, which has made a great change in the appearance of the crops. The wheat crops is considered below an average onc. Oats and barley will be a full average crop. Beans and peas very promising. Turnips are looking well, and a considerable breadth are good. The new grass is a very light crop, and a good deal has been got well into pike; the old grass meadows are now growing pretty well, and if let stand a little longer may be a tolerable fair crop. Our corn markets are rather on the decline from the present prospect, as we do not consider it likely to be a late harvest from appearance, as the wheat was shot out of the ear as soon as usual, but all depends on the weather to come hereafter. The great lamb fair which was held at Yetholm on the 5th inst. was numerously attended by both buyers and sellers; the market was scarcely so brisk as expected, although high prices were obtained for some of the best lots; bred lambs were sold from 18s to 23s 6d a head, half-bred from 16s to 23s, and Cheviots from 12s to 15s a-head. The wool trade is hardly so brisk as was anticipated, very few parcels being sold that day; since then there has been a good deal of business done, and the prices nearly about last year's; the best samples, all hogs, from 1s 9d to 1s 10d per lb; half ewe, and half hog, 1s 6d to 1s 7d per lb.—*July 14.*

#### MONMOUTHSHIRE.

There perhaps never was a season when it was easier to distinguish between the good and bad farmer, by the state of his crops than the present. On highly cultivated farms, and on good land, the wheat crops have improved far more than could have been supposed possible from their backward appearance and the cold ungenial weather we had early in the spring. In general, however, the plant is thin and the straw short. Barley is also much improved, and looks on the whole, better than the wheat. Oats are in many places good, but the seed did not all germinate together, and consequently the ripening will not take place at the same time. Potatoes have partially failed, particularly on cold soils. Turnips are coming up well, and the mangel wurzel is forward and strong. We were particularly struck with the fine appearance both of this root and the turnips on Sir Charles Morgan's farm, near Newport, which is indeed, in every respect, one well deserving the attention of the agriculturists. The hay crops are better than could have been expected. On the low lands there is not much reason to complain, but dry soils afford little worth mowing.

#### GLAMORGAN.

In the rich vale lands the wheat crops wear a more promising appearance than the farmer had reason to expect in the early part of the season. Barley looks well, and we have seen some fine fields of beans. Taking the harvest throughout, however, there seems to be no hope at present of its amounting to an average crop. On the hilly farms the produce will be scanty, and there is a less breadth of wheat sown than we ever remember. The price has been high in this county, and, unless checked by an importation from Ireland, will continue so. The great activity prevailing among the works has contributed to keep up the price. The crops of hay about Cardiff, and in good situations, are not deficient; but upon the

higher lauds the grass is still uncut and very short. We may anticipate a high price next winter.

#### HADDINGTON.

Our weather continued very dry until the middle of June, when dropping showers came to the relief of our crops, which had begun to wear a stunted appearance, and would have infallibly proved a very thin one at harvest. I am happy to say they now promise a fair bulk, and with fine weather would expect a full average crop of spring corn. I think I mentioned in my last, fallow wheats were universally thin, that after green crop partakes now of the like complaint, the long drought having prevented them tillering out; they are, however, represented to be uncommonly well filled. For the last four days they have been exposed to a very high and cold wind, which has broken them a good deal down, and, where much exposed to its fury, many of the cups rendered empty. The demand on Friday was in consequence a good deal better, and price up 1s 6d per quarter upon the average. Beans have likewise been a good deal injured, from the blossom being forced off. Oats and Barley, I would say, present the most abundant crop in this quarter. The foregoing observations apply to lands of good quality: upon the poor and late soils the complaints of a defective crop are very general. The cold high winds have had a prejudicial effect upon the potatoe and turnip crops; the former still partakes of a good deal of the few past seasons, being blanky in the drills and not of vigorous growth; the latter I would hope to improve much, if to-day's rain be followed by heat, from their being late in braiding it will require very genial weather to bring them to an average crop. Hay is a miserable crop, and in a great many instances the farmers have not thought it worth the expense of harvesting, but have put on cattle to eat it upon the ground. From the rains having come on earlier in the west of Edinburgh than here, the crops have made a more remarkable improvement, and my informant there thinks every one will be a full average. Wheat, though thin upon the ground, possesses a very large square head, which will give quantity but not quality. The getting in of the hay has been a good deal interrupted by the rain. Prices of all kinds of corn have receded since my last—beans 2s, oats 4s, wheat 3s to 4s, beans and peas 2s to 3s. I think harvest cannot be nearer than a month, and with the short stock of spring corn in the farmers' hands, coupled with a scarcity of green food, there is every chance of prices regaining their position.—July 18.

#### PERTH.

The wheats here are very thinly planted, and promise nothing like an average return, except in some favoured situations; they are now pretty generally out of bloom. Barley seems a fair average in most places. Oats have a splendid appearance, and look better than I have seen them do for many years. Peas and beans are a good deal stunted, and look very indifferently. Hay is reckoned below an average, and potatoes (a crop which has much more influence on the corn trade than people imagine) has failed much, numerous fields having been ploughed up and re-planted or sown with turnips: this last article, owing to the late rains is coming on favourably, but a great deal yet depends upon the weather. To-day we have high cold winds with an appearance of more rain. Our spring grain is almost quite exhausted, in fact, it may be said we have nothing but wheat; the stocks in the rich farmers' hands pretty large, owing greatly to its unsaleable quality, having been in many instances sprouted. It is only a month ago since we were informed that your wheat crops were generally very thin on the ground over all England; now no new plants could have come up since, and I suspect you will

find when the blades fall off towards the ripening season it will be found much lighter than was imagined, at least I am certain it will be the case here. Our harvest will, I think, be eight or ten days later than last year with good weather; much less wheat was planted here last season than formerly, and from different reports I learn it was the same with you.—July 15.

#### EAST LOTHIAN.

The weather this month was generally dry and mild, at the same time frequently cold, and there has been less sunshine than usual at this season. Showers were frequent, but these being most slight, their effects were soon dissipated by the high winds which generally followed. On the 11th and 24th, however, rain fell in considerable quantities, which were of great benefit to the different crops. The sowing of turnips is completed; early sown fields of the Swedish variety on light soils, are singled out and look well, but on those of an adhesive nature, a regular braird has only been obtained since the late rains occurred. Feeding paying so well last year, has induced an extended cultivation of this esculent. Potatoes are much better than for the two preceding years, still, blanks are not unfrequent, from the sets having rotted in the ground, and in several instances there is a good deal of curl. Here, it may be stated, that where the feeding of cattle is the object for cultivating this root, a variety called Cups may be planted year after year without detriment, a respectable farmer having done so for above twenty years. Hay harvest has commenced, and, as anticipated, is a very poor crop, perhaps not equal to one-half that of last year; the late rains will prove advantageous to the after-math. The weather has favoured the working of the fallows, an operation in some instances behind, several fields having only got the winter furrow. Winter wheat came into ear about the same time as last year, has seldom been so deficient in bulk, and though on damp soils, after green crops, it may turn out productive, yet, taking this grain in general, even with favourable weather, it does not promise to be an average; Spring sown wheat got stunted by the drought, and the rains were too late for rendering it a full crop. Barley and oats, upon the whole, promise to be fair crops—the former where early sown is already in ear, and of course may be expected to yield grain containing abundance of saccharine matter, a circumstance of vast importance to brewers and distillers; several fields of oats, chiefly of the potatoe variety, are partially tulip-rooted, which must lessen their productiveness. Beans and peas are not amiss except where early sown on thin wet soils. Grain in early part of the month showed a tendency to advance; latterly, however, prices are looking down. At Gifford fair, on the 14th ult, lean stock met with a dull sale, caused no doubt by the bare state of the pastures.—June 30.

#### FIFESHIRE.

With the exception of a few mild and warm days about the middle of the month, the weather has been cold and stormy, with frequent showers, and a good many cloudy days. For about a week, from the 13th to the 19th, the crops made rapid progress, and there was a most marked improvement in their appearance: but since the 19th there have been boisterous winds and cold nights, which have greatly checked vegetation, and in all exposed situations the fields have lost much of their freshness. The wheat is now coming into ear, and some of the earliest is in bloom. It is about eight

days later than usual, and is considerably under an average breadth and bulk of straw, and cannot be less than a third below the crop of last year in quantity. The barley is generally on ordinary, and oats upon light soils a very fine crop; but both are somewhat stunted upon clays. Pease and beans have, with few exceptions, a most miserable appearance. They are very short and thin upon clays, and it is only where the ground is light that they are at all like an ordinary crop. Potatoes have again failed less or more almost everywhere; and even those that have braided have a weak stem, and there is a poor prospect of a crop. The weather has been all that could be wished for preparing the ground for turnips, and there has been a sufficiency of moisture to ensure a fine braid of all the first sown; but in consequence of the great breadth of ground prepared, and a want of manures, the sowing is still going on, and will be for some time just as manure can be procured. The hay harvest has commenced partially, and the crop is mostly light. The pastures have suffered a good deal from the cold and high winds, particularly upon elevated situations; and should the weather not get a little milder soon, there will be a want of a second crop of cutting grass. There is almost universally a fine braid of young grasses. The grain markets have experienced little alteration for the last month, and cattle of every description are rather looking up.—June 29.

#### CANADA AGRICULTURAL REPORT.

Though the Spring sowing-time was unusually late, the crops in the neighbourhood of Montreal are generally, with the exception of a part of the Wheat, as forward now as at this time last year. The Wheat, for an average of seasons, is backward, but has a healthy appearance, and if it escapes injury from vermin and disease, we may have a good crop. The circumstances of its being backward may be favorable to it, should the Wheat-fly appear this year. There will not be much of the Wheat fully in the ear this season at the period that the fly disappeared last year, and it is only at the particular time that the ear is first shot out, that the fly can do injury. It is reported, and I believe correctly, that there is not so much Wheat sown this year as usual, owing to the backwardness of the season, and the consequent unfitness of the soil to receive the seed in time, and to its failure in so many instances last year. The farmers will have no reason to regret substituting other grain, where the soil was not in good order for Wheat in reasonable time. They will find that a good crop of Oats or Barley is better and more profitable than a crop of Wheat that is below an average. The Oats and Barley sown in May on land properly prepared, have a very good appearance. From the 1st of June, the weather has been extremely favorable for planting Potatoes, and as there need not have been any interruption to the work, it is probable they will be generally finished this week. I cannot state whether the seed has been so much subject to the dry-rot this season as it was last, but I am convinced it would be prudent for all farmers who had diseased seed last year, to have changed it for what was perfectly free from disease. I remarked that Potatoes, grown from seed partially affected with dry-rot, were subject to be diseased this year. In any case a change of seed is good. The meadows look extremely well on all lands that are moderately fertile, and the crop of hay is likely to be abundant. Pastures are considerably improved, and the produce of the dairy is abundant,

and at a moderate price. Butchers' meat is high, and will probably continue so for some time to come. This circumstance, combined with the favorable appearance of the hay crop, may be an inducement to the farmers to feed cattle for the full supply of our markets. I hope we shall not be long subject to the reproach of being unable to supply our own markets with butchers' meat, with the abundant means we have of doing so. It is a peculiar feature of this season, that the wind is inclined to continue almost constantly from the north-north-east and east—an unusual circumstance in Canada, where the prevailing winds are from the west and north-west. The temperature is also inclined to be low, but notwithstanding it does not appear to have had an unfavorable influence on vegetation. If we have had a severe winter in British America, we are by no means singular in that respect. In the British Isles, and in most other European countries, they have experienced unusually severe weather last Winter and this Spring, and perhaps the inhabitants of these countries had not the same, or so good means to protect themselves from the effects of severe weather as the people of these Provinces. Though the last harvest was not very abundant, or the produce so good as usual, we have much cause of thankfulness that there is a sufficient supply of food in the country for all our people, and those strangers who come amongst us; and that there are very few of our population who have not the means, if they exert themselves, to supply themselves with what is necessary for their reasonable wants.

#### SWAN RIVER.

#### AGRICULTURAL REPORT OF THE WESTERN AUSTRALIAN AGRICULTURAL SOCIETY.

“ In estimating the quantity of wheat the produce of the present harvest, we are induced to fix it at the lowest possible average, say, twelve bushels per acre, which will give 13,878 bushels; from this, deducting 2,000 bushels for the seed for next season, we find, computing the population at 1,200, and allowing 8 bushels per head per annum, that we have provision for nearly 450½ days. The crops are generally looking well this season, though in many instances not so heavy as on some preceding years, probably from the rains having been unusually protracted, or from the lands being in some degree exhausted by a continuation of the same crops for a series of years without aid. The sheep flocks appear not to have increased in the usual proportion to the number stated for last year, probably this may be accounted for by many proprietors having culled their flocks of the aged and coarse woolled ewes, added to which there have been several severe losses sustained on the road in driving flocks to the York district, where now nearly the whole of the sheep in the Colony are depastured, and, we are happy in our ability to state, are in healthy and fine condition. We have endeavoured this season to render our wool more worthy the London market, in being particular in the washing and packing, and from its having been clipped somewhat earlier than heretofore, we trust it will be found more free from grass seeds, &c. Horn cattle in the York district, and elsewhere, having sufficient scope, continue to do well. Cows have considerably fallen in value during the year; but working bullocks continue to obtain the usual high prices, there having been no importations, many casualties, and the young stock of that description too generally going to the butcher. Horses continue to do well, and are liable to fewer diseases than,

perhaps, in any country where they are used. We have great satisfaction in observing, that roads and bridges have latterly been taken more into the consideration of the Colonial Government than hitherto. Fears are entertained that the promulgation of the Government Regulations regarding the sale of lands, may have deterred many persons from settling among us, and that it is not generally known that large quantities of land may be purchased from the settlers in the York, Hotham, and other good districts, at about 1s. per acre. We have sincere pleasure in congratulating your Excellency and ourselves on the very friendly intercourse which has been established, and, we hope, cemented, between the settlers and the Aboriginal inhabitants. They now have the utmost confidence in us, assisting as stock-keepers, &c., and are trustworthy messengers with letters and parcels to any distance.

**GENERAL AGRICULTURAL REPORT FOR JULY.**

The progress made by all branches of vegetation, since the publication of our last month's report, has been truly astonishing. Such have been the effects upon it, of both the month's thunder showers and other genial rains, aided by an occasional dense and sunny, though not to say very parching, atmosphere, that our growing corn crops, one and all, on the well farmed soils, which those who farm them have been enabled to so far escape the pressure of the present long existing unprofitable and perplexing times, as to keep them in good heart, or that were at all worthy of being sown with them, have experienced a surprising increase, both in bulk and quality of ear, pod, straw, meal, and grain. In brief, the whole of our present month's communications, both written, and verbal, from the perusal of both metropolitan and provincial publications, as well as our own observations—it having been for some years, our practice to explore as great an extent of country as time would allow us, on the eve of corn harvests—have emboldened us to fearlessly assert, that it is our firm belief, that the present year's general growth of corn—especially wheat—as also pulse and hops, will, barring atmospheric disasters, be, in the whole, considerably greater than was expected, and superior to that of last year, though in some parts, even of the fertile county of Essex as well as some of our northern and western districts, there are said to be partial deficiencies, in most parts of it. On the Isle of Thanet, however, and several other parts of East Kent, the general crop, especially of wheat, barley, and beans, promises to be abundantly great; which, too, we have been credibly informed, is the state of the generality of them, in our other southern, eastern, western, and midland, with very little deficiency in those of our northern districts. We found, on the Isle of Thanet, considerable breadths of wheat, of those soils which had been well manured with a compost of well mixed sea-weed, farm-yard, bullock-lodge, and stable dung, the parings of banks, by-roads, sides of foot paths, road dust, ashes, &c., well strawed and eared, and from five feet six to five feet eleven inches high; indeed, we saw no deficiency on the Island—nearly the whole of which we attentively explored—except a few small pieces of sickly-looking wheat, barley, and canary seed, situate, for a short distance, close to the road side, about half way between Ramsgate and Margate.

So contradictory are accounts, relative to this year's growth of fruit—some asserting, its promise is good, others, but indifferent, that we can say but little about it, further than there appeared to be a fair growth of

apples, pears, and cherries, and that they are selling at moderate prices.

As to the grass-fattened, or, rather, *grass-finished*, sheep and beasts, these have, in the course of the month, undergone an equal degree of improvement with the corn and pulse crops, pasture herbage, seed grasses, winter tares, &c.; and every description of live farm stock is described as being generally healthy and doing well. Many of the Scots, Herefords, and Devons, and most of the Lincolnshire and Leicestershire sheep that have reached both Smithfield and Islington markets, in the course of the month, have been, the backwardness of the Spring taken into consideration, unusually prime.

The harvest, the commencement of which has been retarded, by the recent rains, has only, we believe, as yet, but very partially commenced, on rye, winter barley, and peas; but it is expected to become pretty general, on these and wheat, should the weather be fine and ripening, in a very few days. The hay harvest is said to have been productive of a good crop, of both meadow and seed hay.

The only political murmurings we have heard of, among farmers, in the course of the month, have been at the clearly manifested inability, of both our Agricultural Committees, to discuss the causes of, and point out remedies for, our long existing agricultural grievances; the only political amusements, the fate of the rapidly falling off Central Agricultural Association, and the insignificance of the squeaking trumpeter, that has usurped the appellation of *The Agriculturist!*

We regret, however, that it is our painful task to assert, that, from an appeal to the benevolent, advertised in last Monday's impression of The Mark Lane Express, that the almost entire crops of a farm, occupied by a Mr. William Stanford, of Whaddon, Wilts, consisting of 86 acres of wheat, 50 acres of barley, 57 acres of oats, 14 acres of vetches, and the same breadth of turnips, the whole estimated at £1,400, and wholly uninsured, were destroyed, by a terrific hail and thunder storm, on the 5th inst. Mr. William Stanford appears to have also lost 1,360 sheep, by rot, valued at £2,500, about four years ago.

In this month's markets and fairs, for the sale of both live and dead farm produce, prices have been, of every thing, with the exception of those of wool—which have remained about stationary—somewhat, but not very considerably, drooping.—Those for the sale of poultry and dairy produce, in London, being said to be rendered dull, by the absence of families from town.

The following is a retrospect of the prices and supplies of the different kinds of fat stock exhibited for sale, in Smithfield and Islington Cattle Markets, since the 20th of June.

Total . . . . .	2,014	15,497	79	6
Supply of preceding month. } 2,488	11,294	48	--	--

It appears, by the above statements, that the supplies, at Smithfield, have embraced, this month, 4,114 beasts, 15,650 sheep and lambs, 1,033 calves, and 1,364 pigs more than those of the preceding month. At Islington, the supplies of the present month have consisted of 474 beasts less, 4,203 sheep and lambs, 31 calves, and 6 pigs more, than those of that which immediately preceded it.

About 4,230 of the beasts, forming the present month's supplies, of the above markets, came from our northern grazing districts, up the St. Alban's road; about 4,305 up the other northern roads; about 1,810 from the western and midland districts: about 1,430 from Norfolk, Suffolk, Essex, and Cambridgeshire: about 1,884, by sea, from Scotland; about 300 from Kent, Sussex, and Surrey; and most of the remainder, including about 150 lusty town's-end cows, from the marshes, &c., near to, and within a few miles of, London.

As the numbers of lambs are given suppositiously, and we cannot, on account of their being included in the numbers of sheep, pledge ourselves to be accurate, in stating them separately, we have deemed it proper so far to alter the form of our report, to state them collectively.—Lambs have, however, this month, fully equalled, if not considerably exceeded, the number of sheep.

PRICES.—SMITHFIELD.

	June 24.				July 25.						
	s.	d.	s.	d.	s.	d.	s.	d.			
Inferior Beef . . . .	2	8	to	3	0	..	2	6	to	2	10

Pork . . . . .	3	6	to	4	8	..	3	6	to	4	4

By the foregoing quotations, it appears that most kinds of meat were somewhat cheaper on the 25th of July, than the 24th of June. In the prices of Smithfield and Islington markets there has been little variation, with the exception of the inferior kinds of meat, at Smithfield, being lower than those at Islington, at which, but little of it makes its appearance.

We were, to-day, Monday, July 25, credibly informed, in Smithfield, that mutton sold, on Saturday last, in Newgate market, at from 2d to 4d per 8lbs more than lamb, a circumstance that, in our 39 years' Smithfield experience, we do not recollect to have before witnessed.

The sheep and beasts have been, in both the above markets, throughout the month, of fair average quality; whilst a considerable number of those exhibited

at Islington have been, for the time of year, unusually prime.

Here follows our comparison of supplies and prices of fat stock exhibited in Smithfield on Monday, July 27, 1835, and Monday, July 25, 1836.

	July 27, 1835.		July 25, 1836.	
	s. d.	s. d.	s. d.	s. d.
Coarse and inferior beasts . . . . .	2	0 to 2	2	6 to 2
Second quality do. . . . .	2	8 to 3	4	10 to 3
Prime large oxen . . . . .	3	6 to 3	8	8 to 4
Prime Scots, &c. . . . .	3	8 to 4	0	4 to 2
Coarse and inferior sheep . . . . .	2	2 to 2	4	3 to 3
Second quality do. . . . .	2	6 to 2	10	3 to 4

Lambs . . . . .	4	4 to 5	0	4 to 5
Large coarse calves . . . . .	3	0 to 3	6	4 to 4
Prime small do. . . . .	3	8 to 4	0	4 to 10
Large hogs . . . . .	3	0 to 3	4	3 to 3
Neat small porkers . . . . .	3	6 to 3	10	4 to 4

SUPPLIES.

	July 27, 1835.	July 25, 1836.
Beasts . . . . .	2,916	2,385
Sheep and lambs . . . . .	29,240	25,100
Calves . . . . .	240	290
Pigs . . . . .	263	370

It will be seen, by the above statement, that beef was from 4d to 6d; mutton 6d to 10d; veal 10d to 1s; and pork 6d per 8lbs dearer; lamb 4d per 8lbs cheaper, on Monday, July 25, 1836, than on Monday, July 27, 1835; whilst the supply of the former comprised 531 beasts, and 4,140 sheep and lambs less, 50 calves, and 87 pigs more than that of the latter, market day.

Nearly, or quite, a moiety of the present month's supplies, both in Smithfield and Islington markets, have been comprised of short horns; the remainder of Herefords, Devons, Scots, and Welsh runts.—Those of sheep and lambs, in about the same proportion of old and new Leicesters and Lincolns, South Downs, Kents, and Kentish half-breds, horned and polled Norfolks—chiefly the latter—Dorsets, and sundry other breeds and crosses.

From Scotland, there has been a considerable decrease, in the supplies, of both live and slaughtered beasts: but an increase of sheep—the latter having amounted, in the course of the month, to about 2,500.

The genial showers of this month, though they have retarded the commencement of the harvest, have greatly augmented the promise of an abundant general crop.—As to when the harvest will become general, this must be left to the caprice of the watery Saint.

STATISTICS.—In the article "France," of the

*Dictionnaire Geographique Universel*, now publishing in Paris, by a geographical society, the following statement is given of the capital of the French soil and of the revenues of the Empire. The arable lands, at a valuation of 30 francs the hectare, are worth 13,690,800,000 francs; the woods, vineyards, meadows, and other lands, 2,828,800,000; ponds and marshes, 31,920,000; rustic buildings, 3,000,000,000; cattle, valued at the lowest price, 16,703,941,676; poultry, 51,600,000 head, at 1 franc, 51,600,000; swine, 3,900,000 head, at 40 francs, 156,000,000; asses, 2,400,000 head, at 25 francs 60,000,000; farming utensils, 3,000,000,000; total, 39,522,061,676 francs. To this may be added the annual receipts—from manufactures, 1,820,102,000; agriculture, 4,678,708,000; colonies, 40,380,000; foreign countries, 3,46,020,000; in warehouse, 52,000,000; total, 6,937,210,000 francs. The produce of the taxes of every class is 924,410,000 francs.

## AGRICULTURAL INTELLIGENCE, FAIRS, &amp;c.

**BRISTOL ANNUAL CATTLE MARKET.**—On Thursday last this mart was more largely supplied with poor stock, principally Irish, than on any previous occasion, but a great number were driven away unsold. Beef fetched from 55s to 60s per cwt; Mutton, 5½d to 6d per lb; and Pork from 7s to 8s 6d per score. There were not many good horses exhibited. Cart Colts were in great demand, and sold at high prices.

At **SHERBORNE FAIR** there was about the usual supply of Sheep and Beasts, but it was not equal to last year's exhibition. Horned lambs sold from 11s to 15s a head; Downs from 14s to 18s; best Wethers, those in high condition, fetched from 32s to 36s. There was not much demand for the poorer sort of Sheep, and a great many of this description were driven away unsold. Prime beef sold readily at from 9s to 10s per score. Store Beasts were not in demand, in consequence of the scarcity of feed.

**WARWICK FAIR** was thinly attended by buyers, in consequence of a Fair at Southam being held on the same day. The present scarcity of keep induced sellers to bring many beasts and sheep not over fat, but a considerable number were driven away unsold. The prices were, for Beef, 5½d to 6½d; Mutton, 5½d to 6½d; Lamb, 7d to 7½d. A great number of Milch Cows, but few buyers.

**GLASTONBURY Monthly Cattle and Cheese Market** took place on Monday the 18th inst. and presented an excellent supply of fat stock and cheese, which met a ready sale. It is now placed beyond a doubt that this market will take its stand among the leading markets of the neighbourhood; for although Sherbone and Wedmore fairs were held on the same day, yet the attendance and interest excited by this central and very advantageous market were not in the least abated. Much praise is due to Mr. Richard Say, spirit merchant of this town, for the indefatigable exertions he has made, and the unwearied interest he has taken in the prosperity of the market; and the importance attached to the establishment of this mart by the neighbouring agriculturists, breeders of stock, dealers, and the public generally, must be highly flattering to all those gentlemen who have aided, by their influence and patronage, to promote its formation. The next market will be on Monday, the 15th August.

**DUNSE FAIR.**—At this fair, there was a good show of bred and half-bred lambs, the demand for which was rather dull at the commencement of the market, but the whole were afterwards disposed of. Bred wether lambs may be quoted at from 20s to 22s, half bred from 15s to 18s 6d.

**RINK FAIR.**—The show of lambs at this market was very small, only a few lots from the Borders having been brought forward, which met with slow sale at a small reduction in prices from the same market last year. Good lots may be quoted at from 9s 9d to 11s 3d, inferior in proportion. This being a principal market for the sale of Cheviot wool, there was a numerous attendance of buyers consisting almost exclusively, however, of Scotch manufacturers; the business done before the close of the market was very considerable, at a rise of about 4s per stone on last year's prices. The best lots of White Cheviot brought from 35s to 36s 6d; inferior from 33s upwards; laid, best, 25s to 27s 6d; inferior from 23s upwards, per stone of 24lbs.

At **KENNINGHALL FAIR** there was a large supply of lambs, which met a dull sale at 1s to 2s per head below the late prices, varying from 12s to 22s each.

**SHREWSBURY FAIR** was abundantly supplied with sheep. Many lots were not in condition for the butcher, having only had their lambs recently taken

from them; these were sold with difficulty. Prime small sheep were worth nearly 6d per lb. Others little more than 5d, and stores were nearly unsaleable. The supply of fatted cattle was very moderate; prices ranging from 5d to 5½d per lb. Stores were parted with very slowly, and at low prices. Pigs did not sell so well as at former fairs. In the cheese marts, a very considerable quantity was pitched, upwards of twenty tons being sold at the New Market in Howard-street, and great quantities at the Circus, and other places. New skims, 34s to 38s per cwt; middle dairies, 45s to 50s, best new, 60s per cwt. Some lots of prime old were held for 75s to 78s per cwt, at the Howard-street Market, and one lot was put on the Canal there at 81s. A number of lots of butter were offered at the Circus, and in the morning a few were sold at about 11d per lb; but later in the day 10d per lb was the price. Bacon, if dry, brought 7½d per lb, if damp, considerably lower; and hams were sold at 8d.

**ASKRIGG FAIR** took place on the 11th inst. There was a great show of sheep—nearly 14,000—and almost all of them were sold at prices from 9d to 1s per head lower than last year. The cattle exposed were more numerous than usual at this fair. The sale was dull—prices were lower by 10s a-head than at Stagshawbank.

**AYR MIDSUMMER FAIR.**—There could not be fewer cattle than from 1,500 to 2,000 head, being a greater supply than was ever brought forward on any former year. The greater portion were young Highland beasts; but there was also several lots of young Ayrshire cattle, for all of which there was a brisk demand, the market being well attended by dealers from a distance, several from Dumfriesshire, who came to take stock to the south. Two-year-old Ayrshire stots sold from 4l 10s to 4l 15s. Two-year-old Highland stots from 3l 10s to 3l 15s; six-quarter-olds, very small in bone, from 2l 2s to 2l 5s. Yearlings, same description, from 23s to 30s, as in quality. A superior lot of three-year-old Highland queys from Saddle, near Campbellton, brought 5l 5s, and for the best lot in the market of this kind, which were in good condition for this season of the year, the price was from five guineas to 5l 10s. For the best work horses prices varied from 32l to 35l. Good animals were bought at from 24l to 30l; and inferior or poor conditioned cattle from 20l downwards.

**INVERNESS SHEEP AND WOOL MARKET.**—The sellers at the Perth Wool Fair will not have cause to regret having disposed of their stock here, in preference to waiting the result of the Inverness market, as the prices obtained here were fully as high, and in some instances higher, than those given in the north on Friday last.—Last year the principal business was done late on Saturday, and much of it on Monday. It was then remarked that every year the buyer and seller were later in coming to terms—and this year is no exception. We give them in the meantime the average rates as they can yet be best ascertained. The purchasers were numerous, and evidently disposed to buy, although very reluctant to come forward. Amongst them we observed Mr. Lockwood, and Mr. Brooks, Huddersfield; Mr. Maxwell, and Mr. Boyd, Liverpool; Mr. Hall, Dornoch; Mr. Cameron, Corycnochillie; Mr. Macdonald, Drumintorie; Mr. Whyte, Angus-shire; Mr. Donaldson, Glasgow; Mr. Hadden, Aberdeen; Mr. Clark, from England; Mr. MacLaren, Callender; Mr. John Stewart, Mr. Turnbull, Inverness; P. Sellar, Esq., Morvich; Gabriel Reid, Esq., Gordonbush; Major Gilchrist, Opisdale; Mr. Clark, Erribol; Hugh Macaskill, Esq., of Tallisker A. McKinnon, Cory; Dr. McKinnon, Kyle; Edward

Gibbon, Esq., Dunvegan; Captain Ross, Kilfinan; Mr. Mackay, Kcoldale; Mr. M'Arthur, A. M'Donald, of Barrisdale; Colm Munro, Esq., Dingwall; H. I. Cameron, Esq., banker, do; W. Murray, Esq., banker, Tain; A. Gair, Esq., banker, do; W. Murray, Esq., of Westmoreland; P. Brown, Linkwood; Mr. Young, Maryhill.

The Old Monday Market in Devizes, which for a long series of years has been suspended, was revived on Monday last. There was a fair supply of beasts, pigs, &c., which sold freely; attendance by dealers numerous; also a good supply of vegetables and fruit.—Bacon sold at 7d per lb; Cheese from 50s to 70s per cwt. The ordinary at the Cross Keys was respectably attended.—In consequence of Melksham Market falling on the same day, the next Market will be held on Monday the 25th inst, and every succeeding fortnight.

**SOUTH HAMS.**—Hay harvest is nearly finished in the earlier parts of this district. Most of the crops, particularly of clover and other artificial grasses, have been slight, but the greater part has been saved in excellent condition. Much of the Wheat is thin on the ground, but the kerning is generally good. At the late fairs and markets, the price of cattle has declined, and the sales have been dull; sheep have obtained a better sale. Wool is 12d per pound. The "weeping Saint" has shed an abundance of tears, to the joy of many; for the rain which fell on Friday (St. Swithin's day) came opportunely for the turnips, potatoes, after grass, &c. *Plymouth Journal.*

**THE HAY CROPS.**—Within a circuit of several miles round Maidstone, the hay has never been known to have been got in better. The cinquefoil, clover, and trefoil, have produced heavily; and the grass, although not quite equal to the latter, except in good soils, is yet a good average crop.—*Maidstone Gazette.*

**THE CORN CROPS.**—The wheat in the strong grounds is now in full ear, long in the straw, and looking well. In the weak grounds it is "spindly and delicate." The lent corn, is, however, much suffering for want of rain. A few showers, if they arrive early, will be of great service, particularly to the backward pieces.—*Ibid.*

We have had copious rains during the last week, with intervening days of warmth, under the influence of which the crops are making great progress. Wheat has passed the flowering stage unharmed, and barley has been for some time in ear, and oats rapidly following. The weather has been remarkably favourable for the green crops; as the shaws enlarge, the occasional blanks which were visible in some potatoe fields, disappear, and the second planting seems to have vegetated well. It is now ascertained that the fears as to this crop have been greatly over-rated, and that although there will be some instances of individual loss, the present appearance of the crop, and the great breadth under it, promise an abundant supply for the next season. Turnips generally look well, although there are individual complaints of great destruction from a new

enemy, the linnet,—and the aftermath of clover promises a good second cutting.—*Perth Courier.*

**STIRLING.**—During the first week of the last fortnight there was a good deal of rain and cold winds. Nothing, however, could be more favourable than the weather for the last week—soaking thunder showers followed by warmth and sunshine. If the crops are not all that the farmer could wish, they are at least far beyond what he could have anticipated six or seven weeks ago. The fields have now arrived at that state that a pretty fair estimate might be made of their probable return, were the harvest weather to prove favourable. Wheat promises to prove excellent in quality, but, with few exceptions, deficient in quantity. It is thin and short both in head and straw. Here and there may be seen pretty good fields of beans, but they are also rather unpromising, if we include the whole of the carse lands. Oats may be considered everywhere as promising more than an average; and barley bids fair to equal it. Haymaking has become general, and the weather, on which this produce so much depends, promises to be favourable. There are fields on the carse lands, and many on the dryfield lands, which will prove an average, but as a whole the crop will be deficient. The complaint, which prevailed some time ago, of the failure of the potatoe seed was well founded. In many places the blanks had to be replanted; still the potatoe crop never was in a more promising condition. The late warm rains have everywhere given the plant a vigorous, healthy appearance, and there is every reason to hope that this important crop will prove abundant.—*Stirling Journal.*

**FLIES ON SHEEP.**—It may be useful to some of your readers to be informed of an inexpensive preparation, as a protection against the Fly in Sheep. The following composition has been successfully used for many years with a very considerable flock, and I can therefore recommend it with confidence to your agricultural readers:—Hog's lard or soft grease, 2 lbs.; Flour of sulphur, 1 lb.; Oil of amber,  $\frac{1}{2}$  pint; to be mixed into an ointment. A quantity about the size of a walnut has been found, by experience, quite enough for each animal, and it may be smeared over the whole surface either with the hand or a common brush.—Either common tar, oil of tar, or coal tar, which is now produced in such large quantities at the different gas works, may perhaps be found to be a cheaper and efficient substitute for the oil of amber, which is occasionally rather expensive.—Other animals may be effectually protected from the annoyance of flies by this ointment.

Communications from Scotland show the spirit of laudable enterprise to be awake there. A patriotic hope is entertained that valuable additions are likely to be made to the produce of her soil. It was mentioned at a dinner of the Highland and Agricultural Society of Scotland last week, by Professor Graham, that the Hon. William Leeson Melville, now resident at Calcutta, had transmitted from the higher countries of India three parcels of seeds of important plants: some of these have already been deposited in the earth, and it is fondly anticipated that the soil and climate will not prove ungenerous. The *Deodar* pine is among them. This tree grows without branches to the height of one hundred and fifty feet, and to thirty feet in circumference. The wood is valuable for its durability, having been found uninjured by the "*fuga temporum*" in temples which had stood two centuries at the least. On the same occasion it was mentioned that seeds of the *pinus maritima major*, a tree cultivated by desire of the French Government in the *Landes* and *Sables* near Bordeaux, to restrain the land flood, had been transmitted by the factor of Viscount Palmerston, at his lordship's desire, to the Horticultural and Highland Societies. A plan too has been transmitted from Mr. Strong, of Leith, for supplying the Edinburgh market with fish from the deep sea, by means of well-laid smacks. The undertakings thus suggested, and especially the last, it is generally believed, will not give increased force to the old saw, "Let well alone." Other projects not less useful in

themselves promise additional employment to the poor, and general benefit to the country.

**LONDON CATTLE MARKET.**—We have the best authority for saying, that of late the shipping of cattle and other live stock to the London market, has been a losing trade to those who have for a considerable time been the means of keeping up our markets, by the extraordinary high prices paid in purchasing for exportation. This business has, we fear, been driven beyond its proper limits, and the consequence is, that beef and mutton, as well as live stock, are at this moment selling at prices as low as in the Edinburgh market; and owing to this reverse, cattle experienced a fall this morning of fully 10 per cent; sheep and lambs as much, and a good many unsold for want of buyers. Some lots of cattle bought some time since with a view to the London market, in all probability must be sold at home at a considerable sacrifice. For the present, therefore, exportation from this quarter is almost at a stand still.—*Edinburgh Weekly Journal July 6.*

**HINTS TO AMATEUR GARDENERS.**—The late genial showers must not fall in vain, but instant advantage must be taken by the watchful planter in setting out in harmonious groups his stores of biennials for next year's flowering, such as wall-flowers, hollyhocks, Canterbury bells, &c., giving to each plant a foot square; general crops of winter vegetables should now be finished planting and sowing. To render the flower garden gay in the autumn sow in masses, or around baskets or the edges of the flower borders, candy tuft, Virginian stock, Venus looking-glass, sweet alysum, &c., which will succeed their earlier brethren and glad the eye in sombre November. The last stock of dahlias should now be planted, and amateurs, who aspire to floral honours, must watch well the opening blossoms of their seedlings to select one whose beauties will be the bark, in which their future immortality may safely ride. The rain is more than favourable to laying the summer shoots of dwarf roses, by which you in time get them of various hues, mingled in large masses; the ground being closely covered, in imitation of dame nature, instead of the poor starling little bushes, hardly showing their blossoms among their loftier neighbours, as if ashamed of their sickly growth. What is more beautiful on the edge of a lawn, or grassy glade, than a magnificent mass of rose blossoms enriching the scene, and lighting up a back ground of dark holly, or laurel.

**TRADE OF SALONICA.**—Salonica exports wool cotton, silk, tobacco, grain, sesamum, linseed, hempseed, harekins, lambskins, timber, staves, beeswax, nuts, and hemp.

**WOOL.**—The wool is inferior to the wools of Roumelia, and does not render above 25 per cent. of first quality; it is likewise less cleanly. The Roumeliot wools only leave a loss of weight of  $3\frac{1}{2}$  to 4 per cent., whereas those exported from Salonica leave  $7\frac{1}{2}$  to 8 per cent. These wools are purchased, for the most part, for Austria and France. None of late years has been sent to England. When there is a demand for America (that is, since the alteration in the American tariff,) they bring to Salonica wools to cost under eight cents., by mixing them with those of the Negropont, selling the finer qualities, and thereby bringing the seconds to cost under the American rate; this, however, is at variance with the oath required upon its entry into American ports. Upon washing the Salonica wool, there is a loss of 45 per cent. The quantity yearly brought to market is about 1,000,000 lbs.

*The Sussex Advertiser* says—"Some erroneous statements having been made as to the reduction of duties on the importation of wool into France, for the information of our agricultural readers, we insert the following copy of a letter upon the subject, received by G. Heathcote, Esq., M.P.:

"Copy of a letter from G. R. Porter, of the Statistical Department, Whitehall, July, 1836.

"Sir,—I am directed by Mr. Poulett Thomson to inform you that the duty levied upon the importation of wool into France, which previous to September, 1834,

had been 33 per cent. on the value, was recently reduced to 22 per cent., and that this reduction has received the sanction of the Legislative Chambers.

(Signed) "G. R. PORTER."

"For Gilbert Heathcote, Esq., M.P."

**DRAWBACK ON SOAP.**—The amount paid for drawback on soap used in the worsted trade of Leeds, was, in 1831, 11,475*l* 9*s*; in 1832, 11,484*l* 1*s* 7*d*; in 1833, 12,179*l* 5*s* 9*d*; in 1834, 6,469*l* 8*s* 11*d*; and in 1835, 6,018*l* 10*s* 11*d*. The quantity of sheep and lambs' wool washed with the same was, in 1831, 18,414,883 lbs; of woollen and worsted yarn, 1,662,078 lbs; of worsted stuff, 302,069 pieces; and of pieces partly composed of worsted, 11,576. In 1832, wools, 18,536,656 lbs; yarns, 1,857,268 lbs; stuffs, 350,710 pieces; partly worsted, 8,960 pieces. In 1833, wools, 19,064,502 lbs; yarns, 1,998,354 lbs; stuffs, 346,421 pieces; partly worsted, 12,588 pieces. In 1834, wools, 19,889,872 lbs; yarns, 1,709,673 lbs; stuffs, 259,815 pieces; partly worsted, 11,550. In 1835, wools, 19,905,452 lbs; yarns, 1,305,235 lbs; stuffs, 491,650 pieces; partly worsted, 10,695 pieces. The amount paid for drawback on soap used in the worsted trade of Halifax in 1831, was 7487*l* 18*s* 8*d*; in 1832, 7190*l* 9*s* 6*d*; in 1833, 6440*l* 11*s*; in 1834, 3,727*l* 15*s* 5*d*; and in 1835, 3,957*l* 12*s*. The quantity of wool washed with the same in 1831, was 17,971,000 lbs; of yarn, 3,152 lbs; of stuffs, 364 pieces. In 1832, of wool, 17,251,400 lbs; of yarn, 2,867 lbs; of stuffs, 400. In 1833, of wool, 11,562,109 lbs; of yarn, 2,888 lbs; of stuffs, 240. In 1834, of wool, 17,863,200 lbs; of yarn, 10,000 lbs; of stuffs, 616 pieces. In 1835, of wool, 18,994,800 lbs; of yarn, 6,240 lbs; of stuffs, 712.

## REVIEW OF THE HOP TRADE.

JULY 1836.

At the end of last month the hop market grew very heavy, and prices continued to fall, in consequence of the weather proving so favorable for the coming crop, and the district reports being so flattering for the time of year. The estimated duty stood at 250*m*. for some time, about the middle of this month—since then it has receded, and is now quoted at 235*m*.; most of the growers deem this too high, as the bine has not branched out sufficient at present, to show much burr. For the last week we have had showery weather, which was greatly wanted by the backward bine, and if this is succeeded by warm growing nights, a good crop may be looked for: should wet and cold follow, the growth may be but very partial as the mould is likely to increase, and some seasons that destructive ravages, taking the plant in burr, has materially reduced the crop, as well as spoiled the quality. There is a little more business doing on the market, the principal inducement being the lowness of prices, as they are quoted about 10 per cent. lower than in June, and the possibility of the wet and cold injuring the coming crop.

### PRESENT PRICES.

East Kent Pockets, good, . . . . .	80s to 100s
Bags . . . . .	70s — 90s
Mid Kent Pockets . . . . .	55s — 85s

[N.B. We are promised the weekly estimate of duty since the year 1802, showing the weekly variation up to the present time which we propose giving in our next; this will prove interesting to grower, consumer, and speculator.]

## REVIEW OF THE CORN TRADE DURING THE MONTH OF JULY.

The accounts received from the southern and western districts of England concur in representing a considerable disparity in the growth of all kinds of grain. Wheat, on strong retentive soils and well-cultivated farms, has with the favourable change of the weather so rapidly improved that a moderate crop is now anticipated, but on the light, weak, cold lands the plant stands thin, and the deficiency is estimated at least one-fifth of the produce of last season, and the straw generally short, and a diminished breadth sown. Barley is irregular and thin, and will not yield an average, except in favoured situations. Oats are short in the straw, and will be below an average. In the eastern part of the country wheat has surprisingly evinced the powerful influence that sunny days and genial nights can communicate to vegetation, and the blooming of the plant has transpired under a combination of the most favourable circumstances; the ears are in many instances large and full, but the falling off on the poorer and more inferior lands will reduce the aggregate yield below the growth of last year; particularizing the three larger counties, it may be stated that in Suffolk wheat will be less heavy and bulky in the straw than last year, and the return less productive, and that though the fields present to the passer-by a favourable aspect, yet they will not bear close inspection, being uneven and thin, and the quantity sown less than last season. Barley promises a moderate average, and an increased breadth of land cultivated. In Norfolk wheat will be defective, and by some calculated as likely to prove two or three combs per acre less than the growth of last season. Barley, for the most part, stout and bulky. In Lincolnshire the rains have restored the healthy green of the growing crops, but the wheat, from the excessive change in the temperature, has broken out into ear upon the warm soils rather prematurely before a sufficient length of straw has been produced, portending diminished bulk in corn and straw, and the same remarks are applicable to oats. In the northern counties wheat is reported as deficient in straw, and short in ear, except on the highly cultivated lands, and in favourable situations, otherwise it is thin and patchy. The breadth of barley is considerably increased, but being generally thin and short is reckoned as likely to yield much below an average for the quantity grown. Oats look tolerably well, without indicating abundance. The continuance of warm dry weather rendered the approach of St. Swithin on the 15th of some little interest to the trade, as the *prerogative* which the Saint enjoyed in the

superstition of the *ninth* century has been handed down to the present era of the *nineteenth*: if, therefore, augury "has not been taught in vain" this canonized Bishop will shed his watery influence for the next forty days, and if his favours are not showered too copiously much benefit will be derived by the farmer from his humid prescriptive right. The heavy rains we have since experienced have refreshed the earth, and being accompanied with dull cloudy weather have had the effect of improving, not only the quality of the grain in wheat, by checking the premature ripening of the ear occasioned by the forcing heat of the sun, but has given renewed life to the vegetative powers of barley, and especially oats, for the fate of which well-grounded fears were beginning to be sustained; and the anticipated produce of beans and peas is likely to be secured by this timely supply of moisture, but the period is now becoming critical, that the strong wind and rain with which we have been visited should cease and the weather remain as warm and bright as it is at present indicated. In early districts reaping is about to commence, so that the harvest will not be more than a week or ten days later than last year; the cutting of wheat having commenced in the more southern districts in 1835 between the 20th and 27th of July, and on the day of the latter date the first samples of new wheat appeared in Mark Lane.

In Scotland the weather has been very propitious for the growing crops of wheat, and though barely an average produce is looked forward to, yet the improvement has been greater than could have been anticipated. Barley and oats were much in want of rain, and by its timely supply, have been considerably benefited though barley is still reckoned a thin crop, but oats in many districts will prove an average growth.

In Ireland the weather is represented as most favourable and conducive to the growth of all grain, alternately sunshine and rain prevailing; and though no doubt exists that the breadth of land sown with wheat is much diminished, yet the produce is likely to yield a moderate average. Barley and oats are progressing rapidly, and without being luxuriant have assumed appearances for the most part satisfactory to the growers. Flax is in bloom, but owing to the previous drought is extremely short in the stem, and the return therefore must be proportionately diminished.

During the first three weeks of the past month, the fineness of the weather checked speculative feeling, and millers were only inclined to purchase

for their immediate consumption; and though the supplies were moderate, yet prices receded 2s to 3s per qr., and the trade continued to rule languid and dull; but on a succession of heavy rains and wind, and the generally unsettled character of the weather, farmers were unwilling to send their stocks to market, and speculators withholding their granaried samples, reduced the amount of arrivals, which with an improved disposition to purchase, caused the currencies to advance fully 2s. per qr.; should, however, the favourable appearances continue as to temperature, a depression rather than additional is likely to ensue until the crop is partially secured, and some idea can be formed of the result of the crop: few, who have old Wheat on hand, being inclined to quit their stock till the casualties attending the harvest in this county are past.

The dull state of the home market, and few opportunities being offered for shipment to foreign parts, has rendered bonded wheat less animated, and the only sales reported are some good Danzig at 36s, and Mecklenburg, at 30s.—Of late, however, the unfavourable accounts of the crops of Wheat in the United States, particularly in the southern districts, has caused rather more enquiry, and prices are fully supported. At Liverpool considerable purchases have been made on speculation with the ulterior view of shipment to America, at prices varying from 3s 9d to 4s 6d per 70lbs.

The heat of the weather created in the minds of holders of flour considerable anxiety to sell, as the quality was being materially affected, and bakers, on the other hand, bought sparingly, fearful of the condition of the article; the trade, therefore, remained extremely dull, and ship qualities experienced a slow sale at a decline of 1s per sack; but since the alteration in the weather, and the advance in wheat, the currencies have fully regained their previous rates, and have in some instances been rather exceeded.

Bonded flour has been in request for shipment, principally to the West Indies, Cape of Good Hope, Mauritius, and Quebec. Prices have remained steady at 22s to 23s for Danzig marks; *Witt's* brands commanding a preference. At Liverpool higher prices have been obtained, Hamburg and Danzig qualities realising 25s 6d to 26s per bbl. and sour, 20s to 21s.

The only alterations in the duties have been a decline of 1s 6d on rye and peas, making the duty on the latter article 8s; this decline has been occasioned by the aggregate averages having rather unexpectedly advanced to 41s and a fraction, the week ending the 8th of July being 2s higher than the foregoing, since which, the aggregate of the six weeks averaged above 41s; this sudden rise, on inspection, appears to have arisen from the Lancashire averages, that is, those of Manchester and Liverpool, which have varied the two last weeks from 41s 4d to 45s 7d, on a quantity sold of 1319 qrs, the total amount returned as sold in all the

towns of England and Wales not exceeding 2068 qrs, leaving for Middlesex and all the other counties the disposal only of 749 qrs; the average in London being 35s 1d to 36s 6d. The *rum*, therefore, on the article in Lancashire, must have been almost *unprecedented*, at least, for the consumption, as the warmth of the weather would check the usual demand; but there has arisen, it is stated, a singular *propensity* for the purchase of *blue peas*, and which being short in supply, holders have become anxious that they should be replaced by foreign qualities of white.

Until towards the close of the month the receipts of barley were very limited, and as the demand continued for grinding qualities, and partially for distilling samples, holders were enabled to realise 1s per qr more money; grinding obtaining 33s to 34s, and distilling, 35s to 36s; these rates, however, having brought forward increased supplies, especially from Scotland and Ireland, and different samples of foreign offering at from 21s to 23s for good Danish, Holstein, and Mecklenburg, and 24s for Saale descriptions; the trade flagged, and a reduction of 1s per qr was submitted to.

The quantity which has paid duty is noted in the following table, comprising also the quantity of OATS, BEANS, and PEAS, rendered free for the consumption in LONDON, LIVERPOOL, HULL, and BRISTOL, for the current year ending 23d of July.—

	London.	Liverpool.	Hull.	Bristol.
	qrs.	qrs.	qrs.	qrs.
Barley..	1065	—	—	265
Oats....	5114	26	—	66
Beans...	2344	1030	127	741
Peas....	7075	3275	925	715

The malt trade has remained firm, and as the sale of the article has been principally confined to the country demand and the smaller brewers, there are few samples offering, and in a few instances rather more money has been realised.

The supply of oats has been very limited, and upwards of 76,000 qrs less than in June; the principal deficiency occurring in the Irish receipts. The large import however of the previous month, has, by meeting the demand of the more necessitous purchasers, caused the trade to rule heavy, especially as the duty on the admission of foreign qualities has remained at 10s 9d per qr., and consequently several bonded parcels have been pressing on the market; in fact most of the cargoes newly arrived have been offering ex ship, good feed, say Swedish, Danish, Holstein, and Mecklenburg at 22s to 24s; Riga and Archangel at 22s to 23s. The currencies have in consequence receded 6d for good fresh corn, and 6d to 1s for other descriptions. Exports continue to be made to the West Indies.

The demand for beans in the early part of the month was limited, and as several samples of foreign were pressed upon the market, holders were obliged to submit to a reduction altogether

of 2s to 3s, and in some instances even more, as there appeared little probability of the duties receding lower, and consequently most of the supplies in bond were ready for admission, which with the fine and healthy appearance of the crops, naturally led to a reduction in their value. Beans being an article, the consumption or demand for which it is difficult to force; the continuance, however, of warm weather, being deemed injurious to their full podding, prices partially rallied, but have again become dull, remaining fully 2s cheaper than at the commencement of June.

Peas have ruled extremely dull, particularly white qualities, owing to the number of foreign offering on the market, and a reduction of fully 3s per qr has been effected; the duty having declined to 8s per qr and strenuous efforts are being made to reduce it to 6s 6d or even 5s. A few samples of new white have appeared, regular, and in good condition, but rather small, for which 36s was obtained, but the tendency in price was rather downwards; in grey or maple little speculation has taken place, quotations closing nearly the same as at the commencement of the month.

During the month of July the following quantities of grain and flour have arrived in the port of London.

In CANADA the season, though backward is not unfavourable for the crops, and though less wheat has been got into the ground this year owing to the protracted winter, yet the deficiency is made up with spring corn. The crop of hay was satisfactory; the markets were dull for wheat; at MONTREAL Archangel wheat had realized 5s per 60lbs; Baltic red, 5s 3½d to 5s 4d; and Upper Canada 5s 6d per 60lbs; the late imports from England of wheat have not moved so readily off as had been anticipated. An active demand had been experienced for flour, and fine qualities had been bought at 29s for exportation.

In VAN DIEMEN'S LAND the wet weather was preventing the completion of the harvest, injuring the grain left out in the fields, and damaging the newly thatched ricks; the prices of wheat at Hobart Town and Launceston remained at 9s to 10s 6d; Barley, 5s to 6s 6d; Oats, 4s 6d to 6s per bushel. The

market as well as the Sydney trade will be regulated mainly by the arrivals from India, England, America, and the Cape of Good Hope.

At SYDNEY, New South Wales, several arrivals of wheat and flour had come to hand from Hobart Town, and Launceston, and various cargoes were expected from America, India, and Cape of Good Hope; prices, however, remained at 12s 6d per bushel for the best descriptions; flour had declined 5s per 100lbs, and was noted at 23s to 25s; Oats, 4s 6d; Barley, 5s 6d; Indian corn was ruling high, being noted at 9s per bushel; but as the accounts of the crops in Van Diemen's Land were favourable, prices were tending downwards, and on the anticipated imports of wheat taking place, the currencies were expected materially to recede.

From SWAN RIVER it is stated that the crops are generally looking well, though in many instances not so heavy as on some preceding years, probably from the rains having been unusually protracted, or from the lands being in some degree exhausted by a continuation of the same crops for a series of years without aid. The produce of the present harvest was estimated at the lowest possible average, say twelve bushels per acre, which will give 15,878 bushels, and deducting 2000 bushels for the seed the ensuing season, and computing the population at 1200, allowing 8 bushels per head per annum, enough provision will be found for nearly 450½ days.

At VALPARAISO and RIO DE JANEIRO business was much interrupted by the unsettled state of Peru, and in fact of all the South American provinces; the stock of Flour had been increased by arrivals from America, and as the demand was limited, prices were expected to recede.

In France the same character of weather is prevailing as has been latterly experienced in England, and the excessive heat, which in the more southern districts is likened to the "hot air of Senegal," is parching up the ground, and turning off the grain prematurely, proving particularly detrimental to the late sown wheats, spring corn, and pulse. The appearances however, generally, of wheat, are such, that holders are anxious to quit their stocks on hand, more especially as the heat is affecting the condition of the samples; the markets consequently are supplied to a greater extent than the current demand requires, and prices are therefore receding, and are become in some places perfectly nominal. Flour, for the same reasons, is heavy sale, and complaints are being made by millers of the scarcity of water. Much of the rye is already cut, and at Bordeaux new samples of wheat had been shown, good in quality; this latter market was largely supplied, and arrivals still daily coming to hand from Normandy; but the accounts from Languedoc, intimating that the warm weather had been injurious to the wheat, the surplus stocks which are now accumulating, may thus find a ready vent, should the reports prove correct. At Nantes, the few arrivals of grain which the lowness of the water in the Loire permits, are taken into granary; and as foreign cargoes are being rendered free on the coast of the Bay of Biscay, and then forwarded to Bordeaux, Marseilles, &c., prices are not expected to advance, though the heat of July is proving injurious to the grain in certain situations. At Marseille the currencies had been rendered nominal, owing to the approach of harvest, and aspects of the crops. In Burgundy, however, it was stated a deficiency would be experienced owing to the drought, which, if correct, would materially influence prices at Marseille. Oats were

LIVERPOOL.

WEEK ENDING JULY 25.

IRISH and ENGLISH WOOLS have been a good deal inquired for, and commanded upon the whole tolerably fair prices. The annexed are the current quotations:—

Irish Wools—Irish fleeces, mixed lots, 17½d to 18½d; ditto wethers, 17d to 17½d; ditto hogs, 19½d to 24d; ditto combing skin, 16d to 17d; short skin, 14½d to 16½d. Import for the week, 179 bags; previously this year, 3,423 ditto. English Wools—Combing fleeces, 19½d to 20½d; Down ewes and wethers, 19d to 20½d; ditto tegs, 21d to 22½d; super. skin, 18d to 19d; head ditto, 15½d to 17d.

SCOTCH WOOLS.—The accounts from Inverness and other fairs in Scotland represent a considerable business to have been done in wools generally, at prices about adequate to the current rates of this market. Apprehension is expressed that the weight of Laid and White Highland will be considerably inferior to the clip of last year, owing to the casualties of the Spring. A steady business has been done here during the week at last week's prices.

	per stone of 24lbs.

FOREIGN.

JULY 25.

The London supply has embraced, since this day se'night, about 910 packages, mostly from New South Wales, Germany, and Spain. At the city sales of last week, which were well attended, wools went off briskly, at the following prices—Australian, from 1s 4½d to 2s 10½d; and Van Diemen's Land, 1s 8d to 2s 8d per lb. In private contract trade, but little doing, at our last week's quotations. There are still four City sales to take place this day (Monday) and to-morrow of about 2,500 packages, principally of Colonial wool.

BONES.

Since our last there have passed the SOUND or ELSINORE, the GREAT BELT, and the HOLSTEIN CANAL, ships loaded with Bones, bound for Hull, 13; Berwick, 2; Newcastle, 1; Grimsby, 1; Boston, 1; Bridlington, 2; other parts of England, 1.

# THE POLITICAL COMPANION

TO

## THE FARMER'S MAGAZINE.

[SPEECHES OF MEMBERS ON THURSDAY EVENING, THE 21<sup>st</sup> JULY, ON THE NON-REPORT OF THE COMMONS AGRICULTURAL COMMITTEE.]

Lord DARLINGTON was desirous of knowing from the noble lord opposite (Lord Howick) whether the agricultural committee intended to report this session? He had heard, with no little regret and astonishment, that the committee had determined to make no report. He was confident that if such were the case, the agriculturists throughout the kingdom would feel great dissatisfaction on learning, that after sitting and hearing evidence for five months, the committee were not prepared to satisfy the nation on a subject of such importance. He wished to know whether any motion was intended in order to bring on a general discussion, or whether any other means would be taken to inform the public why the committee had made no report?—Lord HOWICK—Perhaps I ought to leave it to the chairman of the committee to give a reply, but as the noble lord has addressed himself to me, I may be permitted to observe that it was no less a matter of surprise to me than to others that the committee on the state of agriculture has come to no report. The motion for reporting the evidence only was made by the right hon. member for Cumberland, and it was seconded by the noble member for Buckinghamshire; but the members of government upon the committee were perfectly ready to discuss the propositions contained in the report which had been drawn up by the chairman, the hon. member for Hampshire. In deference, however, to those who were immediately connected with the agricultural interest, they agreed that no opinion upon the evidence should be expressed. I did venture to express my surprise that in a committee of twenty-five members, eighteen of whom were county representatives, no one connected with the agricultural interest brought forward a proposition even for discussion. (*Cheers.*) If, therefore, the noble lord (Darlington) has been disappointed, from the same disappointment the members of government are not exempted. (*Hear.*)—Sir J. GRAHAM: Since the noble lord has made this answer, it is perhaps due to myself to state that I was certainly the person who made the motion that no opinion should be expressed by the committee. (*Cries of "Chair."*)—Mr. HUME: If the right hon. baronet proceeds, I hope that I also shall be allowed to make a few observations. (*Cheers.*)—Sir J. GRAHAM: I was only about to make one remark on what has been said by the noble lord, which in itself was irregular, inasmuch as it was not an answer to a question so much as a disclosure of the proceedings of the committee. If the conduct of individual members is to be canvassed, I claim a right to discuss the conduct of the members of the government. (*Cheers.*)—Mr. HAWES: If the right hon. baronet is to continue the debate, I presume that any member who takes an opposite view of the subject will have the opportunity of giving an answer to his speech.—Sir J. GRAHAM: If any technical difficulty be thrown in my way, I am prepared to conclude with a motion (*hear hear*); but I claim my right to give an explanation, in consequence of what has fallen from the noble lord. It is impossible that any subject can be of greater importance; and by whom was the proposition for a committee made? By an independent member, or by one of the Secretaries of State in the present government? Did government undertake the inquiry, and did any minister take the chair? Under Lord Grey a Cabinet Minister presided over the investigation of the committee, and it was kept under the distinct control of government; but, in this instance, no member of the government took the chair,

nor did any constantly attend the progress of the inquiry. The chair was filled by an independent member; and if the question of attendance be introduced, that is matter of record: a note was made of the daily presence of the members of the committee, and that will speak for itself. The noble lord says that government acquiesced in the motion that no report should be made. True; and since it had been made matter of discussion, I may say that no man commented with greater severity on the proposed report of the hon. member for Hampshire than the Noble Secretary at War. I therefore hear him talk of it as a bare acquiescence with astonishment. (*Hear, hear.*) I understood him to say that nothing could induce him to agree to the report of the hon. member for Hampshire. There was, indeed, another report of a different description, which he was disposed to favour; but the truth was, that the members of the government came down to the committee without having made up their opinions—they went about fishing for a report in any quarter where it could be obtained, and they were glad to catch at anything let it come from where it would. (*Cheers.*) They had nothing to propose themselves, and now they made it a matter of censure that some other member of the committee did bring forward a motion. (*Cries of "Move, move."*) I beg leave to move that the other orders of the day be now read. (*Laughter.*)—The SPEAKER put the question.—The Marquis of CHANDOS: It is quite true that I seconded the motion of my right hon. friend that no report be made, and I will fairly state why. The report laid before us for adoption was of such a nature, that if it had gone before the country as adopted by the committee, it would have done more injury to the farmer than anything else that can well be imagined. I therefore thought it my duty—and if there be any blame in doing so, I am willing to bear it—to second the rejection of that report. When the evidence goes forth it will show, among other things, who attended; and I would much rather stand alone in my opinions than be fettered by such as were offered in the report.—Mr. SHAW LEFEVRE: Having had the honour to be chairman of the committee I may be allowed to say that I endeavoured to conduct the inquiry as impartially as I could. (*Cheers.*) My object was, that no class of persons connected with agriculture should have it to say that its case had not been considered. (*Hear.*) It is true that, after the report I had drawn up had been read, it was moved that the evidence should be laid before the House without any observations; and it is true also that the Secretary of State for the Home Department supported that motion. He did so very much in deference to the opinion of the noble member for Buckinghamshire, and my noble friend expressly said that until he heard the noble marquis he was not prepared to agree to the proposition of the right hon. baronet. [Lord J. Russell said something to Mr. Shaw Lefevre.] He reminds me that the expression he used upon the occasion was, that he deferred to the authority of the noble member for Buckinghamshire. My report certainly did not meet the views of the committee, and all I can say of it, is that it was formed on an honest conviction that it was supported by the evidence (*cheers*), and if the committee had allowed it, I could have shown that every paragraph had been established. As to the interests of the farmer, I can assure the House that no one has a greater interest in maintaining them than I have: the great evil has been, that the farmers never were told what was the true state of the case. (*Cheers.*) They had too great a dependence upon corn-laws. (*Cheers.*) Therefore I said that they ought, in the first instance, to look to their landlords, and that when they had fairly and properly reduced their rents, the farmers must rely on the other sources possessed in common by all agriculturists, by

which many are now enjoying a state of comparative prosperity. I am aware that unless the report obtained the sanction of the great majority of the committee, it would not have had due weight with the country, and for this reason I do not say that we could have come to any other conclusion than not to give any opinion. At the same time I am bound to add, that if after such a protracted inquiry and such a mass of evidence the committee was unable to agree upon any distinct measure of relief, it is a very convincing proof that it is not in the power of the legislature to do anything. (*Cheers.*)—**Mr. HUME**: Although the committee consisted of country gentlemen, in the proportion of, I believe, three to one, and although the committee was appointed at their earnest instance, I am delighted to find that the investigation has ended as I foretold. I will only make this observation to the noble marquis. He hopes that the evidence will go forth and show how far his case has been made out; but the portion of the evidence I have seen destroys his case entirely. I have not seen the latter part of it, but what I have seen establishes that the labouring man—in whose behalf the country gentlemen were so loud, who never thought of themselves in the preservation of the corn-laws, but only of the agricultural servants—for the last six months prior to the sitting of the committee was in a better condition than for years past.—**Mr. J. E. DENISON** complained of the undeserved attack which the right hon. baronet (Sir J. Graham) had made upon the government, and expressed his regret that the motion for no report to be made had been adopted, although he admitted that he did not agree in all parts of the report drawn up by the chairman. He feared that the country would be disappointed at the separation of the committee without the expression of any opinion.—**Sir B. Vere** thought the country had a right to look to the Legislature and to the Government for a report. No such motion as that of the right hon. baronet would have been made had it been thought likely that the committee would come to a satisfactory conclusion.—**Mr. WAKLEY**: I rise in consequence of the remark of the hon. member for Middlesex, who talks of the improved condition of labourers employed in agriculture. I wish to be informed whether any of the labourers were examined, and if they were, from what counties they were selected?—**Lord JOHN RUSSELL**: I feel bound to afford such explanation as I can give relative to the statement of the right hon. baronet opposite. The noble member for Buckinghamshire had stated that it was his intention to move for an inquiry into agricultural distress, and the Government was of opinion that, with the many complaints on that subject from the owners, and more particularly from the occupiers of the land, it was fit to appoint a committee. At the same time, in proposing such a committee, I did not state that there was any great or very prominent measure of relief which could, in my opinion, be pointed out by its labours. With respect, however, to certain burdens on the agricultural interest—with respect to county-rates and poor-rates, I thought that such a committee might be able to ascertain whether measures to be adopted by Parliament might or might not be practically beneficial, and lead to some improvement. In naming the committee, I placed upon it a great majority of members for agricultural counties, and I believe it was objected at the time, that out of 30 members, 23 or 24 represented, almost exclusively, the agricultural interest. The committee was appointed, and my honourable friend the member for Hampshire was made chairman of it. The investigation was prosecuted with great diligence, and when we first came to the question, what should be the matter of inquiry? I think every member of the committee will support me in the statement that I said it would be unwise to put fetters upon it; (*cheers*), that no fetters ought to be put upon the inquiry beyond such as were necessary to prevent the evidence extending to subjects quite foreign and unconnected. The consequence was, that the committee entered into an investigation more extended than that of the committee of 1833. At the conclusion of their labours, and when a sufficient number of the committee was in attendance, my honourable friend,

the chairman, produced his draft of a report. It was communicated to me, as well as to others; but it so happened that I believe I was one of the last to receive it. The committee was summoned to consider it: no less than twenty-five members attended, and eighteen of those were members for counties. And with regard to members for counties, it is to be observed that of those whom I had named as representing counties connected with manufactures, the noble lord the member for Lancashire declined to attend; so that the county members were chiefly members for agricultural counties, and represented agricultural interests. I came to the committee under the expectation that the draft of the report was to be considered point by point, and prepared to give my opinion upon every sentence. It was to me matter of great astonishment to find the right hon. baronet, the member for Cumberland, the chairman of the committee of 1833, propose immediately that the whole report should be suppressed, that not a word of it should be taken into consideration; but a resolution be passed, declaring that the committee would only report the evidence. I thought the course extraordinary, but my surprise was lessened, and my opinion a good deal changed, when I heard the noble marquis, the member for Buckinghamshire, second the motion. (*Cheers.*) Certainly I had expected, that if the report of my hon. friend the chairman were not adopted (and I was not disposed to press upon the committee all the statements it contained), it would be considered fairly, and then members would state their individual opinion. It did not contain any proposal for the immediate relief of agricultural distress; but I little thought that a motion would be made for its total suppression—suppression, too, by those who had been calling upon the House for months, and not only for months but for years, to take into consideration the distresses of the agricultural interest. (*Cheers.*) The right hon. baronet and the noble marquis had no proposal to make, they had no definite remedy to offer, but merely moved the suppression of the report. I said on the occasion that if I, as a member of the Government and of the committee, agreed most reluctantly to that course, it was not that I was not prepared to enter fully into the statements contained in the draft of the report or in any substitute that might be offered; and I added that my wish was that the committee should give an opinion, in the first place, with respect to the Poor-laws and the Poor Bill now in operation; next, upon a remedy applicable to tithes affecting agricultural interest; and thirdly, upon the question of the currency, a subject that had occupied much of the attention of the committee. I declared myself ready to enter into these topics, to debate these points, and to endeavour to cause my opinions to prevail; but if they did not prevail, I was ready that the committee should agree to a report containing the opinions of the majority.—**Sir J. GRAHAM**: You proposed nothing.—**Lord JOHN RUSSELL**: I stated that these were fit subjects for a report, and I added that my opinions were very much those embodied in his draft by the chairman. I must also mention that I gave it to the committee as my opinion, that a further ground for hesitation and reluctance in agreeing to the resolution of the right hon. baronet was, that great disappointment would prevail in the country, and that the farmers who had applied to Parliament for some inquiry and for some remedy, if they would have been disappointed at the refusal of investigation, would be still more disappointed at the separation of the committee, without making any report. I have said thus much to show that Government at least is not responsible for the committee having come to no result. (*Cheers.*) My noble friend near me (Lord Howick) has observed, that the committee, by adopting no report, did negative many a statement both with regard to agricultural distress and the remedies applicable to it. I certainly concurred very much in that opinion. For instance, with respect to the currency, it has been said in the present and in former sessions, that the great remedy for agricultural as well as for all other distress, was the repeal of the bill introduced by the right honourable baronet (Sir R. Peel) effecting a change in the circulating medium. That

subject was fully investigated by the committee, and by not coming to any resolution it has confirmed the opinion entertained by the right honourable baronet and myself, and repeatedly stated in resolutions of this house. It shows that those who have endeavoured to raise the country on that subject are not prepared in a committee of twenty-five members, eighteen of whom represented agricultural counties, to back their own opinions. (*Cheers.*) I repeat, then, that for the non-adoption of any report ministers are not responsible; we were quite ready; I came down to the committee fully prepared to have some three or four days' debate on the report, and those who are responsible are the members who have over and over again asserted that the agricultural interest is in distress, and that relief could be given by Parliament. (*Cheers.*) The result of the whole is that—admitting, as I must do, that distress has prevailed for some years among the occupiers of the land, a distress which I have always lamented, and which, I hope, is now diminishing—it is not to be relieved by a change in the currency (*hear, hear*); that it is not to be relieved by a repeal of the malt tax (*hear, hear*); that it is not to be relieved by any specific measure that Parliament can apply to the evil. (*Hear, hear.*) I have not been forward in calling myself the advocate of the agricultural interest—I have not been forward in summoning meetings of farmers to demand inquiry by Government or by Parliament—(*much cheering*)—I have not been forward in asserting that justice was denied to the agricultural interest (*hear, hear*); but I will tell the House what, as a humble member of the administration, I have done. I have been forward in co-operating with a former Government, as a member of that Government, in passing a bill which I thought would prevent abuses in the administration of the poor laws, which would prevent large sums of money being laid out imprudently, and which would tend to restore to the labouring classes of England that character of independence which they formerly enjoyed (*cheers*); I have likewise endeavoured to my utmost, and I hope not unsuccessfully, to pass through Parliament some measure which might relieve the agricultural interest from the levy of tithes in kind, one of the most oppressive burdens that could be inflicted. (*Cheers.*) I have also assisted my right hon. friend near me, the Chancellor of the Exchequer, in proposing some alleviation, by some aid from the public, with respect to county-rates. These things I have done because I thought they were practical measures, tending, as they advanced and promoted the interests of agriculture, to advance and promote the interests of the community. (*Cheers.*) I never have, and I never will profess myself to be the sole and exclusive advocate of any one interest, agricultural, commercial, or manufacturing. I consider it the duty of a member of Parliament, as well as of a member of the Government, to attend to the interests of all impartially. (*Hear.*) I never will endeavour to raise a cry upon these subjects, or to promote an imputation on the character of Parliament, or on the character of either of the two great parties who occupy these benches. (*Much cheering.*) I think that the right hon. baronet opposite (Sir Robert Peel), in all his conduct, either with respect to the currency or the malt-tax, took a wise and an enlarged view of the interests of the country (*hear*); and I am not disposed to let any party feeling interfere with the discharge of what I consider my duty; but having attended to these three great questions—poor-rates, tithes, and currency—I hope we shall stand as fairly before the country as those who, indulging in perpetual and empty declamations on distress, have endeavoured to increase discontent, without having any measure to propose by which distress could be relieved, or discontent removed. (*Cheers from all sides.*)—Mr. O. GORE contended that although the committee had thought proper not to make a report, that was not a sufficient ground for asserting that no sufficient case of distress had been made out on the part of the agriculturists. There was scarcely a tax raised in the country which did not bear directly or indirectly upon the farmer; and if any proof of the existence of extreme distress were wanting, he would refer to the

state of the rents throughout the farming districts, which had fallen, in many cases, from a *U* to half-a-crown, and in some cases even the farmers refused to take the land rent-free.—Sir R. PEEL said, that he thought it necessary, after having been a member of this committee, to trespass upon the House with a few words on the present occasion. When this committee was originally appointed, it would be recollected, perhaps, that he had reluctantly given the proposition his assent; and the reason upon which he assented to it at all was, that being perfectly aware that distress did prevail to a very great extent in the agricultural districts, in many parts of the country, he knew with what feelings of bitterness and alleged hardship men who were deeply concerned in these interests, deeply and personally affected by that distress, might view an unconditional refusal on the part of the Government and of the House to inquire into their condition. But well he recollected also that whilst he gave this as his reason for acquiescing in the appointment of this committee, he at the same time predicted that nothing but disappointment would be the result. (*Hear, hear.*) He foretold this upon many considerations. In the first place, he called to mind the committee upon this very subject in 1833, which reported its opinion to the house, that the agriculturists should seek relief from their own exertions rather than from any extraneous or collateral sources. In that report he had acquiesced, and he remained still unaltered in his opinion, that make whatever report the newly appointed committee might, it would come in the end to the same result—that it would be a delusion for them to tell the country, or to hold out a hope, that Parliament had the case of the agriculturists at all within their power. (*Hear.*) He certainly could not deny that the present system of tithes was a very serious burden upon the land, and, so far as it went, a fundamental cause of the distress which prevailed. But this subject he considered to be one which should more properly be dealt with by the House itself than by a select committee, nor did he expect that whenever the House might come to the consideration of the question it would suffer itself to be in any way guided by the opinion of a select committee. Then there was the matter of the currency. The inquiry before the committee was certainly a general one, and therefore it would have been unwise to have thrown the slightest impediment in the way of their examinations even upon this point. He had thrown, then, no impediment in the way of this particular question mooted in the inquiry, fixed as his own opinions were, that without discussing the expediency of the new system of currency which had some years ago been adopted, great distress must inevitably prevail throughout the country if any attempt were made for returning from the convertible currency which they now had to the inconvertible paper currency which formerly existed. (*Hear, hear.*) He thought it would be impossible now to return to the old system without materially endangering the stability of the property and interests not of one but of every class of persons in the kingdom, and giving rise to doubt and anxiety of the most painful character. The country having had a metallic standard and a convertible currency during a period of fourteen years, and all the transactions during that period having been engaged in under that currency, and upon the faith pledged, time after time by the House, that that currency and that standard should not be again departed from, he considered that it would be useless and hazardous in the extreme to hold out any prospect of a reopening of the question. He thought it was now agreed upon on all hands that Parliament had never adopted a measure more likely to secure to industry its reward, and to preserve a fair equality in the prices of labour and of necessaries, than that for a just and unfluctuating currency. The result of their inquiries in this very committee went to prove, as he thought, the beneficial workings of this measure; the condition of the working classes was found to have been gradually improving under the present system of currency, and it was already shown that any alteration in that system could now only act injuriously upon those who depended upon the price of their daily labour for their support.

(*Hear, hear.*) With respect to the course adopted by the committee in declining to frame a report upon this subject, he must say that, for his own part, he was not at all surprised at it; and he thought that whatever disappointment might be felt by some parties at the absence of such a report, that disappointment was small compared with that which would have been experienced had the committee merely reported opinions upon which they were all agreed. [Such, we believe, were the concluding words of the sentence, which were instantly drowned in laughter.] For his own part he believed he could say that he had a much deeper personal interest in agriculture than in any other interest or branch of industry in the state; he felt the most strongly rooted attachment to all that was connected with the agricultural calling, and he believed that these were the strongest social reasons to justify this feeling of preference; but at the same time he felt so perfectly satisfied that the hopes of the agricultural interest must rest eventually upon their own exertions, that he could not bring himself to encourage on their part the delusive expectations that the legislature, either by an alteration of taxation or any other change in the financial system of the country whatever, could permanently or substantially place them in an improved condition. (*Cheers*) He would rather tell the agriculturists to look at the farmers of Scotland, and endeavour to work out some plans of amelioration and consequently of relief for themselves, which, however inadequate, perhaps, for the temporary necessity, would eventually be found much more efficient and permanent in its advantages than any which Parliament, by a legislative enactment could afford. To say the honest truth, he must say, that he did not anticipate that any immediate or striking amelioration could at the present juncture be afforded, either by the exertions of Parliament or of individuals. Such important changes and such stupendous improvements had been making of late years, in the mechanical arts of the country, and in their application to the wants of society, that every interest in the county must be expected to be affected by them to a considerable extent. The great increase and improvement in the means of conveyance, particularly in the use of steam navigation, by bringing into competition the most distant soils which had hitherto been disused, must inevitably lead to the disadvantage of their longer and more highly cultivated lands, which, up to within a short period back, had enjoyed the monopoly which their advantageous position afforded them. It was under these impressions that he had agreed to the proposal made by the committee, that they should not frame a report. At the same time he thought some of the circumstances connected with that resolution on the part of the committee were worthy of remembrance. If he recollected rightly, a report was presented by the chairman to the committee, and the committee expressed itself under great obligations to the chairman for the ability and delicacy with which he had performed his task. But if he was quite clear in what followed, it was that the noble lord, having come down with the report in his hand, went through it to the committee, reading it backwards like a magician (*a laugh*)—began at the end, and so up to the beginning, proceeded to strike out all the brains of the report, (*a laugh*.) stating in detail at the same time most satisfactory reasons why they should not make a report at all. (*Cheers and laughter from both sides of the House.*) With regard to the currency, for instance, the noble lord read in the first place a passage from the King's speech, and then the resolution which had been passed by the House that any alteration in the system of currency at present existing would lead to very dangerous and prejudicial results, and therefore would not be acquiesced in by the House. The noble lord then added, that upon the very first day of the committee's sitting, if he had been told that a division would take place upon the question of the currency, he should have predicted what would happen, for that the subject was one which he considered far too important in its bearings, not upon agriculture only, but upon every interest and individual who had anything at stake in the country, to be decided upon by a select committee appointed to enquire into

the state of agriculture. The noble lord next came to the question of the corn-laws, which he also thought was too weighty and complicated for the committee to deal with (*Hear, hear*); and then the noble lord touched upon the proposed reduction of the malt-tax, with a corresponding remission of foreign duties, which he said was a subject to which he hoped his right hon. friend, the Chancellor of the Exchequer, would devote his earliest and best attention, but in respect to which in the meantime he thought the committee was hardly called upon to express an opinion. (*Hear, hear.*) He (Sir Robert Peel) followed the noble lord on this occasion, and said that so entirely had the noble lord gathered up every important resolution which the report of the committee contained, and so entirely was he satisfied with the noble lord's reasons for so doing, that he thought they would be acting much more prudently, and run the risk of causing much less disappointment to the public, by abstaining altogether from making a report, than by presenting to the House the mutilated document which remained in the hands of the noble lord, confined, as it was, to a variety of matters of comparatively trifling importance. (*Hear, hear.*) He believed that something was said in it, for instance, about the reduction of one-seventh in the county-rate, which had recently taken place through the new arrangement throwing part of the expense of criminal processes upon the country. But, as he (Sir R. Peel) thought that the country was by this time pretty well acquainted with this gratifying fact, he looked upon it as a matter not sufficiently important in itself to call for an announcement from the committee to the agriculturists of England that a reduction of one farthing in the pound upon the county-rates had been obtained for them. (*Hear, hear, and a laugh.*) The noble lord then suggested something about the very important advantages which the agriculturist might reasonably hope to derive from the new poor-laws, if their future operation should but prove as successful as the experience of the past appeared to warrant. But this really appeared to him to be a subject which the committee was not called upon to discuss; for, if they had been told by the chairman at the commencement of their sittings that the best thing they could do would be to direct their attention to the working of the new poor-laws, he thought they might still be adventuring a little too far to predict that they would prove a very considerable benefit to the agriculturist, however the evidence might eventually be such on the whole to warrant a favourable notice on the subject. Besides this and other topics which he had named, there were a variety more suggested by different hon. members. There was a plan, for instance, which had recently been discovered, for the improvement of stiff lands, and some important facts connected with the draining of soils, which, though, certainly, interesting to those who happened to have stiff and undrained lands, could scarcely be looked upon as of sufficient importance to be entered in the report of the committee. In fact, he believed that the whole committee were at once disposed, if the noble lord's proposal was adopted, to strike out everything in the report which related to the corn laws, the reduction of the malt tax, and the corresponding remission of foreign duties; that, after all, the plough stood in rather too bold a relief in their report. (*A laugh.*) Some gentlemen, to be sure, talked a good deal about harrows, and a variety of other mechanical contrivances, which they respectively thought of sufficient importance to mention; but, upon the whole, he fancied the general feeling of the committee was rather to the omission of all these particulars most willingly. Therefore, under these circumstances, had he acquiesced in the proposal to make no report at all upon the subject of this inquiry, as it appeared impossible to frame any report in which the opinions of all parties could be brought to coincide upon any of the more important features of the question. —After a few words from Mr. Hawes, which were drowned in the bustle caused by members leaving the House, and from Sir R. Peel in explanation. —SIR J. GRAYHAM briefly explained, and withdrew his motion. —Mr. S. LEFEVRE then brought up the report of the committee, amidst some laughter and cheering.

## TURF INTELLIGENCE.

The July Newmarket Meeting, which commenced on the 12th ult., though well attended by persons of wealth, rank, and distinction was meagre rather than otherwise in regard to the interest produced by quadrupedal competition, if we except the July Stakes, which on the first day of the Meeting was not decided till after a second severe struggle had taken place, a dead heat occurring between the Anglesea filly, brother to Beiram, and the Fille de Joie filly: and it must be admitted a dead heat between three is a circumstance of very uncommon occurrence. For a few weeks prior to this Meeting, some money had been ventured on the July Stakes, for which the Fille de Joie filly was the uniform favourite up to the moment of starting; the Angelica filly appeared in the betting constellation, but not as a star of the first magnitude; however, on the day of trial, she shone with superior lustre, and by winning the second heat, carried off the prize. For these stakes there were twenty-three subscriptions, and seven candidates appeared at the post for the purpose of disputing the honours of the contest.

Mr. Bird's Redshanks, who has occasionally glimmered in the betting for the Doncaster St. Leger, came out twice at the Newmarket July Meeting, and was successful on each occasion, a circumstance which cannot fail to elevate him in the estimation of those who discuss the doctrine of chances, particularly in regard to the important stake to be decided at Doncaster in September next.

The three most important stakes in the kingdom are exclusively for three-year-olds; namely, the Derby, the Oaks, and the Doncaster St. Leger; and we are of opinion that the three-year-olds of 1836 are an inferior annual sample: as far as relates to public performances, Bay Middleton must be placed at the head of the list; and it cannot be denied that there is no other test or criterion by which to judge a horse's powers half so good as that just mentioned; yet in the case of Bay Middleton, even this mode of mental decision presents a more than ordinary degree of qualifying consideration. Bay Middleton was eminently successful at Newmarket, but, before we allow him great merit for his performances at this celebrated place, we must look at the quality of the nags which came against him: if we except Elis, not one of them could assert the most remote claim to superiority; Elis might be regarded as a good average sort of nag, and Bay Middleton found extreme difficulty in beating him. Bay Middleton came out again on Epsom Downs, and carried off the Derby; but owing to the scandalously disgraceful manner in which the start for this stake was conducted, the chance of success was rendered very unequal, particularly in regard to Gladiator, who did not

get away till Bay Middleton, and the field generally, were something like one hundred yards in advance. And what is the consequence of such a state of things? Gladiator has the distance just mentioned to make up before he can get placed, and must very much increase his speed in order to accomplish this object; therefore while he is thus exerting himself, while he is subjecting his animal system, and particularly the lungs, to violent operation, Bay Middleton is going at his ease; and when at length he comes up, "the puff is taken out of him," in a great degree, while Bay Middleton, held together till this moment is ready to be let out "with all the go in him." Let us suppose for a moment, that the power and speed of Bay Middleton and Gladiator were equal, exactly on a par, we feel not the least hesitation in asserting that under the circumstances of the start for the Derby of the present year, the latter could have no chance of winning. We observed Robinson (rider of Bay Middleton,) as he rose the hill after the start, turn his head, and, as he observed the situation of Gladiator, a smile of confident satisfaction played on his countenance—he felt he held the race in his own hands.

The start for the Derby of 1836, reminded us of the start for the Doncaster St. Leger in 1827; in the last mentioned case, Mameluke, beyond all question the best horse of his year, could not be got off, for a considerable length of time, and in consequence of his bad start was ultimately beaten by Matilda. We do not mean to assert that the Athenian, (to whom is attributed the blame of causing the delay at the late Derby affair,) had he gone off kindly would have been the winner, although, he, as a two-year-old, ran very successfully; but he put aside the chance of Gladiator, as the rider of the latter, (W. Scott,) waiting for The Athenian, was evidently not aware the start was final, till the field had got to a very considerable distance. Chifney rode Mameluke (one of the very best tempered horses in the world) for the St. Leger, and was the owner (he and his brother at least,) of the unruly Athenian. Of all trainers living, there is not one who takes more care of his horses than John Scott; none who more anxiously or more accurately estimates the qualities of his adversaries, or places his nags with more acuteness of judgment, and that he felt tolerably confident of winning the Derby with Gladiator, we have not the least doubt, as he had reserved him for it; while the previous performances of this horse might be justly considered an excellent basis upon which to form such an opinion. Gladiator has been for some time the favourite for the Doncaster St. Leger, and, whatever may be the result, we feel confident he will be brought out for it in as good a form as possible.

For some weeks past the betting, which at this period of the year is generally so brisk upon the two leading events of Goodwood Races, has been remarkably dull, owing to the doubt or mystery which seems to envelope them: we allude, of course, to the Goodwood Stakes and the Goodwood Cup, which will have been decided by the time these remarks reach the eyes of our readers, though, as the Meeting in question does not commence till the 27th of July, we shall not be able to give the detail of them before our next number.

At Goodwood every thing is done with the greatest accuracy possible, and, in forming the various stakes, &c., the horses are brought more together perhaps than at any other Meeting in the kingdom. In the Goodwood Stakes, which, by the numerous subscriptions are swelled into such a rich prize, the quadrupedal candidates are handicapped with the greatest nicety. Rockingham is the favorite for these stakes, and it is intended by his owner to start him for them; the weight allotted him is 9st 12lb: Rockingham is a powerful horse, was the winner of the Great St. Leger in his year, trained on, and has been a successful racer; and, therefore, with this weight on his back, ought to win; he has not done too much work, was never overmarked, and is at this moment "as fresh as paint." Neither Bay Middleton nor Touchstone appear in the list for the Goodwood Stakes; and though Hornsea has accepted, and stands at what we consider not an unfavourable weight (9st 11lb) he is not expected to start, but will, in all probability, be reserved for the Cup. Ascot, who ran Mundig last year to a stand still for the Derby (Mundig could scarcely move five yards beyond the post, although the winner), and who ran unsuccessfully several times subsequently, is, nevertheless, a neat and a good little horse; he has been kept in reserve for some time, and as he is not overweighted for these stakes (8st 7lb), we should suppose he will come out for them. He ran too often last year, rather too much was "taken out of him," seeing that he was then only three years old. Silenus, the same age as Ascot, has been allotted 8 st. for these stakes; but it is generally understood that he will not appear for them, as he is named for the Cup also, where his chance is much more favourable, notwithstanding he will have one pound more to carry.

Silenus, it will be recollected, was a favorite for the Derby of 1835 for a short time, but sunk into nothingness before the day of starting; however, he appeared on Epsom Downs for it, and could neither go the pace nor the distance. He has done little since; we had lost sight of him for some time, and he seemed to be forgotten, when, lo! like a ghost emerging from a mist, he creeps into notice for the Goodwood Cup. As a maiden four-year-old, and not having been placed in the Derby or the St. Leger, he is entitled to a reduction of weight to the amount of fourteen pounds, so that he stands as favorable for the Cup as

possible; his weight for it is 8st 11lb, yet he is not the favorite: Hornsea, the same age, but carrying nine pounds more, forms the apex of the betting list. Should Rockingham win the Goodwood Stakes without distress, he will most likely start for the Cup: Touchstone will not come out for it, nor yet Bay Middleton, on account of the extra weight they would have to carry, the one for winning the Ascot Cup 7lb, the other for the Derby 8lb. Sheet Anchor, who had acquired a very good character, is understood to be amiss; his name has not been mentioned in the money market for some time.

Liverpool races commenced on the 19th inst.

Amongst the competitors for the Liverpool Trade Cup, appeared our old acquaintance Mundig, in nature "as true as steel;" but whose successful race for the Derby in 1835, we were of opinion, would ruin his future prospects as a racer, as our readers are very well aware: notwithstanding the evanescent success of this horse last September at Doncaster, our opinion remained unshaken; he comes out for the Cup in question, with a favourable weight on his back (8st 7lb), and could not get placed. Such must be the result of premature or overstrained exertions at a period of life when the bone has not acquired a mature solidity, the tendon and muscle the requisite development, hardness, and elasticity.

While penning this part of the present article, we received the account of the conclusion of Liverpool races, by which we find that General Chasse came out for the Stand Cup the next day but one after his defeat, and carried off the prize. The conditions of the Stand Cup being weight for age, was in favour of the General; while another circumstance attending it was still more favourable to him; he was met at the starting post by only Mundig and another; and therefore, in the language of the school, "had nothing to beat."

#### STATE OF THE ODDS:—

##### GOODWOOD STAKES, P. P.

4 to 1	agst Mr. Theobald's Rockingham
8 — 1	— Mr. Osbalde-ton's Rush
10 — 1	— Duke of Richmond's Pussy
10 — 1	— Jacob Faithful, by Langar
10 — 1	— Mr. Forth's Louisa
12 — 1	— Felix, by Sultan, out of Fortuna
20 — 1	— Lucifer, by Lottery.

Oak-apple will not start for the Goodwood Stakes.

##### GOODWOOD CUP, P. P.

5 to 2	agst Lord Chesterfield's Hornsea
6 — 1	— Sir E. Baker's Bran
10 — 1	— Lord Jersey's Silenus, whose starting for this Cup is doubtful.

##### DONCASTER ST. LEGER.

9 to 2	agst Lord Wilton's Gladiator
8 — 1	— Mr. Bird's Redshank
8 — 1	— Mr. Mostyn's Trapball
9 — 1	— Mr. Allanson's Culture
12 — 1	— Colonel Westem's Wedge
12 — 1	— Mr. Orde's Bee's Wing
30 — 1	— Mr. Dawson's Locomotive

A DURHAM COW,

the property of Mr. Strickland of Tewkesbury Gloucestershire exhibited at the Smithfield Show 1835

*Engraved by W. H. B. 1835*

Drawn by H. B. K.

# THE FARMER'S MAGAZINE.

SEPTEMBER, 1836.

No. 3.]

[VOL. V.

## THE PLATE.

THE DURHAM COW, of which an Engraving is given in this Number, was the property of Mrs. Strickland, of Tewkesbury, Gloucestershire: a Premium of Fifteen Sovereigns was awarded to her as being the Best Fat Cow. The animal was five years and one month old, was bred on the farm at Tewkesbury, and excited much attention, not only from her own merit, but as being the property of a Lady, whose reputation for the breeding of superior stock stands so high, and is so well known in the West of England.

## ON AGRICULTURAL CHEMISTRY.

BY THOMAS SHAPTER, M.D.

No. III.

“The deficiency among Agriculturists is not so much, perhaps, in experimental, as in scientific knowledge. It is without doubt true, that there may be, and indeed are, good practical farmers, who have but little pretensions to science: but it were too much to assert that even these, however good, might not become better; that they have reached the maximum of improvement; and already discovered the means of obtaining from Nature the utmost which it is in her power to bestow.”

In the previous paper on Agricultural Chemistry it was defined what manures were, and in what they differed from that class which it was thought judicious to term “amenders of the soil:” it was also pointed out in what manner they operate so as to alter and improve the nature of the ground to be manured: and, further, the application of these principles was entered upon in reference to vegetable matters: it was stated, that as certain vegetable products, much used in this country as manure, were largely composed of woody fibre, and which is endued with considerable powers of resistance, it was necessary, in order to render them of service to vegetation, to decompose it, by submitting them to a process of fermentation.

It has been shewn, by some very accurate analysis, that woody fibre contains relatively a larger proportion of carbon than the other vegetable principles, from which circumstance we infer its greater insolubility, as the smaller the proportion of this element the greater is the solubility of the compound. We are aware, from observing the process of fermentation, that during its operation oxygen is absorbed, and free carbon is evolved: it then becomes evident, by fermenting vegetable fibre we gradually diminish that element which forms its chief character, rendering it, in its altered condition, susceptible of being dissolved in water—thus becoming entitled to the term manure.

As all the condensed and solid parts of vegetables contain woody fibre, and which can only be rendered soluble in water by long fermentation, and as it is especially in the fibre that the carbon re-

sides, so necessary to vegetation, we cannot dispense with fermenting vegetable matter, in order to extract this element, so essential as a manure.

It may appear, from what has been now said, that the general practice of ploughing in certain green crops, in order to fatten the land, is injurious, which practice was much recommended when speaking of green crops in the previous paper: but it must be borne in mind that they are thus ploughed in, perhaps, before, or, at least, during the period of flowering, when the plant is albuminous;—the small proportion of fibre that is contained in them being but little formed, and soft, so that the heat and action of the water to which it is submitted in the ground are sufficient to its decomposition, which effect would not take place if the stem were dry, and drained of its juices by the formation of seed.

Sir H. Davy does not appear, however, convinced of the necessity of fermenting dry straws before they are employed, but rather addresses himself to the convenience of such a process. He obtained eight grains of matter soluble in water, of a brown colour, from four hundred grains of dry barley straw: wherefore he infers that there can be no doubt the straw of different crops, immediately ploughed into the ground, affords nourishment to plants; but that there is an objection to this method of using straw, from the difficulty of burying long straw, and from its rendering the husbandry foul. “When straw,” he observes, “is made to ferment, it becomes a more manageable manure; but there is likewise, on the whole, a great loss of nutritive matter. More manure is, perhaps, supplied for a single crop; but the land is less improved than it would be supposing the whole of the vegetable matter could be fairly divided and mixed with the soil.” It is upon this inference of waste that he deems it more economical to chop the straw, and keep it dry till it is ploughed in for the use of the crop, than to add it to the dung-heap for the sake of putrefaction, as in the former case its decomposition is much retarded, and thus its effects are more lasting.

The unmixed dung of quadrupeds may be turned in with the soil without inconvenience immediately it is removed from the stables: there are, indeed, those who think this may be done very advantageously; but it would appear that, by mix-

ing it with litter previously,\* and permitting some slight fermentation before laid upon the soil, it is of greater advantage, and certainly more profitable; as, by so doing, the growth is not likely to be rank—a fault which may occur from the pure dung; and the litter itself with which it is mixed becomes also a manure, from the fermentation that has ensued in consequence of the addition of the pure dung.

In conducting the process of fermentation, there are a few circumstances to be noticed by which it may be more effectual, producing a manure far richer and more beneficial than is ordinarily obtained; and certain precautions should be used, by which many inconveniences, attached to the ordinary mode, may be avoided.

The prevailing notion among farmers is to employ dung fully fermented; indeed many go so far as to permit the woody fibre to be perfectly destroyed, and the heap to have become cold. That this is wasteful and injurious there can be no doubt.

In place of the usual method of heaping up the mixed soil and litter in a great mass, and leaving it in such situation to putrify uncovered and exposed to the intemperance of the seasons, by which it is alternately rained upon and then acted on by the sun, a putrefactive process is rapidly established, and the gases so essential to agricultural produce are generated and evolved, and, in consequence of their great disposition to mingle with the atmosphere, are for ever dissipated.

Sir H. Davy arrives very confidently at the conclusions here laid down. He says that “a *slight incipient* fermentation is undoubtedly of use in the dunghill; for by means of it a disposition is brought on in the woody fibre to decay and dissolve when it is carried to the land or ploughed into the soil; and woody fibre is always in great excess in the refuse of the farm.” But so convinced is he that too great a degree of fermentation is prejudicial, that he affirms it to be better that no fermentation should ensue in the manure before used, than that it be carried too far; for such excess of fermentation destroys and dissipates the most useful parts of the manure. He supports this opinion by some strong facts, referring also to the experience of those who have practically adopted his views. So important and valuable is this to the farmer, that it must plead the excuse for quoting the following passage from the work of Sir H. Davy:—“In the writings of scientific agriculturists a great mass of facts may be found in favour of the application of farm-yard dung in a recent state. Mr. Young, in the *Essay on Manures*, adduces a number of excellent authorities in support of the plan. Many who have doubted have been lately convinced; and, perhaps, there is no subject of investigation in which there is such an union of theoretical and practical evidence. I have myself, within the last ten years, witnessed a number of distinct proofs on the subject.”

“I shall content myself with quoting that which ought to have, and which I am sure will have, the greatest weight amongst agriculturists. Within the last seven years (1812) Mr. Coke has entirely given up the system formerly adopted on his farm of applying fermented dung; and he informs me that his crops have been since as good as they ever were, and that his manure goes nearly twice as far.”

\* Or by the addition of that mineral so valuable to the farmer, viz., limestone, of which we shall speak further presently.

The experiments which this distinguished philosopher instituted, in proof of the above, are no less simple than they are conclusive: some hot fermenting manure, consisting principally of the dung of cattle and litter, is placed in a large retort; a receiver is adapted to the retort in a mercurial pneumatic apparatus, so that the condensable and elastic fluids disengaged might be collected. The results are thus detailed:—“The receiver soon became lined with dew, and drops began, in a few hours, to trickle down the sides of it. Elastic fluid likewise was generated: in three days thirty-five cubical inches had been formed, which, when analyzed, were found to contain twenty one cubical inches of carbonic acid; the remainder was hydro-carbonate, mixed with some azote, probably no more than existed in the common air of the receiver. The fluid matter collected in the receiver at the same time amounted to nearly half an ounce. It had a saline taste, and a disagreeable smell, and contained some acetate and carbonate of ammonia.

“The beak of another retort similarly filled with a very hot dung, was introduced beneath the earth against the roots of some grass: in the short space of a week an evident effect was produced, the grass growing with much more luxuriance than elsewhere.”

In order to obviate these different sources of loss, the farmer, instead of heaping up his mixture of dung and litter in a great mass, and leaving it to putrify uncovered and exposed to the intemperance of the seasons, should place it under the shelter of a shed, so as to be guarded both from the sun and rain: each clearing of the stable should be laid extended in a separate layer, and not thrown together in one heap. The beds thus formed of the separate layers should not be raised much more than two feet in height; and when the heat rages above 100°, or so high that smoke is evolved, making it evident the natural heat of the dung is being exhausted, the beds should be turned back, that this advanced stage of its decomposition may be retarded.

It may be laid down as a law, that the process of fermentation ought to be arrested when the straw commences to change to a brown colour, and when its tissue loses its consistence; for it is a certain mark that the fibrous texture of the vegetable matter is becoming broken down, when the manure becomes perfectly cold. These effects are to be arrested either by undoing and spreading the bed, so as to increase the extent of surface, and thus moderating the rapidity of the putrefaction, as above observed; or by mixing with it earth, rubbish, grass, &c.; or else by carrying it at once to the fields and burying it.

When the dung has but very little consistence—that is, contains but a very small proportion of fibrous material, as is the case with the dung of the fat horned cattle during the spring and autumn,—it ought immediately to be employed; for when its composition is of this soft nature, its decomposition soon ensues, and its heat, which in the first place is very great, is rapidly exhausted. Should it, however, be inconvenient to employ it immediately, a somewhat similar course should be resorted to as recommended above, when the ordinary heap of litter and manure had arrived at the condition to be retarded, viz., that of mixing it with earths and other dry and porous materials; such are to be particularly employed as may be likewise amenders of the soil of which the land is composed to which the dung is destined.

The present prevailing mode amongst farmers

cannot but be highly wasteful of the beneficial particles of manure. In almost all farm-yards the dung and litter, as taken from the stables, is exposed in high-piled heaps to the changes of the climate. The moisture and the warmth eliminates the natural heat of the dung, and the rain carries with it the salts, the urine, and all the soluble juices; and a collection of the most nourishing of its juices is formed at the bottom of the bed, which are thus lost to all agricultural uses. As fermentation proceeds, new soluble compounds are formed, which in their turn are dissipated; so that by degrees all the nutriment and stimulant principles of the manure are lost, and there remains only the "feeble" mixture, which is of no effect.

To remedy as much as is possible these effects, independent of the covered shed, a well or ditch should be formed, into which all the fluids running from the dung-pit may be received, so as at once to use them on the fields. Chaptal proposes that a large hogthead on a small carriage should be employed, and which may be filled from the reservoir. On its utility he says, "It produces wonderful effects the second year, when it is used after the mowing."

To be enabled to decide the question as to causing or not causing the litter of the dung-heap to ferment, it is necessary to know somewhat of the composition of the ground to be manured. If the lands be compact, argillaceous, and cold, the less the dung is fermented the better: for two good effects are then produced—the first that of enriching the soil, moving it, and rendering it more permeable to air and water; the second that of heating it during the successive stages of decomposition and fermentation. If, however, on the other hand, the soil should be light, porous, calcareous, and hot, the *quick* dungs are preferable, since they heat less and bind better, and, in place of laying open the soil, already too porous, to the filtering of the water, it tends to moderate its free passage. A long experience is necessary, however, to perfect such observations, but when it is required to apply manure to soils of different composition, we should bear in mind the more general principles.

The manure from animals bearing wool are the most hot; that of the horse comes next; those of cows and oxen are the least hot of all.

Animal substances, whether they be solid or fluid, alter more rapidly than vegetable. As a general law it may be stated, the less the quantity of earthy salts, the more rapid is the progress of decomposition: their putrefaction produces ammoniacal gas in great abundance. It is this result which particularly distinguishes them from vegetable matter, whose decomposition only gives place to the formation of this gas when they contain in their composition some small portion of albumen. It is especially to the development of this gas, there is every reason to believe, that the very beneficial results arising from the application of some dry animal substances is of such advantage, as will shortly be pointed out.

After the mixed dung of which we have spoken, the urine of horned cattle and horses forms the most abundant manure that can be procured for agriculture; and it is not without regret that we witness every day the little trouble taken to preserve it.

There are few animal substances whose composition varies so much as that of urine;—the nature of the food, and the state of health, produce

great differences. As animals graze upon plants more or less dry or watery, they yield more or less urine, which is more or less charged with salts:—those nourished by a dry forage make less than those nourished by fresh herbage, but the former are more saline than the latter. Urine which is made immediately after drink is less animalised than that which has been long secreting. These circumstances explain the little accordance of the analysis of this secretion by different chemists.

Sir H. Davy observes, that urine is the manure on which the greatest number of chemical experiments have been made, and the nature of which is best understood.

The urine of the cow contains, according to the experiments of Mr. Brand—

Water.....	65	Sulphate of potassa..	6
Phosphate of lime...	3		
Muriates of potassa and ammonia }	15	Carbonates of potassa and ammonia.....	4
Urea.....			

The urine of the horse, according to Vanquelin and Fourcroy, contains—

Carbonate of lime....	11	Muriate of potassa..	9
Carbonate of soda....	9	Urea.....	7
Benzoate of soda....	24	Water and mucilage.	940

We may see, from these analyses, that the urines of different animals vary considerably; but that there is this one leading feature—that all the salts they contain can pass into the plants with the fluid that holds them in solution, when the animal arrangement may become dissolved, as is the case with the urea, which is alike easy of solution and easy of decomposition.

On the other hand, however, there are some principles contained in the urine which the digestive organs of the vegetable have not the power of decomposing;—such are the phosphates of lime, the muriates and sulphates of potass:—these serve only to excite and stimulate the organs; but we must regard the urea, mucilage, uric acid, and other animal matters, as eminently nutritive.

Urine, as immediately made from the animal, cannot be employed as a manure: it would act with too much force, and would dry up the plant. It is necessary to dilute it with water, or to leave it to ferment.

Urine is of great service in moistening those substances of which the composts are formed: it augments their fertilizing qualities, and facilitates the fermentation of those which it is necessary to decompose to render them available for the nutrition of the plant. It is also of use combined with plaister, chalk, &c., and in this mode forms very active manures, especially when applied to cold lands.

Bones, in the present day, have become an object of great consideration to the farmer. This portion of the animal frame is in great measure composed of phosphate of lime and gelatine. The bones which are for the most part employed contain equal proportions of these substances. We obtain from the bones of oxen from fifty to fifty-five per cent. of gelatine; from those of the horse thirty-six to forty; from those of the hog forty-eight to fifty. The less compact the tissue of the bone, and the younger the animal, the greater is the proportion of gelatine. The bones of the fect of the elk, of the stag, of the roe, of the hare, yield, on analysis, eighty to ninety per cent. of the phosph

In order to employ bones advantageously as a

manure, they should, if not ground, be broken into small pieces, then heaped together, and left till a commencing of fermentation ensues: this is known by the formation of the penetrating odour of ammonia that prevail. The heap should then be thrown down, and the material composing it be scattered in the earth; or it may be mingled with the grain and harrowed in with it; or if the grain be sown in a furrow, it is well to line the furrow with it.

In some countries, especially in France, the fat and gelatine is extracted from the bones by boiling water, before sold to the agriculturists; but by this operation they are deprived of the greater portion of their fertilizing virtue.

Chaptal says that he has observed with care what takes place when the bruised bones are undergoing fermentation—that the heap becomes covered on its surface by a layer of slight, unctuous, acrid, and pungent matter, which appears to be formed of a combination of gelatine with ammonia, which is developed by the decomposition of all the animal matters. The same general laws will apply to the application of bones as a manure, as to the dung manures that have been spoken of, as regards the utility of their being fermented; so that if they are employed without this process being commenced, the gelatine is but slowly decomposed, and though the same result eventually is produced, a longer time is required.

Besides the efficacy of bones by decomposition of the principles, we may suppose some beneficial results to accrue from the water of the soil dissolving by little and little the gelatine, and transmitting it unchanged through the organs of the plant. Whether we consider the utility of bones as referable simply to a nutrient power, or under the double relation of nutrient and stimulant, it is evident that their action is very powerful in forwarding vegetation.

## TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—Perhaps some may have hoped that the various excuses for troubling the public with the treatment which has been adopted with success in remedying the various diseases to which cattle are subject, had been exhausted, but at least from those which remain I deem might be a most important selection, viz. that there has not as yet appeared any continued series of papers descriptive of the varied diseases which now exist, and are, I fear from improper management, daily increasing in cattle of every description, in a publication of such extensive agricultural circulation as THE FARMER'S MAGAZINE. This deficiency is more apparent, since it appears particularly adapted for the circulation of such information, however limited in extent, as it is the intent of these papers to convey; it is therefore with intention of remedying this deficiency in your columns I propose to forward to you for publication a monthly paper, in which it shall be my endeavour to describe in the most comprehensive manner the symptoms which, from practical observation, I have found most general and decided, and the remedies which I have found in a like manner the most advantageously exhibited. I wish it also to be understood, I would divest these papers of those technicalities, which render any information, however accurately expressed, comparatively speaking, of little service. The agriculturist is the person whom it is my wish to benefit, and it therefore behoves me to express myself in such a

manner as may be most easily understood by that body generally; and here let me remark, that if from the perusal of these papers any individual of that highly intelligent body of men derives any assistance in the management of his stock, so far as remedying disease is concerned, the author of these papers will be amply remunerated, and the end for which he has placed them before the public attained.

Mr. White remarks in his introduction to the Compendium of Cattle Medicine, page 29, "Every farmer may easily make himself competent to prescribe for his own cattle, and ought to do so." Be it then my pleasing task to render the agriculturist less liable to the imposition and injurious effects arising from the receipts of the druggist and the ignorance of the cow-leach. It will not require much depth of reasoning on my part to prove the perfect inability of these two personages to prescribe, or rather administer, to the animal with advantage; the one to the hurried message of most probably a boy who has been dispatched to the druggist's for a drench, mixes a nostrum which has been transmitted from generation to generation, and which is "to be given in a quart of good ale." Now it is ten to one that the beast is labouring under a violent inflammatory attack, of the nature of which he is altogether ignorant; and what is therefore the consequence? the inflammatory action is increased; fuel is added to the already strongly excited system. The only time when a proper remedy might have been applied with advantage, nay certainty, is passed; and when the veterinary surgeon is called in, he generally finds all over. These losses are attended with a serious inconvenience to the farmer. The animal is most liable to these attacks when in a thriving condition: hence the seriousness of the loss. A word of the cow-leach. It is, perhaps, presumption in me, to endeavour to deteriorate from the universality of talent combined in the person of this individual,—he is very often blacksmith, farrier, "cow-doctor," and not unfrequently clerk to the parish church,—that is to say, if there is one in his village. This universality of talent extends still further; he is consulted by all the children and dames in the parish for applications to cuts, scalds, &c. for the cure of which he possesses a sovereign panacea. I have given this short but, I trust, impressive description of the cow doctor, feeling that it will prove a stronger argument than any I can adduce, in proving in utter incapability, both by nature and education, of this individual to apply such remedies to the diseases of cattle as the urgency of the case may require. He is perfectly ignorant of the law of nature, by which vascular action may be reduced by sedatives; of the effects arising from a disordered state of the digestive organs, and consequently of the means to be used for the removal of the cause,—of the different stages of inflammatory fever,—in fact of every thing which it is necessary to know, or requisite to practice. To whom, therefore, is the farmer to look for assistance? Veterinary surgeons (I allude to such as have undergone the routine of the Veterinary College, &c.) it is true, are qualified by education and practical information, to administer the most advantageous remedies, but the great distance at which in a number of cases they reside from the farmer, renders their knowledge useless, from the very want of a subject whereon to exercise it; for when he arrives, he, generally, either finds the animal dead, or the disorder to have reached such a stage as to preclude the possibility of a recovery. To whom then, I repeat, is the farmer to look for assistance? The answer is plain enough—To himself; "he may easily

make himself competent to prescribe for his own cattle, and ought to do so." There cannot be a more mistaken notion than the supposition that a thorough knowledge of the nature and properties of all drugs is necessary to enable the farmer to become *bonâ fide* his own veterinary surgeon; no such extensive knowledge is at all necessary, it is by far the least important part of his task; the consideration of the cause which produces those manifest effects which we term disease, will invariably point out the remedy to be applied for its removal. I have mentioned this from having frequently heard farmers urge as an excuse, for not superintending this important branch of farming economy, "their ignorance of drugs." Now observe his (the farmer's) consistency. He places the management of these valuable animals, in the hands of a man, who, if he were questioned, would be unable to explain the medicinal properties of any one drug in the whole Pharmacopœia; and why does he so place it? Because, forsooth, he (the farmer) is "ignorant of drugs." This is really too ridiculous, and be it told to the shame of the agriculturists of England, of the nineteenth century, it exists (when candidly considered) to an alarming extent. Nothing is more easily overcome than this apparently difficult task; nearly all the diseases of Horned Cattle arise from one cause, viz:—indigestion. Knowing this we can easily apply the remedy, which of course will vary with the manifest effects; but I will not contemplate myself, this shall appear under its proper head. It is certainly necessary he should have a few medicines in his possession, but much more depends on their judicious selection and administration, than on their number.

I might urge, as additional excuse for the publication of these papers, the endeavour to counteract the ill effects which have arisen from the circulation of such ridiculous publications as "Chater's Cattle Doctor," and many others I could name. These works have a most pernicious tendency, emanating as they do from the most eminent "Cow Doctors," their formulas are received with implicit belief, however positively absurd they may be.

I hope I may, without presumption, express a conviction of the benefits that will result to the farmer from the mode of treatment which I shall recommend, simple it may be, but on this very simplicity is grounded the conviction I express. It is not to be supposed the agriculturist can devote his time to the study of anatomy, strictly speaking; but at the same time I would advise every one in such cases as those in which, either from their general fatal termination, or any other cause, the remedies are found unavailable (for it would be ridiculous to suppose that in *all* cases either the farmer, or any one else, could save the animal) the death of the animal follows—his attending at the opening of it, and by carefully examining every part, discover (which he easily will do) the exact seat of the disease; or if a general one, the primary cause of its being so. By so doing, and comparing the idea he had previously formed of its nature, he will attain by far the most important part of the knowledge it is necessary he should possess; he will ascertain how far the effect is dependent on the cause, and the reason of different effects being manifest as the disease extends or abates its influence; and lastly, he will ascertain the *positive* cause of the death of the animal. All this may be easily acquired without any anatomical knowledge; perseverance, industry, and minute observation, are all that is necessary; the first, from its evident necessity in inducing us to prosecute our search unregardless of

the many apparently inconsistencies which will present themselves; the second, because however good our natural abilities may be, without diligence it is impossible to apply them with advantage; the last, from its making apparent, that which by mere casual observation we might deem unattainable. In drawing this my first paper, to a close, let me earnestly entreat the farmers of Great Britain seriously to consider the fallacy, the inconsistency of the plan which numbers of them are pursuing; they are committing by far the most valuable part of their farming stock to the management of persons ignorantly bigoted, in pursuing a mode of treatment, which is evidently ridiculous. The personal superintendance of the farmer, in the veterinary department, is attended with another advantage which I have not mentioned, viz:—that from his having the opportunity of seeing the animal immediately after it is attacked, he must necessarily possess a threefold advantage over even the veterinary surgeon, by his ability to exhibit such remedies as are desirable, and then check the growth of the disease in its infancy. With these remarks I therefore close my paper, and propose commencing No. 1 of a series of papers on "The Diseases of Cattle Generally," in your next monthly publication, to which this will form an introduction. Your obedient servant,

Aug. 8th, 1836.

AGRICOLA.

## OF MONEY AS A MEDIUM OF EXCHANGE.

BY CHARLES BABBAGE, ESQ., LUCASIAN PROFESSOR OF MATHEMATICS IN THE UNIVERSITY OF CAMBRIDGE.

In the earlier stages of societies the interchange of the few commodities required was conducted by barter; but as soon as their wants became more varied and extensive, the necessity of having some common measure of the value of all commodities—itsself capable of subdivision—became apparent: thus money was introduced. In some countries shells have been employed for this purpose; but civilised nations have, by common consent, adopted the precious metals. The sovereign power has, in most countries, assumed the right of coining; or, in other words, the right of stamping with distinguishing marks, pieces of metal having certain forms and weights, and a certain degree of fineness: the marks becoming a guarantee, to the people amongst whom the money circulates, that each piece is of the required weight and quality.

The expense of manufacturing gold into coin, and that of the loss arising from wear, as well as of interest on the capital invested in it, must either be defrayed by the state, or be compensated by a small reduction in its weight, and is a far less expense to the nation than the loss of time and inconvenience which would arise from a system of exchange or barter.

These coins are liable to two inconveniences: they may be manufactured privately by individuals, of the same quality, and similarly stamped; or imitations may be made of inferior metal, or of diminished weight. The first of these inconveniences would be easily remedied by making the current value of the coin nearly equal to that of the same weight of the metal; and the second would be obviated by the caution of individuals in examining the external characters of each coin, and partly by the punishment inflicted by the state on the perpetrators of such frauds.

The subdivisions of money vary in different countries, and much time may be lost by an inconvenient system of division. The effect is felt in keeping extensive accounts, and particularly in calculating the interest on loans, or the discount upon bills of exchange. The decimal system is the best adapted to facilitate all such calculations; and it becomes an interesting question to consider whether our own currency might not be converted into one decimally divided. The great step, that of abolishing the guinea, has already been taken without any inconvenience, and but little is now required to render the change complete.

If, whenever it becomes necessary to call in the half-crowns, a new coin of the value of two shillings were issued, which should be called by some name implying a unit (a Prince, for instance), we should have the tenth part of a sovereign. A few years after, when the public were familiar with this coin, into one hundred instead of ninety-six farthings; and it would then consist of twenty-five pence, each of which would be four per cent. less in value than the former penny. The shillings and sixpences being then withdrawn from circulation, their place might be supplied with silver coins, each worth five of the new pence, and by others of ten pence, and of two pence halfpenny; the latter coin, having a distinct name, would be the tenth part of a Prince.

The various manufactured commodities, and the various property possessed by the inhabitants of a country, all become measured by the standard thus introduced. But it must be observed that the value of gold is itself variable; and that, like all other commodities, its price depends on the extent of the demand compared by that of the supply.

As transactions multiply, and the sums to be paid become large, the actual transfer of the precious metals from one individual to another is attended with inconvenience and difficulty, and it is found more convenient to substitute written promises to pay on demand specified quantities of gold. These promises are called bank notes; and when the person or body issuing them is known to be able to fulfil the pledge, the note will circulate for a long time before it gets into the hands of any person who may wish to make use of the gold it represents. These paper representatives supply the place of a certain quantity of gold; and, being much cheaper, a large portion of the expense of a metallic circulation is saved by their employment.

As commercial transactions increase, the transfer of bank notes is, to a considerable extent, superseded by shorter processes. Banks are established, into which all monies are paid, and out of which all payments are made, through written orders called checks, drawn by those who keep accounts with them. In a large capital, each bank receives, through its numerous customers, checks payable by every other; and if clerks were sent round to receive the amount in bank-notes due from each, it would occupy much time, and be attended with some risk and inconvenience.

**CLEARING HOUSE.**—In London this is avoided, by making all checks paid in to bankers pass through what is technically called "*The Clearing House.*" In a large room in Lombard-street, about thirty clerks from the several London bankers take their stations, in alphabetical order, at desks placed round the room; each having a small open box by his side, and the name of the firm to which he belongs in large characters on the wall

above his head. From time to time other clerks from every house enter the room, and, passing along, drop into the box the checks due by that firm to the house from which this distributor is sent. The clerk at the table enters the amount of the several checks in a book previously prepared, under the name of the bank to which they are respectively due.

Four o'clock in the afternoon is the latest hour to which the boxes are open to receive checks; and at a few minutes before that time, some signs of increased activity begin to appear in this previously quiet and business-like scene. Numerous clerks then arrive, anxious to distribute, up to the latest possible moment, the checks which have been paid into the houses of their employers.

At four o'clock all the boxes are removed, and each clerk adds up the amount of the checks put into his box and payable by his own to other houses. He also receives another book from his own house, containing the amounts of the checks which their distributing clerk has put into the box of every other banker. Having compared these, he writes out the balances due to or from his own house, opposite the name of each of the other banks; and having verified this statement by a comparison with the similar list made by the clerks of those houses, he sends to his own bank the general balance resulting from this sheet, the amount of which, if it is due from that to other houses, is sent back in bank notes.

At five o'clock the Inspector takes his seat; when each clerk, who has upon the result of all the transactions, a balance to pay to various other houses, pays it to the Inspector, who gives a ticket for the amount. The clerks of those houses to whom money is due, then receive the several sums from the Inspector, who takes from them a ticket for the amount. Thus the whole of these payments are made by a double system of balance, a very small amount of bank notes passing from hand to hand, and scarcely any coin.

It is difficult to form a satisfactory estimate of the sums which daily pass through this operation; they fluctuate from two millions to perhaps fifteen. About two millions and a half may possibly be considered as something like an average, requiring for its adjustment, perhaps 200,000*l* in bank notes and 20*l* in specie. By an agreement between the different bankers, all checks which have the name of any firm written across them must pass through the clearing-house; consequently, if any such check should be lost, the firm on which it is drawn would refuse to pay it at the counter; a circumstance which adds greatly to the convenience of commerce.

The advantage of this system is such, that two meetings a day have been recently established—one at twelve, the other at three o'clock; but the payment of balances takes place once only, at five o'clock.

If all the private banks kept accounts with the Bank of England, it would be possible to carry on the whole of these transactions with a still smaller quantity of circulating medium.

In reflecting on the facility with which these vast transactions are accomplished—supposing, for the sake of argument, that they form only the fourth part of the daily transactions of the whole community—it is impossible not to be struck with the importance of interfering as little as possible with their natural adjustment. Each payment indicates a transfer of property made for the benefit of both parties; and, if it were possible, which

it is not, in place, by legal or other means, some impediment in the way which only amounted to one-eighth per cent., such a species of friction would produce a useless expenditure of nearly four millions annually: a circumstance which is deserving the attention of those who doubt the good policy of the expense incurred by using the precious metals for one portion of the currency of the country.

One of the most obvious differences between a metallic and a paper circulation is, that the coin can never, by any panic or national danger, be reduced below the value of bullion in other civilised countries; whilst a paper currency may, from the action of such causes, totally lose its value. Both metallic and paper money, it is true, may be depreciated, but with very different effects.

**DEPRECIATION OF COIN.**—The state may issue coin of the same nominal value, but containing only half the original quantity of gold, mixed with some cheap alloy; but every piece so issued bears about with it internal evidence of the amount of the depreciation: it is not necessary that every successive proprietor should analyse the new coin; but a few having done so, its intrinsic worth becomes publicly known. Of course the coin previously in circulation is now more valuable as bullion, and quickly disappears. All future purchases adjust themselves to the new standard, and prices are quickly doubled; but all past contracts also are vitiated, and all persons to whom money is owing, if compelled to receive payment in the new coin, are robbed of one-half of their debt, which is confiscated for the benefit of the debtor.

**DEPRECIATION OF PAPER.**—The depreciation of paper money follows a different course. If, by any act of the government, paper is ordained to be a legal tender for debts, and, at the same time, ceases to be exchangeable for coin, those who have occasion to purchase of foreigners, who are not compelled to take the notes, will make some of their payments in gold; and if the issue of paper, unchecked by the power of demanding the gold it represents, be continued, the whole of the coin will soon disappear. But the public, who are obliged to take the notes, are unable, by any internal evidence, to detect the extent of their depreciation; it varies with the amount in circulation, and may go on till the notes shall be worth little more than the paper on which they are printed. During the whole of this time every creditor is suffering to an extent which he cannot measure; and every bargain is rendered uncertain in its advantage, by the continually changing value of the medium through which it is conducted. This calamitous course has actually been run in several countries: in France it reached nearly its extreme limit during the existence of assignats. We have ourselves experienced some portion of the misery it creates; but by a return to sounder principles, have happily escaped the destruction and ruin which always attends the completion of that career.

Every person in a civilised country requires, according to his station in life, the use of a certain quantity of money, to make the ordinary purchases of the articles which he consumes. The same individual pieces of coin, it is true, circulate again and again, in the same district; the identical piece of silver, received by the workman on Saturday night, passing through the hands of the butcher, the baker, and the small tradesman, is, perhaps, given by the latter to the manufacturer in exchange for his check, and is again paid into the

hands of the workman at the end of the succeeding week. Any deficiency in this supply of money is attended with considerable inconvenience to all parties. If it be only in the smaller coins, the first effect is a difficulty in procuring small change; then a disposition in the shop-keepers to refuse change unless a purchase to a certain amount be made; and, finally, a premium in money will be given for changing the larger denominations of coin.

Thus money itself varies in price, when measured by other money in larger masses: and this effect takes place whether the circulating medium is metallic or of paper. These effects have constantly occurred, and particularly during the late war; and, in order to relieve it, silver tokens for various sums were issued by the Bank of England.

The inconvenience and loss arising from a deficiency of small money fall with greatest weight on the classes whose means are least; for the wealthier buyers can readily procure credit for their small purchases, until their bill amounts to one of the larger coins.

As money, when kept in a drawer, produces nothing, few people, in any situation of life, will keep, either in coin or in notes, more than is immediately necessary for their use; when, therefore, there are no profitable modes of employing money, a superabundance of paper will return to the source from whence it issued, and an excess of coin will be converted into bullion and exported.

Since the worth of all property is measured by money, it is obviously conducive to the general welfare of the community, that fluctuations in its value should be rendered as small and as gradual as possible.

The evils which result from sudden changes in the value of money will perhaps become more sensible, if we trace their effects in particular instances. Assuming, as we are quite at liberty to do, an extreme case, let us suppose three persons, each possessing a hundred pounds: one of these, a widow advanced in years, and who, by the advice of her friends, purchases with that sum an annuity of twenty pounds a year during her life: and let the two others be workmen, who, by industry and economy, have saved a hundred pounds out of their wages; both these latter persons proposing to procure machines for calendering, and to commence that business. One of these invests his money in a Savings' Bank; intending to make his own calendering machine, and calculating that he shall expend twenty pounds in materials, and the remaining eighty in supporting himself and in paying the workmen who assist him in constructing it. The other workman, meeting with a machine which he can buy for two hundred pounds, agrees to pay for it a hundred pounds immediately, and the remainder at the end of a twelvemonth. Let us now imagine some alteration to take place in the currency, by which it is depreciated one-half; prices soon adjust themselves to the new circumstance, and the annuity of the widow, though nominally of the same amount, will in reality, purchase only half the quantity of the necessaries of life which it did before. The workman who had placed his money in the Savings' Bank, having perhaps purchased ten pounds worth of materials, and expended ten pounds in labour applied to them, now finds himself, by this alteration in the currency, possessed nominally of eighty pounds, but in reality of a sum which will purchase only half the labour and materials required to finish his machine; and

he can neither complete it, from a want of capital, nor dispose of what he has already done in its unfinished state for the price it has cost him. In the mean time, the other workman, who had incurred a debt of a hundred pounds in order to complete the purchase of his calendering machine, finds that the payments he receives for calendering, have, like all other prices, doubled, in consequence of the depreciation of the currency; and he has, therefore, in fact, obtained his machine for one hundred and fifty pounds. Thus, without any fault or imprudence, and owing to circumstances over which they have no control, the widow is reduced almost to starve; one workman is obliged to renounce for several years, his hope of becoming a master; and another, without any superior industry or skill, but, in fact, from having made, with reference to his circumstances, rather an imprudent bargain, finds himself unexpectedly relieved from half his debt, and the possessor of a valuable source of profit; whilst the former owner of the machine, if he also has invested the money arising from its sale in the Savings' Bank, finds his property suddenly reduced one-half.

These evils, to a greater or less extent, attend every change in the value of the currency; and the importance of preserving it as far as possible unaltered in value, cannot be too strongly impressed upon all classes of the community.

## TO THE EDITORS OF THE IRISH FARMER'S AND GARDENER'S MAGAZINE.

GENTLEMEN—I have observed with great concern that there has been in several parts of Ireland this year, a partial failure in the potatoe crop, and, moreover, that the failure is not confined to Ireland, as I have just received from an intelligent Scotch friend, of the highest respectability, and who has devoted much attention to the improvement of agriculture, the following communication:—"We are suffering grievously in Scotland, by a taint or disease in our potatoe crop. Every year this pestilential disease is spreading wider and wider its devouring ravages." And my friend expresses a hope that I am continuing the experiments which I had set on foot to discover the cause of the fatal malady.

I fully expected that the valuable information contained in the Essays "On the failure of the Potato Crop, and the best means of averting a recurrence of the evil," which obtained the premiums offered in 1834, by the Royal Dublin Society, and by the Agricultural Society of Ireland, would have proved effectual; and I feel confident that such would have been the case, if proper attention had been paid to those precautionary measures which were recommended. I sincerely hope that the authors of those essays have continued their researches, and will, as early as they may find it convenient, favour the public with their further remarks—meantime as an appendix to one of those essays, contains the results of some experiments which I made, I beg to submit to you some observations with reference thereto, and am chiefly induced to do so, from the conviction I feel that a *proper selection of potatoes for seed in autumn, and a careful preservation of them during winter*, are indispensable preliminaries in order to secure a good crop the ensuing year—and when it is considered that the greatest attention is be-

stowed by a succession of imported seed, to improve, or at all events to keep from deterioration, the various species of grain, it seems not a little extraordinary that the culture of potatoes should have been generally neglected to a degree almost sufficient to invite annihilation.

[The communication referred to by our esteemed correspondent is of so much importance at this time that we reprint it.—CONDUCTORS.]

Dublin, December 9th, 1831.

I purchased last March 30 cwt. of the most promising Scotch pink-eye-potatoes I could procure at the quays. A near relative procured from the same vessel, and at the same time, 10 cwt. and had them cut in the usual manner, and planted immediately, and they produced a good crop.

As my ground was not ready for planting, the 30 cwt. of potatoes I purchased were laid up in a heap on a boarded floor for about a fortnight, after which time as much of them was cut each morning as sufficed for the planting of the day; and the small potatoes were put aside by my desire from day to day, in order to be planted entire afterwards.

The ground allotted for the potatoes was rather less than an acre and a quarter Irish, was well manured, and seventy drills were opened therein. The cut potatoes were planted in sixty-nine drills, and the small whole potatoes were planted afterwards in the seventieth drill. A week elapsed between the planting of the first of the cut potatoes and the planting of the whole potatoes. The sixty-nine drills proved nearly a failure; nevertheless I suffered such plants as appeared to remain, and had mangel wurzel sown in the vacant spaces. The result of the potatoe crop was, that the sixty-nine drills of cut potatoes produced sixteen sacks, or about 32 cwt of potatoes, and the seventieth drill three and a half sacks, in about 7 cwt. so that, whilst the sixty-nine drills of cut potatoes produced little more than the quantity of seed planted, the seventieth drill of whole potatoes yielded at the rate of nearly twenty tons per acre.

I had for some time been of opinion, that the partial failure of the potatoe crop complained of more or less for the last few years, and particularly where the seed had been imported, had arisen from the potatoes not having been properly matured in consequence of late planting, from their having heated in the pits where they were deposited, or in the vessel, or from exhaustion by vegetation previous to planting; and I was desirous to ascertain whether a security could be found in planting the whole potatoe, and the result of the experiment warrants the inference that unless the vegetating principle be destroyed, this plan may with confidence be adopted.

The failure in the present instance I consider to have arisen in consequence of the potatoes having been so much exhausted by vegetation, and perhaps by partial heating, as not to have had sufficient stamina to vegetate properly or generally when cut; for it may be observed that decay commences on the cut side, and extends to and destroys any roots that may have been formed, should they not have acquired sufficient strength and become independent of the parent set.

Some persons have supposed that the old kinds of potatoes have degenerated, and that security can only be found in the introduction of new sorts; but I made an experiment nearly similar to that I have described with a new variety of potatoe recently imported from South America. I considered this description to be a late potatoe; but early in April, on opening a pit in which a quantity of them were

deposited, I found they had vegetated in a considerable degree. I had a quantity of them in this state cut and planted, taking care not to plant the bottom part of those potatoes—having observed that this part did not vegetate the preceding year. The yield of these potatoes was inconsiderable, both as to size and quantity; but the produce from the remainder of these potatoes which were planted whole, (but not until a fortnight afterwards,) was such, as to realize all I had heard of the productiveness of this species; and as to size, some of them were from four to five pounds in weight.

As a proof of the dependence that may be placed even in the smallest potatoes, if sound and planted entire, I have to mention, that observing some potato plants to appear on ground which had been under potatoes last year, I had forty-eight of these plants transplanted on a small piece of ground, containing three-sevenths of a perch; eight of the smallest of these plants, some of them proceeding from potatoes less than that a marble, were placed by themselves.

The 8 plants produced 12 lbs. of potatoes.  
The 40 do. do. 43 lbs. do.

48 plants produced 55 lbs. being at the rate of 128 lbs. per perch.

These were cup potatoes, and the produce was, under the circumstances, considerable, and would have been greater, but the larger plants were injured by the wind; to which may be attributed their not having being so productive as the smaller ones. Cases may occur when it may be found useful to resort to the transplanting of potatoe plants, and particularly if effectual means shall not be discovered to prevent failures in the crop. But I feel confident that if proper attention be paid to the selection of good matured seed, to its preservation during the winter, and to the timely planting of the respective kinds, at that period which nature points out by the appearance of vegetation—that crops as good as any we have heretofore had may be expected from proper culture, even although the practice of cutting the seed be persevered in in such cases. But if all the circumstances referred to do not apply to the seed at the time of planting, the best security against a failure will be found in planting the whole potatoe. I entertain, however, sanguine expectations, that the most favourable results will arise from the researches which have been instituted, and from the great interest the subject has excited, and consider that so far from a diminution in the produce of this valuable root a great increase may be looked for, if due attention be paid to the treatment of potatoes intended for seed, and if the planting of the entire potatoe be adopted. As a certain mode of procuring good sound seed, I would strongly recommend that a quantity of potatoes be every year raised from the seed of the most approved kinds. I had this year from a perch of ground under seedlings of the white apple and pink-eyed species, 102 lbs. of potatoes, which I confidently expect will next year yield me from one to two tons of potatoes, superior for the purpose of seed for the following year to any I should be able to procure.

It will be perceived by the statement referred to that 30 cwt. of Scotch pink-eye potatoes were planted in seventy drills, whereof the sixty-nine drills under cut potatoes produced but 32 cwt. whilst the seventieth drill under small whole potatoes produced 7 cwt. All these were suffered to remain in the ground until they were perfectly ripe, and were then properly secured in a pit as seed for the following year.

The large South American potatoes alluded, and

the seedlings also were suffered to mature, and were likewise preserved for seed.

The experiments of 1834 having thus proved that the planting of the whole potato ensured a good crop in cases where a failure would otherwise have occurred, I caused the above 39 cwt., the produce of Scotch seed, as well as 50 cwt. of actual Scotch seed purchased at the Quay, to be planted in March, 1835, without having been cut. They were however sorted, and a number of drills of large and of small potatoes were alternately planted, in order to ascertain the produce from the respective sizes. All these potatoes gave a good crop, and there was not any perceptible difference in the yield of the Scotch or Irish seed; or of the large or small potatoes. But on the potatoes being dug there was not any trace of the Scotch seed, whilst the Irish was in many instances so sound, after having performed its functions, that although it was far advanced in autumn, I planted some under the impression that it would again vegetate. A few failures occurred in the Scotch seed, and on searching for the cause, it was found that the potatoe had been cut by the spade or plough; and from this circumstance it may be inferred, that had these potatoes been cut, a general failure would have been the consequence. The South American potatoes were planted whole in the spring, as soon as they showed signs of vegetation, and in alternate drills of large and small; and here, also, there was not any perceptible difference between the growth and produce of the large and small seed. I had kept in the house one potato of this description, of a remarkable shape, and weighing 5lbs. This was cut into ten pieces, all of which vegetated so luxuriantly that the plants could not have been distinguished from the rest had they not been particularly marked; and it thus appeared, that this variety, if properly matured and preserved, may with safety be cut, if planted at the proper season: and having found this description very productive, and although large, yet of good quality, I left a considerable quantity to mature as seed for the ensuing year.

With respect to the seedling potatoes which weighed 102lbs., being the produce of a perch of ground, they were all planted whole, and succeeded well, having produced 17 cwt. or about 19 fold. These were likewise preserved for seed.

From the success that attended the planting of the small whole potatoe in 1834, and the chance plants from the smallest seed, 48 of which transplanted on 3-7ths of a perch, produced 55lbs., I determined on saving a small quantity of small potatoes, the refuse produce from the Scotch seed termed "hazards, and small," as they were perfectly ripe at the time of digging—and the market price of such was only from 8d to 1s per cwt. These were planted in February, and although the season has been decidedly unfavourable they promise well; and that you may judge of the soundness of this seed, I send you specimens thereof, and of the produce—I would in particular direct your attention to a cluster of young potatoes, in number twelve, formed above the parent and together with it firmly attached to the roots. You will perceive that several of the young potatoes are already double the size of the original, which clearly indicates that the diminutive size of the seed does not descend to its offspring; you will also perceive that the seed, instead of having been exhausted by having remained so long in the ground, and by having fructified, is so sound that a person unacquainted with the circumstances,

would suppose that it had never been planted.—It appears, in fact, capable of producing a second crop. But I am sorry to have to remark, that even these potatoes if cut, would not have resisted the late inclement, and as regards potatoes, ungenial season, as a few of them were cut by way of experiment, and planted apart—but they did not vegetate; and it may, I consider, be inferred that the pink-eye potatoe is a species which if cut, will not succeed except under favourable circumstances.

The South American potatoes were planted early in March, and cut, with the exception of the small, which were planted whole. All these occupy about one acre and a half of ground, and present throughout the most luxuriant appearance. But had the planting been deferred as in 1834, until the potatoes were exhausted by vegetation in the pits, there would, I doubt not, have been again a failure, in such portion as was cut. I have carefully examined three Irish acres of potatoe gradually planted this year from the month of February to the month of June, and the crop is uniformly good, with the exception of a few ridges of Bangor and of black potatoe, raised from the produce of 1 cwt. of each which were planted on the 23rd and 29th of March, 1835, in common with other kinds, to ascertain their respective produce. They were not taken out of the ground until late in the season; were carefully preserved; were planted whole in February, and early in March, and the plants in both cases are, with very little exception, curled. I cannot otherwise account for the curl, than from the seed of which they are the produce, not having matured, in consequence of late planting as regards these kinds, but purpose to retain a quantity of each this year for seed, in order to ascertain whether the curl is hereditary, or whether the disease will cease, if by early planting the seed be allowed full time to grow as well as to mature; and this leads me to an observation as to seedling potatoe, that great care should be taken to separate the early from the late kinds, as from the same bed some plants will be found to vegetate very early, whilst others are extremely tardy in their growth.

Having thus stated the results of my experiments, I shall just mention, that a neighbour who is extremely particular in the management of potatoe purchased this year 2 cwt of Scotch seed from the quay,  $1\frac{1}{2}$  cwt of which he planted whole, and has the prospect of an excellent crop, whilst the remaining half cwt., being the largest, were cut, and of these only about one set in every six vegetated, and those so weakly, that on examining their roots there appeared but a potato, or rather abortion, the size of a pea, at the extremity of a small fibre.

My experiments of 1835, as well as those of the present crop, strongly confirm the opinion expressed in 1834—that “*if proper attention be paid to the selection of good matured seed—to its preservation during the winter—and to the timely planting of the respective kinds at that period, which nature points out by the appearance of vegetation,*” crops as good as we have hitherto had may be expected from proper culture, even although the practice of cutting be persevered in. But that if all the circumstances referred to, do not apply at the time of planting, the best security will be found in the whole potatoe.”

I have to observe, as the result of further experience, that even with the greatest care, as to the seed of some descriptions of the potato, con-

fidence cannot be placed in their success if cut, although if the season be favourable they may succeed. In order to ascertain the stamina of potatoe intended for seed, some of them should be cut in autumn previous to their being deposited in the pit, and if the cut potatoe be firm and sound on opening the pit in spring, the potatoe of which they form a part may be cut for seed, but if soft and bearing indications of decay, it will not be safe to cut them. In purchasing imported or other potatoe for seed, such of the parcel as may have been accidentally cut should be carefully examined, as their condition is the best criterion of the general strength of the seed.

I would strongly recommend, as an economical and prudent measure, that the cultivator of potatoe should lay aside, in autumn, for the express purpose of seed for the following year, a quantity of “*hazards or small potatoe,*” from such descriptions as he may desire to cultivate, and from such part of the crop as has been early planted, and is properly matured. Each kind should be kept separate, and put in a narrow pit well circumstanced, and too many should not be placed together, lest they should heat.

It will of course be necessary to change the seed from one description of ground to another, and occasionally to introduce fresh seed, as in the case of grain. It appears also desirable to raise new varieties from seed, which practice I continue, and find that from 100lbs to 112lbs may be obtained the first season from a perch of ground, and an increase of nineteen fold the second year, which probably exceeds what could be procured by any other means.—In preparing the seed the pulp of the potato apples which have been selected for the purpose, should at about the month of November be put into a vessel of water, and the aqueous particles afterwards strained through a cloth. The solid parts which remain should be dried in the sun, and the seed can then be very easily separated. It should be sown in April, on a well prepared bed, and transplanted in showery weather when sufficiently strong in drills, the plants about six inches asunder and the drills twelve inches apart.

It is evident that we have not availed ourselves of the extraordinary resources which nature has afforded for the cultivation of this valuable plant, or we should not have to complain of a failure in the crop.

A thorough investigation of the subject will, I doubt not, fully establish, that the fault is our own, and that the preventive means are simple, and within the reach of all; as to the practice of leaving the seed exposed to frost, or the seed and manure to the parching sun, as if the intention were rather to congeal, or to bake the potato, than to promote its vegetation, however irrational such practice may be, it is but too common, and may be regarded as a further trial to which this naturalized Exotic, so deserving of our care, is wantonly subjected.

Dublin, 23rd July, 1836.

L. C.

#### SAVING OF FLAXSEED, &c.

One important fact is now completely established with respect to the growing of flax, which is, that the home sown seed is equal to the best foreign for sowing; as every report we have heard agrees that the crop from the Irish seed this season is generally equal to that from the foreign, and in many instances superior. Another most valuable fact is likewise

nearly confirmed, viz., seed saved and sown from year to year on the same farm, will continue to improve the quality of both seed and flax for a number of years; of this we have proof in several cases from six to twelve years. It may be said that this is contrary to the established rule with other seeds in this country, where frequent changes are requisite; however, an exception in favor of flaxseed may be accounted for from the circumstance of it not being a native plant, and that it requires a number of years to bring it to perfection in our comparatively cold climate. The summers of America, Egypt, Sicily, and also the countries on the continent of Europe, where flax is grown, are all warmer than ours during the period of its growth.

Besides the above highly important considerations, it should also be generally known that flax may be dried on the field like oats or any other grain, stacked till the following spring, the seed thrashed out, and the flax watered the first moderately warm weather. By this treatment, the quality of the flax will be at least as good as that watered green from the field, the fibre will be stronger, and stand the preparation for the mill-spinning better than the softer and less ripened flax. This mode of treating the crop will enable every grower, large or small, to save the seed, who chooses to lie out of the money for six or seven months, at the same time it will pay ample interest for the delay of return.

It may be useful to growers to observe, that formerly most people pulled the flax too soon by a week to ten days; perhaps the unripe plant yields a softer and more silky-like fibre, and suited the rock-spinning better, but it is now admitted by many mill spinners, that the ripe flax stands the several operations of dressing with less loss to the consumer.

Now on the eve of pulling the flax, every inducement to save the seed should be made public. Every hogshead of seed sown will yield from four to seven hogsheads good seed fit for sowing,\* and for crushing for oil; besides the *drawings*, which are better than bran, weight for weight, for feeding cattle. The linseed cake or linseed meal is still better for feeding, as the oil, which is in some degree purgative, has been pressed from the seed, leaving the cake the most nutritive substance of any thing we know, for cattle of all kinds. Two pounds of the cake, ground to meal, moistened with cold water for eight to twelve hours, then diluted with warm water and given to calves two or three times a day, will make them thrive better than eight to twelve quarts of milk. The expense of the meal is not quite 2d., while the milk is worth 9d. to 1s., so that there is a saving of 7d. to 10d. per day in feeding each calf. After the few first feeds, there is no use in giving milk.

Another very profitable way of using Linseed Cake is practised by some intelligent graziers in Scotland. When they put the beef cattle out to grass, they continue to give the cake till fit for the butchers, which is a month to six weeks sooner than without the cake, thereby not only having the cattle early at market and getting a high price, but also saving greatly in pasture. About 4 lb. of the cake daily is sufficient for a bullock on the grass.

L.I.N.U.M.

\* Say that 40,000 hogsheads were sown this season in the North of Ireland, and that the whole produce in seed would be saved, there would, at the average of five hlds. to one sown, be 200,000 hlds. which, at the low price of forty shillings per hld. would be 400,000*l.* saved to the country! and this enormous sum is thrown away, by inveterate habit combined with indolence.

## AN IMPROVED MODE OF THATCHING.

COMMUNICATED BY ——— CHURCHILL, ESQ., OF DORCHESTER.

The Somersetshire mode of thatching is preferable to all others. It consists in using unbruised straw, provincially called reed, instead of bruised straw with the ears on it. The practice of Devon, Dorset, and Somerset, in this respect, is an example to all England, which we are surprised has not been more generally followed, as it lasts nearly as long again as common straw, and does not offer the temptation arising from grains of imperfectly thrashed corn, which induce mice and birds to infest the dwelling and make holes in the thatch. The mode of preparing the straw is simply to take a sheaf of wheat and to place it in a reed-press, made of two pieces of timber ten feet long, put on a stool, and having women to lay hold of the ears of corn, who draw out the straw and cut off the caps, and then binding up the sheaf for use. In this process women are usefully employed in wet weather, and the corn is much more easily thrashed when in short ears than when encumbered with the straw. The thatching work done with the reed will last ten years longer than that done with the common straw, and as to the appearance there is no comparison; one is an elegant neat covering, and the other a slovenly ragged one. Many gentlemen, possessing fancy cottages and rural habitations, have been so struck with the neat and picturesque appearance of the cottages in the three western counties, as to have sent for persons to prepare reed for them in the counties where their dwellings are situate.

There is another advantage also to a farmer, that the reed when carefully taken off hay or wheat-ricks may be tied up and used again a second year; and this in pasture counties, where straw is scarce, is no small consideration. It is usual for landlords to pay for the drawing of the reed by the hundred sheaves, in consequence of the superior durability of the work, as it is considered to endure beyond the ordinary term of a lease, and therefore contributing more to the interest of the landlord than the tenant.—*Baxter's Library of Agricultural and Horticultural Knowledge.*

## THE ALLOTMENT SYSTEM.

TO THE EDITOR OF THE YORK CHRONICLE.

SIR,—One of the most portentous characteristics of the present age, is its concentrating centralizing principles. The careful observer of the history of mankind, and of the peculiar features of our age, cannot see the rapid advancement of these principles but with terror and alarm;—alarm for our national existence, and constitutional independence; for though the evil may not break forth in the present age, yet the seeds of the elements of dissolution are sowing, and without some daring and patriotic stand is made in asserting sound principles, the most dreadful consequences will follow. We are rapidly proceeding to a state of feudalism; the yeomanry, the peasantry, are hurrying on to vassalage; a certain class are assailing the ancient aristocracy with a view of destroying the last remains of our nobility, as the necessary step for their own despotic aggrandisement; and political disunion, anarchy, confusion, revolution, and finally degrading slavery, will follow. A recklessness of the welfare of this nation, so

strikingly manifest in public sentiment and private practice, is the immediate precursor of this. There are those who, if they would not make us a nation of shopkeepers, would, to serve their ends and principles, convert us into a joint-stock manufactory, and rejoice to see not a sheaf of wheat grown in the country. There are also, on the other hand, those who would grasp the agriculture of the country into a few hands,—a preparatory step to its annihilation; who would pauperize and degrade our yeomanry and peasantry; and next overawe and overturn the landed aristocracy; while the rival interest would mechanize the frames of infantile slaves, and crowd hundreds of *human machines* into hot, infected, and unhealthy steam mills,—all, all sacrificed to the Moloch of wealth.

What must be done? what can be done to maintain the "bold peasantry," as "their country's pride?" not to debase them by sending them to congregate in the district workhouse, but to give them an interest in the country, to arouse a spirit of independence, to excite habits of honest industry, alike favourable to morals and happiness—and what is national happiness but the happiness of the individuals of whom it is composed? To effect this, I propose the allotment system, as well as to arrest, or if possible counteract, the monopoly monster, the British locust cloud.—Let each individual who is desirous of doing something for himself and family, have his two acres, his one acre, or his rood of land, according to his capabilities. Let him have a fair start in the world, and if it does not make all happy and industrious, at least it will all who are so disposed, and be a punishment, deep and permanent, to the idle, the dissolute, and the abandoned; it will at once stamp them with the mark of worthless, open and visible to the world, and therefore the more deep felt and galling.

The allotment system would produce a spirit of union between the different grades of society. At present a lamentable spirit of opposition prevails between the labourers and farmers; witness the recent fires and riots in the southern counties—every method of parish economy is considered as an oppressive measure towards them, and they having nothing to lose in the country, but every thing to gain by disturbance and revolution, and an ill affection to the powers that be is the consequence. But once make them tenants and give them an interest in the soil and poor rate, and they will at once feel their own interest to be the safety of the state and the reduction of the parish burdens, and instead of looking to the land to support them, through the industry of others, they will expect it from their own exertions.

It will stimulate to industry and honest independence. At present the labourers have little to occupy their minds, and they assemble, after their work is finished, in the street corner, or in each others' houses, and talk over the scandal of the parish, and mutually excite their passions and dissatisfaction; too frequently do these meetings adjourn to the public-houses and beer-shops—vile associations poison the mind, and more and more alienate the feelings of the labourers from their masters. Poaching parties are concocted, petty robberies are planned, incendiarism in the excited moments is broached and perpetrated,—and the consequences are a debased and disaffected population.

It would bring up the children in honest habits of industry. If children are reared up in idleness, in idleness or theft they will grow up, but if early taught that their future welfare depends upon their own exertions, they will become useful members of society. Give each deserving man his patch of land

according to his capabilities, and his children, from the oldest unto the youngest will be in constant employment, and with their work will associate the idea of providing for their wants; the more their industry, the greater their comforts. One will dig, another will hoe, another will collect the wasted manure from the roads, and a fourth will hand-weed, indeed all will be brought up in careful and labouring habits, and will early be induced to think for themselves, and instead of having their principles corrupted by evil associates, and their habits ruined by idleness, they will be trained by education for filling creditable stations in society.

It will prevent emigration. Emigration is at best a curse; we lose the producers, but keep the consumers! it is galling to leave our native land, and once show a man that he can live and thrive here, and he will remain; while the surplus labour will be swallowed up by the extra work which will be bestowed on the little allotments.

A word or two on management. Part of the land would be considered a garden, to grow onions, cabbages, carrots, salad, &c.; the rest the farm, half to be planted with potatoes, the rest sown with wheat, and allowed to alternate or rotate, for it will be found that under the cottager's careful cultivation, and the extraneous manure, the land will be kept in fair condition; he may however sometimes substitute a crop of barley, for a change. He will be expected to pay the full rent of the land, and consider himself under no obligation to any one for it, and must bear his fair and proportionate share of the taxes, which he will thus feel an interest in reducing. To effect this let the large farms, exceeding 150 acres, be reduced, and divided amongst the labourers, who are desirous of becoming tenants, and the whole of the rents collected, and the overlooking of it managed by a person appointed by the parish.

I would earnestly call the attention of the land-owners, farmers, and parishes to this plan, as being infinitely preferable in every respect to the workhouse system.

W. E. N.

## IMPORTANT TRIAL.

(FROM THE VETERINARIAN.)

A cause very important to the farmer and the veterinary surgeon was tried at the Nottingham Assizes on the 24th ult. We present our readers with the substance of it.

The plaintiff, Mr. Jackson, of Stapleford, near Nottingham, was owner of several parcels of meadow land, through which ran a small stream of water of excellent quality. It was called the Syk brook. Near its source is a *cromlech* in unusual preservation. It is one of the most perfect Druidical remains which the midland counties possess; and a legend is attached to the brook, that in days of yore, the sick used to resort to this spot, and, after certain Druidical incantations and ceremonies, and drinking of the water which ran beneath the cromlech, they were cured of all their diseases. However this might have been, these meadows had been in the possession of Mr. Jackson's family for some centuries, and the cattle had always done well.

Thirteen years ago the defendant, Mr. Hall, erected some buildings for the manufacture of starch near the brook, and above Mr. Jackson's meadows. No change was observed in the water or the condition of the cattle for the first two or three years; but at length the water used in the manufacture of the starch found its way into this

brook in considerable quantities, and then the milk of all the cows rapidly diminished, many of the cattle became seriously ill, and in the course of some years no fewer than twenty-six of them died, and all of a disease accompanied by nearly the same symptoms, and the fish and the frogs which had peopled the brook all died.

In the manufacture of the starch the wheat from which it was obtained was first ground. It was then macerated in water until the gluten was dissolved and the starch precipitated, and the bran was left floating in the tank. It had now undergone very considerable fermentation, and the whole mass was in the highest state of putrefaction, and exceedingly offensive both to the taste and smell. The liquid containing the dissolved putrefied gluten was now drawn off, and was preserved for sale. It was supposed to be an excellent manure, and for a while there was considerable demand for it; but at length it lay upon hand, and was thrown away, and took its course down a ditch into the Syk Dyke, and that, occasionally in a quantity greater than the original stream.

The bran underwent various washings, and, being sufficiently cleansed, was given to the pigs.

The starch, however, required another process in order to fit it for use. The smell which hung about it was to be taken away, and the starch was to be bleached. For these purposes a solution of the chloride of lime was employed, and when that had done its duty, it too was turned into the stream.

Sulphuric acid was also used in considerable quantities, in order to perfect the manufacture. That also ultimately found its way into the water-course.

At length the defendant yielded so far to the remonstrances of the plaintiff as to construct a *sough*, or circular tiled drain, through the plaintiff's grounds, by means of which the poisoned water was conveyed to a river at some distance, the volume of the stream of which was supposed to be so considerable as not to be materially affected by admixture with these deleterious ingredients.

This being effected, the fish and the frogs began to return to the brook, and the weeds grew on its banks, and the mortality seemed to cease among the cattle; but the defendant refused to make compensation for the cattle that were previously destroyed. In order to recover this compensation an action was brought. The following is the substance of the evidence:—

Eliz. Jackson, sister of the plaintiff.—Has known the water-course which runs through their premises more than forty years. In 1823 a starch manufactory was erected in their neighbourhood. The plaintiff had eight closes, through which this water-course ran. These closes usually contained the dairy cows, from fifteen to twenty in number. There was no other water for these cows but from the water-course, except when they were driven into the farm-yard in order to be milked. Before the erection of the starch manufactory the cows did well; afterwards they were evidently affected by the water.

The first cow died in 1828. She had detected a difference in the water long before. It looked very dirty. It was white sometimes—a film or scum then came upon it, and there was a great sediment at the bottom, of a black colour. It was very good water before—perfectly pure—used for domestic purposes, and the cows did well. In 1828 three cows died, and a calf; in 1829, two cows; in 1830, six cows and two calves; in 1831,

one cow and two calves; in 1832, four cows and two calves; in 1833, six cows; in 1835, one calf; and in 1836, two cows and one calf, making in all twenty-four cows and nine calves, the value of which was £384 3s.

The fish in the pond through which the brook ran died about the same time, viz. 1828. They were perch, gudgeon, pike, roach, and dace. The frogs, and even the weeds, died in the water-course. Now that the water from the starch mill is turned away, the fish, and frogs and weeds have returned to the brook.

The symptoms of illness were these:—The cow began to look thin, and that for three or four months; her coat was rough; her milk went almost from the first. She then began to purge; blood mingled with the fæces, and at length she died emaciated and exhausted. All the cows had similar symptoms, and the illness usually lasted from six to eight months. In the last two that died the illness was of longer duration. The last two were opened; one by Mr. Grieves, a surgeon, and the other by Mr. Grieves and Mr. Pyatt, a veterinary surgeon.

The cows occupied these pastures, except in eddish time, which was about five or six weeks. The cows gave more milk and looked better in eddish time than when on these pastures.

The diminution of milk since the erection of the starch mills was at least two or three quarts daily from all of them, whether sick or well. The value at 2d per quart amounted to £650.

There is a trough in the milking yard. When the cows were brought up to be milked they showed a marked impatience to get at the water, much more so than before. Others of the cows looked very ill, but did not die. Since the water from the mill no longer comes to them, they give more milk and look better.

The water smelled badly before 1828, and so on until the *sough* was made.

She then produced some bottles of water taken that morning: one bottle from the brook, good; one from the *sough* now made to carry away the water coming from the starch mills, and one from the pond above. They were so highly offensive that they were ordered out of court as quickly as possible.

Cross-examined.—Mr. Hall keeps a great many pigs about 100 yards from the commencement of the new drain, and that drain carries all the filth from the pigs. Always has kept an almanac, containing the list of casualties and deaths. They had comparatively little illness or death before the erection of the manufactory, and the illness which they had was not at all like this. She recollects particularly one heifer that died. None of them died of calving. The one that died in the last spring aborted, and died soon afterwards; but she had been ill long before.

Kept many ducks and geese; and the horses drank of the same water as the cows.

Re-examined.—One of the bulls died last year, but not with the same symptoms. He died from eating too many potatoes. Another died about a fortnight ago, and with the same symptoms as the cows, and was examined by Messrs. Grieves and Pyatt: he had been ill since last summer. He was always in the field.

Thomas Gresley is 80 years old; has lived all his lifetime at the village through which this brook passes, and knows it well. Occupied land through which this brook passed; but he has a well or spring separate from the brook, from which his

cattle drank. The brook once contained as good water as ever was drunk, and supplied a great many people in the village with water. It is now spoiled, and not fit for man nor beast. There was a scum at the top, and it is black at bottom, and it smelled like any nuisance. Cattle did well before the starch manufactory was built. There used to be fish in the brook, but the starch water killed them all.

Cross-examined.—A great many houses have been built on the brook. Does not believe that the filth from any of them runs into the brook.

Re-examined.—The brook is very shallow. The houses are at some distance from the brook, and the nuisance in the water is above the houses as well as below.

Edward Aspinshaw.—Was a butcher at Stapleford, and is 88 years old. He and his father had ground by the water-course: the cattle drank there, and had nowhere else to drink. His cattle always did well. Now it is thick and bad; he can smell it very easily—his nose is not hurt. He lived servant to one farmer 11 years, and his cattle run on that ground, and had that water only to drink, and they did well. He has bought beasts that fed on that ground—they were healthy and well.

John Barton.—Lived 44 years there—knows the stream—had a close through which it ran. The water was very good, and the cattle did well. Since then there came a scum upon it, and settlings as black as mud; and a very bad smell. Should not think it healthy for cattle, or for anything else. He made a pool to catch water for his cattle to drink, that they might not go down to the water-course. Has had two colts there injured very much by the water. He removed them, and they got well; but it was six or eight months first.

Cross-examined.—Grazed sheep and calves principally there, because he thought they did not want so much water. He had occasionally horses, but they were in and out as occasion served; but the two colts were out night and day. When they were ill he gave them plenty of good stuff to eat and drink. They fell off in their flesh. Had not been over-stocking,—he had eight or ten sheep and five heifers, with the colts.

Re-examined.—Mr. Jackson did not over-stock his land, so far as he knows of.

John Smedley.—Has a close on the water-course. Gives the same account of the water. He used to turn his cows there in eddish time. The cows many a time refused to drink the water, and he took them home to water. His cattle did not do so well there as in the homestead. In 1831, a cow became ill, and he killed her to save her life. She purged very bad. Coat stared. That was the first thing he saw: did not eat well. He then took her home, and she was killed in his presence. She was as poor as a crow, for she had given over eating. She had a dead calf five days before she died. He laid the disease to the water. He has turned his cows on the eddish by the side of the brook this year, because the sough is made, and the water is become good. There is nothing to injure the water except the starch manufactory.

David Gresley.—Lived there all his life, and is 49 years old. He gives the same account of the water. His cattle did well before the manufactory was made; but afterwards they were much disordered in their bowels, and he thought they were going off. They were partly supplied with water from the stream and partly with some fetched from home. The water was always worse on a Monday

C. Geldeny.—Worked for Mr. Jackson 21 years ago. All his cattle turned into the closes near the water did well. Worked at the starch manufactory the first two years after its erection.

He gave an account of the starch manufactory, and said that the water from it stunk like carrion, or worse than carrion. There was more of this filthy water in the water-course than of the original pure water.

Mr. Hall kept cattle of his own. Water was always put into troughs for them, but they could get at the bad water if they pleased.

Cross-examined.—The bran that had lain fourteen days in the water was sold for horses, cattle, pigs, &c. Mr. Hall kept a vast number of pigs, and a vast number of them died. They were fed with the bran or slimes, and he gave up keeping the pigs because he had bad luck with them. Mr. Hall sold them to Mr. Drew, but he did not take them all home, because a great many of them died. The bran and slimes were afterwards washed more with fresh water, and the pigs did better.

Samuel Harding.—Lived with Mr. Jackson from November 1824 to November 1833. He knew the course from a boy, and described the change in the water. While he was in Mr. Jackson's service six cows died, and two calves. They pastured by the water-course. He *dressed* (opened) all the six cows himself. Their coats were considerably rough, and they had become considerably thin and low. The bowels had been loose, and they were discoloured from the long running out. While living they gave less milk than they ought to do. His next master had beasts pasture on the same stream; but he railed it away, so that they should not be able to drink. Jackson kept his cattle well, amazingly well, and gave them plenty of good hay.

Thomas Sutton, servant to Mr. Jackson twelve years.—A vast many of his cows died, thirteen or fourteen. Was sent by his master to Mr. Hall with a discharge for letting his water down the dyke. Two years afterwards went again with a second discharge. Went again in March last, and asked if he would be so kind as to come down and look at a cow that lay dead. He said that he would not come. He asked him to send another person; he said he would not, and he did not care if they all died.

At a corner of one of the fields, and close to the brook, and on the other side of it, was a tank, which the cows could get at with some difficulty—they used to go there and poke their head through some rails in order to drink of it rather than of the brook; and he does not think that any water from the water-course could get into this tank—he has often drunk from this tank.

John Whalley.—Occupied a close by the side of this water-course eighteen or nineteen years. As good water as ever cattle drank, and they used to enjoy themselves in it. After the manufactory was established it became bad. Lost a yearling calf there, and he removed the rest. This was three or four years after the establishment of the manufactory. They dwindled away, and had bad looseness. Same symptoms as Mr. Jackson's. Made a drain to avoid the tainted water, and got pure water from a spring, and then his cattle did well. Often complained to Mr. Hall; he turned the water one way, and then another, until every place became full, and then it pursued its old course; and Jackson's cattle were compelled to drink from this water. Many yearling calves are certainly lost from purging, without water of this kind.

John Turner.—His father sold the premises on

which the manufactory stands to Mr. Hall thirteen or fourteen years since; there was then no communication by which water could get into the Syk Dyke. It has been made since.

William Dudmore.—Lived with plaintiff five years from 1826. Cows did well before the water came down from the manufactory, but soon began to be deficient in milk from two to three quarts a day. Occasionally turned the cows into the eddish and they then did better; ten cows and two calves died while he was there. Same symptoms. Had plenty of food.

Cross examined.—Cows always freshen upon the eddish to a certain degree; and when they return to the old pasture, still the quantity of milk continues, if the pasture is good.

Elizabeth Warren.—Knows the water twenty-five years, and formerly used it for tea; could not for awhile; now looks as good as before, but has not tried it again.

Joseph Beadnall.—Lived with plaintiff in 1828-29. Two cows died; saw them opened; the whole of the stomachs quite rotten. Symptoms the same.

A statement of the duties paid on the starch manufactured at the mill was put in, in order to show that the mortality was proportionate to the quantity of starch made at different times.

Aug. Grieves, a surgeon at Nottingham.—Analysed the water. Has often been thus employed.

He produced some water from a pond on Hall's premises, taken June 29. It contains a great quantity of putrid vegetable matter, and muriate of lime formed by the exposure of chloride of lime to the influence of air and water. He analysed more afterwards: it varied at different times—both in the quantity and nature of the ingredients. Always the muriate of lime, sometimes chloride, sometimes sulphuric acid, and sometimes acetic acid—these vary to the amount of one-half.

Another water, taken from the dyke crossing the lane immediately below the pond. Contains always a larger quantity of putrid vegetable matter—with a trace of animal matter in a state of decomposition, and also muriate of lime—never detected the chloride of lime.

A third portion was taken from the brook as it now is. It is excellent water.

Examined the water course before the sough was opened, and at other times; found the same ingredients, but less in quantity than in the ponds.

The effect of such ingredients on the human frame is that of an irritant poison. It would be the same as described by witnesses with regard to cattle. He examined a cow and a bull. The internal coat was darker than usual—numerous patches of inflammation were found in the whole length of the alimentary canal.

On the 28th of March last he examined another beast with Mr. Pyatt. The appearances were the same, so far as regards the disease in question. He has no doubt that the loss of the cattle was produced by drinking the water.

Mr. J. Pyatt, veterinary surgeon.—I saw a cow of the plaintiff's on the 27th of March last. She was in a dying state. She died. The intestines were highly inflamed through their whole extent, and ulcerated in many places. Has no doubt that the disease was produced by the water. Inflammation might arise from various other causes, but not connected with this peculiar train of symptoms.

Mr. Pereira, Lecturer on Chemistry at St. Bartholomew's Hospital, had likewise analysed these waters, as taken from the Syk Dyke in its present

state, and from the sough, and from Mr. Hall's pond. The first was pure—the others contained a considerable quantity of muriate of lime, and were loaded with putrid vegetable matter. Whether the frequent presence and action of these deleterious substances on the mucous membrane of the intestines, or their necessary influence on the constitution generally, were considered, there could be no doubt that the mortality among these cattle was to be traced to the empoisoned water.

Mr. Youatt has heard the whole of the evidence. With some slight variation in the different cases, he plainly recognizes, in the disease described, the dysentery of cattle. The usual symptoms of dysentery are, a rough and staring coat—diminished secretion of milk—loss of appetite—loss of condition—purging which bids defiance to all medicine—mucous, and, at length bloody purging—and then death. In the accounts of the appearances after death, given by Mr. Grieves and Mr. Pyatt, he recognizes those of dysentery, but in an aggravated form. There is no doubt that the disease was produced by the deleterious influence of the water.

Verdict for the plaintiff, £270 damages.

I regard this as a very important trial, and deserving a place among the records of veterinary medicine. There can be no doubt as to the character of the disease. It was, at least in its last stage, the dysentery of cattle, but in a more than usually aggravated form. It was not merely inflammation and ulceration of the large intestines—the usual distinguishing characteristics of dysentery,—but these lesions extended through the whole of the intestinal canal. A more powerful agent than can be generally traced was here employed—the water of the brook was surcharged with deleterious matter.

The chloride of lime, although in small doses it may occasionally be employed with advantage in the treatment of the diseases of cattle, and particularly of this disease, must, when frequently and habitually drunk, produce much and perhaps fatal inflammation of the mucous coat of the intestines: but the prime agent was the decomposed vegetable matter which the water contained—the gluten of the wheat in the highest state of putridity. Putrid vegetable matter is one of the most destructive sedative poisons that is known, and under whose fatal influence every vital action is diminished—every function impaired or suspended.

How accurately do these unscientific witnesses describe its progress. The animals scarcely drink of the empoisoned stream ere the coat becomes rough and staring—the insensible perspiration is diminished or ceases. The quantity of milk is lessened—each cow gives from two to three quarts less every day. So far as this secretion is concerned, every animal—those that are ultimately lost and those that have strength to bear up against the depressing influence to which they are subjected—every animal exhibits the character and power of the poison. They who are accustomed to cows begin to look somewhat fearfully around them when the milk diminishes; and if it becomes suspended, they are perfectly assured that danger or death is at hand. The appetite is impaired: in frequent or continual contact with a fluid so nauseous and debilitating, can the villous coat of the stomach retain its healthy character, or will there be a desire for or relish of food? The loss of condition—the rapid wasting is the natural and necessary consequence of diminished ingestion of

food, to say nothing of the Lethean influence of the poison on every organ concerned in the digestion of the aliment. Then,—not at first—say the witnesses, comes the purging, the consequence of the long-continued presence of the poison in the intestines—the consequence of the general impairment of the system—the indication of the breaking up of the constitution.

There is a peculiarity about cattle subjecting them to the fatal influence of agents like those whose mischievous course has been here traced. Cattle are destined to supply us with food while living, as well as after death. The greatest quantity of food, and the greatest profit to the owner, are yielded while they are living. To fit them for this, nature has given a digestive apparatus by means of which every particle of nutriment is extracted from their food; and the digestive organs are always and actively at work. In the improved system of husbandry the thing goes much farther—the digestive functions are strained to the utmost point—the system of early maturity which is so generally and profitably pursued, keeps every organ in a state of dangerous excitement, ready to assume the character of unmanageable inflammation, or gradually to sink, or sometimes all at once break down, under the task imposed upon it. Therefore it is that dysentery has attained fearful pre-eminence as one of the deadliest scourges of our cattle. We have generated a predisposition in them to take on all the fatal characters of this disease. It is generated by many an error in their diet, which, but for the previous diathesis to which we had given existence, would be comparatively harmless. It is the companion or the consequence of almost every malady, and it is the harbinger of their fatal termination.

If the case were to be carefully inquired into—if the farmer would compare the appearance and profitableness of his cattle on certain portions of his farm, and at certain times of the year—and if the veterinary surgeon were better prepared to inquire into and to detect the obscure causes, and the disregarded premonitory symptoms of the diseases of cattle, they would, perhaps, be found to arise from or to be connected with circumstances of a kindred nature with those that were developed in the present trial. It is well known that there are certain pastures on many farms which, without yielding more abundant, or, apparently, more nutritive herbage than the rest, are pre-eminently favourable to the health of the cows, and an increased production of milk; there are others that appear almost as fairly to the eye, but on which the quantity of milk is rapidly and annoyingly diminished, and the cow begins to exhibit, in various ways, the characters of obscure disease. If the case were to be fairly inquired into, the deleterious but unsuspected influence of decomposing or putrid vegetable substances might be discovered to lie at the root of the evil; and at a trifling expense the good qualities of the one pasture might be perpetuated, and the baneful effects of the other removed.

What are the usually recognized causes of dysentery? Any—every cause of local or general debility—abandonment to cold and wet at the time of calving—general abandonment to cold and neglect—a system of starvation—over-work—a long continuance of sultry weather, or rather the sudden setting-in of cold after the constitution has been debilitated by previous heat: these are occasional causes. But what are the general ones? What carries off so many of our yearling calves, and,

long ere her natural time, hurries the dairy cow away? Why, plainly and palpably, the pasturing on low and marshy situations—the neighbourhood of woods—the drinking from stagnant ponds, or half-stagnant rivers—the feeding on sanded hay—the being turned on meadows from which the flood is beginning to dry—the open and evident influence of decomposing vegetable substances; and I am much mistaken if this influence, in a more secret but scarcely less fatal degree, is not connected with the mortality, whether occasioned or habitual, which prevails among the dairy stock of the farmer. This is a view of the subject well deserving of consideration, and to which I shall return at some future period; but in the mean time our brethren in the country, who have more frequent and better opportunities to trace out these causes and indications of disease, would benefit their profession, and occupy their proper station with reference to the interests of the agriculturist, by taking up the matter.

The time, surely, cannot be far distant when the veterinary practitioner will be better prepared for such an inquiry. Reason, common sense, and the interests of the country at large, imperiously demand it.

Y.

CLYDESDALE ORCHARDS.—The gooseberries and currants in the after-mentioned orchards, in the parishes of Dalzell, Cambusnethan, Carluke, Bothwell, and Dalsert, were sold this season, some by public roup and others by private bargain, at the following prices: Garrison—Lord Belhaven and Mr. Jas.

Brownlie .....	£60 0 0
Rannalds—Lord Belhaven & Mr. Jas Henry	53 0 0
Mauldslic Castle—A. Nisbet, Esq. ....	49 10 0
Brownlie—J. Harvey, Esq. ....	49 0 0
Steuart-Hall and Orchard, J. Brown, Esq. ....	31 15 0
Holmfoot—Miss Howison .....	29 0 0
Dalzell—Mrs. Hamilton, .....	26 15 0
Brownlie—R. Steuart, Esq. ....	19 10 0
Garrison Haugh—Mr. Holms, sen. ....	16 0 0
Cornsilloch—Mr. Holms, jun. ....	14 0 0
Braehead—Mr. Orr. ....	13 1 0
Garrison Mill—Mr. J. Brownie. ....	12 0 0
Dalzell Manse—Rev. Mr. Clason. ....	11 10 0
Gillfoot—Mr. Gilchrist .....	11 0 0
Sunnyside—Gillespie, Esq. ....	10 0 0
Dalsert Manse — Rev. Dr. Russell. ....	18 0 0
Hill of Orchard—Mr. Reid .....	9 10 0
Hallerraig—Mrs. Robertson .....	9 10 0
Kirkhill—Mr. Wm. Renwick .....	7 10 0
Do. —Mr. J. Williamson. ....	3 0 0
Clydevall—Mr. Purdie .....	3 6 0
Bothwell Manse—Rev. Dr. Gardener. ....	29 5 0
Bothwell—Captain Bogle .....	6 10 0

Amount sold by public roup. ....	£483 12 0
Amount sold by private bargain, in the different parishes, as far as could be ascertained .....	£99 4 0

Total .....

ISLINGTON MARKET.—The idea of converting the Islington-market speculation into a joint-stock company seems to gain ground. At Bedford resolutions favourable to the plan, pledging the parties to use every exertion to promote “the immediate circulation of the shares among the landowners, graziers, and farmers,” have been voted; and at Boston a meeting has been called for this day (Friday) for a like purpose, at which the Mayor presides.

## GROUP OF POINTERS.

(Plate.)

The Pointer, as our Readers are very well aware, is used exclusively for the gun in the pursuit of the grouse, the partridge, &c. and he is superior to the setter (used for the same purpose) in steadiness as well as in the acuteness of his olfactory organs or powers of smell. Like the Arabian horse, he may be regarded as an exotic, which, in the hands of the English Sportsman, has attained a degree of perfection which will be vainly sought in those countries of which he was originally a native.

If we can place reliance upon the concurrent testimony of those who have expressed their thoughts upon the subject, through the medium of the press, the pointer was originally from Spain; a doctrine which seems feasible, because the heavy lumbering dog, evidently the patriarch of the race, has been uniformly found in that country up to the present moment. The animal in question, then called the Spanish Pointer, is a large heavy creature, *out at the elbows*, with widely-spread ugly feet, and altogether uncouth in his form: his head is very expansive, ornamented with large pendent ears, while his mouth is fringed by a much more than ordinary quantity of what is well understood amongst sportsmen by the term *leather*; and in consequence he is enabled to ascertain the proximity of game in a most surprising manner. However, it will easily be perceived, that, as his legs are crooked, his body ill-formed, his feet spongy and widely spread, he is utterly incapable of that continued exertion for which the highly improved English pointer is remarkable. Moreover, he growls at the hand which is extended to caress him, is remarkably ill-tempered, and always seeking a quarrel with any variety of his tribe which happen to fall in his way; uniting obstinate courage with great strength, few dogs are able to oppose him successfully. He is further remarkable for his propensity to chase hares; we have seen many Spanish pointers in the field, the greater part, though as steady as possible to birds, almost uniformly broke away if a hare happened to move. Having remarked that the Spanish pointer is the original of the varieties which are met with in different countries and places, it may be further observed, that, considered in the aggregate, these dogs approach the hound ramification, and have occasionally been designated *Pointing Hounds*.

The Portuguese Pointer—(or at least such of these dogs as have fallen under our observation), presents, with a lighter form, the glaring defects of their Spanish progenitor, namely, the defective feet, crooked legs, and turbulent disposition. Those which we have seen, from their more fully fringed and longer tail, as well from their countenance, indicated a cross of the sagacious dog of Labrador. Like the

Spaniard, however, they soon tire, and are much inclined to chase hares.

The dog used as a pointer in France is distinguished by a furrow between the nostrils, by which these tube-like passages are very distinctly separated, and which gives to the animal a grotesque and even an unsightly appearance. We have never been able to discover whence this furrow was derived, (but should feel extremely obliged to any Correspondent who could give us the information) which has procured for the dog the appellation of the *Double-nosed Pointer*. We are not sufficiently acquainted with the varieties of the canine tribe in France to be able to form an opinion of the particular strain which, united to the Spanish pointer, produced the dog under consideration; but those which we have seen (and we have shot over some scores, at various periods) have been better formed and more active, than either the Spanish or Portuguese dog, and consequently capable of longer continued exertion: however, like their patriarchal progenitor, and more distant relative, they are very quarrelsome, and generally receive the caresses of their master with surliness, instead of that well expressed pleasure for which the spaniel is remarkable, as also the canine race in general. Further, they are much given to chasing hares. However, the notion, inconsiderately entertained by many, that the "*double nose*," as it is called, tends to increase the acuteness of their olfactory organs, is most erroneous, as the sense of smell is found precisely in proportion to the expansiveness of the head, in the dog, and also in every other animal, as anatomical investigation will incontestibly demonstrate.

The *Russian Pointer*.—Something more than thirty years since, what was denominated a Russian Pointer, was introduced to our notice by a much esteemed brother sportsman, who, we are happy to state, is still able, like Somerville, to enjoy the pleasures of the chase *in his arm chair*, and his appearance was by no means calculated to impress upon our minds a favourable notion of his performance in the field; but unquenchedly thirsting for a knowledge of whatever might conduce to the improvement of the diversion of the Trigger, we eagerly accompanied our friend to the field—only to experience disgust at the semi-abortive attempts of this wretchedly-miserable apology for a pointer. We may perhaps have seen a dozen of these brutes, which, like the people whence they derived their grossly-misapplied appellation, are very unceasingly very rough, imperturbably stupid, and, by way of continuing the similarity to the greatest possible extent, will generally be found infected with loathsome vermin. The Russian Pointer, if he be of Russian original, which we think very probable, is the very ugliest strain of the water-spaniel, his attempts at hunting, or trying for game, offer the very reverse of that beautiful animated range which marks the exertions of the highly improved

pointer; on the contrary, he runs awkwardly, with his nose close to the ground, and therefore frequently springs his game. The dog in question may answer very well for the vulgar pursuit of the coot or the water hen; but he possesses much the same claim to the character of a pointer as a methodist minister to that of a genuine honest Englishman. We have not seen one of these northern barbarians in the field for the last fifteen years.—A pig may be taught to stand at game; but more of this hereafter.

*The English Pointer.*—From what has been stated, it will easily be perceived that the English Pointer must have inherited a considerable portion of Spanish blood, and that much of it still circulates in his veins; but, though our terrestrial ball has revolved for centuries since the Spanish pointer was introduced here, we entertain scarcely a doubt, that the ardently-undefatigable English Sportsman, finding him too slow in his movements and very soon fatigued, had recourse to the hound for the purpose of increasing his speed as well as improving his powers of endurance. The first remove, thus obtained, would be an improvement beyond all question, but it would be found impossible to arrive at that degree of perfection which characterises the pointers of the present day till after a variety of crosses, directed by preserving industry and skill. Not only the various classes of hounds were used, but the assistance of the highly-bred greyhound was deemed requisite; and though it was evidently found necessary to wash out much of his blood, yet the strain frequently manifests itself in the long rat-like tail and other indications which cannot be mistaken. But, of all those who ever made the breeding and improvement of the pointer their study, none exceeded in zeal and perseverance the author of the "Sportsman's Cyclopaedia," the "Shooter's Companion," &c. Cradled as a sportsman, he imbibed an invincible passion for the chase in all its ramifications, which he has ardently pursued through the rugged path of life, and still continues to cherish and enjoy. As soon as he was able to use a gun, the pointers which he followed were large heavy animals, possessing three-fourths Spanish blood, and exhibiting qualities and temper precisely in proportion. Impatient of comparative inferiority with any of his friends—or rather perhaps panting for unquestionable excellence—his attention was turned towards the improvement of his pointers; but either from lack of knowledge or other cause, he experienced nothing but the most miserable disappointment for some time; he was particularly unfortunate in his early notions in regard to the form of the head. At the period of which we are speaking, it was the custom, or the fashion, or both, to regard a large expansive head as not merely the reverse of beauty, but a sort of blemish; and, inconsiderately adopting this monstrously ridiculous idea, he found himself, after several years' experimental crossing, in possession of a set

of dogs with compressed heads, considered *handsome*, forsooth! giddy and uncertain to a most vexatious extent; because, being thus deprived of a sufficient breadth and expansion of the requisite organs (of smell) the operative functions were inadequate to the due and satisfactory performance of that duty which they thus vainly essayed to perform; in the language of the school, *their noses were bad*. However, reflection induced him to *hark back*: he was convinced there could be no effect without a cause:—what, therefore, was the source whence the Spanish pointer derived his unequivocally acknowledged superior powers of smell? to use the words of a would-be-thought genius, whose *specious inventions*, however, will not give to his memory an enviable immortality, it "struck us like lightning," that the large expansive head of the surly Spaniard would afford him the desired information. Therefore, Chance, five years old, a genuine Spanish pointer, was immediately condemned. Dissection exhibited the small white cords which constitute the olfactory nerves or organs, or rather perhaps which receive and convey the impression of scent to the brain, in vast numbers; hence the superiority already noticed. However, for satisfactory elucidation more sacrifices were rendered indispensable: in short, after the examination of a variety of heads, it was found the olfactory nerves or organs were numerous precisely in proportion to the expansion of the head, and therefore, as the heads narrowed, the cords in question diminished, and consequently the powers of smell became inferior in the same degree:—the Spanish pointer and the narrow-headed high-bred greyhound may be regarded as the two extremes: the experiments were delightfully satisfactory!

The difficulty which presented itself was to unite a head sufficiently expansive with a form calculated for celerity and endurance. In the course of his experiment, the writer to whom we have alluded, procured pointers from various parts of Europe, particularly from France, Spain, and Portugal: he had recourse to his sporting friends in this country, and introduced the Leicestershire and Yorkshire blood into his kennel: and after sixteen years of crossing and recrossing, he produced pointers from whose performances he experienced the utmost satisfaction; the group which embellishes our present number is offered as a specimen. He happened accidentally to meet with a pointer on board a Spanish vessel in the harbour of Liverpool, whom the Captain represented as the best blood in Spain. It was the most shapely Spanish pointer which he had seen, and he therefore procured it. White was the dog's prevailing colour, singularly spotted—hence the spots, observable in the portraits united in our embellishment. He was put to a liver-coloured bitch, and the whelps manifested in a remarkable manner the preponderating influence of the sire, in form, colour, and disposition; yet, they were an improvement upon the

Spaniard; their legs and feet were superior; they were more active and much fleet; still they were not satisfactory—it was evident much remained to be accomplished before that combination of qualities could be obtained so as to bid defiance to improvement. One of the litter deserves particular notice; it was a dog whelp, the largest amongst them, and ultimately became a very powerful animal; the head appeared disproportionately large, and from an early period of life, Frank (for such was the name by which he was distinguished) evinced extraordinary sagacity. By the time he had attained the age of twelve months, he knew the poultry, pigs, and indeed all the live stock, of his master; nor would he suffer the intrusion of a stranger: he was an excellent physiognomist, and forbid the approach of suspicious persons in a manner which could not be mistaken—and that too with a determination to accomplish his object or perish in the attempt. He became much attached to the female part of the family, and particularly to the smaller children. Though ill-tempered, and for ever growling, the children pulled him about, and took all kinds of liberties with him, notonly with impunity, but apparently with pleasure to the dog, as he never seemed so happy as under such circumstances. To a little girl of delicate health (six years of age) he became uncommonly attached: he attended her in all her little excursions, watched her motions with the most jealous attention, scrutinized the approach of every stranger with threatening suspicion, and would allow no person to come near his charge unless he felt satisfied no evil was to be apprehended. On this account the dog became a great favourite; but unfortunately there were shades in his character of an opposite kind; he was most assiduous in searching for eggs, which he very greedily devoured; even if the hen were sitting on the nest, it afforded no defence against his depredations; while any strange fowl which happened to come upon the premises, he instantly killed; he was a most accomplished thief in every respect; and from these evil propensities it was found impossible to restrain him.

In the field this dog evinced sagacity, and an exquisiteness of the olfactory organs or powers of smell seldom witnessed; but, although he set winged game very steadily, he chased hares in the most obstinate manner; on the whole, he was very unruly in the field, and on that account his services as a pointer were soon dispensed with, though it was deemed advisable to retain a little of his blood.

A dog which the same gentleman procured from Portugal was awkwardly formed, with feet remarkable for breadth, looseness, and the very large size of the ball—expressively indicated by the term *spongy*. This dog proved very steady, but soon became fatigued, as may be easily supposed from the form and quality of his feet.

The French double-nosed pointers, were uniformly found unruly, very hard, and, like

the Spanish dog, as quarrelsome as possible, generally growling under the caresses even of their master. The faulty legs and feet of these animals were improved by repeated crossings; but, while the French blood was allowed to predominate, they proved headstrong and unpleasant in the field, and were particularly unpleasant on the moors, where the business of shooting should be conducted as quietly as possible,

To be brief: after persevering for sixteen years, and having recourse to every strain which appeared likely to promote the object in view, the author of the *Sportman's Cyclo-pedia*, &c. &c. became possessed of pointers from which he derived that satisfaction which he had so ardently and so perseveringly sought, and which could not fail to be highly approved by the most fastidious disciple of the trigger.

Di, a liver-colour and white pointer bitch, was the first animal of the kind with which he was perfectly satisfied; she was remarkable for depth of chest, strength of loins, well formed limbs, large handsome head, and indeed, for all those essential requisites, which are so admirably exemplified in the group which forms our present embellishment. She was the dam of the recumbent figure (Bob) as well as of the figure to the right (Moll, the sister of Bob); superior pointers the world never saw; the figure to the left (Don) is nearly allied by blood, and may be regarded as of the same family, as his appearance sufficiently indicates.

Much difficulty was experienced in the requisite improvement of the feet; and, it may not be amiss to remark in this place, that Somerville, so generally correct in his notions on dogs used for the sports of the field, fell into a most egregious error in regard to the form of their feet. He shall speak for himself:—

“ ————See there, with countenance blithe,  
And with a courtly grin, the fawning hound,  
Salutes thee cowering, his wide opening nose,  
Upwards he curls, and his large slowblack eyes  
Melt in soft blandishment and humble joy!  
His glossy skin, or yellow pied or blue,  
In light or shades by nature's pencil drawn,  
Reflects the various tints; his ears and legs  
Fleckt here and there, in gay enamell'd pride,  
Rival the speckled pard; his rushgrown tail,  
O'er his broad back, bends in an ample arch;  
On shoulders clean, upright and firm he stands;  
His *round cut foot*, straight hams, and wide spread thighs,  
And his low-ripping chest, confess his speed,  
His strength, his wind, or on the steepy hill,  
Or far extended plain; in every part  
So well proportioned that the nicer skill  
Of Phidias himself can't blame thy choice.  
Of such compose thy pack. But here a mean  
Observe, nor the large hound prefer, of size  
Gigantic; he in the thick woad cover'd  
Painfully tugs, or in the thorny brake,  
Torn and embarrassed, bleeds; but, if too small,  
The pigmy brood in every furrow swims;  
Mould in the clogging clay, panting they lay  
Behind inglorious; or else, shivering ere yet,  
Besour'd and faint, beneath the shelling thorn.  
For hounds of middle size, active and strong,  
Will better answer all thy various ends,  
And crown thy pleasing labours with success.”

Somerville's description relates to the hound; but, as far as regards form, is applicable to every kind of dog used in the

sports of the field, and particularly to the pointer:—it is as correct as possible—except the “*round cat foot*.” It would appear strange how Somerville, so acute and correctly accurate in general, should have been led into a mistake so palpably egregious, as to recommend the “*round cat foot*” as conducive to speed in the dog; it is equally strange that the celebrated Hugo Meynell, the accomplished Beckford, and indeed all successive fox-hunters, should have proceeded upon so monstrous a paradox in the breeding of their hounds. Such a formation of the feet is perfectly in unison with the mechanical or animal organization of the cat kind, but when the structure of the dog is considered, and the strongly-marked difference of the progressive motion of the two species taken into the account, the admirable adaptation in the one case, and the glaring incongruity of the other, cannot fail to be impressed on the mind with the most unqualified conviction. The cat (and so of all animals of the cat kind) is, like the rest of creation, formed for its mode of life. The round foot, and well developed toes, of the cat, enable it to creep stealthily upon its prey, while by this peculiarity of formation, it retracts or draws in the instruments (the talons or claws) by which it is to seize and secure it. When within reach, the cat springs upon its victim, the propulsive force of which results from the form and extraordinary power of the hind legs or quarters. In this operation, or rather combination of operations, the cat is assisted by that flexibility of the body, particularly of the back bone, that contraction and tension, which will be vainly sought in the canine tribe. In fact, the two animals are so distinctly marked in form, manner, and motion, that the peculiarity of the one, the *round foot*, for instance, becomes preposterous, if not monstrous, in the other.

Having already remarked, that breeders of hounds suffered themselves to be inconsiderately led astray by the erroneous doctrine of Somerville, we must here observe, it brings to our mind an incident which may be related as illustrative of the subject under consideration. When Mr. Osbaldeston was master of the Quorndon establishment for the second time, we happened to be in the kennel, and, amongst other hounds which attracted our attention, was Pilot, a middle sized dog, but remarkable for bone; the upper part of his fore leg was nearly, if not quite, as thick as our wrist, to which the “*round cat foot*” presented a grotesque appendage. We felt convinced that he must be *dead slow*; and on hinting our opinion, we were given to understand he did not run well up, and had by no means answered the expectations formed from his extraordinary development of bone. How was it possible! his fore legs and feet were an absolute malformation!

For a correct idea of the perfection of the foot of the pointer, we should steadily keep in view the long wiry narrow toe, and indeed the altogether exquisite formation of the foot

of the hare:—Whence arises the extraordinary speed (and also strength) of this surprising little animal, but from that peculiarity of conformation for which it is pre-eminently distinguished? The hare has no ball to her foot; the dog cannot be divested of this cushion like appendage; but, in breeding, nothing should be neglected that will be likely to reduce its size and softness (so conspicuous in the Spanish pointer) as well as to lengthen and harden the toes. When the foot of the pointer is formed so as to approach as nearly as possible that of the hare, his limbs strong and straight, his chest “*low drooping*,” loins broad, &c. he will go through a lengthened degree of exertion which would be regarded as impossible, by those who have paid but slight attention to the subject.

We are told it was an Earl of Surrey that first taught the dog to set or stand at game, but which of these Earls the writer has not condescended, or has not been able perhaps, to inform us; however, the original date of this transaction amounts to nothing, since, whoever may lay claim to the authorship, the idea arose, beyond all question, from the following circumstance:—All dogs that will hunt will be found, while young to dash headlong into their game and force it to spring: but, in the course of a short period, when they find they cannot catch it by pursuit, they will be observed, as soon as they recognize the scent, to draw more warily upon it, and, after having made a near approach, they will pause for a few seconds, in order to ascertain the exact spot, if possible, where it lies concealed, for the purpose of seizing it before it springs. Hence originated the notion of the setting dog:—his temporary pause was improved into a steady point.

It is not a difficult matter to make any dog set or point, that will hunt; but, at the same time it must be admitted, there are various kinds of these animals, which, however steadily they may point the game, are not well calculated for what the French call *La Chasse au Fusil*; or, in other words, for the pursuit of the grouse on the rugged blue mountains of the north, or the partridge in the inclosures and more cultivated grounds. A dog for the purpose in question should have an elegant lofty range, should possess considerable speed, as well as strength and spirit to endure long and fatiguing exertion. For such a combination the well-bred pointer, (such, for instance, as adorns our present number) is well, we might say, pre-eminently, calculated; for, although there are sportsmen to be met with who prefer the setter to the pointer, on account of his superior strength and hardihood, yet we cannot give in to such an opinion; since, as these qualities, the capacity of enduring exertion or fatigue, are the result of animal organization, so, when the pointer is bred as he ought to be, he will be found equal to the setter in strength and endurance, superior in the acuteness of his olfactory organs, and steadier also.

The pointers whose portraits accompany this publication, were allowed to follow their master into the field as soon as their strength would enable them, before they could manage to surmount the ditches, over which they had frequently to be lifted. They taught or broke themselves into the business they were intended to pursue, and were never terrified by the whip of the professed dog-breaker. The author of the Sportsman's Cyclopedia, &c. &c. generally contrived to have his whelps brought forth in the latter end of February or the early part of March; and, as soon as the hay was cleared off the ground, he allowed them to follow him into the fields, where they immediately began to hunt, and very soon to set young partridges which might be found running in the after-grass towards evening, very steadily. This was adopting the admirable maxim, "Train up a child," &c. and thus, without trouble, his young pointers might be said to educate themselves; and, it may be justly observed, that self-acquirement, or self-acquired education, uniformly makes the most lasting and the most perfect impression on the mind. Towards the latter end of the month of September, they were shot over, and taken out regularly during the remainder of the season.

It has been supposed by some, that dogs which slip so naturally into the method of pointing, acquire afterwards too much set; this, however, is quite a mistaken notion: ill-bred dogs will frequently be guilty of the incurable fault just mentioned (and in fact an ill-bred dog is very seldom worth keeping); but the breed of dogs under consideration, three beautiful specimens or samples of which we have placed before the eyes of our readers, never contracted the lazy, evil, degenerate habit of *pointing at nothing*, if such an anomaly may be allowed; on the contrary, their index was as true as the gnomon of the sun dial; while their *backing, down charge*, and uniform obedience, mode of ranging, &c. &c. were as perfect as possible; they may be regarded as the perfection of the pointer: better dogs for the gun were never seen; as far as relates to beauty of form, we will leave the reader to judge for himself.

However, let it be well remembered by those who are desirous to breed pointers, (and the same rule will apply to every variety of the canine tribe) that it does not necessarily follow, because the best possible breed has been obtained, it can be continued or propagated in perfection inclusively, or upon the in-and-in system of procreation; so far from this, recourse must be frequently had to strains as remote as possible from any degree of consanguinity; and, although an occasional incestuous dip may be advisable, particularly on the score of beauty, circumspection and judgment should be exercised on such occasions, or the most injurious consequences can scarcely fail to result. Even in having recourse to crosses from strange blood, care should be taken to select the individuals so as

to secure the utmost beauty of form as well as every other requisite; if, on one side, there happen defect, an attempt should be made to neutralize or correct it, by the preponderance of the part or quality, on the other. If pointers are bred absolutely in-and-in, they will be found gradually to lose their faculties, will become diseased, and in a short time, will be utterly incapable of continuing their species. Further, let those who breed pointers keep in mind the preponderating influence of the male, particularly where recourse may be had to a strain utterly unconnected by the slightest degree of consanguinity; also, it may frequently be observed, that the females of a litter will present a strong likeness of the sire, while those of the opposite sex will be found to approximate the dam; observations, we have reason to believe, generally applicable to animated nature.

We have heard inconsiderate sportsmen recommend a cross with the setter. We have witnessed the experiment of this incongruous conjunction repeatedly; one good dog in five hundred may be thus obtained; but in general the offspring of the pointer and setter are very unruly, very obstinate, and very rarely indeed worth the trouble of rearing.

What are well understood amongst sportsmen by the term *cross-bred dogs*, we regard with contempt, though an extraordinary animal (one in ten thousand perhaps) has been occasionally thus produced. The late Col. Thornton's Dash, is the most celebrated of these semi-mongrels. Dash was produced by a cross of the foxhound with a highly bred pointer bitch; he was remarkable for his style of ranging upon the moors, as well as for his superior method of finding game; he was equally excellent in partridge shooting, and backed other dogs as steadily as possible. This dog was sold to the late Sir Richard Symons for one hundred and sixty pounds' worth of Champagne and Burgundy, which had been purchased at the French Ambassador's sale, a hogshead of claret, an elegant gun, and a pointer; with a stipulation that if any accident befel him, as might render him unfit to hunt, he was to be returned to the Colonel for fifty guineas. Dash had the misfortune to break his leg; he was therefore sent to Colonel Thornton, who paid the fifty-guineas, and kept the dog as a stallion: from whom, however, a single whelp worth keeping was never procured. Nor was such a circumstance likely; the stock of these cross-bred dogs is uniformly good for nothing.

The late Rev. W. Daniel, compiler of the Rural Sports (which, if the plates be excepted, is one of the most ill-digested farragos that ever disgraced a scribbler, or insulted the genuine sportsman;) extols Colonel Thornton's Dash as a dog from which to procure superior pointers; while in the same volume, at some pages distance, he gives a striking specimen of physiological ignorance, and consequent incapacity for the task which he had undertaken. "Upon no account (says he) accept

or keep a spaniel (it is needless to tell a sportsman not to *breed* from) which has any taint of the hound in his pedigree; although for generations back, they will be sure to hunt hare in preference to winged game, and the stock may be crossed everlastingly, may attain beauty, strength, symmetry, yet this latent spark of the harrier will never be extinguished, and they will always shew their predilection for hare whenever they have an opportunity, and this generally happens when their goodness is most required; namely, in cover, where the winged game is preserved, and there, for the most part, hares are also in the greatest plenty. A stronger instance could not be well exhibited, than in the spaniels of the deceased Lord Waltham and Mr. Hoare: a road only parted the seats of these two gentlemen, and their gamekeepers frequently shot in the woods together: their dogs were equally handsome; but those of the former would drive hares the day through, and consequently sprung everything that accidentally laid in their course; whilst those of the latter no more ran hares than they did sheep; they would indeed find the hares, but follow no farther than they could see them: they were always in their places, twisting around every stub with that agility, and possessed such fineness of nose, that neither woodcock nor pheasant could escape their search. Lord Waltham's spaniel bitches had originally a cross of the beagle, and although this was tried to be remedied by resorting to the best dogs, the tendency to hare could never be removed." What ridiculous, what preposterous, nonsense!

To say nothing of the reverend gentleman's ignorance of our vernacular idiom, or his ill-defined notion of the grammatical construction of the English language, what does this prove? Why, that Lord Waltham's keepers, like W. Daniel, did not understand their business. "*The tendency to hare could never be removed.*" indeed! Then how came the tendency to fox to be subdued in Colonel Thornton's Dash? But, above all, how came the tendency to hare to be subdued in our pointers, since the very best of them have a cross of the hound? It would seem strange indeed, if spaniels could not be prevented from chasing hares, since the foxhound, the most hardy and intractable perhaps of any of the dog tribe used in the pursuit of game, is not only restrained from pursuing hares, but also from following any other animal, and kept as steady as possible to the pursuit of the fox.

Nothing is more common than to hear the sagacity of the Newfoundland dog and the Poodle extolled to the skies, but they are not superior to the well bred pointer in intellectual capacity: indeed, this quality, by whatever name it may be distinguished, will be found precisely in proportion to the expansion of the head; and, as we have already observed that the sense of smell is regulated upon a similar principle, a person who has

duly considered the subject, will be able to form a tolerably accurate opinion of either the one or the other by the appearance of the animal.

The recumbent figure in the engraving (Bob) was remarkably sagacious; he possessed canine discrimination in the superlative degree. On returning home from shooting, in passing a pit, a couple of wild ducks rose from it: the gentleman to whom we have frequently alluded in the course of this article, the owner of the dog, brought them down one with each barrel. One of them fell into the water. The gentleman was accompanied by three pointers, one of which was the dog just mentioned; but, as the coming upon these ducks was a mere accident, and the pit being overhung with trees, and fringed with brushwood, the dogs, though put on the *qui vive*, were not exactly aware for what the gun had been discharged. How to get the duck out of the water became the object of consideration: Bob, though not fond of taking water, had repeatedly fetched a wounded or dead bird out of it, nevertheless. At length, by lifting the dog in his arms, his master contrived to shew Bob the floating object which he was desirous to obtain. The dog entered the water immediately, swam up to it, took it in his mouth—but he no sooner perceived it was not his legitimate game than he spurned it with contempt—he returned without the duck, nor could he be induced to fetch it out: a partridge he would have brought out without hesitation.

A sportsman ought never to lend a pointer, since a dog, whatever his good qualities may be, will not serve a stranger either so willingly or so well, as his master, and returns home all the worse for the indiscreet experiment. However, a friend being very importunate, the owner of the pointers whose portraits accompany the present number, after some hesitation, agreed to accommodate him with Bob, who was well advanced in life, had seen an abundance of game fall before him, and was a finished adept at his business. The gentleman prepared for the field, and the dog, perceiving the shooting jacket, gun, &c. accompanied him without hesitation. In about two hours the dog was observed, at the distance of several fields, returning home very leisurely and very unconcernedly—and home he came, followed in some fifteen or twenty minutes by the gentleman. It was easy to guess what had occurred. The gentleman had not killed a bird; but on repeatedly missing, the dog began to testify symptoms of uneasiness and dissatisfaction; and, at length, after some half-score shots had been wasted, Bob unceremoniously gave up and returned home. The lender was prepared for such a result. He was aware his friend was a very indifferent shot; and as the dog had been in the habit of observing the game fall when the gun fired, he concluded Bob would suspend his exertions when he found them unavailing.

We have already observed, that any dog

which will hunt may be taught to set. We once saw an animal bred between the water spaniel and the shepherd's dog that pointed partridges as steadily as possible. Indeed, it would appear as if this manœuvre or act of pointing, depending as it does on the sense of smell, is not exactly confined to the dog tribe, as the following anecdote will render manifest; which, however, we should not introduce, were not its authenticity placed beyond all doubt. A *black sow*, belonging to Richard Toomer, acquired the knack of pointing. Slut was bred in the New Forest, Hampshire, and was of that sort of hog which maintain themselves upon the wild productions of the Forest, except when they have young, when they require extra food for a few weeks. She was given, when about three months old, by Thomas to his brother, Richard Toomer (both keepers in the Forest) for the purpose of breeding. Little notice was taken of her till she was about eighteen months old, as she had not produced any young; she was seldom seen near the lodge, but chanced to be observed one day near that place, when Thomas Toomer happened to be there. The brothers were concerned together in breaking pointers and setters, some of their own breeding, and others which were sent from different gentlemen; of the latter, although they would stand and back, many were so indifferent that they would neither hunt, nor express any satisfaction when birds were killed and placed before them. The slackness in these dogs first suggested the idea, that by the same method any other animal might be taught to stand, and do as well as one of those huntless and inactive pointers. At this instant the sow passed by, and was remarked as being extremely handsome. R. Toomer threw her a piece or two of oatmeal roll, for which she appeared grateful and approached very near; from that time they determined to make a sporting pig of her. The first step was to give her a name, and that of Slut (given in consequence of having soiled herself in a bog) she acknowledged in the course of the day, and never afterwards forgot. Within a fortnight, she would find and point partridges and rabbits, and her training was much forwarded by the abundance of both which were found near the lodge. She daily improved, and in a few weeks would retrieve birds that had ran as well as the best pointer; nay, her nose was superior to any pointer they ever possessed, and no men in England had better. They hunted principally on the moors and heaths. Slut has stood partridges, black game, pheasants, snipes, and rabbits, in the same day, but was never known to point a hare. She was seldom taken by choice more than a mile or two from the lodge, but has frequently joined them when out with their pointers, and continued with them several hours. She has sometimes stood a jack-snipe when all the pointers had passed it. She would back the dogs when they pointed; but the dogs refused to back her until spoke to,

these dogs being trained to make a general halt when the word was given whether any dog pointed or not; so that she has been frequently standing in the midst of a field of pointers. In consequence of the dogs not liking to hunt when she was with them (for they dropped their sterns and shewed symptoms of jealousy) she did not very often accompany them, except for the novelty, or when she accidentally joined them in the Forest. The pace was mostly a trot; and she was seldom known to gallop, except when called to go out shooting: upon which occasion, she would come off the forest home, at full stretch (for she was never shut up, but to prevent being out of the sound of the call or whistle, when a party of gentlemen had appointed to see her out next day, and which she obeyed as readily as a dog;) and be as much elated as a dog upon being shewn the game. She always expressed great pleasure when game, either dead or alive, was shewn to her. She has frequently stood a single partridge at forty yards distance, her nose in a direct line to the bird; after standing some considerable time, she would drop, still keeping her nose in a direct line for the game, and would continue in that position until the game moved. If it took wing, she would come up to the place, and put her nose down two or three times; but, if a bird ran off, she would get up, go to the place, and draw slowly after it; when the bird stopped, she would stand it as before. The Toomers lived about seven miles apart, at Rhinefield and Broomey Lodges; Slut has many times gone by herself from one lodge to the other, as if to solicit the gratification of being taken out with the gun. She was about five years old when her master died, and at the sale of his pointers, &c. she was purchased by Sir H. Mildmay, and sent to Dogmersfield Park, where she remained some years: she was last in the possession of Colonel Sikes, was then ten years old, and had become fat and sluggish, but would point game as well as before. When killed, which was at Bassilden House, Slut weighed seven hundred pounds: we envy not the feelings of a man who could order the slaughter of such an animal.

---

IMPORTANT INVENTION.—A free man of colour, Henry Blair by name, has invented a machine called the corn-planter, which is now exhibiting at the capital of Washington. The *Intelligencer* describes it as a very simple and ingenious machine, which, as moved by a horse, opens the furrow, drops (at proper intervals, and in an exact and suitable quantity) the corn, covers it, and levels the earth, so as, in fact, to plant the corn as rapidly as a horse can draw a plough over the ground. The inventor thinks it will save the labour of eight men. He is about to make some alterations in it, to adapt it to the planting of cotton.—*New York Paper.*

## TO THE EDITOR OF THE FARMER'S MAGAZINE.

[The subjoined letter arrived too late for insertion in the Magazine published on the first of August, but as it contains much valuable information on the state of the crops during the month of July, although late, we think it will still be found interesting.—E.D. F.M.]

SIR.—The revolving year with its succession of seasons, in this our beautiful country and temperate climate, must appear even to the town immolated part of the community, as the grandest and most sublime work of our Merciful Creator; and to the husbandman it seems especially to be bestowed as the means of reward to his care and toil, and as a perfect fulfilment of the promise given to our first parents, that by industry man should eat bread, although the ground had been cursed by his disobedience.

During the last month of beautiful hay-making weather, this department of agriculture has proceeded, as it needs must have done, speedily and satisfactorily, and on the grass land generally, particularly on the low marshy lands, satisfactory both as to quality and quantity, but not so however in the latter respect as regards the red clover and other artificial grasses, for here has been an unusual falling off in quantity, with the exception of the crop grass which has been good every where. It has been a rare occurrence during the spring and summer to see a good piece of clover, and I do not recollect to have seen fifty acres of seeds likely to produce a fair average growth. The winter tares were however remarkably fine and produced an immense supply of food on almost every farm, thus offering a good substitute for clover, both for green food and hay. The making of tares into hay is a tedious process, but if circumstances happen to be favourable, it is a capital fodder for cattle and sheep, and they will usually eat it in preference either to grass or clover hay. Tares for this purpose should I think be cut immediately the first pod appears, for if they be allowed to remain growing beyond this stage they lose much of their nutritious property. The forward sown turnips, particularly the Swedes, are looking very well, and many acres in this part of the country are now undergoing the process of hoeing.—July, 12th. It is astonishing the manner in which the plants have carried themselves during the late dry weather, and it is only the exception where the fly has been of serious injury. Thus, with a better crop of hay secured than we had last year, and a far better prospect for a turnip crop, it may fairly be presumed that lean sheep will bear a higher price, for although the value of mutton has considerably fallen of late, it yet bears a good price, and wool still remains a far higher price than any other article of agricultural production. At Finden Lamb Fair in this county on the 12th inst, where not more than four thousand were penned, Lambs sold from 13s to 21s. It was a very heavy trade and less than a half of the lambs were disposed of. Some wool was sold at 20s. At Horsham Fair on the 18th inst., the best Lambs sold readily, from 20s to 23s, but lambs of inferior quality hung rather on hand, but these also were pretty generally cleared off at the end of the day at from 12s to 18s. A very few ewes only were offered, and I heard of one hundred only being sold; these fetched 33s per head, but they were far superior to the average run of Down ewes. A few wether Tegs were sold from 25s to 28s.

The harvest is again approaching, and consequently the prospect of the different crops offers the usual

interest of this season of the year. I will speak first as to the wheat, which will I think in this county prove to be somewhat below an average produce; we have not seen so much difference in this grain on the good and inferior land, and I must add, on the good and inferior farming also, as we do at the present time, since the year 1831. On the best coast land there will not I think be much short of an average crop, but on the wet cold land and the high chalky and gravelly soils there will be a considerable deficiency. As an instance of this, *twenty acres of wheat* in the neighbourhood of Chichester, on a dry and poor shrave, have been sold for *fifty pounds*, and I am told the purchaser will have a dear bargain. This is undoubtedly an extreme case, but there is a considerable breadth of wheat this year very inferior in quality to any we have had for the last four years. I had last week an opportunity afforded me by a friend who farms on a dry and inferior soil, of witnessing the effect of the application of soot on young wheat in the spring. The field to which I now allude, has been partly dressed over at the rate of thirty bushels of soot to the acre, and it is quite astonishing to see the benefit that it has afforded to the crop of wheat. Nothing can be more conclusive as to the virtue of this description of dressing, than the experiment which I am now speaking of. The field was sown with wheat out of a clover ley, without any manure being laid on, the whole of the piece having been previously to this year farmed in an exactly similar manner. The field perhaps is seven acres, and about four acres (the poorest part of the enclosure) were selected for sowing the soot on, the remaining three acres not having any soot applied. I have no doubt but that at harvest there will be eight bushels of wheat more an acre on the part that was sooted, than there will be on the part to which no soot was applied. The cost of the soot was sixpence a bushel, being at the rate of fifteen shillings an acre for thirty bushels. The whole of the expense attending the dressing will not exceed twenty shillings per acre, the increase of the value of an acre of wheat will be forty-eight shillings, or eight bushels of wheat at six shillings a bushel, thus leaving a net profit of twenty-eight shillings per acre after deducting the cost and expenses of the soot, and as to any additional labour brought about by an extra crop, such as reaping, threshing, harvesting, &c., the increased quantity of straw will entirely liquidate.

The appearance of the wheat has universally improved during the last month, and it has become much higher than it promised to be, but on close examination a very considerable proportion is found deficient in straw, and which deficiency will be far more easily detected when the ribband to the wheat falls and leaves the ear to stand on its own merits.

The appearance of the barley, like the wheat crop differs considerably in different soils and circumstances, and may prove less than an average, although some barley on the good land is looking very well indeed. On the oat crop there is no question, it will be very deficient—in fact there are only a few pieces of good oats to be found on the best land, and when there is difficulty of finding instances of a fair promise of any particular grain on the good land, there is not usually found much difficulty in finding numberless instances of miserable failures of the same description of corn, on the poorer soils, and thus it is with the oats this season. The pulse crops, particularly the peas and tares, are generally good, and consequently it may fairly be presumed that after the ensuing harvest, the food for man and the food for swine will again return to something like an usual proportionate price, and not present in the market

the anomaly which existed last year; viz. hog-corn bearing a higher price, than the corn which produces the main staff of man's food. The corn markets at this time, July 16, possess a firmness which it would be reasonable to suppose the continued favourable weather to expedite the harvest, would have the effect of destroying, and this undoubtedly would be the case, but from the shortness of the supplies throughout the kingdom. That the supplies should be short after so abundant a harvest as the last is somewhat curious, and the circumstance can only be accounted for by the importations of wheat from Ireland having fallen off, together with the consumption of wheat during the winter by cattle, and the exportations to America and to our own Colonies of wheat and flour having been very far beyond the extent generally supposed. The foregoing causes may account for the present deficient supply, and the impression that the forthcoming crop will be less than an average, may induce some little speculation on wheat; and the Joint Stock Banks have assuredly increased the circulating medium of the country, and *this last circumstance has no trifling effect on prices*, whatever may be said to the contrary by the disciples of the "supply and demand" doctrine. A plentiful circulating medium is the cause of an extensive demand for the necessaries of life; and a high or remunerating price is the effect of this cause. A dense population without the means of purchase, forms no cause for the demand of the comforts of life, although it is assuredly the cause of demand for just so much garbage as will barely sustain human existence. The exportation of wheat and bacon from Ireland, and the demand for potatoes and buttermilk there, is a case in point, and consequently it is absurd to reason that with an increased population the demand for luxuries will increase, unless you have a like increase of circulating medium, or in other words, unless you first create the commodity necessary to negotiate the transfer of the various articles (which are generally admitted to be necessary to civilised life), from the producer to the consumer.—I am, Sir, your obedient and very humble servant,

Sussex, July 23, 1836.

AGRICULTOR.

### GRAND AGRICULTURAL DINNER AT THE MAIDSTONE NEW CORN EXCHANGE.

The dinner in celebration of the opening of the New Corn Exchange was held on Thursday, July 28, in that very commodious building. Lord Marsham presided, T. Rider, Esq. filled the deputy chair, and about 450 guests, principally highly respectable agriculturists from the surrounding districts, attended. We noticed amongst others, Sir W. Geary, Bart., M.P., T. L. Hodges, Esq., M.P., Wyndham Lewis, Esq., M.P., the Mayor of Maidstone, Revs. Messrs. Reeve, Parker, and Haslewood, Sir J. D. Thompson, Drs. Welch and Sibbald, Colonel Middleton, Major Wayth; Esqs. J. Jacobson, T. F. Best, Wykeham, Martin, J. S. Douglas, J. Brenchley, W. H. Stacey, &c. &c.

The usual loyal toasts were drunk with the healths of the noble Chairman, the Members for the County, and the Borough, &c., &c. Several excellent speeches were made, but we have not space for more than the subjoined.

Sir W. GEARY rose to propose a toast which was of such great importance that he begged gentlemen to fill their glasses—BUMPERS—[Sir William attempted to shout out this word in the style of the toast-master, of whose talent he really gave a very

tolerable imitation; the joke was received with great cheering.] He apologized for his presumption in supposing that any of them were not likely to do justice to the toast. It was one in which he was personally interested, as he believed to be the case, more or less, with every one round him, and demanded the respect of every company into which it could be introduced. No person, capable of reflection, could doubt him, when he said that he thought the agricultural interest of this country superior to every other. (*Cheering.*) He thought no one would deny that the agricultural interest was bound up with every other interest of this mighty empire. Whenever the agricultural interest was made to give way to the other interests, he thought that it would be a most unfortunate time for this country. (*Great cheering.*) When long wars were taking place, and bore hard upon the moral energies of this country, who was there to man their fleets and fill their armies but the agriculturists? He hoped that they would always be found combined under the great principles of truth. Their motto was "live and let live"—(*Renewed cheering.*)—and they only claimed that protection which they deserved of the country. He therefore would propose "Success to the agricultural interest, and may the rulers of this country never forget them, but give them that due attention which their importance demanded."—Drank with three times three.

J. ELLIS, Esq., of Barming, rose to return thanks, but such confusion prevailed that we could not hear a syllable he uttered, although it was evident from his gesticulations that he was speaking for a minute or two. The Toast-master and the noble Chairman in vain attempted to procure silence. Mr. C. G. Whittaker, however, was loudly cheered, and during the short period of attention which his interposition procured, Mr. Ellis addressed the meeting in nearly the following terms:—The having for the last thirty years attended every public meeting that has been held in this town, and most of those in London on the subject of agriculture, will I trust be an excuse for rising to thank the hon. bart. for the very handsome manner in which he has proposed the toast, as well as to express my gratification in witnessing the general warmth of sentiment in and from all parts of the meeting in drinking it. From the long and constant communication I have had with agriculturists from all parts, I am fully convinced they only ask for common justice, by being equally protected and taxed with the other classes of society.

T. L. HODGES, Esq., M.P. then rose to propose a toast, and, after a few sentences, was listened to with marked attention. He was afraid that at this period of the evening many of the gentlemen present might wish to depart for their homes, but it was some satisfaction to know that the toast, that had been intrusted to him, was the last upon the list. Although last, however, it was not least in importance, as it regarded the county of Kent, and which he believed they would drink with as much applause as that which had been proposed by his hon. colleague;—more particularly as this toast was a branch of agriculture almost confined to this and one other county. The toast was "Prosperity to the hop growers of Kent and Sussex." (*Great cheering.*) He rejoiced at the pleasant prospect which now presented itself to the eyes of the hop grower, for although he did not think that the duty would reach the sum at which some gentlemen had fixed it, yet he believed that no person would regret the fact unless it were the Chancellor of the Exchequer. (*Cheers and laughter.*) He wished also to congratulate them on the unequivocal symptoms

of improvement in the agricultural interests which were now developing themselves. It might be truly said, that the agricultural was the foundation of all other interests; but he would also beg to call their attention to the fact, that it was impossible for agriculture to flourish, unless trade and commerce also flourished. (*Great cheering.*) He was happy to mention an instance, in which this improvement in manufactures had been proved. He had been recently told by a Lancashire member, that the poor rates in Manchester, which were a short time since no less than twelve shillings in the pound, had been reduced to the comparatively insignificant sum of one shilling and fourpence. (*Cheers.*) This had not been caused by the operation of the poor-law, for it had not as yet extended itself into that county. Such was the improvement in the manufacturing interest, and the agriculturists were experiencing the benefit of it. The noble Chairman, in one of the many eloquent addresses which he had made on that day, had touched upon one subject, which had made a great impression on his mind—namely, the state of the agricultural labourers in the neighbourhood of this great town. This was a subject of deep and great interest. A great change had taken place in the condition of this class of men by the late alteration in the law. (*Hear, hear.*) Duties most important in themselves had now arisen, and pressed themselves on the attention of the people of property of this great county; and the question was, how they could best supply that assistance which the law had denied, and how to lay the foundation of a lasting improvement in the condition of the most important, the most useful, and, he might say, hitherto the most unfortunate, class of men. (*Great cheering.*) It would be their duty to provide the means of affording local assistance to the individual exertions of the industrious,—to assist every man within their influence, in endeavouring to obtain an honest livelihood for himself,—and to regard with compassion and great forbearance the occasional outbreaks which a change of condition invariably produced in that class of men. The local authorities of Maidstone were fully prepared to enforce the law wherever it might be outraged—but he was addressing men who would rather resort to any other remedy than the law. If the possessors of property which had been allowed to accumulate throughout this country—and he begged to say that no nation in the world possessed equal wealth with this kingdom,—he was quite satisfied that if the duties to which he had alluded were fairly performed by the possessors of this property—if they only assisted, from the ample store that Providence had given them, the industrious and deserving to struggle for themselves—he was quite satisfied that no amount of distress would ever endanger either the security or the property of this great country. (*Great cheering.*) He hoped that their increase of wealth would be accompanied with a corresponding increase of kindness, and that the rich would never fail to show the greatest regard for their poorer neighbours. Looking, therefore, with confidence to the improvement of agriculture—hoping that the improvement which had been commenced would continue its progress undisturbed; and that its recipients would use it for the benefit of the community, and thus lay the lasting foundation for the glory and prosperity of England—he felt the most sincere pleasure in proposing as a toast, “Prosperity to the hop-growers of Kent and Sussex.” (*Loud and long continued cheering.*) The toast was drank with the greatest possible enthusiasm.

The noble Chairman then left the chair, and the bulk of the company retired from the room.

## SMALL ALLOTMENTS.

Mr. Baker, of Cottesmore, Rutland, on Wednesday the 20th July, invited the clergy and the largest occupiers of land from the several parishes where this system has been at work upon Sir Gerard Noel's estate, to receive the seventh annual report and statement of prizes, which in this year were awarded by Mr. Cheetham, of Hambleton, Mr. Pickering, of Beaumont Chase, and Mr. Rudkin, of Langham Lodge, on Monday the 18th, Tuesday the 19th, and Wednesday the 20th. The party, as usual, were entertained by an examination of Allotments in Cottesmore and Barrow, some Farms and Stock, returning to Cottesmore at three o'clock. The whole of the business was carefully gone into, and the several prizes handed over to the parties interested in their neighbours' honourable and praiseworthy exertions and conduct. The whole were paid in new coin received that morning from the Mint. The usual topics for discussion being disposed of, the opinion of all present was taken as to the propriety of continuing the annual examination and prizes, of which notice had been given a short time previous to the meeting. They were unanimous in declaring that it was of importance to continue them; and many excellent and well-defined reasons were adduced in support of it. That the system of quantity of land, quality, contiguity, and annual examinations, surpassed in intrinsic worth all others, and was more valuable to all parties than any system of the kind that had yet come under their notice, and in this case Mr. Baker had matured and carried out in all its bearings the principle of his excellent letter addressed to Sir Gerard Noel, Bart., in February, 1832, which scheme had been so warmly supported by that kind-hearted, liberal landlord and friend to the working classes, both in money and personal attention. The following is a copy of the prize award:—

UPPINGHAM.—*Rev. — Dimock's Land.*

- 1st Prize, for good cultivation, 10s to No. 6, Samuel Riddle.  
2d ditto, for ditto, 7s to No. 7, Samuel Thorpe.  
3d ditto, for ditto, 5s to No. 4, Robert Stretton.

Given by Sir Gerard Noel, Bart.

- Commended—No. 2, Michael Cant; No. 12, George Nutt.

*Sir G. Noel's Land.*

- 1st Prize, for good cultivation, 10s to No. 12, Anty Stretton.  
2d ditto, for ditto, 7s to No. 17, Thomas Trigg.  
3d ditto, for ditto, 5s to No. 11, James Elliott.  
Commended—No. 8, Thos. Nutt; No. 7, John Page; 2s each.

Under the 11th Rule, “It is expected that every occupier shall attend some place of worship at least once every Sunday, &c. &c.”—Recommended by the Vestry.—Joseph Nutt, John Page, Wm. Baines, John Mould, Wm. Mould, John Coulson, Geo. Nutt, 2s each. Given by Sir Gerard Noel, Bart.

## RIDLINGTON.

- 1st Prize, for good cultivation, 10s to No. 1, John Haines.  
2d ditto, for ditto, 7s to No. 6, John Barfield.  
3d ditto, for ditto, 5s to No. 3, Wm. Wright.  
Given by the Rev. C. Swann.

Commended—No. 7, Edward Russell; No. 9, Thomas Manton; No. 11, Frances Pennystone; 2s each, by Sir G. Noel.

*New Allotments.*

- 1st Prize, for good cultivation, 10s to No. 5, Joseph Harris.  
2d ditto, for ditto, 7s to No. 7, Robert Manton.  
3d ditto, for ditto, 5s to No. 1, George Webb.

Given by Sir G. Noel, Bart.

Commended—No. 2, Joseph Woodcock : 3, John Dunmore : 2s each ; by Sir Gerard Noel, Bart.

Under the 11th Rule.—Joseph Bryan, Joseph Woodcock, John Dunmore, Geo. Pennystone, Fras. Penny-stone, Wm. Munton, Robert Munton, William Wright ; Edward Russell, Joseph Harris, Geo. Webb, Joseph Barfield, 2s each, by Sir Gerard Noel, Bart.

#### BARROW.

1st Prize, for good cultivation, 10s\* 5s† to No. 7, Fras. Simons.

2d ditto, for ditto, 7s\* 3s† to No. 5, John Leeson.

3d ditto, for ditto, 5s\* 2s† to No. 9, John Letherland. Those marked thus\* were given by the Rev. Henry Nevile, and those marked thus† by the Rev. John Hinman in addition.

Commended—No. 10, Wm. Freeman ; No. 1, Widow Munton ; No. 2, Wm. Huffill ; 2s each, by Sir Gerard Noel, Bart.

Under the 11th Rule,—John Letherland, Thomas Searson, John Leeson, Widow Munton, 2s each, by Sir G. Noel, Bart.

#### EXTON.

1st Prize, for good cultivation, 10s to No. 5, Thos. Bullimore.

2d ditto, for ditto, 7s to No. 37, John Martin.

3d ditto, for ditto, 5s to No. 31, John Scotney.

Very much commended—No. 35, John Wiles, No. 36, John Cross, 3s each.

Commended—No. 2, Everard Cole ; No. 21, Joseph Fant ; No. 24, John Young ; No. 32, Luke Hibbitt ; No. 40, Amos Hibbitt ; No. 43, Joseph Royce ; No. 44, Thomas Wilson ; No. 49, Wm. Webster ; No. 50, George Woodward ; 2s each.

By Sir Gerard Noel, Bart.

#### COTTESMORE.

1st Prize, for good cultivation, 10s to No. 9, John Tyler.

2d ditto, for ditto, 7s to No. 7, Robert Hill.

3d ditto, for ditto, 5s to No. 4, Widow Rawlins.

Given by the Rev. Henry Neville.

2s was also given by the Judges to Widow Rawlins.

Very much commended—No. 2, Widow Sharpe, 3s by Sir G. Noel, Bart., 4s by the Judges.

Commended—No. 22, Wm. Cox ; No. 23, Edward Young ; No. 5, Thomas Stimson ; 2s each, by Sir Gerard Noel, Bart.

Under the 11th Rule, and for general good conduct.—Wm. Chamberlain, Edward Osborn, George Allett, James Sneath, 2s each, by Sir Gerard Noel, Bart.

#### WHITWELL.

1st Prize, for good cultivation, 10s to No. 4, John Bolland.

2d ditto, for ditto, 7s to No. 2, Daniel Smith.

3d ditto, for ditto, 5s to No. 6, John Hibbitt.

By Mrs. Ellicott, sen.

Much commended—No. 8, Wm. Smith, 3s, by Sir G. Noel.

Commended—No. 1, Edward Smith, 2s by ditto.

Under the 11th Rule, "It is expected that every occupier shall attend some place of worship at least once every Sunday, &c. &c."—John Hibbitt, John Bolland, being reported to have attended punctually to this rule, and for general good conduct, 3s each, by Sir Gerard Noel, Bart.

Under the 11th Rule—John Allen, Robert Allen, Henry Hibbitt, John Woodward, 2s each, by Sir Gerard Noel.

#### PICKWELL.

1st Prize, for good cultivation, 10s\* 10s†, Wm. Lanc, aged 82.

2d ditto, for ditto, 7s\* 7s† to Wm. Hayes.

3d ditto, for ditto, 5s\* 5s† to Wm. Allett.

Those marked thus\* were given by Gerard Noel, Bart., and those marked thus† by E. W. Wilnot, Esq. in addition.

Edward Pears deserving of commendation.

The Gardens much superior to any previous year.

PARISH v. PARISH.—Comparative merits, quality of the land, situation, clean and useful husbandry, general management, and the number of years under the system—awarded to Riddington, it being the seventh year of tenancy, 2s each to all the occupiers, by Sir Gerard Noel, Bart.

The Ransome prize of one sovereign to the occupier of the best cultivated Allotment in any of the fields or parishes,—awarded to John Haines, of Riddington.

## RAILWAY COMMUNICATIONS IN AGRICULTURAL DISTRICTS.

(FROM THE CHRONICLE.)

One of the causes of general agricultural depression has been the want to the farmer of the means of transporting his produce, with rapidity and certainty, to those districts where larger and better remunerating prices can be obtained than in his own immediate vicinity. It is well known that, though extensive purchases of fat cattle are made every year, in Herefordshire and the neighbouring counties, for the London market, many are deterred from entering into the trade by the expense, trouble and difficulty, as well as certain loss, entailed in bringing beasts to London, the loss being always set down at 10 per cent. ; sometimes it is even much more. The consequence is, that the spirit of enterprise is checked, and the farmer loses the advantages of competition in the purchase of his cattle, and is often obliged to put up with prices that do not repay his expenses. Wherever railways have been established, they have been the means of removing this drawback upon agriculture. If railways are allowed in some parts of the country, they must be established in all ; if not, a monopoly would be enjoyed by the agriculturists in the railway districts ; thus the farmers near the Birmingham railway will, until other trunks projected for grazing counties are completed, enjoy the privilege of sending their cattle to the London markets in a few hours, to the exclusion of the other farmers, from want of facility of communication.

In order, therefore, to meet the demands of the farmers of Herefordshire, and to enable them to forward their produce to the metropolis in twelve or thirteen hours, which is precisely the number of days at present required, a railway has been planned and surveyed, which will connect the town of Gloucester, now the centre from which several important trunks radiate, with Hereford, passing through Newent, Dimock, and Ledbury, thus bringing railways from the metropolis into the very heart of this fertile and rich county.

The line of country selected by the Gloucester and Hereford railway does not present a single engineering difficulty—it is throughout nearly a perfect level, and this does away with all necessity for either tunnel or inclined plane, which form two most important drawbacks upon the economical construction of a railway ; whilst its being almost in a straight line the whole way, the distance from point to point will not exceed 27 miles in length. It is in consequence possessed of advantages such as no other line in England presents for construction. Independent of the immense traffic of live stock for the London market that must take place upon it, it will afford such facilities of transporting the goods and produce of Staffordshire and Warwickshire, on the one side, and the great and important clothing districts of Gloucestershire, and the eastern counties, on the other, as to open a new field of commerce altogether ; and it is only necessary to refer to the map to see at

a glance the important collieries with which it can be brought into immediate contact. The effect will be to reduce the price of the all important article of domestic and manufacturing consumption, coal, to at least one-third its present price in the neighbourhood of Gloucester, and to increase the carriage on the railway to an incalculable amount. But the most important consideration connected with the Gloucester and Hereford railway is, that it forms part of the actual line of road contemplated to be made for expediting the communication between London and Dublin; and it is probable that the time is but little distant when this road will be the one used, to the exclusion of the other great trunks, the shortest of which is twenty miles longer than this direct line. Not only then will the passengers and goods from fully two-third parts of Ireland, which are now conveyed along the great northern roads, come along this line; but as every day shows the necessity of having a harbour on the western coast of Ireland for American vessels to land and receive their passengers and cargoes, in a few years all merchandise, whether living or dead, destined for the metropolis of England and the adjacent counties, or coming from them to be exported to the United States, must be carried across the Gloucester and Hereford railway. It is, therefore, not possible to find a railway which combines such advantages as this does, whether viewed in reference to facility of construction, for there will be neither tunnel nor inclined plane along its whole course; and it will be the means of enabling the agricultural produce of Herefordshire, and the manufactures of Staffordshire, Warwickshire, and Gloucestershire, to be transported all over England, whilst it will cause activity in all the collieries of the district: and, though last not least, form part of the great line of road that will connect the great metropolis of England with that of Ireland, and will be one of the links of the chain of direct communication between the centre of England and the United States.

### TO THE EDITOR OF THE MAIDSTONE GAZETTE.

SIR,—As the columns of your Journal are always open to any information which may tend to improve the condition of the labouring population, I take the liberty of sending you the following hasty sketch of what I had the satisfaction of witnessing yesterday, in the parish of Hadlow, relative to the cottage allotment system.

Having received an invitation to attend a meeting of the Labourers' Friend Society at that place, I proceeded thither accordingly.

Perhaps I may here observe, that previously to the receipt of the invitation, I was not aware that any society of the kind was in operation at Hadlow. Judge then of my surprise to find that this society, although not six months in existence, was composed of all the principal landholders in the vicinity of that parish; that they had raised a handsome fund by subscription; formed an active committee, which committee had hired a field of eight or nine acres, contiguous to Hadlow, for the use of the labourers—drained a considerable part of it, and divided the part so drained into nearly forty allotments, for which as many industrious labourers drew lots, and were put in possession at a moderate rent. But what excited my greatest surprise was the excellent state of the cultivation in which I found every allotment. Beans, pease, carrots, parsnips, onions, potatoes, cabbages, in short every useful vegetable,

might here be found, in a state which would not disgrace a market-gardener—and this too, be it remembered, achieved since February last.

Too much praise cannot be given to the gentlemen of the committee for their prompt and effectual exertions on this occasion. By their efforts between thirty and forty families of our most valuable population have, I trust, been raised in the scale of society—have been made to feel that they have an interest in the soil worth protecting; whilst it is to be hoped that the degrading term of "parish pauper" will never attach to them or their children.

The noble example set by the gentlemen and landholders in the vicinity of Hadlow, will, I sincerely hope, be speedily followed by those who may reside where the allotment system has not been adopted. Let them reflect that if the Poor Law Amendment bill presses on the sound part of the labouring community, they have the power to remove the pressure, and by so doing to live surrounded by a happy and contented people.

I am Sir, most obediently yours,  
*Bearsted-house, 28th July, 1836.* C. WAYTH.

N.B.—I have no permission to mention names—therefore they are omitted.

### IMPORTANT TO FARMERS.

We invite the attention of our Agricultural readers to the following suggestions; those on the best time for cutting the corn, are curious, as they illustrate the difference of opinion which may exist even among the most intelligent and experienced farmers, on points which we should have supposed settled long since by common consent. As a precautionary measure, the stacking of corn at a distance from hay, and also from their buildings, cannot be too strongly recommended. Many of the destructive fires, by which large quantities of corn have been consumed in this and the adjoining counties, have been occasioned by neglect of this salutary precaution:—

WHEAT HARVESTING.—Professor Musgrave of Cambridge, has addressed a letter to Farmers, urging the advantage of cutting wheat early, whilst the straw is somewhat green. Though the corn may not look so plump, he says, it will weigh heavier, and be more highly prized by the miller, inasmuch as it will yield more flour, probably by two pounds to the bushel. But the great advantage of the practice is that the farmer will have double chance of getting in his crop well; for if bad weather come he may stop awhile without hazard, as corn ripens slowly in such weather; and he will also harvest it at less expense and with less loss from broken ears. Except in dry scorching Summers, he says, wheat is nearly ready for cutting if the grain is so far formed as not to give out a fluid milky substance when squeezed between the finger and thumb, although the straw may have lost but little of its greenness.—Mr. Thurnall, of Duxford, contests the position of the Professor.—"Wheat," he observes, "which has been cut green is generally found to be very deficient in weight—frequently from four to six, and even seven pounds per coomb; and the flour made from it considerably less in quantity, as well as of inferior quality. The latter circumstance may easily be imagined, when it is known that the farinaceous part of immature corn adheres tenaciously to the rind or bran; it consequently requires a greater degree of pressure of the mill-stone to detach it from the outward skin, and every miller who understands his business is aware

that excessive friction in grinding deteriorates the quality of the flour. There are besides the serious objections to early cutting, that both the wheat and the flour are more inclined to spontaneous fermentation, which generates heat, and they consequently will not so long retain their condition. As a farmer, I really am inclined to think that by early cutting a greater risk of weather is incurred, as the wheat requires to be a much longer time on the shock."

**STACKING CORN.**—In consequence of the calamitous conflagrations which have taken place in the last few years, it is strongly urged that Farmers should place their corn as far as possible from their buildings and their hay; and owners of property would greatly consult their own interests by enforcing the necessity of such precaution. It is no exaggeration to state that *many thousands of pounds* have been sacrificed in the last few years by the practice of crowding corn, hay, outbuildings, and dwellings into close contact with each other.

## FAILURE OF THE POTATOE CROP.

(TO THE EDITOR OF THE DUMFRIES AND GALLOWAY HERALD.)

*Castle Douglas, July 16, 1836.*

SIR,—From the various reports of the failure of the potatoe crop in almost every district of the country, and from being a sufferer myself, I was led to examine those I had planted in my garden, as well as those I have in the field, and with the aid of a powerful microscope I discovered the set of the potatoes filled with living animals of singular organization. They are of a light dun colour, with red spots on each side of each joint, and transparent, and I have observed some with 32 joints in their length, which does not exceed half an inch; each of these joints has five legs or feet on each side of the body, consequently in all 320—and I have therefore called them the potatoe multipede, or destroyer. Their heads are furnished with long horns; and their motions, when taken from the potatoe quick and lively, and when a small piece of the potato was laid upon the glass beside one of the animals, it was immediately approached, and most greedily devoured. By the aid of the instrument I could discern the animal in all its variety of stages, from the ova, till it attained its complete formation, but could not discover any of them in the earth around the plant—so that it would appear they are generated in the potatoes; and, as a proof of that, six bolls of potatoes, the remainder of between 30 and 40 bolls as taken from the field, were kept in a well ventilated potatoe house on the farm of Hightae, which, when I examined, there were few to be found that did not contain the identical insects in all their progressive stages of advance, and in no instance did I ever find any other animal but of the same description. I have also examined several gardens—the crops upon the farms of Torrs, Ernespie, Hillowton, Kelton Mains, and Hightae, and found in all of them the same failure, and produced from the same cause. And upon Hightae, where the injury is considerable, the potatoes were planted entire. There therefore remains no doubt that these insects are the cause of the calamity in this country, for these four years past; and, it is to be hoped, some benefactor to his native land will be fortunate enough to find out a preventative. Mr. Curry, who lately lectured here on Chemistry, &c., and who accompanied me in my examinations for four days, recommended the application of common soot to the sets before planting, in preference to hot lime; and from his scientific knowledge, I should feel inclined to recommend this—at least the suggestion is, in my opinion, worthy of a trial. If you consider these remarks deserving of publicity, you are at liberty to make any use of them you may think proper.—I am, Sir, your most obedient servant,

WM. YOUNG.

## THE SHEEP.—No. IV.

(From the Dumfries Herald.)

**Wool.**—Chalky soils, which are so notorious for injuring the fleece, are supposed to act in a corrosive manner, but the correct explanation is not, that the chalky particles attack the fibre in a direct manner, but that they render it brittle by absorbing the oily moisture with which it is naturally imbued.

The felting of wool may be defined to be a property depending on the curls and serrations of the fibre, by which it is allowed to move only with the root foremost, and by which it is enabled to catch and obtain a hold on fibres that are near it, so as to form a web or cloth. Felting is best brought into operation by alternate pressure and relaxation, which may be applied in a variety of ways; thus the ancient method, and one still pursued by the Tartars, was to tramp on a mass or layer of moist wool, so as to form a coarse clothing or carpet, while the modern and most perfect plan is either, as in hat making to apply pressure with the hands, or, as in the finishing of cloth, to pass the fabric repeatedly through rollers. The way in which a close fabric is formed by the juxta-position of a few scattered hairs, gave rise for long, as well it might, to serious disputations among philosophers, and the favourite theories of each, unbased as they were on observation, might, till now, have agitated the scientific portion of our manufacturers, had not the microscope brought to light much of what is true and valuable, as an assistance in our researches.

Moisture appears to be of service during the felting of wool, as it induces it to curl, and enables the fibres to expand, and catch one on another, after they have been bent and compressed by the force applied to them, and is of itself sufficient to felt a fabric, as we frequently perceive in the instance of stockings which are allowed to remain too long in water, when they become short from undergoing contraction, and resemble, after such treatment, an imperfect cloth. It is for this reason the latter, after tumbling over in all directions the fur of which the hat is to be made, wets it before applying pressure; and that the woollen manufacturer, after freeing the web from grease, soaps it before its subjection to the action of the rollers. Without felting, cloth would resemble a net, and would unravel on being cut, from the fibres crossing only in two directions; but the strokes of the mill put an end to this, by laying the fibres in every possible direction, and so twining them one with another, as to render them a coherent mass. Felting often takes place to a considerable extent on the sheep's back, especially in the heavy breeds, when they have been starved, and may always be traced to the wool having been saturated with wet. *Cotting* is only an injurious extension of felting, by which the wool is formed into hard thick knots, which can hardly be unravelled, and is said principally to affect the Cheviots.

The wool of this country is divided into two great classes—long and short—the former varies in length from 3 inches to 8 inches, and before being made into stuffs and worsted goods, requires to be deprived of its felting properties, by passing it through heated iron combs, which remove the feathery parts or serrations, and make it resemble silk or cotton. The shorter combing wools are in general use for hose, and are spun softer than the long combing wools. Short wool is employed in the cloth manufacture, and on that account is frequently called clothing wool. It should approach as much as possible to white, as a clear white ground is required for all cloths that are to be dyed bright colours, as

well as for those dressed white. Grey or black hairs injure the fleece very much, even though few and minute, as they give rise to reddish spots where the cloth is stoved; and as Herefordshire sheep are entirely free from this defect, they are reckoned peculiarly valuable for clothing purposes.

The breed exercises considerable influence on the wool—some sheep, as the merinos, being distinguished for the softness and beauty of the fleece; while others, as some of the small northern varieties, are famed for the very opposite peculiarities.

According to the opinion on the continent, any race of ewes, however coarse and long in the fleece, will, on the fourth cross of the merino ram, give progeny with short wool equal to the Spanish. Of the truth of this proposition, however, Dr. Parry of Bath justly expresses some doubts, derived from his own experience and that of others. But it is certain he adds, that one cross more will, in most cases, effect the desired purpose. "If we suppose the result of the admixture of the blood of the merino ram to be always in an exact arithmetical proportion, and state the native blood in the ewe as 64, then the first cross would give  $\frac{32}{64}$  of the merino, the second  $\frac{16}{64}$ , the third  $\frac{8}{64}$ , the fourth  $\frac{4}{64}$ , the fifth  $\frac{2}{64}$ , and so on. In other words the first cross would leave 32 parts in 64, or half of the English quality; the second 16 parts, or one-fourth; the third 8 parts or one-eighth; the fourth 4 parts, or one-sixteenth; the fifth 2 parts, or one thirty-second; the sixth 1 part, or one sixty-fourth; and so on. Now, if the filament of the Wiltshire or any other coarse wool, be in diameter double that of the Ryeland, it is obvious that, according to the above statement, it would require exactly one cross more to bring the hybrid wool of the former to the same fineness as that of the latter. This, I believe, very exactly corresponds with the fact. The difference between one-eighth and one-sixteenth is very considerable, and must certainly be easily perceived, both by a good microscope, and in the cloth which is manufactured from such wool. In the latter method it certainly has been perceived; but I have had hitherto no opportunity of trying the difference by the former. The fifth cross, as I have before observed, brings the merino-Wilts wool to the same standard as the fourth of the merino-Ryeland.—*Communications to the Board of Agriculture, Vol. v.*

Climate has much influence on the covering of animals, and in none more than in the sheep. In tropical countries, we find the fleece approaching more to hair than wool, as in the sheep of Thibet, so celebrated for the silky nature of their coat; and Burchell remarks, that the skins he brought from the Cape of Good Hope were often taken for those of an unknown quadruped, from the *furry* nature of their wool, if such it can be called, and thinks it is owing as much to the pasture, which is well adapted for giving those animals a soft and useful *fur*, though not suited like New South Wales, for the growth of the finest wool, and that the colony might turn this to great advantage.

The sheep of Herefordshire, Devonshire, and Coteswold Downs, are noted for producing sheep with fine fleeces. The Lincolnshire and Warwickshire kind, which are very large, exceed any for the quantity and goodness of their wool. The fleeces of the northern parts of this kingdom are inferior in fineness to those of the south, but still are of great value in different branches of our manufactures. The Yorkshire hills furnish the booms of that country with large quantities of wool, and that which is taken from the neck and shoulders is used when mixed

with Spanish wool in some of their finest cloths.—(*Penant's History of Quadrupeds.*)

We may conclude this brief preface to the wool trade, by a passing notice of the state of the wools in this part of the island some few years ago. Synson, who wrote in 1684, (MS. Account—noticed in Chalmers' *Caledonia*.) mentions that the people of Galloway had three kinds of wool—the laid wool, or smeared, the moor wool, and the Deal (Dale) wool. The first was named from the operation of laying or smearing the sheep, which he describes according to the modern practice. The moor wool was that of the hill sheep, which he says was the best and cleanest, as the sheep were kept in enclosures of stone-dykes. The Dale wool was not so good, and fouler from the sheep of the low country, being folded within earthen dykes. The wool was sold at Ayr Glasgow, Stirling, Edinburgh, &c., &c., while the sheep were generally sent to Edinburgh.

Chalmers remarks, that Lithgow, the traveller, who walked over this country in 1628, praises the sweetness of the mutton, and the fineness of the wool, which he says is nothing inferior to that of Spain, provided they had skill to fine-spin and weave it as they should. "Nay, the Calabrian silk had never a better lustre or a *softer gripe*, than I have touched in Galloway on the sheeps' backs."

**WOOL TRADE.**—Our first thoughts on the history of the wool trade, would lead us to regard it as little better than a dry detail of uninteresting facts, little calculated, either by name or association, to excite even passing attention. But such is not the case. It forms, in fact, a medium of connection for much that cannot but be amusing to the general reader, as well as important to him who studies it for itself alone, seeing that it embraces in its ample range the interests of mankind, and serves as a foundation on which are based some of the most engaging speculations that ever employed the minds of political economists. It has always ranked as an important part of national industry, and was, till lately surpassed by the cotton trade, the most important of all manufactures carried on in England.

Wool, since Eden closed its gates on our progenitors, has been a current coin, an important material on which has been employed the skill and industry of almost every tribe, and been the means of raising many a petty people to the hard won dignity of a nation. Man at first placed in a comfortable temperature, needed little as a defence against the vicissitudes of the weather; while fashion, then unthought of, or only as a sport, failed to interest the simple-minded races in the cut or texture of the coverings they wore. That the first dresses of mankind were formed from vegetable material, we have the highest authority for believing, as even at present the garb of the natives of some of our lately discovered islands consists of a simple girdle formed from rough cut reeds. But, as the dawn of knowledge smiled upon the savage, and animal sacrifice tutored him in the uncouth rudiments of a coarse anatomy, the superior comfort even of the untanned hide would be remarked, and the clumsy mantle of the Caffre hordes welcomed as a change. Time would not long elapse till roving dispositions, and the encounter of unstable climates, would show the wanderer the necessity of a fabric better adjusted by shape and pliancy to the nature of his wants, while the clinging of lock to lock of woolly fibre, would plainly tell the superfluous nature of the supporting skin, and point the way to make an ill-closed cloth.

Weaving, as we pointed out a short way back, is not absolutely necessary for the manufacture of cloth, since wool will felt, though far from evenly, without

the preliminary process of being laid in threads, so that cloth may be almost coeval with mankind without our being required to assign much mechanical skill or ingenuity to its inventors. But we have tolerably clear evidence, in the inspired writings, that weaving was known in the earliest ages, and also that it was trusted principally to the women. Thus Delilah wove Samson's hair, when he slept in her lap; and a short time after, it is written that the mother of Samuel "made him a little coat, and brought it to him from year to year." At a later period, Solomon thus describes a good wife:—"She seeketh wool and flax, and worketh willingly with her hands." Yet with all this their machinery was not of the perfect nature of our machinery, nor their looms like our looms; for, even at present, the women of Barbary do not use a shuttle in the making of their blankets, but conduct every thread with their hands. That garments were in those early ages made of several pieces, joined by needle-work, is evident on a perusal of Genesis xxxvii.—3; Judges v.—30; and 2nd Samuel, xiii.—13; and this plan is allowed to be even more ancient than the weaving of flax. Job, who flourished, or is supposed to have flourished, before the Israelites left Egypt, shows clearly by his words, that flannel clothing was then in vogue.—"Let me be condemned if I have seen any perish for want of clothing, or any poor without covering; if his loins have not blessed me, and if he were not warmed with the fleece of my sheep;" and that the cloth was woven, and not produced by beating, is evident from his saying, when complaining of his sad estate, "My days are swifter than a weaver's shuttle."

Tents, so frequently mentioned in Bible history, are well known to have been anciently made of skins, the application of canvass to that purpose being a comparatively modern invention; and we find the phrase "Manere sub pellibus," "to remain under skins," frequently employed by the Roman writers, to signify "to be encamped." The early progress of the wool trade is veiled in much obscurity, and only to be discovered by seeking for it in a mass of fable, which in many instances serves the purpose of enabling the old writers to string together, without the risk of being laughed at, much of what, if inquired into, would have amounted only to vague report, or idle supposition.

Phryxus, the son of Athamas, King of Thebes, flying with his sister, Helle, from their step-mother, and riding upon a ram that had a golden fleece, sought to cross the Dardanelles, when Helle was drowned, and the sea was ever after called the Hellespont; but Phryxus arrived safely at Colchis, between the Black and Caspian seas, and having sacrificed the ram to Mars, hung the fleece in a temple dedicated to that god. By this the ancients no doubt meant to intimate, either that Bœotia, the birth-place of so many talented Greeks, furnished the people of Colchis with sheep, or that they sent them sums of money in exchange for the wool of Caucasus. That the latter is the more probable, is apparent from Ovid's account of the Argonautic expedition, in which he shows the hardships that Jason encountered in his successful endeavours to bring the golden fleece from Colchis back to Greece, implying the value of the article, and leading us to believe that the Colchians had, by the aid of severe penalties, long monopolized the growth of wool. Moreover, Mount Caucasus and its neighbourhood, form the favoured nursery from whence the improved fleece-bearing animals have gradually spread over the rest of the world, and as such would be looked upon, at the time we speak of, by adjacent tribes with jealousy and

hatred, for where is the nation that can calmly behold a compeer engrossing a hoard of wealth, nor struggle to dispute their prices by a market of their own!

The old poets and historians, when wishing to express a person of great riches, always spoke of him as having a great number of sheep or cattle. Thus Ulysses, who, according to Homer, possessed more wealth than any twenty heroes of his age, numbered among his stock about thirteen thousand sheep or goats. David, also, whose riches were of the same kind, according to 1st Chronicles, xxvii., set Jehonathan over his treasures in the field. All the Greek poets affirm, that the wealth of kings originally consisted in herds and flocks; and so it did for ages after their era, and in some few countries almost to the present day.

In reading Homer, we are reading the most ancient author in the world, except the great law-giver, Moses, and receiving not only pleasure from the beauty of his imagery, but instruction from the minute accuracy with which he details the manners, customs, laws, and politics of the people he describes. According to him, the Greeks were well clothed in woollens, and just as fearful of cold as men could be. In the fourteenth book of the *Odyssey*, he represents Ulysses as complaining bitterly of the frost during a nocturnal ambuscade, having forgotten his cloak, and trusted to the warmth of his vest, and shelter of his shield.

"Here longer in this field I cannot lie,  
The winter pinches, and with cold I die;  
And die asham'd (Oh, wisest of mankind,)  
The only fool who left his cloak behind."

Sheep skins were also used in the time of Homer as beds, and have continued so to be employed by every people on the verge of civilization.

"The honest herdsman rose as this he said,  
And drew before the hearth the stranger's bed,  
The fleecy spoils of sheep, a goat's rough hide  
He spreads; and adds a mantle thick and wide."

Among the Romans, woollen clothes were alone held in estimation, linen being regarded as a mark of effeminacy, and even a criminal luxury, by that brave and hardy people; indeed, some of their greatest families boasted that they made no use of linen in their houses, and it only spread by slow degrees over their territories. They carried the manufacture of woollens to great perfection; and, though despising luxury in linen, had yet no objection to a great variety of flannel dresses, which, as in the case of the rugs or shaggy cloaks (*endromidæ*) worn by their ladies after exercise, and alluded to in an annoying way by Juvenal (*Satire vi.*), were often of the most beautiful pattern, and ostentatious colours.

The great number of ordinances, penal laws, privileges, and immunities, which were issued in Spain in different reigns, for the preservation and special government of the sheep, were owing to a succession of kings being lords of all the flocks, and considering them, as they are styled in their commands, "*the precious jewels of the Crown.*" A royal council was formed, under the title of the Council of the Grand Royal Flock, which, we believe, exists to this day, though the late monarchs have not had a single sheep. Various exigencies of state in different reigns, alienated by degrees the whole flock from the Crown, together with all its privileges, which were collected and published in 1731, under the title of "*Laws of the Royal Flock,*" a volume in large folio, of above 500 pages.

The last flock of the Crown, consisting of forty thousand sheep, was sold, owing to war and want,

to the Marquis of Iturbietta, during the reign of Philip the First. So highly are sheep and their attendants esteemed in Spain, that Isidro, the protecting saint of Madrid, was firmly and popularly believed to have been a shepherd; and that Pope Sextus Quintus the Great, was verily a shepherd, and not a swine herd, is as strictly adhered to by a devout and Catholic populace.

The cloth manufacture of Padua is a very ancient one, and the noble Venetians were, for its encouragement, obliged by law to wear no other cloth, at least for their gowns; but the *Tunica Patavinae* were so coarse, in the time of Martial, as would appear, from the following couplet, that the senators contrived and found means to evade it:—

“Vellera cum sumant Patavinae multa trilices,  
Vix pinques tunicas sorra secare potest.”

L. 14, Ep. 143.

Coarse Paduan drabs exhaust the wasted fleece,  
A saw can scarce work thro' the stubborn piece.”

It appears evident, from ancient history, that the first inhabitants of all the countries of Europe were either naked, or nearly so, owing to their ignorance of the clothing art. Such, in particular, was the uncomfortable state of the inhabitants of this island, who are supposed only to have used the bark of trees, and to have smeared themselves with unctuous matter, after the manner of other savages, to protect themselves from cold. Some writers are of opinion that the inner bark of the tree alone was used, and that not till woven into a kind of cloth, such as the South Sea Islanders at present make.—(*Henry's History of Great Britain*.) Long after the people of France, Spain, and Germany were decently clothed, they continued the latter abominable practice, so differently were they situated in regard to intercourse with strangers, and opportunities of acquiring the useful arts. It is impossible to discover, with certainty, when or by whom the custom of wearing clothes was introduced into Britain. Some suppose that the Greeks, and after them the Phœnicians, who visited the Scilly islands, and sometimes the continent of Britain, for trading purposes, first awakened in the breasts of our savage ancestors a desire for comfortable protection, as both these nations were celebrated for elaborate attention to their attire.

“The Britains,” says Cæsar, “in the interior parts of the country, are clothed in skins,” and these are supposed not to have been sewed together, but to have been cast over the shoulders as a mantle,—indeed their stiffness rendered them aught but pleasant, as we may guess from their endeavours to make them soft and pliable, by steeping in water, beating them with stones and sticks, and rubbing them with fat. The people of the southern parts are supposed to have been well acquainted with the dressing, spinning and weaving, both of flax and wool, having been instructed by a Belgic colony long before the invasion by the Romans. Two kinds of cloth which they manufactured at that period (B. C. 55) were much celebrated among their invaders, the first a thick harsh cloth being worn by them in cold northern climates as a sort of mantle, and agreeing in many respects with our Lowland plaids, the other made of fine wool dyed of different colours, woven into chequered cloth, and corresponding to our Highland tartan. They are also supposed to have made a felt of wool, without either spinning or weaving, and to have stuffed mattresses, with the portions shorn from it in dressing. The Britons must have been well acquainted with the dyeing of wool, as the Gauls were celebrated at that period by Pliny, for their invention of a “method of dyeing

purple, scarlet, and all other colours, only with certain herbs.” The herb which they chiefly used for the purpose was the glastum, or noad, and they seem to have been led to the discovery of its value in dyeing cloth, from their former use of it in staining their bodies. A deep blue having been the colour they stained their skins, it long continued a favourite, particularly with the Caledonians, as a tint for all their dresses. Though the most civilized of the ancient Britons were tolerably acquainted with the most essential branches of the woollen manufacture, yet that useful art was not much diffused in our island till the landing of the Romans, whose soldiers, being almost all drawn from the plough, were well adapted, when settled in the country, to foster the arts of peace. In order to benefit the country and themselves, their emperors were at great pains to discover and procure the most excellent artificers of all kinds, particularly the best manufacturers of woollen and linen cloth, whom they formed into colleges or corporations, with various privileges, and governed by a procurator, who was, however, under the direction of that great officer of their empire, the Count of the Sacred Largesses. In this manner, it appears the first woollen manufactory was established at Venta Belgarum, now Winchester, in the year of our Lord 55, or 100 years after the conquest of the country.

No mention ever occurs in the ancient writers of the importation of sheep into Britain, from which we are led to suppose that they had found their way into it long before its forcible separation from the Continent by natural convulsions. Camden, in his work on Britain, quotes, from an old orator, part of a beautiful panegyric on the great Constantine, in which the happiness of Britain is most eloquently described, and its advantages in regard to sheep most graphically depicted.—“Innumerable are thy herds of cattle and thy flocks of sheep, which feed thee plentifully and clothe thee richly.” So that, allowing for the high-flown nature of the verbiage, the sheep of the island must have been far from indifferent, and well worthy of any trouble the grasping Romans might be put to in the erection of manufactories.

The Caledonians were supposed by the Romans to be almost entirely destitute of clothing, but in this they were misled, it being their custom to strip before advancing to battle, a plan which would not only serve them when grappling with an enemy, but would also allow them to move rapidly even in a fen. Apart from this, many nations have got credit for going naked, who were, in reality, perhaps clothed with tolerable decency, owing to an absurd and careless mode of expression common in conversation, that of calling every thing naked which is only partially so. Of this we remember an illustrative couplet, almost amounting to a bull, but unluckily we cannot give our author—

————— a vest had on,  
Which from a naked Pict his sire had won.

The upper garment of the ancient Britons, and all the other nations, was the plaid resembling the mantles of skins they had formerly used, and worn on their first introduction only by persons of rank, so great a luxury were they esteemed. For a considerable time they had no other garments but these mantles, which, being scanty in the extreme, left their legs and arms entirely naked. This was, however, soon remedied by the introduction of the braccæ or breeches, formerly mentioned, which resembled our breeches and stockings united, and continued for many years a fashionable article.

The history of our wool and the woollen manufac-

ture at one period and in one point of view is the history of our public revenue, while in a succeeding period it becomes the capital object of our commerce, and the important subject of our political councils. The preserving and supporting it against foreign rivals, the due regulation of its numerous branches, and the proper restrictions that were deemed requisite to the commercial benefits resulting from it to this country, have occupied our ablest statesmen for more than a century past. The value of our wools to the legislature was so universally acknowledged, that they formed the subject of a nursery-book, curiously entitled "The rearing of London bridge upon wool sacks," and alluded to in a bantering way by Beaumont in his "Knight of the burning pestle." The first legal mention of our woollen manufactures occurs in 1224, in an act of Parliament made for the regulating of the breadth of cloth.

(To be continued.)

## CASTRATION.

BY PROFESSOR VATEL, ALFORT.

**CASTRATION BY THE CLAMS.**—This is chiefly practised on the horse, the ass, and the mule. It is seldom adopted for the bull, unless there is reason to fear that the operation by *bistournage* cannot be executed.

The necessary instruments are, a keen convex bistoury, or a razor; two pieces of packthread, moderately strong; a pair of pincers or forceps, and the clams.

The clams are two inflexible pieces of wood, usually consisting of a portion of elder-branch split along the middle, and being about three quarters of an inch wide, and five or six inches long.

Before it is cleft, a notch is to be cut round it about an inch from each extremity, and large and deep enough to hold two or three rounds of the pack-thread. When it is split, each of the corresponding extremities is sloped away from the notch to the end, and which, when the pieces are adjusted and tied together at that extremity, permits them to be separated in the form of a V.

Some practitioners, when they do not use elder, make a groove along the plain surface of each of the pieces, in order to contain a caustic substance, as corrosive sublimate or blue vitriol, made into a paste with meal or turpentine, in order to hasten the mortification of the parts on which the clams are placed.

The animal is cast on its left side, if the operator is a right-handed man, but otherwise on its right side. A piece of web is then passed round the fetlock of the hind leg which is uppermost, and, being brought to the fore arm on the same side, exposes the genital parts. The operator now seizes with both hands the left testicle (the animal being supposed to have been cast on that side,) holds it tightly, and slides his left hand so as to embrace the spermatic cord above the testicle: the scrotum is thus tightly stretched over the testicle. The surgeon then takes the bistoury in his right hand, and, proceeding from before, backwards, he cuts through all the envelopes of the testicle, if he intends to perform the *uncovered* operation: or he only cuts through the scrotum and dartos muscle, if he means to attempt the *covered* operation.

In the first case, the testicle immediately protrudes from the cavity which contained it; in the second case the operator tears with his fore-finger

the cellular tissue which unites the scrotum with the tunica vaginalis. The operation having proceeded thus far, the surgeon lays down the bistoury, and seizing the testicle with the right hand, pulls the cord gently, but steadily, in order to draw it down. If the animal strongly contracts the cremaster muscle, nothing will sooner distract his attention, and cause him to cease his frequently powerful action, than pricking his lips. Then taking the clam in his right hand, and the testicle in his left, he will place the clam on the spermatic cord, above the epididymis, sliding it from behind, forwards: an assistant immediately seizes the clam with his pincers, and compresses it, and permits the operator to tie it firmly with the packthread. The same is then effected with regard to the other testicle.

The clams ought to compress only the spermatic cord, and not the envelopes of the testicle, and they should be tied sufficiently tight to stop the circulation of blood in the testicle. Some practitioners cut away a portion of the testicle before they release the horse, in order to diminish the extension of the cord by the weight of the testicle. Others leave the testicles entire.

After the operation, the horse is much depressed: he appears to be confounded by his new feelings—he carries his tail between his legs, his head hangs low, and he walks with his thighs apart from each other. Being returned to the stable he crouches behind from the pain which the continuance of the clams produces; he should be tied securely to the manger, lest he should tear off the clams, and he should be carefully watched. A cradle should also be placed round his neck, and he should be bled if he appears to be irritable and feverish.

Some veterinarians, after the operation, lead the horse to the watering place, and suffer him to remain there a considerable time. Others lead him about for some hours, if the weather is fine, and repeat the exercise on the three or four succeeding days, until the suppuration is established. This last method of proceeding is the one most generally followed, and the most beneficial.

The testicles become mortified in about forty-eight or sixty hours after the application of the clams. They are either left to drop by their own weight, or the packthread which confines the clams being cut through, the decayed portion of the spermatic cord is cut through with a pair of scissors.

During the first ten or twelve days after castration the animal is kept on gruel, with hay or grass, according to the season of the year; he is not exposed to any current of air, or to anything which can arrest the process of suppuration, or induce a metastasis of inflammation, always a very serious thing in such cases.

The consequences of castration by the clams are pain, inflammation, swelling, and suppuration. The pain and inflammation are inevitable. When they exist only in a moderate degree, no particular treatment is required. Swelling always precedes suppuration, and usually does not commence till the second day after the operation. It may be slight or extensive. In the first case it usually commences at the anterior part of the prepuce, and does not subside until the healing of the wounds is considerably advanced. Nothing is required but to guard against whatever would impede the favourable progress of the case. When the tumefaction is great, so as to spread around the wounds and under the belly, and to ascend

along the cords, and render the superior part of them hard and painful if touched, the case is becoming serious. The strictest antiphlogistic treatment, general and local, should be adopted. We are sometimes compelled to have recourse to scarifications, which often give vent to a red and glutinous serosity, that indicates a tendency to gangreen. The suppuration which is established after castration is always preceded by engorgement of the parts in the neighbourhood of the wound, and by a febrile action, which begins to develop itself on the second or third day, arrives at its height on the fourth, and continues until the suppurative process has been fully established. In this process a serous fluid is secreted, at first yellow becoming afterwards a little white, and finishing by assuming the character of pus. This laudable secretion, the progress of which may be interrupted by a variety of circumstances, increases until the tenth or twelfth day; then diminishes more or less slowly, and does not cease until the 24th or 30th day.

**CASTRATION BY CRUSHING OR BRUISING.**—1. *The Horse.*—This cruel operation, which, on account of the torture it produces, ought never to be practised, has been advised on the spermatic cord, by placing it on some hard substance and crushing it with repeated blows; and on the testicles by the same mode of proceeding, or by compressing them forcibly between the claws of a large pair of forceps.

2. *The Bull.*—On this animal the operation is performed in somewhat the same way, and some veterinarians give decided preference to this mode of castration. The instruments necessary for practising it are, 1st, Cords to confine the head of the bull to the manger, or a tree, or a post, by means of several turns round the horns and the fixed body. 2d, Two hobbles, which being fastened round the hind feet, and then brought between rings or nooses that are attached to the fore legs and continued over the withers prevent the animal from kicking. 3d, Two bars of wood, each of them seven feet in length, placed under the belly of the animal, and supported by two men, in order to prevent him from lying down. 4th, Two round pieces of wood thirty or thirty-four inches long, and six inches in circumference. 5th, A large hammer with a flat surface similar to that used by shoemakers; and 6th, A cord of moderate thickness eighteen or twenty inches long: four assistants will also be required.

The bull being fastened by the head and his legs secured, and the bars held under his belly by two of the assistants, one of whom also lifts the tail, the operator places himself on his knees behind the animal, and examines whether the spermatic cord and the testicles are sound. He then places the two cylindrical pieces of wood, one before and the other behind the scrotum, and about an inch above the testicles; the two other assistants, the one on the right and the other on the left, lay hold of them, and press them together so as tightly to squeeze the spermatic cords, drawing them backwards: they then perform a quarter of a circle with them, that which is in front being a little before the other, and the hinder one a little inferior, and so they hold them firmly, resting the extremities of them on their knees.

The operator having remained in the same position grasps the testicles with his left hand, and draws them firmly down, so that the cord may lie still more tightly over the inferior piece of wood; and then, having the hammer in his right hand,

he repeatedly strikes one of the cords lying upon the inferior and posterior cylindrical piece of wood, always letting his blows fall on the cord, and not too hardly, that he may not produce a degree of disorganization that may lead to sloughing. He continues this according to the age and size of the subject, until he thinks he has sufficiently crushed the cord, and then he attacks the other cord in the same manner. Having proceeded thus far, he ties a ligature rather tightly about the testicles, in order to prevent them ascending (many veterinary surgeons, however, neglect this precaution,) and rub the whole of the scrotum with lard or butter, in order to prevent the intense inflammation which might otherwise follow all these contusions: and, having once more examined the parts, in order to be perfectly assured that he has thoroughly crushed each of the cords, in order so that the absorption of the testicles may be prompt and complete, he releases the patient.

The effect of this operation is the obliteration of the spermatic vessels, and the consequent atrophy of the testicles, which diminish to the size of a small nut. The animal seems to suffer much less pain after the operation than would be deemed possible. During the first four-and-twenty hours he probably experiences a slight degree of fever, but he rarely loses his spirits or appetite; or, should he do so, a moderate bleeding averts all danger. The whole of the genitals become more or less swollen, and exhibit a red hue; at the expiration of eight or ten days this disappears, and the testicles are speedily absorbed.

**CASTRATION BY TORSION OR BISTOURNAGE.**—This mode of operation is oftenest adopted for bulls, but sometimes however for rams and for goats. It is seldom used for horses in any of the departments of France, but there are certain countries in which the horse is commonly subjected to it.

1. *The Bull.*—Castration by bistournage is effected in the following manner:—The animal is suffered to remain in his usual place, but is fastened to the manger so that his head shall be as low as possible. One assistant only is wanted, and four or five pieces of worsted and small cord twisted together, and five or six inches in length.

The assistant seizes the muzzle of the bull with his left hand, and the left horn with his right hand; and the operator then laying hold of the testicles, the animal does not often make any resistance, unless it is necessary to use considerable force in order to reverse them, and then probably he lies down but he soon gets up again.

The operator, bending, with his legs apart, or being on his knees, or behind the bull, seizes the inferior part of the scrotum with one hand, and with the other gently pushes the testicles as high up into the bags as he can, and again letting them descend, and so on alternately sliding them upwards and downwards three or four times. This is particularly necessary when the scrotum is small, and the skin hard, and the testicles large and round, in order that the scrotal integument may be distended, and it and the spermatic cord rendered more pliable; but it is useless when the testicles are oblong or small, and their envelopes and the spermatic cord relaxed.

The operator, next with his thumb and fore and middle fingers of the left hand, takes hold of the left spermatic cord at its origin near the epididymis; then taking the scrotum at its inferior part on the same side, between the thumb and fingers of his right hand, and pressing on the lower part of the testicle, first from before hindwards, and

then from below upwards, and keeping the left hand fixed and steady, he reverses the testicle, at the same time returning the inferior part of the scrotum to its proper place, the inferior part of the testicle having become the superior, and this organ being pressed against the posterior part of the cord.

The operator then loosening his hold of the cord with his left hand and the scrotum with his right, seizes the inverted testicle and its cord with both hands, presses it lightly downward, and, applying his right thumb on the origin of the spermatic cord, he with his left hand causes the testicle to make a circular movement around the cord, maintaining the testicle in this position with his left hand, to which he gives a circular movement in order to receive the testicle as it passes round the back of the cord. He continues this until he has caused the testicle to revolve twice around the cord, and thus to compress the vessels and nerves, and the spermatic canal. From this double revolution of the testicle the operation takes its name, *Bistournage*. Finally, the operator quits hold of both the testicle and the cord in order to seize the inferior part of the scrotum with both hands, and, placing them one above the other, he forces the testicle as near as he can to the inguinal ring.

He proceeds in the same manner with the other testicle, and heterminates his operation by passing the cord of worsted and hemp several times round the scrotum and below the testicles, and securing it with a double knot. The cord should be drawn tightly enough to keep on the scrotum, but not to cut through it, or even to wound it. If it were to slip off the scrotum, the testicles would descend, and the spermatic cord would be untwisted; and if the scrotum were to be cut through, the support of the testicle would be lost. The principal art of the operation consists in the application and the security of this ligature. The animal may now be released.

This mode of castration requires no previous preparation or after treatment, especially if the patient is at grass. The inflammatory engorgement that follows is very slight; it is no more than is necessary for the prompt and complete obliteration of the spermatic cords. The ligature round the bottom of the scrotum may be removed forty-eight hours after the operation. It is rare that any accident follows this mode of castration.

If the ligature should have come off soon after the operation, or the the torsion should have been incomplete, the testicles will resume their natural situation; and a new operation must be proceeded on, unless a considerable enlargement of the cords should have supervened, when it will be impossible to twist them again until the inflammation shall have subsided. If, however, the cords should remain for a considerable time large and hard, it will be necessary to have recourse to castration with the clams, and in the *uncovered* way.

2. *The Ram and the Goat*.—The bistournage is performed on both these animals, if they have not been deprived of their organs of generation, a little while after their birth, and when the testicles have attained a certain stage of development. The operation is very easily performed. An assistant sitting, takes the animal between his knees. After having thrown him on his back, he manages to hold the two legs on either side in each hand. The operator, standing before him, proceeds in precisely the same manner which has been already described.

## LINCOLNSHIRE AGRICULTURAL SOCIETY.

The seventeenth anniversary of this society was held at Lincoln on Thursday August 11. The show of cattle and horses was very large and rather superior, but that of sheep exceedingly scanty. The attendance at the show was numerous and highly respectable; and amongst the visitors we observed Henry Handley, Esq., M. P. for the Southern division; Chas. Chaplin, Esq.; R. A. Christopher (late Dundee), Esq.; J. Fardell, Esq.; &c. &c.

A Dinner took place as usual at the City Arms hotel to which 71 gentlemen sat down. The chair was occupied by J. Fardell, Esq., and the vice chair by—Jepson, Esq., of Heighington. On the right of the chair sat H. Handley, Esq.; Chas. Chaplin, Esq., and R. A. Christopher, Esq., took their seats on the left. Among the company were noticed T. Brailsford, Esq., Barkwith; Major Brown, of Welbourn; P. Bromhead, Esq., J. Bullen, Esq.;—Lamb Esq., of Auburn; R. Dawson, Esq., Withcall; and F. Oates, Esq. The second table was presided over by Chas. Hayward, Esq., having Rd. Carline, Esq., the Secretary, as vice.

The cloth having been drawn, the chairman gave the following toasts:—"The King" "The Queen and Royal Family;" "The Noble President of the Institution, Lord Brownlow, and thanks to him for his venison" (*cheers*); "Restoration of health to Lord Yarborough, and thanks to him for his venison."

The Treasurer, CHAS. HAYWARD, Esq., then announced the state of the funds of the society, from which it appeared that there is an improvement from the last year's account; and that there is now a balance of 25*l.* 4*s.* 4*d.* in favour of the society. The money taken for admission at the Show-Yard door that day was 16*l.* 1*s.* Mr. Hayward then proceeded to read the schedule of the prizes awarded; (for which, as well as for a list of new subscribers, see advt.)

Parkinson and Bell having been called into the room, the chairman handed over to them the amount of the prizes they had gained, and warmly recommended them for their praiseworthy conduct.

The CHAIRMAN next proposed the health of the Members for the county.

Mr. HANDLEY said on the part of his absent colleagues as well as himself he begged to tender them his thanks. It was always a matter of great gratification to him to attend on such occasions as the present, and not the less so now, because it was the commencement of his own holidays. He could assure them it was much more congenial with his feelings to discuss agricultural matters there than tithes and corporations elsewhere. (*Hear and laughter*.) He could not too warmly commend societies like this, and he repeated his gratification in being present; because it was by such means they became more likely to improve the breed of their stock, and thus better able to contend against those chances to which agriculture was liable. (*Hear*.) He had no doubt his colleagues, if they had not found that their duties required their services in another place, would also have attended that meeting.

The CHAIRMAN next proposed the Members for the City, regretting that their parliamentary duties prevented their attendance. (*Cheers*.)

The CHAIRMAN again rose, and proposed the health of the successful candidates, Mr. Thacker and Mr. Dawson, who returned thanks.

Mr. HANDLEY proposed the health of their excellent chairman, who briefly returned thanks.

The CHAIRMAN proposed the health of Charles

Chaplin, Esq., when three times three hearty cheers were given.

MR. CHAPLIN expressed himself highly flattered by the kind remarks with which the chairman had introduced his name. It afforded him great pleasure to see so large and respectable a meeting, and also to hear so satisfactory a report of the funds as the treasurer had that day given. He trusted if things went on as they at present did, they should speedily experience an increase of their numbers. *Agriculture was now looking much better than it had done, and he hoped the change for the better would manifest itself in that society.* He repeated his thanks for the honour the company had done him, and assured them as long as he lived he should have great pleasure in attending their meetings.

The CHAIRMAN next proposed the health of the Judges, and thanks to them for their valuable services on the present occasion. Mr. Smith, of Middle-Rasen, returned thanks.

The health of the Stewards was next drank, and thanks to them for the onerous duties they had performed, for which Mr. Jepson, the vice-chairman, returned thanks.

The CHAIRMAN said he had another toast to propose, and one which he was sure would meet with the approbation of every one present. When he mentioned the name of Mr. Hayward, they would all acknowledge his diligence in the society's behalf, and the smallest compliment they could pay him would be to drink his health.

MR. HAYWARD expressed himself highly honoured by the manner in which his name had been received. He was glad to find the accounts turned out so well, from which he augured that they would continue for years to come, to proceed in their useful career, through the favour of those who were supporters of the institution. The farmers certainly did not come forward in the way he could wish, for they were proverbially a supine class—yet if they would only come and see how the society's affairs were conducted, he was sure they must heartily approve it. (*Cheers.*) Mr. Hayward then alluded to the new subscribers, one of whom, Mr. Christopher, had kindly consented to act as Vice President for the ensuing year; and he begged leave to propose his health, which was drank with loud cheers.

MR. CHRISTOPHER expressed his sincere thanks for the manner in which the last toast had been received; and said he felt it was the duty of every person who had an interest in agriculture to do all he could in its behalf, and he had great pleasure in giving his name to that society. (*Loud cheers.*)

MR. BRAILSFORD, one of the members of the Lincoln and Lindsey Association for the Protection of Agriculture, said, as they happened to have present a distinguished member of the House of Commons, who had devoted a great deal of time to the agricultural question, he hoped he might be allowed to call upon him to favor them with a history of the circumstances, and the cause of the non-adoption of the report. He begged to call on Mr. Handley. (*Loud cheers.*)

MR. HANDLEY said they had at that table those gentlemen whom the Lincoln and Lindsey Agricultural Protection Society deputed to the Central Society in London, with a view to consider what should be the recommendations submitted to parliament in the shape of protection or otherwise. He (Mr. Handley) also, as a member of that association, had the pleasure of meeting Mr. Brailsford there, and the result of their deliberations was, that Parliamentary Committees were appointed to inquire into the state of Agriculture. He happened to be named

as one of the committee of the House of Commons. He attended that committee from day to day, and from week to week, and although considerable dis-appointment had been expressed here and elsewhere that no report had been produced, before he sat down he hoped to convince them that, notwithstanding the report was agreed upon, a mass of evidence had been obtained that must be made available to their benefit in the ensuing session of parliament. The committee was composed of gentlemen of all opinions and persuasions. Even he (Mr. H.) entertained a great difference of opinion with many eminent agriculturists as to the remedy best calculated to improve their condition. There were 23 County Members, with three or four of his Majesty's Ministers, and six or seven most important Commercial Members of the house, included in that committee. After most diligently examining all the evidence produced, it was difficult to come to any satisfactory conclusion; and as to the nature of the evidence offered, if they had the patience to wade through three or four large folio volumes, they would be as well acquainted with it as himself. Each gentleman put questions to the witnesses upon the particular points he wished to elucidate, and at the conclusion the chairman in the usual manner was called upon to give a report. Of that chairman, although differing from him in many points, he believed the committee were unanimous as to one matter, namely, of the impartiality and assiduity with which Mr. Lefevie discharged the duties of chairman. He produced a report, which if it had not been alluded to in the House of Commons, he (Mr. H.) should hardly have felt himself at liberty to enter upon there, as it was a private document for circulation amongst the members alone; but it having got wind, and being known to many, there was no necessity longer to keep it a secret. It commenced by acknowledging very extreme distress among the agriculturists, more particularly as regarded those who were occupiers of strong clay lands, and stated various reasons as the grounds of the distress, among others that of in some instances excessive rents. It then went on to recommend a remission of the Malt Tax, and that the graduating scale of duty upon Foreign Corn should never descend below 5s. instead of 1s. as at present; also that Liverpool, Wakefield, and London, should be excluded from the returns. There were other minor points recommended, such as the advantages of a statistical board, &c. After the report was produced, the committee adjourned for a few days; and when they met again to discuss the matter, Sir James Graham said he found so little to assent to in the report, and knowing the great difference of opinion that existed among the members of the committee, he felt that unless they were unanimous in their recommendations, it would have little or no weight with the House of Commons, on whom they must depend for carrying out whatever was required. This was seconded by Lord Chandos, and he believed there could not have been found any two members to vote against it.—The next question was, how to give a report which should be carried with some degree of unanimity in the committee, and that seemed to him as difficult as it would be to make any thing intelligible of the language uttered at the tower of Babel. (*Laughter.*) He was in favor of the repeal of the malt tax, and of increasing the duties on foreign imports, more particularly Russia tallow; he also recommended a return to the silver currency (*hear, hear*), but on canvassing the committee, the majority was found to be against it. Other remedies were suggested, but were equally unsuccessful in getting a majority; and they all agreed in rejecting the report to which Mr. Brails-

ford had alluded. If they had agreed to any report, it would have been a milk-and-water sort of a thing; and as he (Mr. H.) stated at the time, he felt he would much rather report the evidence without any remarks on it, than agree to a report going from that committee in which he could not concur. (*Hear.*) The hon. member then adverted to the part he had taken with reference to a repeal of the malt tax, and also to a report by the Commissioners of Excise, in which they recommend the reduction of the malt tax one-half, hoping thereby to prevent illicit malting.—It had been proposed to remit the duty upon foreign barley, but the increased demand which it was expected would be required by the reduction of the malt tax one-half, it was stated could not be supplied by home produce. Upon this point he had from time to time felt it his duty to get all the information he could, and in attending the committee upon agriculture he had taken a considerable part in the examination of the witnesses, and always to this point, "Is it your opinion, if there should be a large increased demand for barley, that it is in the power of the agriculturists of this country to produce that increased demand?" Without one single exception every witness answered decidedly in the affirmative. (*Hear, hear.*) The hon. gentleman then returned to the original question, and expressed his belief that the report in question was one which they would be sorry to see carried. He hoped, however, that in the next session of parliament a measure would be founded upon the evidence which would meet with the satisfaction of the Central Committee. In the mean time, much might be done to guard against the occurrences of the past, by their own individual exertions.

Mr. BRAILSFORD returned thanks in the name of the company for the very lucid and satisfactory answer which the hon. member had given to the question that was put to him.

The CHAIRMAN proposed the health of the Secretary, Mr. Carline.

Mr. CARLINE briefly acknowledged the compliment that had been paid him.

Mr. HANDLEY proposed the health of Mr. Collitt, (the legal agent of Mr. Perkins, the builder of Islington Market,) who was present. Mr. H. expatiated upon the advantage to the graziers that Islington Market was certain to prove, admirably as it had been arranged for the reception of stock, and avoiding all the inconveniences and cruelties that were necessarily incurred at Smithfield, and concluded by proposing the health of Mr. Collitt.

Mr. COLLITT, in returning thanks, entered at some length upon the Islington and Smithfield market question; and showed the superior advantages which the former possessed over the latter.

Mr. HANDLEY—With reference to his sending stock to Smithfield as had been stated by his levianth friend, (*laughter.*) he certainly had sent ten or twelve, but he would send no more.

Mr. DAWSON said, as a friend to Smithfield market, and he believed he sent as much stock there as any one in this county, he must express his opinion in favour of it. He did not think it was possible to establish another market, because all the buyers went to Smithfield, and it was of no use to send stock where there were no buyers.

Mr. BULLEN said he must confess he was surprised at the observation that had fallen from his friend, Mr. Dawson, for he had given him credit for being on all occasions a man of sense and judgment; but, in the present instance, he must take the liberty of differing; and though he acknowledged himself much younger in judgment as well as age, yet, as

he had paid great consideration to the Islington market question since its establishment, he could not give way to Mr. Dawson on that point. Mr. Bullen then compared the facilities of the two markets, Islington and Smithfield, and wondered how any man could give the preference to such a nuisance as Smithfield.

After a few other toasts were given, the Chairman retired, when Mr. Fardell, jun., was called to preside, and the evening passed off with the utmost conviviality.

## ON HORSE SHOEING BY ONE-SIDE NAILING.

BY MR. J. CARLISLE, WIGTON.

(From the Veterinarian.)

Messrs. Editors.—I have now been a subscriber to your valuable Journal for a length of time, and confess that I never perused it without finding something very important; and I hope it will ever abound in scientific information worthy the attention of every veterinarian. In order to contribute my share, I beg to make a few remarks on the highly important system of one-side nailing, brought into general notice by that ingenious and praiseworthy gentleman, Mr. Turner, to whom the public is much indebted.

I should have been glad had this subject been taken in hand by a more talented and scientific veterinarian, who could have done justice to that little practised yet unrivalled system of one-side nailing. When I say unrivalled system, some may probably think I am getting out of bounds; but I speak from diligent and practical observation, combined with a knowledge of the anatomy of that vascular and delicate organ, the horse's foot.

Horse shoeing is certainly a very important operation, and has been much studied, and many improvements made in the art by several of our veterinarians; our learned Professor, Mr. Coleman, has made the horse's foot his principal study, and has explained the anatomy of that organ with the greatest minuteness; yet there remains a large field for cultivation.

In the first place, I shall ask my professional brethren one question. Supposing we are called to give our advice in twenty cases, out of this number shall we not find ten of lameness in the feet? I venture to say that you will answer in the affirmative; and the major part of these horses are suffering from contraction, which I consider the most deadly foe which that elastic organ has to contend against, and which the veterinary surgeon finds the great difficulty in subduing.

Now, an injudicious method of shoeing is generally the cause of contraction: hence disorganization, ossification of cartilage, navicular lameness, thrushes, &c.: in short, it is a complicated lameness; and the shoeing smith (in general) must bear the blame. The horse is turned over to the veterinary surgeon; his shoes are pulled off, his soles are pared out, and all the exuberant parts of the horn cut away with a drawing knife; in short, the whole horny box is made as yielding as possible. A blister is then applied to the coronet, and with the addition of leather and tar stuffing, the shoes are again nailed to the feet, with four nails placed in each quarter of the shoe. O thou universal fetter! what an absurd conclusion of his well-meant endeavours to check the progress of contraction and set at liberty the elasticity and vas-

cularity of that organ which is so wonderfully adapted by nature to perform its office.

Our alternative now remains between the old system of shoeing, and the one suggested by Mr. Turner,—that of one-side nailing; there is no other system of shoeing that deserves consideration. For my part, I would earnestly recommend all who are engaged in our laudable profession to give Mr. Turner's plan a fair trial. I have done so myself with the most perfect success; although at first I did it with fear. In consequence of the shoe being attached to the foot by little more than one side, it appeared to me to be insecure, yet, I saw (in another point of view) its superior advantage over the shoe in common use, as it would admit of more freedom to the foot. I was therefore resolved to put the system of one-side nailing fairly to the test; and I will pledge my truth and honour, that even in hunting, posting, and on roadsters of every description, I have used it with success.

Having proved the security of the shoe, it only remains to show the advantages resulting from Mr. Turner's mode of shoeing over that in general use. By a frequent application of this unyielding hoop (which is attached to the foot by four nails in each quarter) the horse's foot undergoes a wonderful alteration in its formation and structure, even before the animal has arrived at the age of five years; and I attribute it solely to this fettered system of shoeing; and if that system is continued, we may ever expect to meet with a good supply of contracted feet. One moment's reflection will clearly prove, that the shoe in general use will certainly impede the functions of the foot, destroy the elasticity to a great degree, constrict the vascularity, and cause a general disorganization of the whole horny cavity. Now, if a shoe with nails only at one side be attached to a foot that had never before suffered from the mutilation of the drawing-knife or the restraint of a shoe, we shall find that this foot will retain its natural formation even during the hardest work which this valuable animal is subject to undergo; whereas, on the other hand, if we apply the shoe in general use (i. e.) a shoe firmly attached to the foot by four nails placed in each quarter, and rivetted, we shall then witness the reverse effects; for after its first application, it gives that complicated organ a tendency to contraction: and from this evil spring almost all the maladies the foot is subject to. All this, however, is too well known to require any further explanation.

Now, one-side nailing has done wonders on account of the restored freedom to the foot which this shoe so perfectly admits of; and by this regained elasticity the foot is able to perform its functions and remove the apparent constipation: it then begins to assume its natural formation, the lameness is totally or in a great measure removed, and the horse pursues his labours with more ease and pleasure to himself, and greater security to his rider.

Permit me to recommend the above system as a good preventive against corns, and the principal auxiliary as a curative. In consequence of the play of the quarter, the compression and concussion are, in a great measure, removed, which I consider the principal cause; and by the application of the drawing-knife in skilful hands, those great ends may be obtained, to our own credit and the satisfaction of our employers.

I do not flatter myself with the idea of converting the opinions of a whole fraternity; yet the above hints may serve to operate on the minds of a few, so as to put the system to the test, and prove its superiority before the enlightened world; then we shall have the pleasure of seeing it practised in every

shoeing forge, both at home and abroad, and then, and then only, we shall boast of a perfect reformation in the art of horse shoeing. This will require time, and the perseverance of the few, to prove its utility in despite of the prejudices of the many. *Nil desperandum.* A recent author has told us, that "for great truths there will always come a time and place."

## CULTIVATION OF POTATOES.

TO THE EDITOR.

Sir.—I observe it stated, that in some counties there is a great failure of the potatoe crop; this, I think, may be remedied by sowing the seed. Sets will not last above twelve or fourteen years; after that time they decline, and hardly return treble seed. I tried the experiment last year in a small way, and the produce was astonishing. What is very remarkable is, that these seedlings produce potatoes of different kinds, and sometimes new sorts are procured. It is no difference whether the apple comes from one kind or another. I saved the red rough seed, and I had five sorts from it.

The following is the method I took to get them the size of hen's eggs in one year:—Take a bunch of potatoe apples, of any sort, in November, when they are ripe; hang them up in a warm room during winter, and at the end of March separate the seed from the pulp by putting them into a basin of water until they are soft; squeeze them with the fingers; gently pour off the water, and sow the seeds in drills with the feathers of a goose quill in a good bed of earth. When the plants are about an inch high, draw a little earth up to them with a hoe in order to lengthen their main roots: when they are about three inches high, dig them up and separate them carefully from each other in order for planting out in the following manner:—Prepare a piece of fresh ground by trenching it well, dig up the seedling plants as before directed, and plant them out in the ground thus prepared in such a manner that there be 16 inches between each plant. As they advance in growth, let them receive one or two earthings up in order to lengthen the main root, and encourage the shoots under ground. By this management potatoes may be brought to a good size in one year.

Southmoulton, July 19.

T.

THE LONDON VETERINARY MEDICAL SOCIETY.—We understand that no compromise or approach to reconciliation has taken place; but that it is the intention of the present Committee of Management, that the Meetings of the Society shall, in future, be held at the residence of Mr. Vines.

FEMALE REAPERS.—The practice of labourers' wives assisting in the harvest field is becoming more general in this county than formerly, and, by increasing considerably the earnings of the poor, tends greatly to promote the comforts of their cottage-homes. The Chelmsford and Essex Agricultural Society are endeavouring to foster this spirit of industry, and we beg to remind the farmers that three prizes—one of 20s, one of 15s, and the other of 10s—are given to the wives or widows of labourers (in the employ of a member) who shall have earned the most money during harvest by cutting corn. We are sure the farmers of the neighbourhood will further the object of the Society, by giving those who are willing, an opportunity of competing for these prizes.—*Chelmsford Chronicle.*

## EXCERPTA CURIOSA.

1597.—In Carrick, are kyne, and oxen, delicious to eate; but their fatness is of a wonderful temperature; that although the fatness of all other comestable beasts, for the ordinarie vse of man, doe congeale with the cold aire: by the contrarie, the fatness of these beasts is perpetually liquid like oile.

1765.—There was in the parish of Braunston, in the county of Rutland, an ewe which had seven lambs, all alive, within less than a year; and when fat, did not weigh above fourteen pounds and a quarter.

1765, July 14.—A curious mare, 28 inches high, from the East Indies, was brought in a coach from Gravesend to Leicester Meuse, and after being curried and dressed, carried in a coach to Carleton-house, when it was shown to the Prince of Wales, who seemed highly pleased with it; afterwards it was carried in a coach to the Queen's Meuse. This was a fine little animal, of a dun colour, the hair resembling that of a young fawn's. It was said to be four years old, well proportioned, had fine ears, a quick eye, and a set of fine teeth, with a handsome long tail, and very good natured.—Qy. Did she breed in England?

It cannot be too extensively known, for the benefit of breeders and fanciers of horse-flesh in general, that by pursuing the plan adopted by Jacob of old amongst the flock of Laban, horses may be bred of any colour or possible combination of colours. Dr. Thomson, of Hamilton, in the case which lately took the round of the newspapers, actually followed the suggestion of the Patriarch, and got a celebrated animal painter to take Batty's beautiful horse, which painting was placed constantly in the stall before the mare during the period of utero-gestation. We know of seven gentlemen in this neighbourhood (Hamilton) who are following the same course with their mares this season; and we only fear that the mania may extend among the farmers, and tend to annihilate the celebrated Clydesdale breed. An animal painter has taken a residence in town for the purpose of enabling himself to supply the demand of the country gentlemen for fancy horses.

## MACHINE FOR THE UPWARD TRANSMISSION OF WEIGHTS.

A very ingenious machine for the upward transmission of weights of any description is now on exhibition at the Mining Hall, next Exeter-st., and deserves the attention of mine proprietors, wharfingers, and all persons who have the management of extensive stores, as one well calculated to save a great deal of time, labour, and expense. The construction of this power is very simple, and its steady operation is quite assured. Its chief agent is a pair of wheels; or, if necessary, a series moving with their diameters in the direction of the weight to be raised,—say the shaft of a mine. Taking the one pair of wheels, moving on the same fixed axis, we find that from the end of a radius or arm in each, a chain descends, so as to hang on opposite sides of a square passage. To each chain are suspended, at different but regulated distances, quadrangular frames, to the upper sides of which strong projecting iron rims, moving on the principle of the hinge, are attached. The boxes, or receptacles for the weight to be raised, have corresponding edges on each side. When the wheel above is turned, and a single box below is placed in connexion with the lowest frame, it is caught by its rim, and with one revolution of the wheel is sent up as high as the frame on the opposite side to that on which it is borne: here it is again caught and sent up to the apparatus on the opposite side again, and so on, by alternate transmission, it is brought to the top of the shaft.

The machine being kept constantly laden below, and its wheel constantly turned above, it follows that at each revolution of the wheel a box is delivered; and thus, in an exceedingly short space of time, a vast body of matter can be carried up through any depth of shaft. It is not easy to describe such machines, however simple they may be, in very simple or intelligible language, and we have not been much practised at specifications. We must therefore leave scientific men to understand us through their own quick intelligence; and to all others whom the matter may concern, we recommend the employment of their own eyes. The machine could be most humanely employed in great mines in quickly sending the workmen up or down, to save them from their present tedious and tiresome expedients for that purpose. In unloading ships at wharfs its operation would be found amazingly rapid and proportionably convenient. It may be remarked also, that its operation is wholly unaccompanied by danger, and that its speed may be accelerated or diminished, or it may be stopped altogether at any moment, with perfect facility and convenience. On the whole, we must confess that we were struck with the complete efficiency of this admirable invention, which we are glad to find is protected by patent.

ROYAL SPORTS.—Louis the Eleventh ordered the Abbot of Baigne, a man of great wit, and who had a knack of inventing new musical instruments, to get him a concert of swine's voices, thinking it impossible. The Abbot accordingly mustered up a number of hogs of several ages, and placed them under a pavilion covered with velvet (before which he had a sound-board, painted, with a certain number of keys), thus making an organ; and as he played on the keys with little spikes, which pricked the hogs, he made them cry in such tune and concert as highly delighted the King and his Court.—Is there not in this story something covert as to the usual treatment of the people by Kings?

HORSE RACING OF OLD.—The deed is still preserved among our city archives, by virtue of which the Town Cup is annually given at Salisbury races. It bears date March 28, 1654, and is a compact between Sir Edward Baynton (as the representative of certain noblemen and knights who subscribed a fund for the purpose) and the mayor and commonalty of Salisbury. Under this deed the latter received 320*l*., and thereupon bound themselves to provide annually for ever, "a faire cupp of silver gilt with gould," of the value of 18*l*.. Among other curious regulations to be observed at the race for the cup, it is ordered, in the aforesaid deed, that the corporation shall provide yearly "three men with muskets to be charged with powder, to be discharged as followeth—that is to say, one of the said three men to stand at the first myles end from the starting place of the said race, and there discharge his musket as the runninge horses passed by him; one other of the said three men to do the like at the second myles end from the said starting place; and tother of the said three men to do the like at the end of the third myle from the said starting place." The improvements in the speed and breed of our modern race horses have long since rendered unnecessary this very ingenious method of urging them to the goal.

CUMBERLAND.—As one of Mr. Thomas Pearson's workmen was mowing a field of grass, in a secluded place, near High Heskett, he cut over a hare without doing the least injury to the animal. The hare did not offer to stir from the spot, upon which the man laid down his scythe and lifted her up, when he discovered to his amazement, no less than eleven young ones under her; he immediately set her down, and she again took her place upon the seat without the least apparent fear. Several gentlemen have since visited the place, and on one occasion they saw three old hares in the field and near the seat, and they are of opinion, that the eleven young ones are the progeny of the three hares, more especially as some are considerably larger than others.

## WOOL FAIRS.

## DEVIZES WOOL AND CATTLE MARKETS.

(ABRIDGED FROM THE DEVIZES GAZETTE.)

As we stated in our last, both these markets on Thursday were remarkably well attended, and business to a very considerable extent was effected, notwithstanding the opposing circumstance of neighbouring fairs being held on the same day. With regard to the facilities for the disposal of Wool, there is but one opinion:—Devizes is better situated than any town in the West of England, for a Wool Mart; and it is also generally considered, that a very large Cattle Market may be established. The greater number of our neighbouring graziers, and many of the opulent dealers, although living at a distance, have promised to give it their best support. About three o'clock in the afternoon nearly 200 persons partook of the Ordinary at the Assembly Rooms. On the removal of the cloth, the customary loyal and other toasts were drank in succession. The Chairman then proposed success to the *Devizes Wool and Cattle Markets*; and dilated on the advantages they would confer on the town and neighbourhood. He also begged to propose in connection with the toast, the health of his hon. friend and colleague, who had taken a very great interest in promoting these markets.

Mr. ESTCOURT rose, and in appropriate terms expressed his grateful sense of the very kind feeling evinced for him, assuring the company that he attached the highest value to their good opinion. Although he was at all times desirous of promoting the good of the town by every means in his power, he feared that greater credit was attributed to him in the present instance than he merited. He had been one only of a large number, who took part in forwarding that which he now believed was permanently established—a Wool and Cattle Market in Devizes.—There was again great reason for congratulation on this the second Wool Market. He was happy to find that there had been no diminution in the interest taken—no diminution in the quantity of wool exhibited and sold—and above all, no diminution in prices; the business done was also upon a sound basis, without any artificial inducements held out. He would repeat what he said on a former occasion, that Devizes was formed by nature for a Wool Market; and that there had been great supineness in not establishing it before. After a few more observations, Mr. Estcourt proposed the health of the Chairman, to whom he thought the company were particularly indebted, as he had come purposely from Portsmouth to lend his aid and influence to the proceedings of the day. *Drank with three times three, and repeated cheers*

CAPT. DUNDAS, after thanking the company for the compliment paid him, observed that he was at all times ready, whenever his services were required. His residence at Portsmouth was but temporary—for three years, if he and his gallant and excellent friend under whom he served should so long live; but wherever he might reside, no distance, however great, should ever be an obstacle to his using his best efforts to promote the interests of the town and neighbourhood of Devizes.

Mr. POLHILL passed a high but a justly merited eulogium on Mr. Salmon, and proposed his health.—The toast was drank in the most warm and flattering manner, and afforded Mr. Salmon a strong proof of the very great esteem in which he is held by his townsmen and neighbours. It was some time before the cheering ceased.

In returning thanks, Mr. SALMON said, if ever he wanted words to express himself, it was on the present occasion; for he was there as a private individual only—holding no official situation, and he therefore flattered himself that the kind feeling shown, must be attributed to personal regard, arising from a long acquaintance. For any part he might take in promoting the welfare of the town, he claimed no merit—his interests were interwoven with theirs. He could not refrain from adding his congratulations on the success which had attended the Wool and Cattle Market. He was not in a station

to possess his thousand acres, or to send his thousand fleeces to market; but he had on many occasions the pleasure of acting the part of mediator between landlord and tenant, and generally with success. He most cordially thanked the company for the kind manner in which he had been received, and with great sincerity drank their good healths.

CAPT. DUNDAS then proposed *The Magistrates of Hants*, and the health of Dr. Quarrier, (one of that body) who had done the company the honour of dining with them. *Drank with three times three.*

Dr. QUARRIER, in returning thanks, said, it was impossible for him to express the high sense he felt of the honour conferred upon him by the gallant chairman proposing, and by so highly respectable an assemblage so cordially and kindly uniting in drinking his health, a stranger among them. He had been but a few days in Wiltshire, but during those few days, he had been deeply impressed with the high cultivation of their lands, and the advanced progress of agricultural improvement evinced around the neighbourhood. He might be permitted to state, that the farms of his friend on his right hand, (Mr. S. Mills,) must excite the admiration of all who viewed the extreme order which reigned throughout his extensive occupations. It was delightful to observe the glad and bright countenances of his labourers, expressive of the spirit of industry infused into them by their employer; and he would venture to say, that from John O'Groat's house to the Land's End, nothing could exceed the admirable cultivation of the lands of Elston, and its adjoining farms. He had also had the gratification of visiting the manufactures at Wilton—where the manufacturer seemed to vie with his neighbouring agriculturist, in giving employment to men, women, and children. They seemed to be prosperous; and, he was happy to observe, in a most improving condition. He was one of those who must deprecate the attempt made to sever the agricultural from the manufacturing and commercial interests. In the present state of society in England, all were dependant one upon the other. The agriculturist rose corn, wool, &c.; the manufacturer wove the wool; the commercial and shipping interest disposed of the produce with increased value. It was by the healthful combination of all those interests that the whole could prosper; and any person who might deteriorate the one, must most assuredly injure the whole. It had afforded him the highest gratification and delight to observe the prosperity of Wiltshire. He should long—very long—remember the agreeable and pleasant day he had spent among them; and he again drank with the most perfect sincerity and satisfaction, success and prosperity to the Wool and Cattle Market of Devizes.

The CHAIRMAN announced that Mr. Long, one of the members for the Northern Division of the County, had consented to act as chairman at the next Wool Market Ordinary in February; and that Mr. Budd, Mr. Jonathan Grant, Mr. W. Ferris, and Mr. Thos. Lavington, would be the Vice-presidents.

Mr. BUDD said, although he had pledged himself to do all in his power to support the wool market at Chippenham, he would with great pleasure act as one of the Vice-Presidents at the next Devizes Wool Market Ordinary; for he was convinced that those markets wherever held, had a tendency to uphold the interest of the farmer. These were stirring times, and required every man to be at his post. It would be but of little service to seek the assistance of others unless they exerted themselves. A great deal remained to be done. Improvements had already been made, and many more must take place. They had hitherto placed too great a dependence upon the landlord, and too little reliance upon themselves. It was not by a mere reduction of rent that any considerable relief could be effected, but by their own energies. [*Some disapprobation was here manifested, and a cry of "it won't do! it won't do!"* Mr. Budd proceeded.] Some gentlemen exclaimed it won't do; but he would contend that it would do. He would ask those gentlemen whether any reduction of rent would altogether compensate for a reduction of 10s or 12s per sack in the price of wheat? No! but he would tell them what would—greater at-

tention to the land—superior cultivation, and consequently a larger produce. He would admit that they had experienced a heavy gale of wind, and many an honest man had been blown overboard; but there had not been, there was not, that deep and general distress that some persons would wish to make appear; and he would again say that those who were desirous of getting forward must trust to themselves, and not to their landlords. (*Renewed disapprobation.*) Mr. Budd said he would not willingly utter a word that should give offence to any one. He was not a landlord, and therefore could not be supposed to speak from selfish motives,—nor was he bred a farmer; but from his childhood he had been taught never to despond. It was perseverance and energy that the British navy overcame all difficulties and dangers, and rode triumphant on the ocean; and by perseverance and energy, Agriculture would rear her head and prosper. God forbid that he should for a moment contend that landlords had not a duty to perform as well as tenants; and if any landlord neglected his duty, he would say *shev him up!* What he wished to impress upon the company was, that by trusting too much to others, it frequently happened they relaxed their own efforts, and sometimes became unnerved and powerless. Rely upon it (said Mr. Budd in conclusion,) that it is by perseverance, and by perseverance only, that we shall weather the storm.

Mr. T. LAVINGTON said, it might perhaps appear arrogant in him to address the company, but having been one of those who manifested disapprobation at some of Mr. Budd's observations, he would not shrink from giving his reasons for so doing. That gentleman had said—every thing depended upon the farmer—not upon the landlord. Now this was a doctrine that might do very well for great capitalists like Mr. Budd, but in his opinion it was very ill-calculated for the little farmer like himself. He agreed with Mr. Budd, that the farmers were bound to bring their utmost energies into action, and he believed they did; but every one must concede that seasons of depression and distress occasionally arrived, against which no energy, no industry, could successfully compete. To whom then should the farmer look for assistance, but to his landlord? The landlord was his natural protector; and landlord and tenant must pull together. He was aware that he was speaking in the presence of magistrates and landlords, but whilst he had expressed himself (as he always should) freely and openly, he hoped he had done so without giving offence.

Mr. S. MILLS having obtained permission to propose a toast, first congratulated the company on the very large attendance at the Wool Market that day. The quantity of Wool exhibited (he said) was certainly not greater than at the former market; with regard to quality, he had scarcely ever seen finer—some of it being far superior to the Southdowns of Sussex; and the prices, he was glad to observe, were inclining upwards. Amidst the adverse circumstances with which the farmer had to contend, it was therefore matter of congratulation that he could obtain a fair price for his wool. An observation had fallen from Mr. Budd, in the correctness of which he certainly could not concur. Mr. Budd appeared to think that agriculture had been merely fanned by a gentle breeze, from which, instead of being depressed, she rose with freshened vigour; but in his (Mr. Mills's) opinion, she had been visited with a storm, a recurrence of which would carry desolation before it. She had suffered extreme distress, but he was not without hopes that she would revive. He had often thought that there was too much speculation—too great a competition among the farmers in taking their farms; and in some degree they lowered their respectability and independence. They did not make their bargains with that cool, nice calculation that either the tradesman or manufacturer did; and it very frequently happened that they engaged to give a much higher rental than the farm would enable them to give. In such cases, they were obliged to depend upon what was called the liberality of the landlord at the audit-table; but which there would not be that necessity to exercise, if the farm was taken upon equitable terms. An excessive rental was also, in the long run, injurious to the

landlord, inasmuch as he relied upon that he could not possibly continue to receive, and which may be said to be a fictitious income. Mr. Mills then paid a high compliment to the exertions of Mr. Budd both by sea and land, observing that the services he had rendered his country entitled him to be received with open arms by every company of Englishmen. He concluded by proposing as a toast, the healths of the gentlemen who attended the wool-hall, and the cattle market, that day, as purchasers.—*Drank with three times three.*

Mr. ROSSITER of Frome, returned thanks on behalf of the wool-dealers; and Mr. JAMES of Salisbury, on behalf of the cattle-dealers.

The CHAIRMAN next proposed a bumper toast to the health of Mr. Bethune Bayly—a gentleman to whom the company were primarily indebted for the establishment of both the wool and cattle market.—*Drank amidst loud and continued cheering.*

Mr. B. BAYLY said it would be great presumption in him if he for one moment supposed that he merited the compliment passed upon him. The duties of Secretary had certainly fallen to his lot, and he had performed those duties with pleasure and with zeal; but they were far too humble to entitle him even to the slightest praise. The market had been established by the united exertions of his fellow townsmen and neighbours, and he was truly happy that it had been so far successful; but to ensure its permanent prosperity, still farther exertions were required. It depended indeed upon themselves, whether, both the Wool and the Cattle Market should retrograde or go forward.

CAPT. DUNDAS proposed as a toast *The Yeomanry of England*, and with it the health of one of the best specimens of English Yeomen—*Mr. Young of Marden.*—*Drank with applause*, and Mr. Young returned thanks.

After some other toasts had been drank, Mr. Neate was sent for, and on his arrival, the CHAIRMAN said in the name of the company he publicly thanked him for the very handsome dinner he had provided, and begged to drink his good health. The whole company followed the example, and drank Mr. Neate's good health—a compliment which was suitably acknowledged.

The company then separated.

## LEWES WOOL FAIR.

The annual Lewes Wool Fair took place at the Star Inn, on Tuesday, July 26. At three o'clock about 100 of the principal flock-masters in the county with several wool-buyers sat down to dinner. Inigo Thomas, Esq. in the Chair, supported by the Hon. C. C. Cavendish, W. C. Mabbott, J. D. Gilbert, jun., J. E. Ellman, T. W. Scutt, H. Blackman, Esqs., &c. &c. 1

The cloth having been removed, and the usual loyal toasts given from the chair,

The CHAIRMAN proposed the health of the wool-buyers, and Mr. Elkington returned thanks.

Mr. JOHN ELLMAN said, in compliance with the request of the Chairman, he would proceed to give the company whatever information he could on the subject of the price of wool. He had been from home some time, and was ignorant of the nature of the bargains which might have been effected in this county, and could only give such information as he had been enabled to gather at other meetings which he had attended. He could report that at Thetford fair Mr. Coke offered his hoggets at 2s and his ewes at 1s 7½d, which offer was accepted without the slightest hesitation. The Duke of Norfolk's wool was offered at the same price and accepted, with the exception of the ewes, which being rather low in condition were sold at 6d per tod less. Mr. E. here remarked, that he regretted that the absurd practice of trimming lambs had not yet been discontinued by the farmers of this county. He knew that the farmers of Norfolk would be glad to purchase the Sussex lambs if they were unclipped. The hoggets were

universally sold at 2s. In ewe wool there was a great difference in price; on the whole he thought the Sussex ewe wool was considerably better than that of Norfolk. Mr. Bligh of Norfolk sold his at 2s and 1s 7½d. He (Mr. Ellman) had attended at Mr. Webb's letting of rams on the previous Friday. There were a number of wool-buyers present, and as much as 57s had been offered for the best wool. He argued well from the circumstance that a great anxiety had been shown to purchase wool of any—even the worst descriptions. Mr. Ellman concluded by offering his wool, consisting of 800 fattening, ewe, and ram fleeces, and 700 hoggets (not folded) to Mr. Legge at 64s a tod.

The CHAIRMAN proposed the healths of the Duke of Richmond, and the Earl of Egremont.

Mr. ELKINGTON (a wool buyer) observed that Mr. Ellman's account of the state of the wool trade, as far as it went was correct enough:—but Mr. Ellman had omitted to tell them all. He had not told them that at Thetford fair wool was bought at 1s 6d per lb. He (Mr. Elkington) had bought upward of 100 packs at less than 1s 6d.

Mr. LEGGE replied to Mr. Ellman. There was at present a good trade, and an increasing demand for manufactures, and he only feared that it might be impeded by the desire of the growers to obtain such high prices. Mr. Legge then offered Mr. Ellman 1s 10d per lb, or 58s 8d per tod, which offer was refused.

Mr. J. ELLMAN then made a proposition with respect to the period at which the fair was held. It proposed that in future it should take place on the 20th July. The shearing now was completed earlier than formerly, and it was very desirable that the fair should occur as soon after the shearing as possible. Another advantage arising from the change would be that the Lord Lieutenant would probably make a point of attending, which he could not now do in consequence of Goodwood Races being always on the last Wednesday in July.

The proposition was seconded by Mr. LEGGE, and carried unanimously.

Mr. Harris transferred his wool, 330 ewes and 107 hoggets to Mr. Legge, at 56s.—Mr. Tourle offered at 62s; refused.—Mr. Jas. Hodson sold at 56s.—Mr. Hurst (Eastbourne) offered at 1s 10d per lb; refused.—Mr. Fuller's (Tarring) refused at 58s.—Mr. Legge proposed 56s for Mr. Woodman's (Falmer) for his wool, (1230, out of which 450 tegs; refused.—Mr. Walter Woodham's sold at 57s (quarter hoggett).—Mr. Bine's (280 hoggets out of 1000) offered at 58s and refused.—Mr. T. Ellman offered at 60s; declined.—Mr. Botting at 56s (quarter hoggett); refused.—Mr. Saxby, (West-dean) offered at 58s; declined.—Mr. J. Saxby, (Northeast) sold at 56s.

Business continued to be transacted until a late hour, and a great many sales were effected at an average of about 56s with quarter hoggets; with a larger proportion of hoggets, from 57s to 58s.—About 23,000 fleeces were transferred to Mr. Legge alone.

## INVERNESS SHEEP AND WOOLFAIR.

(From the *Inverness Courier*.)

We had given in a previous number, a report of the proceedings at this fair but at the request of a correspondent, as well as from a conviction of its value, we are induced to repeat this more comprehensive account. Ed. M. L. E.

This important market, at which the staple products of the counties of Inverness, Ross, Suther-

land, Caithness, and Elgin are annually sold, to the amount of from 150,000l to 200,000l, was held here last week. Thursday and Friday were the appointed days, but it was Saturday before the principal lots changed owners, or any idea of the prices likely to prevail could be obtained. The effects of this market are felt by all classes of the community in this northern part of the kingdom, to say nothing of its influence in regulating prices in the south; and we have, therefore, great pleasure in stating that the market has been a good one both for sheep and wool. On Cheviot widders there has been an advance, over last year's prices, of from 15 to 20 per cent. Those flocks which last year sold for 26s 6d each, brought this year 30s; others rose from 22s to 26s. One fine lot of Cheviot widders sold for 30s each; another, 29s 6d; another 27s 6d. These were extensive lots; the best Cheviot stocks in Sutherlandshire went as high as 31s 6d the widders, and 19s the ewes. Ewes have rather declined in value, whether Cheviot or black-faced. This is supposed to be owing to the great fall which took place in this description of stock at the latter end of last year's markets in the south, and also to their being comparatively poor in condition. The loss of lambs by the backwardness and severity of the spring would, of course, have some effect in raising the value of the stocks of lambs on hand, and accordingly they sold here at 1s and 2s more than last year. In wool, the rise of price is fully equal to that on carcase. The best clips of Cheviot wool last year were disposed of at 20s 6d per stone; this year the same lots have sold at 25s per stone. Two extensive lots, amounting together to near four thousand stones, for which 20s 3d were received in 1835, sold at this market at 24s, and others in like proportion. The following is a note of the prices:

### SHEEP.

Cheviot widders .....	24s 0d to 31s 6d.
Do ewes .....	16s 0d to 19s 0d.
Do lambs .....	9s 0d to 14s 0d.
Black-faced widders ...	15s 0d to 21s 6d.
Do ewes .....	9s 0d to 12s 0d.
Do lambs .....	8s 6d to 11s 0d.

### WOOL. per stone of 24lb.

Laid Black-faced .....	10s 0d to 22s 0d.
Unlaid ditto .....	12s 6d to 14s 0d.
Unwashed Cross-bred ...	12s 6d to 14s 0d.
Washed ditto .....	14s 0d to 16s 0d.
Unwashed Cheviot .....	17s 0d to 18s 0d.
Washed ditto .....	21s 0d to 25s 0d.

More Cheviot wool was sold out and out at this market than was ever disposed of here upon one occasion. The purchases of sheep were also very extensive. Mr. Paterson of Sandside bought upwards of 3000, mostly widders. We may mention that the Rhudunan sheep, a fine black-faced stock, sold at 21s the widders, and the ewes, 12s.

The Sutherland contract for smearing materials was obtained by Mr. Anderson, Edinburgh. It consists of thirty or forty tons of butter, and about six hundred barrels of tar. We heard the price of butter stated at 52l per ton, an advance of fully a third. The kind of butter used for this purpose is that which has been held over for a year, and is of coarse quality. In consequence of the great demand last year in England, (another proof of the comfort and full employment of the manufacturing population,) little was left over, and on this account there is a scarcity.

The Inns were crowded beyond all former ex-

ample, and the public ordinaries, at the Caledonian and Royal Hotel, were fully attended. On Thursday, Mr. Brown of Linkwood, presided at the Caledonian Hotel; on Friday, Mr. Davidson of Cantray; and on Saturday, Mr. Pagan, from Liverpool. At the Royal Hotel, the chair was taken successively on these days by Major Gilchrist of Ospisdale, Sir Colin Mackenzie of Kilcoy, and Mr. Macdonald, banker, Fort William. Some practical subjects were discussed or glanced at, in the speeches and sentiments which circulated round the table after dinner, which we may briefly notice.

Sir Francis A. Mackenzie of Garloch, stated that he had written to the Secretary of the Highland Society wishing that a premium should be given to aid in the extirpation of foxes from the pastoral districts. A large premium would, he thought, lead to this desirable result, and if 300*l* were offered, the sum could easily be made up. He himself would not hesitate to give 50*l* if necessary. Mr. Paterson of Sandside expressed his doubts whether such a scheme would be successful; they had tried something of the same kind in Sutherland, and it was found that the more the premiums were increased the sheep decreased, instead of being better preserved. The noble family of Sutherland had spent thousands of pounds on this object, but in vain. He still thought that perseverance and a friendly co-operation among the tenants were all that was required to destroy the foxes; if they were as anxious to kill a fox on their neighbour's farm as on their own, they would succeed better than they did. Mr. Sellar, Morvich, and Mr. Reed, Kilcalmkill, dissented from Mr. Paterson as to the Sutherland Association, which they contended had been very useful in the destruction of foxes.

A hint was thrown out by Mr. Sellar, that it would be highly desirable if the Highland society would fix the time for holding their shows of live stock, in the different towns and cities, either a little before or a little after the time of harvest. He was prevented, he said, from attending the last Inverness show, as at the time it took place he had about a hundred women, besides, men working at his harvest, whom he could not leave without considerable inconvenience.

Mr. Brown of Linkwood alluded to a statement which had appeared in the Glasgow newspapers, purporting to be from a farmer in Invernessshire, who stated that he considered his farm, though a small one, to be worth 100*l* a year more since the introduction of steam navigation into this quarter. Mr. Brown condemned this statement as extravagant and ridiculous; there had not yet been time afforded to estimate the advantages of steam navigation in the conveyance of fat stock to the London market from the Moray Firth, and if there were time, it was absurd to talk of 100*l* a year being gained from such a cause on a small farm. Mr. Dudgeon, Arboll, Mr. Young of Burghead, Mr. Sutherland, Aldourie, and other gentlemen, also condemned the statement as extravagant, and calculated only to raise rents unaturally and unjustly. While on the subject of steam communication to the London market, Mr. Pagan took occasion to recommend Mr. Charles Burrell, London salesman, who was an active, respectable, and faithful agent for such as required his services in the disposal of their stock in Smithfield.

With respect to agricultural improvement in the North, Major Forbes Mackenzie of Fodderty stated that he was the first man in Ross-shire to cover a

field with lime, and his neighbours all said he was ruining his land! Mr. Paterson of Sandside alluded to an improvement in conveying sheep and stock which was talked of, namely, a steam-boat across the Firth at Burghead, which would save an immense deal of travelling. He hoped it would be soon carried into effect.

Mr. Mackinnon of Corry intimated, that he thought of changing entirely the stock on his estate in Skye, for the improved breeds of the south, which fattened better and were more profitable. Cantray and others doubted whether this would answer; they thought it would be much better to improve the system of rearing the native stock, which were inured to the climate, &c., than by forcing the cultivation of the short-horned breeds. Mr. Mackinnon added that he would continue the experiment, as he had no doubt of its success. (We would here remark that Mr. Traill of Ratter, and Mr. Horne of Stirkoke, have reared the Tees-water breed very successfully in Caithness; and other experiments of the same kind in the north have proved advantageous.)

A proposition regarding the mode of conducting the business of the market was discussed. We shall explain it more at length. Inverness sheep and wool market was first established in 1817. For several years the number of persons engaged in business was so limited that no one found any difficulty to discover in each branch of the business the whole persons connected with it. If, for instance, he was a seller of Cheviot wool, he could take his choice of one of the three staplers who were present; if a buyer, he soon discovered each of the twenty to thirty sellers who had come. In like manner, the three or four *Jobbers* who had attended, stood perfectly recognised by every individual who had sheep to sell, and the few sellers knew at once to what person it was of any importance to make application. Since then, however, the numbers and the sorts produced have been greatly multiplied. There are Cheviot, and cross, and black-faced varieties of wool and sheep. There are sellers of widders, of ewes, and of lambs, and so on of each variety, and their corresponding buyers. Besides the staplers, there is an assemblage of manufacturers, and of farmers from the various counties who come into market, each finding it nearly impossible to discover among the assembled crowd the dealers in the particular commodity they desire to purchase. To remedy this state of things, it occurred to several gentlemen that it would be of importance to induce the whole persons attending to transact business to assemble together on the morning of the first day of the market, with a clerk to be appointed, for the purpose of registering the address and description of business wished to be done by each. In this register, if the buyers of Cheviot wool were placed in one column, and the sellers in another, a glance at the paper would enable them to discover one another. If the names of the buyers of black-faced wool occupied the third column of the paper, and the sellers of it the fourth, the same result would follow; and so with the sellers of wintering for stock, and the buyers and sellers of cross wool, widders, ewes, lambs, smearing materials, &c. If these were registered, and the register made patent to all, business would be prodigiously facilitated. The gentlemen attending the market unanimously agreed to adopt this proposition, and appointed the following gentlemen a committee to carry it into effect at the next fair:—viz., Major Gilchrist, Mr. Mackenzie, banker, Mr. Johnston, Mr. Young,

Mr. Sellar, and Mr. Brown to be Convener. These gentlemen will, we trust, spare no trouble to do the thing effectually, as it promises to facilitate very materially the business of the market.

We shall not attempt to give a list of the farmers and gentlemen present on this occasion from all parts of the northern counties, but amongst those attending from a distance were the following:—

**WOOL BUYERS.**—Mr. Thomas Lockwood, Huddersfield; Mr. Walter Lockwood, ditto; Mr. Samuel Eastwood, ditto; Mr. Brookes, ditto; Mr. Ford, of the firm of Dockray and Co., ditto; Mr. Clark, Market Harbour, Leicestershire; Mr. A. Laing, of the firm of Dicksons and Laings Hawick; Mr. Gavin Hadden, of the firm of Hadden and Sons, Aberdeen; Mr. Wm. Archibald, from Alloa; Mr. Donald Maclaren, Callender, Perthshire; Mr. Charles Macdonald, of the Port Eglington Carpet Company, Glasgow; Mr. Coll. Turner, of Roseneath; Mr. A. Johnstone, from Elgin; Mr. Macdonald, Drumintorran; Mr. Smith, Fort William, &c.

**COMMISSION AGENTS.**—Mr. George Maxwell, of the firm of W. A. and G. Maxwell, Liverpool; Mr. W. R. Ronald, of the firm of Thomas Phillips, and Co., Liverpool; Mr. George Watson, of the firm of Watson and Macdonald, Liverpool; Mr. John M'Askill, Liverpool; Mr. W. Macleod, of the firm of Macleod, Houston, and Co., Liverpool; Mr. Gilbert Fairie, of the firm of Fairie and Rowland, Liverpool; Mr. Duncan Stewart, of the firm of Stewart, Bald, and Co., Liverpool; Mr. Boyd, of the firm of Hossack and Boyd, Liverpool; &c.

**CONTRACTORS FOR SMEARING MATERIALS.**—Mr. Adam Anderson, Edinburgh; Mr. Lamont, Greenock; &c.

**SHEEP BUYERS.**—Mr. Andrew Lamb, Liverpool; Mr. John Pagan, ditto; Mr. Alex. Robb, Stirling; Mr. Dickson, Penrith; Mr. Neilson, ditto; Mr. Moffat, Dumfries-shire; Mr. Hunter, ditto; Mr. Roan, ditto; Mr. Kennedy, ditto; Mr. Walker Johnston, Moffat; Mr. Gibbons, Carlisle; Mr. Watson, Keillor, Perthshire; Mr. Scott, Montrose; &c. &c.

**CIRENCESTER WOOL FAIR.**—For the last few days our streets have been crowded with waggons, carts, and horses with pack saddles, all laden with wool from the adjoining hills. About one hundred and fifty packs of wool has been weighed in the neighbourhood, and about the same quantity here, the price averaging from 1s 3d to 1s 6d per lb. Although stock and corn bring but inferior prices, yet we are happy to see that wool bears a remunerating value, and enables the farmer to take home some of that convenient thing called ready money. The purchasers were Messrs. Morgan, woolstaplers, Glasbury, through the medium of their agents, Mr. Wm. Hughes, of Brecon, and Mr. Richard Williams, of Aberdare, who have within the last month distributed no less a sum than six thousand pounds through the county in the purchase of wool alone.

**CHIPPENHAM WOOL MARKET.**—The success of our market has exceeded the most sanguine expectations of its supporters—all of whom now consider it established beyond doubt.—The attendance of buyers and sellers was greater than at our first Market. Sales were brisk, with an advance upon the prices obtained at the late markets and fairs. About 250 bags were pitched, the greater part of which was disposed of at the following prices:—Ewe and Wethers from 42s to 46s; mixed Flocks from 45s to 48s; Tegs from 50s to 52s per tod of 28lbs. Down fleeces were chiefly in request. After the Market, Mr. Neeld entertained a party of friends at the White Hart, among whom were

Mr. Salter, Mr. Geo. Bailey, Mr. Budd, Mr. Deere, Mr. Little, and several of the supporters of the market.

**WOOL.**—LONDON.—The public sales of wool, the produce of the colonics and other parts, having concluded, the following are the particulars of the averages realized during their progress. Between 5,000 and 6,000 bales were announced for public competition, of which 4,600 were Australian and Van Diemen's Land wools, a small portion from the Swan River and the Cape of Good Hope, and the remainder principally German, Spanish, and Peruvian fleeces. During the sales there was a full attendance of buyers from the manufacturing districts, and several agents to complete foreign orders present. The Australian wools are improved in fineness, but were generally of short staple. The Van Diemen's Land choice descriptions, on the other hand, were fit for combing, and realized proportionably high prices. The following are the accurate average prices obtained during the sales:—Australian: choice fleeces, 2s 6d to 3s 3d per lb.; good and ordinary, 2s to 2s 8d; and wools in the grease, from 1s 5d to 1s 9d. Van Diemen's Land: the finest fleeces, 2s 6d to 3s 4d; ordinary and good, from 2s to 2s 8d; and in the grease, from 1s 3d to 1s 6d. The finer qualities embraced all the best marks from from the colony. Eight bales of Swan River wool fetched from 2s to 2s 4d; and Cape of Good Hope from 2s to 2s 5d. On the average the quotations of colonial wools may be stated fully 2d to 3d per lb higher than those realized at the corresponding period of last year.

**ENCOURAGING SIGNS OF THE TIMES.**—There are forcibly apparent at the present period, a few striking and important facts, which, indicative as they are of the state of the empire, should not escape universal attention; nor will, we trust, the conviction fail to be entertained, that as the condition of the people is a correct index of the power and efficiency of government, the present administration is entitled to the gratitude of the country. From every part of the manufacturing and commercial districts, the accounts are highly gratifying. In every branch there is ample employment for all; and the rate of wages is increasing—circumstances, which must prove of great benefit to the agricultural portions of the community, arising from an increased consumption—to that important class which, employed in the cultivation of the land, has long suffered under a state of depression, but which assisted further by the operations of the poor law unions, is, we hope, rising to participate in the general benefit. Crime, too, is evidently upon the decrease. The Irish Judges congratulating the respective juries upon the fact of its diminution is most striking. Without alluding to the more southern provinces, the calendar for Yorkshire, considering the immense district which it embraces, is also small, and the offences are not of a deep and serious character. In the extremely populous district of Durham the calendar is very light. At Appleby there is not a single case. In short, the calendars throughout the whole of the circuit are extremely light. Here are abundant grounds for congratulation and for thankfulness. Nor is this all. The present gratifying state of prosperity is not based on a false and fictitious foundation. It is a tree whose roots are firmly fixed in the heart of the soil, and whose branches overspread the land. Amidst this gratifying state, the arts and sciences are extending their sphere of usefulness; and literature is presenting additional attractions and delights. Public improvements were never carried on, on a scale so magnificent as is the case at the present period; and to crown all there is every prospect of a bountiful harvest.—*Sunderland Herald.*

**PHOENIX PEA.**—A few days ago the wife of John Moody, of Whittington, near Chesterfield, obtained 332 peas from 80 full-grown pods, the produce of a single pea, which grew in a situation where it had been accidentally sown. The peas thus procured filled a pint measure.

## AGRICULTURAL REPORTS.

## SUFFOLK.

At this important season to the farmer, the weather is of the greatest importance, and as far as harvest has proceeded, it has hitherto been of the most propitious kind for the ingathering of the fruits of the earth; for which we feel thankful to Him who has declared that summer and winter, seed-time and harvest, should not fail, and pray for a continuance thereof; whatever may be the desire of a few interested individuals to wish for a wet harvest, we certainly think that both for man and beast, that what is termed a fine harvest, must be most acceptable, and taking the whole country throughout, those individuals must be of very sordid dispositions indeed, that, because from local circumstances or situations, they have secured the greater bulk of this year's produce, or because they may be holders of a stock of old Wheat, to wish their neighbours (if they can be so called) who occupy more backward spots of the earth, should not be blessed with the like favourable weather, the least we can say of them, they are not patriots. The Wheats, as we anticipated in our last report, are not equal to what they appeared to a passer-by, and the bulk is little more than half, compared to the last two years; we know of large breadths in well cultivated districts, which produced little more than one good load per acre; there is, however, in one part of this county, where from the great depth and fertility of its soil, (we allude to what are called the woodlands, but which is now as free from timbers as a desert) the Wheats are very heavy, but take this county as a whole, we must again assert, the Wheat crop is not of average bulk, is effected by smut, and, we fear, more or less injured by mildew. We were not surprised to read in the market letters in your last publication, that the new Wheats were of inferior quality compared with the old. The Barleys are a fair average bulk, and if well harvested will be a good sample, and we anticipate, as the prices of sugar and molasses are steadily advancing, that distillers will have occasion for Barley for the purposes of distilling, therefore if secondary qualities are taken off for that purpose we may safely calculate on remunerating prices. Oats, of which there are not but a small breadth grown in this county, are a tolerable crop. Peas are somewhat bulky in the straw, and fairly loaded with pods. Beans are short, but the prospect for a crop is about an average. Clovers are very short; we cannot yet form any opinion as to whether there will be a crop of seed. Turnips are generally a good plant, having been more or less attacked by black Jack; they appear quite stunted. Mangel wurzel is promising to be a good heavy crop, and of which there is a larger breadth cultivated this year than for the last several years. The wheat harvest is nearly completed, and in many parts of this county the barley harvest is proceeding rapidly; with a continuance of weather, such as we have hitherto experienced, to the end of the month, nearly all kinds of produce will be secured in this county.—Aug. 20.

## NORTH DEVON.

The drought from the commencement to the middle of last month checked the growing of the meadow grass, that it has not produced so much hay as was anticipated, and complaints are made of deficiency in the portion which still remains to be cut; it is however a pleasure to find, that the greater part already saved has been put together in the best condition, and that the superior quality will compensate in some measure for the deficiency in quantity. The rain, which commenced on the 15th ult., has so much improved the after-grasses, that a good share of feed may be expected from them. There was a continuance of wet with little intermission until the 2nd inst., frequently attended with cold, and heavy gales of wind, which in some situations laid the corn, and in others twisted the straw to a considerable degree, yet it does not appear that any serious injury has been sustained; the wheat ears are short, though seldom

better filled, and was thought, until a few days since, to be without fault; but it has been discovered, that in many situations there is an unusual quantity of smut: the yielding of the wheat is expected to be good, yet from the general thinness of the straw, it will be below an average crop; there is a considerable quantity of old wheat on hand, which from the decrease of tillage last season will be found useful, and probably sufficient to make good the deficiency of the present year. Barley and oats, sown in seasonable time on good land, is thin in the straw, yet since the late rain they have filled well in the ear, and from present appearances will be of good quality, and produce a full average yielding, but those grains on coarse lands and cold clay soils, will not much exceed half an average crop; the deficiency is thought to be principally owing to the difficulty of getting the seed into the land at the very late period when it was sown; none of this kind of barley will be of less than two or three different growths, we may therefore calculate on good malting samples being scarce; the late-sown oats are also of various growths, short and thin in the straw, and altogether with an appearance not likely to prove very profitable to the farmer; though the crops have suffered so much in this district, from the ungenial state of the weather in the spring, yet they are spoken of more favorably in the southern division, and said to be good in the eastern part of the county. Prior to the 15th ult. the turnips were suffering by flies, and in a few situations the black caterpillars were making great ravages; the rain since that period has cleared them of those enemies, and as the sowings were repeated in a favorable time, there is now a promising appearance of a general good crop. The failure with the potatoes is to a greater extent than has been noticed in any preceding year; various are the conjectures as to the cause, some attribute it to small worms (not noticed before) which are found in considerable numbers in the decayed parts; these worms are about three quarters of an inch long, with black heads, and white bodies full of legs; as we cannot find that any such complaints exist where small potatoes have been planted whole, we are induced to think that it chiefly proceeds in cutting the pieces too small, by which means (as the ground has been so extremely dry, the last three or four seasons, at the planting time) the juices of the sets have been entirely absorbed, and thereby rendered unfit for vegetation. The supply of fat bullocks in our late fairs and markets have been rather short, yet the prices have declined, the best are now from 9s 6d to 10s per score; fat sheep and lambs are offering freely at 5d per lb; calves and pigs realize about the same prices as in the last month, but are not in much request; wool meets a ready sale at prices fully up to, or beyond, the farmer's expectations. A few fields of wheat and oats were cut in the neighbourhood of Barnstaple and Bideford between the 2nd and 6th of this month, and a considerable quantity of wheat was cut last week on the best lands, the chief part of which has been carried, some prematurely, according to the opinion of the best judges, who think injury will be done, as the straw is found to be much greener than the ears; the cutting of wheat will be general on all the inferior soils by the latter part of this week; there has been a few samples of new oats in our markets, which were sown in February, the quality of which was good; no new wheat has been yet offered, nor have we heard of any barley being cut; and it will be from two to three weeks before much barley or oats are cut.—Aug. 15.

## WILTSHIRE.

Reaping having commenced, we can speak with some confidence as to the present state of the crop. Monday the 8th was the more general day for beginning on the hill district of the county. A deficiency in the quantity of straw is the prevailing character, and though this observation will apply both to hill and dale, it more particularly applies to high and poor land. For some years past the difference between the wheat crop on good and bad soil has been trifling. Frequently the hill farm, from a milder course of cropping and better general management, has produced as many bushels of wheat to the acre as the stronger wheat land. But this year forms an exception. The wheat on the good land is in the present year generally a better crop than on the poorer soils. We never remember so much red weed (poppy) on the sands, or so much madern (wild chamomile) in situations which suit this troublesome plant. We do not expect the crop will turn out so much by two or three sacks per acre as it did last year. Here it may be well to observe that the crop of the last year was an extraordinary one in this county, and that the county reports from other parts of the kingdom did not describe the wheat crop to be so large as ours. Such a very small proportion is lodged (laid), that we shall not much exceed the truth if we say none. The colour of the straw is bright, even the very thin does not indicate the least tendency to blight; so that the berry and yield from the straw will probably be good, and in a degree make up for the deficiency of bulk. Still we are of opinion that the crop will, on the whole, turn out to be the worst we have had since the year 1829. The number of old ricks in the yards is considerable, and if our predictions as to the present crops are correct, they will be wanted before another harvest. Barley is somewhat below an average. Beans short, but well podded, and free from insects. The turnip crop is much more promising than last year at this time. The black maggot which caused so much desolation last season, is for the present gone, after having made his appearance much earlier than last year, and cleared many an acre of healthy plants. The history and habits of this grub are as yet but little known.—Aug. 11.

## NORTH RIDING OF YORKSHIRE.

Aug. 11th a broiling day, whilst last Thursday was as cold as Christmas; therefore, of course, the weather is very changeable; but if it continues such days as this, we shall be over head and ears in harvest next week. With respect to the crops, we shall, as usual (at this time of the year), give an account of them to the best of our judgment, as we, like many poor farmers, have no old wheat left, and very little money in our pockets. First, of wheat:—it is considered a good crop; indeed, a better crop than we have had for some time, but the high winds some time back have done much damage. There are scores of acres sown with oats that other years would have been sown with wheat. Last wheat seed time we had better than 40 acres of seeds and clover, which we generally sow with wheat; but the weather was so wet, we left 20 to sow with oats, and we find this is the case with many; of course, there is a greater breadth sown. The general appearance of the crop is a full average. Barley is likely to be a better crop than we once expected it, but the sample cannot be good, for we never saw it come into ear so irregularly as it has done this year. Beans were likely to be short, but they have made good progress since the late rains. We are afraid the high winds have injured both them and barley, as well as wheat. We

have begun harvest in some forward parts, but it is not general; next week, or the week after, it will be general. We were very much alarmed about our turnips a short time back; indeed, some fields were completely destroyed by the black caterpillar; but from what we have heard lately, they are not so bad as was anticipated. We went in company with a friend to look at a field near Fountains Abbey, which we heard was nearly destroyed by them; no sooner did we get into the fields than up got, we should think, 200 rooks. We were sorry to disturb them, as we were sure they would be after the caterpillars, and when we came to examine where the rooks rose from (which was much eaten) there was not a caterpillar to see (it appears the rooks had not discovered them before they had done so much mischief), but near the road where the rooks durst not go they were in abundance; therefore, rooks are a good thing. By-the-by, there was not a single turnip pulled up by them, as is the case when they search for grub or wire worm. We do not hear of any preventive for their destruction, except ducks turned on the fields. There is one thing we should do if ours were so affected, and we would recommend any one to try the same; and that is powdered hellebore root, dredged on the plant; we had some caterpillars on a gooseberry tree, and we dredged a small quantity on it, and next day there was not one on the tree. Why not do the same with turnips? it would be too expensive for those sown broad-cast, but for drilled ones we think it would be a good thing, as it might be drilled on the rows by a common Scotch drill, but the coulter should be taken off, leaving the spout. We would strongly recommend a trial of this. Our markets are rather on the decline; labourers very scarce, and nearly master of us.

## DURHAM.

The weather throughout July was the most unpropitious month for the growing crops that we can remember for many years, being a series of cold, windy, thunder storms, heavy rains alternately, and the crops of corn are much beaten down and injured; the thin wheat has been much broken down and loosened at the root by the very stormy winds, and the subsequent heavy rains have beaten down the more weighty crops; the last ten days the weather has become very hot and sunny, and frosty nights appear to be producing fungus or rust upon all the heavier crops, some of which are very black, and we do not see any that has escaped the infection more or less, though we never anticipated anything like an average crop this season, yet since May it had improved more than could have been expected, but it is now reduced to a certainty that the wheat crop must be a very failing one, the great bulk of the wheat land being of a sterile, poor description, and generally very ill cultivated, will not produce this year more than one-half the average of the last three years, and that of very inferior quality; the better descriptions of land, of which we anticipated a fair average crop, will now be rendered very deficient from the effect of fungus, which appears more and more evident every day. The oat crops will be partially good; the tempestuous winds have injured them, as also Barley very much, and in many instances a premature ripening will be the effect, and consequently a small bad sample. Turnips have suffered great ravages by a black caterpillar, and many have lost their crop entirely; some who have had recourse to the expedient of employing a number of persons to kill them, though an expensive mode, have had the satisfaction of saving their crop, but others have generally lost their crop.—Aug 10.

## AGRICULTURAL INTELLIGENCE, FAIRS, &amp;c.

**THETFORD FAIR.**—At this fair from 12,000 to 14,000 sheep and lambs were penned; for lambs the sale was slow, at from 14s to 21s 6d per head; shearing ewes, and crones sold freely, the former from 30s to 36s; crones, from 14s to 21s. Some very superior Leicester lamb tups were shown, belonging to Mr. Jas. Okey, jun., of Cambridge, which were sold by auction, from 3/ 10s to 5/ per head.

**ASHBROSE FAIR.**—There was a large quantity of sheep penned, which went off very briskly, with little variation in price from previous fairs. Of beasts there was a large show; fat and incalved cows were much in demand at good prices; but store beasts were not quite so well sold. Of horses there was a very large supply, many of which were good and useful animals, and a considerable extent of business was done. Upon the whole the fair was much better than we could expect, considering the great deficiency in keep.

**MELROSE FAIR.**—This great annual fair, for lambs, was computed at fully 60,000, and as near as possible about the same number as last year. Best lambs, top price, 19s 6d. Half-bred, top price, 17s, current, 12s to 15s. Some lots of the small kind at 9s. Cheviot lambs, top price, 10s, current, 7s to 9s. The prices obtained for the half-bred and Cheviot lambs from 6d to 1s a-head less than last year, but prices upon the average much better than anticipated, and is reported to have been an excellent market, and nothing of any consequence left unsold.

**FALKIRK TRYST.**—Falkirk August or first Tryst was scarcely so numerously attended with black cattle as we have formerly seen. The ground allocated to this market was only one-half of the market stance occupied by the September and October markets, and was not full, the numbers computed being from 6,000 to 7,000 head, there being no sheep shown at this market. It was soon observed that fat cattle were in quick demand, and sold readily off at from 6s 6d to 7s 9d per Dutch stone, sinking offals. The supply of good fat beasts was by no means so large as usual at this season, the uncommon quantity of rain that has fallen having hurt the pasture, and kept back the cattle. Half-fat cattle, for clover fottage, were also sought after and sold at about the same prices as at this market last year. But for lean stock it was a very dull market, they having sold at prices fully 8/ per cent. below those of last year. Some lean Norland two-year-olds went off at 3/ 3/ 10s, and 4/ a-head. Scarcely any West Highlanders to be seen. But from what we could observe on Wednesday evening the cattle were well sold off. Few south-country dealers have appeared at this market. A very considerable show of horses was brought to market, both for draught and saddle, and several droves of unshod Highland ponies. Of the horses, few were of the high-priced kinds, varying from 12/ to 25/, and at all inferior prices. A good choice of saddle ponies was to be had, but a dulness of sale was observable, though by the end of Wednesday a considerable business had been done.

**MINNYHIVE LAMB FAIR.**—The show of lambs was very considerable, and in numbers greater than that of last year. Although there were a great many dealers present, sales were not considered very brisk, from the reluctance of the holders to forego the chance of Lockerbie market on the ensuing Tuesday, except for a tempting price. Another circumstance which may account for the limited sales, was that a considerable part of the stock was held by dealers by profession, who probably had purchased more with an ultimate view to the Lockerbie than the Minnyhive market. Still the quantity of business done was very considerable, and fully two-thirds of the stock produced changed owners. The top price was at the rate of a guinea each, and the general run of the market was considered at a shilling per head less than last year's prices. There were about 9,000 lambs shown, principally half-bred and Cheviots, of excellent quality. The prices at this fair cannot be said to be regulating,

because it is but in infancy as a market. The attendance, however, was great, and had distant dealers been aware of the quantity and quality of stock exhibited, it is certain that many more would have been present. The fair is of great importance to the district, and it is evidently the duty of our leading gentlemen to encourage it by every means in their power. Not the least important feature of the day, was the presence of a regular Banking Establishment, ready to accommodate the public by facilitating money transactions. This was indeed an accommodation, and, though unusual in this district, such have been found to be attended by many advantages at the great trysts and markets in Scotland and England.—*Dumfries Times.*

**LANARK ST. JAMES'S FAIR.**—The number of lambs on the moor was estimated at about 20,000. Throughout Tuesday the demand was exceedingly flat; prices fell to the average of 7/ 10s a score. Some superior lots brought 9/. An attempt was made to reduce the score from 21 to 20, but this was so stoutly resisted by the north country buyers, that the old clad-score system had to be continued. Owing to the coldness of the spring months, the lambs were generally not in good condition. On the second day buyers remained backward till mid-day, when a rapid transfer of stock took place, at a further reduction of ten shillings a score. About seven thousand lambs left the market unsold. On Wednesday the market sustained its long established character for a fine display of young horses. The number shown was unusually great, and they were mostly of a superior quality. One year old colts brought from 8/ to 15/; two year-olds from 15/ to 26/. Good horses of four years, from 25/ to 35/; lighter from 30/ downwards. A great number remained unsold.

**LOCKERBIE LAMB FAIR.**—The numbers shown were on the whole rather under an average, not exceeding, it was supposed, 35,000. The half-breds were more numerous than in any previous year, constituting, perhaps, little short of the half of the market. There were also more black-faced than usual, many having come from Lanark. The chief deficiency was in the Cheviot, owing principally to the loss of lambs in the Spring. From the previous markets of Lanark and Langholm, a dull fair was anticipated, but it turned out otherwise. The demand was very extensive and general. In a few hours all the principal lambs were disposed of, and at night only a small portion remained for the market of next day. The half-breds were of good quality, and the yearly improvement in the breed and condition was very observable; one or two of the best large lots gave about 20s., a number more from 17s to 18s; few of the drawn lambs of this sort came below 15s. A few lots of first-rate Cheviot wedder lambs were from 12s to 13s, but 10s to 11s was the general price. Good second Cheviot ewe lambs were generally sold from 9s to 11s. Black-faced were readily sold at prices beyond Lanark. The purchasers were from many districts of the kingdom, chiefly from the north of England and Galloway; and several considerable lots of black-faced, Cheviot, and half-bred, were bought for feeding in Forfarshire. Most of the Yorkshire wool staplers, who deal in the county, were at this fair, and left few parcels unsold in the hands of the farmers. The prices have been improving, and 23s was readily obtained for laid Cheviot per 24 lbs. The attendance of farmers from almost every district of the South of Scotland, and North of England, was greater than usual; and on the whole, the result of this important fair must have been every way satisfactory to the sheep farmers, and added another to the late prosperous years which they have experienced.

**PAISLEY ST. JAMES DAY FAIR.**—In the cattle market the supply of horses was tolerable, but there was little demand for them. The prices of good two year-old colts ran from 20/ to 25/; for one very fine pair 30/ each was asked. Draught horses ran from twenty to forty pounds. The supply of ponies was more limited than usual, the prices of those of

small size ran from 6*l* to 18*l*. There was a larger supply of black cattle for marts and winterers than usual, and very little demand for them, the prices ran from 3*l* to 4*l* 10*s*. At the last quoted price, cattle that would feed to from 25 to 30 stone, could be readily purchased. The supply of milch cows was rather limited, prices ran from 10*l* to 12*l* for the best description in the market.

At NORTHALLERTON FAIR last week a respectable gentleman of that place sold five young colts, (full blood), the price averaged upwards of 100 guineas each, the same person also sold during the said fair, 25 fat bullocks, and 12 equally as well fed heifers, to a most respectable butcher resident at Bedale.

STIRLING LAMMAS FAIR.—At our fair the price of hay for the season was arranged; but it would appear that little had been done in that line. 80*s* a ton had been obtained for coarse hay of the first quality, but it is probable that dryfield, or what may have suffered from the weather, will be at a lower price.

At MARK FAIR the supply of beef and Mutton was very abundant; prime beef, of which there was a scarcity, fetched from 9*s* to 10*s* per score; ewe sheep, 5*d* per lb., wethers, 5½*d* to 6*d* per lb., Lamb, 6½*d* per lb.

EAST RETFORD, Aug. 18.—With respect to the weight of the crops in this neighbourhood, one general remark will apply to nearly the whole of the plantations, viz. that it will be decidedly below an average one, though perhaps the quality will be as good as ever was known, as neither filth nor disease has ever visited them during the whole season.

FARNHAM HOPS.—The cleanliness and luxuriant growth of the bine at this place, led the growers to expect, six weeks ago, that there would have been a most surpassing crop; this expectation is now gone past, and they can calculate within a few hundreds what their growth will be. The best grounds have plenty of bine from tip to toe, but the lower shoots are many of them abortive, so much so, that the fruitful shoots can scarcely be reached with the hand, yet with a twenty feet pole, much remains well clothed with promising hops, and in those never failing grounds from 15 to 20 cwt. per acre may be calculated on. The grounds on the outskirts of the parish, have, this year, shown, to the astonishment of all, the effects of good management and continued culture of the surface, many of these spots are well feathered to the ground, and not a little of this successful growth, may be attributed to Mr. Lance's introduction of the new manures of hair and carbon. The practice of putting stable dung on the crown of the hill, is very questionable as to its service; seeing that in the middle of the rows, there is to be found, the feeding fibres, the innumerable rootlets, with the spongy mouths on the sides and end of them, here then the food should be given; of manure and culture, these fibres will again grow across the alleys in a few days, if broken off by the horse hoe. Of the surrounding villages and hamlets, we have much to say, had we space; here, we find culture overcoming the sterility of soil, mineral manures, and botanical knowledge obtaining crops, where barrenness otherwise, would have occasion chagrin; in one place we find the introduction of marls as a dressing, and in another the male plant of hops judiciously cultivated, to give fulness and vigour to the female strombile. So much is this practice of the surrounding hop growers, that they get their hops forwarder than the town, and the bine is made to sweep the ground, being feathered and well clothed with hops to the very hill; so fast are they getting their hops to assimilate to the more favoured grounds of the town, that Sir Thomas Millar of Froyle obtains nearly every year, as much per cwt for his hops, as the Farnham ground obtains at Weyhill fair; therefore we may conclude, as Hudibrass says, "The value of a thing must be what it will bring"—indeed the successful culture of the surrounding spots of Hale, Froyle, Binstead and Frensham is only to be exceeded by the hospitable manner and good old English reception there to be met with by an enquiring friend. Of Alton, where there are nearly 200 acres of hops, we hear but a sorry ac-

count, our perambulations not extending so far, we can give no information from ocular observation.

FARNHAM, Aug. 20.

L.  
A TUP WORTH HAVING.—A friend we conversed with the other day mentioned the following remarkable circumstance:—At shearing time, in the end of May last, the fleece of a bred tup, the property of John Bell, Esq., of Torbeckhill, parish of Middlebie, appeared so bulky that it was deemed worth while to weigh it—result, 20 lbs some odd ounces. So large a woolly one year's growth is, we believe, totally unprecedented in this quarter, and as white-washed, un-smear'd wool, is worth at least 1*s* 6*d* per lb, such as criticise the wonders of Dumfriesshire will oblige us by saying whether they ever before heard of a single member of a Scottish hirsell whose fleece would be cheap at thirty shillings sterling. The present, as we have more than once said, are palmy times for the hill farmer, whatever may be the fate of his neighbour in the valleys.—*Dumfries Courier*.

BABRAHAM TUP SHEW.—Mr. Jonas Webb's tenth annual tup show of Southdown Tups, took place on Friday, July 22, on his farm at Babraham. The attendance was exceedingly numerous, there being many of the principal agriculturists and flock-masters from the neighbouring counties. The letting commenced about two o'clock, the animals (one hundred in number) being of the very first-rate description—indeed we heard several of the first judges state that they did not believe that a similar number of such "magnificent creatures," being the property of one individual, could be witnessed in any part of the kingdom. A spirited competition took place for several of the lots, nearly the whole of them being let for the season,—one or two only were purchased. There were ten sheep, the stock of one tup, which let at sums amounting to 226*l* 16*s*. Also three sheep, used by Mr. Webb as shearlings last season, let for 95*l* 11*s*. Among the hirers were, the Dukes of Bedford and Norfolk, Earl of Hardwicke, Lord Braybrooke, Mr. Adeane, Mr. Coke, Mr. Pym, Mr. Hammond, Mr. Newton, Colonel Rushbrooke, &c.—At half-past four, about 150 gentlemen sat down to a very handsome and abundant repast, given in a commodious building erected for the purpose in a close near Mr. Webb's house, Mr. Elliot Smith, auctioneer, being in the chair, supported by Mr. Adeane, Mr. Pym, the Rev. G. L. Jenyns, Mr. W. P. Hammond, Capt. Gambier, Mr. Norris, Mr. Geo. Jenyns, &c. Mr. Pym bought Mr. Adeane's ewe wool, at 45*s*, and his hogget, at 56*s*; and Mr. Webb's, at 45*s* and 56*s*; Mr. Baldry purchased Mr. Norris's, (which had been kept entirely on pasture) at 57*s*. Several other sales were effected.

A field pea of a new kind has been brought to us by Mr. Gillett, of Halvergate, which from its great cast and superior sweetness and size, is worthy the attention of agriculturists. Five years back Mr. Gillett discovered it in a field of his own among some common pea. He has since cultivated for an increase, and now has forty acres. A field of five acres and a half produced last year 76 coombs and 3 bushels. A sample both of the last and present crop is laying in our office, and may be inspected by any gentlemen who think the subject worthy their attention. The price is 30*s* per coomb.—*Norwich Mercury*.

SINGULAR BEE-HIVE.—The workmen at present employed in erecting a new wall to enclose the church-yard at "Allowa's auld haunted biggin," made a curious discovery last week in the course of their operations in digging for a foundation. It was found necessary to encroach a little on the church-yard for this purpose, by which a variety of the wrecks of frail humanity were raised from the spot where they had been originally deposited many years previously, and among other fragments a skull was exposed to view. On examining it, the men were astonished to find its interior occupied by a colony of humble bees called millers, by schoolboys, and on a closer inspection, it was discovered that the little busy creatures had "improved each shining hour," as their bony abode was well stored with wax, honey, and young bees.—*Agr Observer*.

**GENERAL AGRICULTURAL REPORT FOR AUGUST.**

There was, for some days subsequently to our last month's report going to press, much heart-burning, amongst farmers, and not a few of the best of their landlords, against both the Parliamentary Agricultural Committees, and the theoretical, we could almost say imbecile, Central Agricultural Association, which last, had fallen into great disrepute. Since, however, the harvest has been in pretty general progress, the political troubles of the former seem to have lulled into halcyon calm. They possibly reconciling themselves, by considering that providence, in giving them a bounteous abundant harvest, will be far more beneficial to them than any legislative enactment or interference, and thence make its gracious bounty the sheet anchor of their hopes. It appears, too, from the intelligence we have received from all quarters, that, notwithstanding the lamentable Wiltshire disaster we noticed in our last month's report, and there having been several instances of considerable breadths of wheat, barley, and oats beaten down and damaged by the hail and thunder storms of the present month, there will be a general good, if not what might be called an abundant, crop, should the latter part of the corn harvest meet with no more atmospheric disasters, or other obstructions than the first has hitherto met with. Indeed, we, who are rapidly approaching the vale of years, do not recollect a harvest, in this country, wholly free from disastrous atmospheric visitations. Most of our English and Scotch, as well as some Irish, farmers, seem to be tolerably well satisfied, with the state and condition of their crops; hence, nearly all the calamitous rumours of the month, appear to have been contrived as price spurs, by speculators in grain. As relates to Scotland, both the Dumfries, and Perth Couriers, and Edinburgh Advertiser, which have not been unfrequently giving unfavourable accounts of the state of the general corn crop, seem now to admit, that the harvest in Scotland will be better than was expected, the former having recently, with great poetic sublimity, asserted that "The present tract of beautiful weather, which has already changed the face of nature, set in on the 5th inst. ; and, although frosts appeared early in the mornings of Friday and Sunday, not a drop—we suppose of rain, for we are not acquainted with *frost drops*—has fallen since ;" subsequently, gravely and astronomically asserting that—"In the tables ascribed to Herschel, Thursday, the 4th is the transition point assigned from foul to fair, and there seems to be a strong tendency in electrical matters to run in sets, our hope is there will be little broken weather now till the end of harvest!" The Perth Courier asserting—"The long continued rains, which terminated on *this day week*, have been succeeded by the finest weather. Wheat is ripening fast, but cutting is not expected to commence until the end of the month." The Edinburgh Advertiser asserting—"The weather, since *Thursday last*, has been warm and dry, and every way favourable for ripening the crops, which, we are happy to learn, have not been materially injured by the late heavy rains." In our southern, eastern, western, midland, and even as far north as the longitudinal line that passes along the southern borders of Yorkshire, the corn harvest is expected to reach a general conclusion, should the weather continue favourable to it, either before or speedily after the commencement of the ensuing month; by which time, the hop harvest under the same auspicious favour, it is hoped will have become pretty general, upon an abundant growth of fine coloured, full buried, hops.

As to tillage, in the present bustling state of the corn harvest, this is quite out of the question, with the exception of the teams being either employed in trifallowing, or carrying out manure, for the approaching wheat seeding, at such times that the carrying of corn is retarded by rain. "Now," says the author of a homely, but useful book, on husbandry, published in 1675, speaking of August, "this month returns the countryman the amount of his year's expenses, and encourages him to another year's adventure. If it prove dry, warm, and free from high winds, it rejoices his heart, increases his gains, and abates a great part of his expenditure."

Live farm stock, generally speaking, appears to have been, during the whole of the month, healthy, and the fattening part of the depastured sheep and beasts as thriving in the absence of parching sunshine, the stinging fly, &c., and, from having within their reach plenty of sweet water, as thriving rapidly in their pastures, and the ewe flocks, recently weaned lambs, and store tegs, subsisting on the sheep downs and other short grass lands, also as lusty and doing well: yet some few farmers and graziers were, previously to the present month's rains, complaining of a deficiency of grass.

As relates to store stock, including milch cows, this in some of our provincial fairs appears to have experienced a brisk sale, at advanced, in others a dull one, at somewhat depressed prices; but in our corn, fat cattle, and hop markets, sales have been very languid, at somewhat drooping; in those for the sale of hay and straw, at barely, of wool, horses, poultry, and dairy produce at fully, our last month's, quotations.

Notwithstanding, however, the quietude of agricultural politics during the greater part of the month, that part of his Majesty's ill-advised Speech, with which he addressed the House of Commons, in adjourning Parliament, on the 20th, which asserted—"I have learned, that you have, with *great labour*, brought to maturity enactments upon the difficult subject of tithes in England and Wales, which will, I trust, prove, in their operation, equitable to all the interests concerned, and generally beneficial in their results," caused much severe animadversion and ridicule in Smithfield, on Monday; many of the farmers and graziers, who attended that market, asking, or rather exclaiming, a precious boon this! The old story over again.—Great labour, indeed! As to the labours of both Houses, in the last Session, these they seemed to think were, for the most part, composed of frivolous and vexatious debate, and that a more quiet legislature was, for the most part, very desirable.

The following is our retrospect of supplies and prices of fat stock, exhibited in Smithfield and Islington Cattle Markets, since the publication of our last month's report.

**SUPPLIES.**

Total . . . . .	1,696	15,725	65	10
Supply of } preceding } month. }	2,014	15,497	79	6

It will be seen, by the above statements of supplies, that those of Smithfield have comprised, this month, 1,755 beasts, 15,440 sheep and lambs, 1,093 calves, and 1,814 pigs less than those of that which immediately preceded it; those of Islington have embraced 682 beasts, and 14 calves less, 318 sheep and lambs, and 4 pigs more than those of last month.

About 5,325 of the beasts, comprising the month's supplies of the above markets, came from our northern grazing districts, viz. Lincolnshire, Leicestershire, Northamptonshire, &c., up the St. Alban's road; about 4,855 up the other northern roads; about 1,726 from the western and midland districts; about 1,260 from Norfolk, Suffolk, Essex, and Cambridgeshire: about 420 from Scotland; about 140 from Sussex, Surrey, and Kent: and most of the remainder, from the marshmen, cowkeepers, stall-feeders, &c., in the vicinity of London.

PRICES.—SMITHFIELD.

	July 29.		Aug. 22.	
	s. d.	s. d.	s. d.	s. d.
Inferior Beef . . . . .	2 6	2 10	2 2	2 6
Middling, do. . . . .	3 0	3 4	2 8	3 2
Prime, do. . . . .	3 6	4 4	3 6	4 4
Inferior Mutton . . . . .	2 8	3 0	2 6	2 10
Middling, do. . . . .	3 0	3 4	3 0	3 6
Prime, ditto, . . . . .	4 0	4 6	3 10	4 8
Lamb . . . . .	3 10	4 6	4 0	5 2
Veal . . . . .	4 0	4 10	3 10	4 8
Pork . . . . .	3 6	4 4	3 8	4 8

It will be seen, by the above comparison, that but little alteration has taken place, in the course of the month, in the prices of beef and mutton: whilst those of lamb have advanced from 2d to 8d, of pork 2d to 4d: those of veal declined 2d per 8lb.

A comparison of supplies, and prices of fat stock, exhibited for sale, in Smithfield Cattle market, on Monday, August 24, 1835, and Monday, August 22, 1836—

At per 8lbs, sinking the offal.

SUPPLIES.

	Aug. 24, 1835.	Aug. 22, 1836.
Beasts . . . . .	2,832	2,935
Sheep and lambs . . . . .	28,610	23,650
Calves . . . . .	190	325
Pigs . . . . .	370	330

From the above account, it appears that most kinds of stock were somewhat dearer, on Monday, August 22nd, 1836, than on Monday, August 24th, 1835; whilst the supply of the former day embraced 103 beasts, and 135 calves more, 4,960 sheep and lambs, and 40 pigs less, than that of the latter.

A full moiety of this month's supply of beasts have been, both in Smithfield and Islington markets, comprised of short horns; about a fourth, not far from equal numbers of Herefords, Devons, and Welsh runts; and the remainder, of Scots and Norfolk home-breds; with some, but not a great number, of Sussex and Irish beasts, Staffordshire steers, heifers, &c., with the before-mentioned town's-end cows.—As relates to sheep and lambs, the former of these have been, as nearly as could possibly be ascertained, in about equal numbers of old and new Leicesters, South Downs, Kents, and Kentish half-breds; with, as relates to the latter, a considerable number of the white-faced west country breeds, and horned Dorsets, and sundry casual or incidental breeds.—From Scotland, the numbers of sheep and beasts have been comparatively few,—the former having amounted to 1,650; the quantity of slaughtered meat from that part of the kingdom having been, in the course of the month, very limited.

The quality of the stock, in both markets has been, throughout the month, in the whole, tolerably good: but the inferior kinds, for which there is no demand at Islington, is quoted, on account of its quality, considerably lowest in Smithfield, where it is wanted for low priced purposes.

REVIEW OF THE HOP TRADE.

AUGUST, 1836.

The demand for Hops throughout this month has been but moderate, and little has been done on speculation, notwithstanding the great fall that has taken place in the estimated Duty, which we quoted last month at 235m., and we now state at 190m. The weather has continued ever varying, and unsuited for the plant; the mould has increased considerably in Mid Kent as well as East Kent, and the bine, even in the best grounds, has not branched out so as to produce a heavy growth. The Hops are now entirely out, so that the probable estimate per acre can be pretty accurately judged; the Duty is not likely to vary much from the present estimate. If the nights remain cold, the Hops will be small and want condition, so that the last year's growth may be better worth the attention of the consumer. If we enjoy warm nights and fine days as the Hops hang singly, they will grow out very fine and possess condition.

PRESENT PRICES.

East Kent Pockets, . . . . .	84s	—	105s
Bags . . . . .	76s	—	100s
Mid Kent Pockets . . . . .	70s	—	90s
Bags . . . . .	60s	—	84s
Weald of Kent Pockets . . . . .	65s	—	90s
Sussex Pockets . . . . .	65s	—	84s
Yearlings . . . . .	40s	—	60s
Old olds . . . . .	18s	—	42s

The picking this year will not be general till about the 15th September, so that the season will be fully three weeks later than last. New Hops, it is expected, will realize a good price, as the supply will not only be late, but moderate.

## REVIEW OF THE CORN TRADE DURING THE MONTH OF AUGUST.

The seasonable supply of moisture, which the crops received during July, was extremely beneficial to their growth, and has caused WHEAT "to fill the bushel" much better than could have been anticipated, and it is not unworthy of mention that the plumpness and filling out of the grain in ear, has been known to make a difference of one bushel in eight, thus the shortness in straw and thinness of plant will be in *measure* partially compensated. All accounts received from the different counties seem to corroborate our statement made last month, that though the new wheat yields well, and in some instances to an unusual extent, owing to the full development of the grain, and length of ears, yet the deficiency on the light, gravelly, and poor soils will reduce the aggregate return below an average produce, more particularly as compared with later seasons. Smut also prevails to a considerable extent, and partial complaints are made of mildew, especially in the fens, many samples exhibit premature harvesting, having been cut too green, a system if hastily adopted and without judgment, and discretion as to the mature state of the kernel, is likely to prove detrimental to the quality in its return to the miller. Where the grain has become ripe, it has been housed in excellent condition, and the plan now pursued by farmers in several districts, of cutting their wheat with the scythe and employing more hands, renders them much more independent of the vicissitudes of our climate, and the rapidity with which the fields are cleared, astonishes the farmer who is wedded to *ancestral* customs. The BARLEY crop on the aggregate is favourably reported, particularly in Norfolk and Suffolk, being reckoned a fair average bulk, and if well harvested will produce a good sample; on the other hand, in some districts, especially in the western parts of England, the crop is thin on the ground and the straw stunted, and the sample likely to be coarse and irregular; as, however, the breadth of land sown with the article has been much increased, we are on the whole likely to have a large quantity offering the ensuing season, and as the prices of sugar and molasses have been steadily improving in value, it is thought a more active demand will be experienced for the secondary qualities of barley on the part of distillers, and should such be the case, farmers may calculate on another year of remunerating prices for this article. OATS vary much in their produce, according to locality and time of sowing: in some districts they are extremely thin on the ground, and unusually short in the straw and bell; while in others, the crop is thick and luxuriant, but taking the average, it will be deficient. The Lincolnshire new oats which have appeared in Mark Lane have been of good quality. Beans, from the want of rain, have turned off unfavourably, and will not prove the abundant crop at one time anticipated. The stalks are short, and in many instances badly podded, and the pods which have appeared are small; notwithstanding this partial failure, we are inclined to believe that the yield will not be below a moderate average. Peas have turned out a satisfactory produce, the quality even good in colour, but rather small.

From Scotland the agricultural reports have assumed a much more favourable character; the raw,

wet and boisterous weather, with chilling winds from the east and north-east, has been succeeded with a fine sunny temperature, unclouded skies and southerly gales. Wheat has not received any material injury from the cold and storm, except being retarded in its growth, which in a northerly climate renders the harvest more precarious. The quality of the wheat is however in instances represented as coarse and thin, and though the return will be deficient, yet it will be less than was at first calculated upon; in the lowlands reaping has already commenced. Barley, particularly in the northern counties, is short, thin and unpromising, and oats have not been long in ear; but the warm weather latterly experienced, has, with the powerful agency and co-operation of moisture, caused the vegetative powers of the plants speedily to effect a very visible alteration in the aspect of the fields; the produce however of this latter article, oats, promises on the aggregate to yield well, the straw though often found short is thickly headed, and in some parts a heavy crop is expected, but should the same animation pervade the manufacturing districts, and employment continue to a similar extent as at present experienced, especially in the flax spinning mills, the consumption of oatmeal, which is augmenting considerably, will check the shipment of oats, the ensuing, as it has done the present season. The stocks of wheat are far from being exhausted and many are the barn yards still well stocked with stacks. Turnips present for the most part the appearance of a heavy crop.

In Ireland the want of moisture was proving injurious to the crops, especially of summer grain and flax, but a seasonable and copious fall of rain has relieved the anxiety entertained on this account for the fate of the growing plants, and the wet being succeeded with warm genial weather has communicated a general fertility and strength, the ears filling well, and the accounts taken as an aggregate are favourable for all descriptions of grain. The samples of new oats which have appeared hold forth a satisfactory promise as to quality, and have at the leading markets realized 11s 6d to 12s 6d per barrel. Flax in the early districts of the county of Down is now pulling and looks well; the later sown having a second growth, cannot be expected to be so good. Should dry weather continue there may yet be a good season's produce, but at present it is impossible to predict what the result will be of the immature flax.

Harvest having commenced under the most favourable auspices, has caused a general dulness to pervade the wheat trade; and farmers, who for the most part entertained a favorable opinion towards retaining their stock, having shown more disposition to bring their samples forward, the supplies have exceeded those of the previous month by upwards of 13,000 qrs, and as millers could only be induced to purchase on lower terms, a gradual reduction was obliged to be submitted to of from 4s to 5s; but towards the termination of August, the weather having become more unsettled, and the *new* wheats, the first sample of which appeared in Mark Lane on the 8th of August, having come to hand much inferior to the earliest parcels received last year, being coarse, smutty, and tender, enabled holders of the better descriptions of old to realize 1s to 2s per qr more

money, the market at the close of the month being firm at the improvement: the new qualities ranged in value at from 42s to 50s, the best 52s, except the first sample exhibited, and that was a middling quality of Talavera, which sold at 58s.

An improved demand has prevailed for bonded wheat, in consequence of the receipt of orders for shipment to the United States; in addition to some speculative attention being directed towards the article in consequence of the agricultural reports from the more Southern States of America, and particularly Maryland, Virginia, &c., and should the result prove confirmatory of the unfavorable accounts of loss from drought and Hessian fly, much of the surplus stock of wheat on hand in this country arising from fresh investments are likely to find a more profitable vent, than awaiting the result of our own harvest. Little actual business has however transpired, holders generally demanding higher rates than purchasers are at present inclined to accede to, more particularly as a scarcity of vessels has been experienced for America. The stocks in bond have received an accession during the month of more than 15,000 qrs, principally from Danzig, the condition has varied considerably, some cargoes arriving sound and fresh, but the largest proportion turning out heated and much out of condition, which may perhaps in great measure be attributed to the imperfect mode adopted of drying the bulks as they arrive from the interior, by exposing them to the sun on the banks of the Vistula, which proves successful in hot weather, but when rain has prevailed, and the earth has been partially saturated with moisture, corn being an article extremely susceptible of imbibing any dampness in the atmosphere, which under the above circumstances must arise morning and evening, is not likely to be brought sufficiently into good condition to bear a lengthened voyage to England; the better samples of Danzig are offering here in bond at 36s. At LIVERPOOL, sales have been effected at 4s 6d to 4s 8d per 70 lbs for lower Baltic wheat, and 4s 9d to 5s, and as high as 5s 3d for Danzig, principally for shipment to America.

Though no alteration has been made in the top quotations of town-made flour, yet the trade has ruled very heavy, bakers only taking quantity necessary to meet their immediate wants, and prices of secondary parcels have receded in value. Owing to the continuation of warm weather holders of ship qualities were anxious to quit the different parcels on arrival, which could only be effected at a decline of 1s to 2s per sack. Bonded flour has continued to meet inquiry for shipment, principally to the West Indies; and good Danzig has readily obtained 22s; but as the accounts from the United States appeared to intimate, that though the produce of wheat would be more than equivalent to the demand, yet that the exports would be materially diminished, the article has attracted increased attention, as South America, the Mauritius, West India Islands, and other parts, which were dependant on America for the imports of flour, will now require large shipments from European ports to make up the deficiency. At LIVERPOOL purchases have been making of most of the parcels offering at 22s to 25s for sweet Baltic qualities; and American Western Canal sour, 22s; fine do., Rochester, 25s per barrel.

The alterations in the duties consist of an advance of 1s per qr on Wheat, the duty being 37s; 1s 6d per qr on Oats, duty remaining at 12s 3d; and instead of a diminution in the duties on Peas, as anticipated by many, an advance has taken place of 3s per qr, owing to part of the Lancashire averages having been struck out by the Inspector-General,

otherwise the forced average of 43s 8d for the week ending 22nd July, if followed by another high rate, would have doubtless reduced the duties to 6s 6d or perhaps 5s; instead of which, the aggregate average on the 29th being only 38s 8d, and on the 5th of August 35s 2d, the duties have been enhanced to 11s per qr.

The high range of the prices of distilling and grinding barley, and the approach of harvest, added to a favourable report of the crops from those counties usually supplying Mark Lane, combined in bringing forward increased supplies from Scotland, and especially Ireland, and many foreign parcels pressing on the market duty paid, caused the samples to prove much more than adequate to the demand, and prices have in consequence given way fully 1s to 2s per qr for both descriptions; and foreign in bond being almost unsaleable, Mecklenburg and Holstein being offered at 20s to 22s. During the month about 4,000 qrs have paid duty. A few samples of new barley have been shown from Kent and Suffolk; the quality of the Chevalier was good, but of the others only middling; no price is yet fixed for the samples, being shown more with a view of ascertaining their value than of effecting sales.

The malt trade has remained in a languid state, without, however, the currencies undergoing any variation.

The supply of oats from England and Scotland has been very moderate, but from Ireland considering the period of the year the importations have been liberal, and exceed those of the previous month by nearly 2000 qrs. A few parcels of new oats have appeared from Kent, Lincolnshire, Cambridgeshire, and Ireland, and in addition to the 13,000 qrs of foreign oats which paid duty the last week of July, several cargoes on arrival from abroad have been also entered for the consumption, which circumstances have contributed to render the trade languid and heavy, purchasers buying with caution, and speculators having little inducement to get into stock, as the new Irish crop is favourably reported, and no reduction has taken place in the quotations of the better descriptions, but inferior, particularly Irish and foreign, and stale ill-conditioned samples have been difficult of disposal at a decline of 6d to 1s per qr. The new English oats have in one or two instances come green and prematurely harvested, but other English samples, with the Irish, were of good quality. The inferior sorts of foreign will not admit of entry at the present duties of 12s 3d, and even the finest can be only rendered free at a considerable sacrifice; fine heavy Dutch brew are offering at 28s, duty paid; Russian sound feed are worth 22s to 23s; other foreign feed, 22s to 24s. New Irish oats from the west coast have been offering at 11s to 11s 6d, deliverable in October and November.

Though several parcels of foreign beans have been offering free, yet the reports of the crop having been less favourable, the article has experienced more inquiry at an advance of fully 1s per qr. The averages also are progressively advancing, and as the duties will no doubt decline to 9s 6d, holders will be enabled to make their entries at the lowest range likely to be attained this season.

Several samples of new peas have been at market, Essex and Kent boilers obtaining 35s to 36s, Suffolk, 36s to 27s, grey, 34s; towards the middle of the month nearly 7,000 qrs of foreign having paid the duty of 8s, and being pressed on the markets, caused the trade to become heavy, grey being noted 1s to 2s per qr; but in white little alteration was experienced in the quotations; as the duty has advanced,

the market has rather improved, the article being more ready sale, and white qualities realizing 1s per qr more money.

The following are the quantities of Barley, Oats, Beans and Peas which have paid duty in LONDON, LIVERPOOL, HULL and BRISTOL, for the current year ending 20th of August.

At HALIFAX fine flour was selling at 35s 9d per barrel, but prices were expected to recede, as, in addition to the large supplies from Canada, shipments were on their way from England and Gibraltar.

In JAMAICA the stock of flour was very limited, even in the baker's hands, and the importers had no fresh samples to offer. Some good Copenhagen flour had realised 56s 8d currency per barrel, equal to 40s 5d sterling.

In FRANCE the general tenor of the agricultural reports indicate that the crop of wheat will be materially deficient, as compared with the produce of last year, and by many, the diminution is estimated at one-third, on cold, sandy, and chalky grounds, and one-fourth on the richer soils, and by some, it is calculated that the general produce will be on an average, one-fourth below the growth of 1835; the quality is, for the most part, inferior, much of the grain from want of moisture, having been rendered small shrivelled; smut also prevails to a considerable extent. Barley is not complained of, but oats are short in the straw, and, with a few exceptions, deficient in the bell, and thin on the ground. At PARIS however, the impression appears to be, that the quality will be inferior to that of last year, and the quantity about one-sixth less; but as the harvest was the past season extremely abundant, it may be estimated at a low average return; however, in reading over the markets' letters from the different departments, we are induced to think, that many samples, though thin and light, and considerably inferior to the produce of 1835, yet there are many parcels will be found heavy and plump, exceeding even those of the last crop, which may reduce the aggregate yield nearer to an equality than the past growth. At Marseille prices of the better qualities of wheat have improved in value, owing to belief gaining ground that the ac-

counts respecting the falling off in the produce of the new crop, are not without foundation. At all the leading markets the currencies are either firm, or evincing a tendency to improve.

In the Upper Baltic markets, little alteration has been sustained; at St. Petersburg and Riga, with the exception of a few purchases of rye, nothing of interest has occurred in the grain trade; linseed at the former city was held at 41s 5d to 42s 4d for the best qualities. At Konigsberg, notwithstanding the dull accounts received from England, prices remained firm for wheat; high-mixed old of 1834 was noted at 34s to 36s, new, 26s 10d to 28s 6d: rye, 15s 3d to 20s: oats, 11s 9d to 12s 6d. The weather the beginning of the month was cold, stormy and wet, and much damage had been sustained by the flooding of the Pregel; wheat and rye promised a tolerably good return, but barley and oats the contrary. At Danzig extensive purchases of inferior qualities of wheat had been made for Liverpool, at 25s to 24s; the demand for the better descriptions continued, but the supplies were not equal to the quality required; real fine high-mixed wheat, great part the growth of 1834, had sold at 32s 6d, and 3000 to 4000 qrs of wheat had been purchased for Philadelphia with a freight of 8s: rye was also in request for the United States. The wheat crop was favorably reported; rye was cut, but only a moderate produce; barley, oats and peas had assumed an unpromising appearance; rapeseed had been got in out of condition, and was not fit to bear a long voyage. In the Lower Baltic ports prices have sustained little variation; purchases of wheat have been making in MECKLENBURG for shipment to the United States at 26s, the currencies having ranged from 25s 6d to 26s 6d; barley was held at 17s 6d; rapeseed was improving in value, and was noted at 29l to 30l per last. In HOLSTEIN, wheat was worth 25s; barley, 18s to 20s; rapeseed, 29l 8s to 30l, warranted dry. On the rich well-cultivated lands the yield of wheat, barley and oats was expected to reach a fair average, but on all inferior soils it will be considerably below one, and in many cases to the extent of one-half; taking the whole of the Duchy, if the weather remains favorable, the amount of produce will be rather less than an average; but if the contrary, the deficiency will be considerable: rapeseed had yielded better than had been anticipated. At HAMBURG, several orders have been received for shipment, principally to the United States, and prices of wheat have been firm with a tendency to advance, other articles have sustained little variation; rapeseed was quoted at 30l 10s to 31l 17s per last. At BREMEN, wheat has continued to meet demand for the United States, and previous currencies were in consequence supported.

In HOLLAND, the crop of wheat was generally represented as inferior in quality and weight to the produce of last season.

The accounts from the UNITED STATES of America are rather more favorable, for though the destruction of the wheat crop had been considerable in the Southern States, and the failure had extended to parts of Pennsylvania, yet in Ohio, Genesee, Vermont, &c., and the more important wheat districts of the Union, the weather had had a very beneficial effect on the crops, which held forth more promising results than had been anticipated; advantage however was being taken by holders of wheat and flour to demand higher rates, and the stocks being extremely small, they were enabled to realize the enhanced range of price, until the deficiency in the crop is more accurately ascertained, which will doubtless prove much less than the average of former years, yet no direct import will be required to meet the home consumption; but

there will be a material diminution in the capabilities of exporting flour to South America, the West Indies and other ports, who have hitherto depended for their supply of flour from America. At New York, all the foreign wheat had been cleared off, and the only quotation was North River quality at 55s; Western Canal flour had advanced to 32s 7d to 33s 9d per barrel. At BALTIMORE, fine white wheat had obtained 64s 4d, and new of the same quality had been contracted for at the same rates; prime red was quoted worth 62s 4d per qr; Howard Street and City Mills flour had improved, and was selling at 35s 9d to 36s per barrel.

**WOOL MARKETS.**

**BRITISH.**

AUGUST 22.

During the last week the disposition for making purchases has varied; at the commencement the ardour previously displayed in purchasing seemed to abate, at the close there were pretty good signs of returning briskness.

The future state of the market seems to be wrapped in obscurity; the fact of the goodness of trade would seem to predict briskness, but the fact that only a small proportion of the new clip has actually reached the market, contrary winds having delayed its progress, would lead to the conclusion that an advance will not speedily take place, but that some dullness may be expected.

But, however, should the trade for the manufactured material remain in its present state, it will be only affected slightly by any extraordinary influx at any particular time.

**FOREIGN.**

AUGUST 22.

About 1,000 bales of German wool have formed the past week's supply. Public sales of about 4,000 packages of Australian, Cape of Good Hope, German, East Indian, Turkish, and Russian wools, will take place, at Garraway's, the 7th, 10th, 13th, and 14th. Private contract trade is tolerably brisk, at our last week's quotations.

**BONES.**

Since our last there have passed the SOUND or ELSINORE, the GREAT BELT, and the HULLSTEIN CANAL, ships loaded with Bones, bound for Hull, 12; other parts of England, 2.

## TURF INTELLIGENCE.

The month (August) which has just passed away, has been remarkable for the number of Races which have taken place during its progress, if not for the general importance of the meetings, though, in regard to the latter consideration, inasmuch as our observations will necessarily carry us back to Goodwood, the present article will embrace one at least of the most important and influential meetings of which this country can boast; which, as respects the Turf, leaves all other parts of the world at an immeasurable distance. The Goodwood race list, it is true, includes neither a Derby, an Oaks, nor a Great St. Leger; but who can peruse or contemplate this judicious and well estimated document without perceiving much more than ordinary consequence attached to each of the items of which it is composed, but particularly to those prominent and unparalleled features, the Drawing Room Stakes, the Goodwood Stakes, and the Cup? Warmly supported by the influence of persons distinguished for pre-eminent rank, conducted in a manner much superior to any similar establishment, Goodwood meeting, regarded in the aggregate, must be considered the first in the kingdom.

The late Goodwood meeting commenced on the 27th of July; and therefore, although we made a few observations on the most prominent candidates for the Stakes and the Cup, we were unable to communicate to our readers the decision of these highly important prizes, or rather the performances of those nags which took the lead in the money market. Rockingham was named for the Goodwood Stakes and also for the Goodwood Cup; and prior to Ascot Races might be considered a general favourite. In a former number of our publication we stated our opinion of the racing capabilities of Rockingham: we remarked that, although he won the Doncaster St. Leger, his speed was not of a very superior description, and posterior events have fully proved the truth of this notion or impression on our minds. Rockingham lay by and was well nursed for the most valuable Cups of the present season, and made his debut for the year at Ascot. On this occasion he met an excellent racer, (Touchstone) by whom he was beaten without being able to force his competitor to "the top of his rate:" the wretched second which Rockingham made on this occasion ought to have convinced every person that "his day had gone by;" though he was only a six-year-old, who had never been over-marked, nor yet done too much work. In a conversation on this subject with an enthusiastic admirer of Rockingham, he insisted that this horse lost his race for the Ascot Cup owing to the bad jockeyship of Macdonald; however, we think very differently; Rock-

ingham, compared with Touchstone, sinks to nothingness in any view of the case, and on this occasion, it was as evident as possible from the moment they came away from the starting post that he could not stride one yard with him. However, as Rockingham was as favourably weighted as possible for the Goodwood Stakes and the Goodwood Cup, he was not destitute of support amongst the book men. Mr. Theobald (his owner) thought Rockingham's chance for the Stakes was preferable to that for the Cup, having neither Touchstone nor any of those formidable opponents to meet from which he had anything to dread. However, *le même chose*, Rockingham reiterated his exhibition at Ascot, and even his warmest friends must have now been convinced that his racing powers (never of the first order) had evidently experienced a fatal retrocession. It was as clear as possible that he had not the shadow of a chance for the Goodwood Cup against such opponents as Hornsea and Elis; but as he had been backed by the public, Mr. Theobald very generously allowed him to start—he did not get placed: Hornsea won very cleverly, Elis running second, Bamfylde third.

If Epsom races have languished for some years under the the management of the Baron de Tesseir, Dorling, and Co., if Ascot meeting grew sickly under the sinister direction of its prominent, or rather its pecuniary, official agents, the venerable Ebor, celebrated in the Roman annals, as well as for its gallant opposition to that ferocious Norman robber, William I. which shone with dazzling lustre as a star of the first magnitude in the racing constellation, has been equally unfortunate of late, and is fast fading away under the unsatisfactory and suspicious guidance of its mysterious, if not murky, functionaries. Many of our readers will perhaps recollect the *Budget affair* at the York (August we believe) meeting of 1835: if so, they will be aware that Budget in cantering up to the starting post threw one of her plates: and that the clerk of the course, instead of waiting a few seconds for the purpose of refixing the plate, started the rest of the field, and declared the start fair (how stood the clerk's betting book on this occasion?) But the Jockey Club reversed this monstrous decision. On the last day of the York August Meeting, (which was the 4th ult.) Mr. Bowes's, The Cauld Lad of Hylton, ran second for the Produce Stakes, Mr. Skipsey's The Bard contriving to get his nose first to the winning post; but the rider of The Cauld Lad (George Nelson) charged Heseltine, who *jockeyed* The Bard, with foul riding, with having in fact at the distance, ran against him, nearly knocked his horse down, and thus forced him out of his

ground or line. We know Nelson, we have seen him ride many times, and we believe him to be a man who would scorn to make an unjust charge against any person; we have observed the *jockeyship* of Heseltine on more than one occasion, but never admired either the working of his head or his hands; the business was referred to the Stewards, who gave the race to The Bard. This seems strange! The days of crossing and jostling have long since passed away; the acknowledged law of riding is for each jockey to take his own line or ground and keep it; nor have we the least doubt that had a jockey at Newmarket been guilty of forcing a competitor out of his ground, he would have been disqualified and consequently disgraced. In the present state of York as a Racing Establishment, the formerly splendid August meeting having dwindled into an almost unattended business of two days, it may have been judged prudent to hush up the matter; yet, however well intended such prudence may be, it can scarcely fail to create mistrust and dissatisfaction as well as to produce the most injurious effects upon future proceedings. If a horse be forced out of his ground, he will in all probability change his leg; and, in such case, what chance of winning remains for him, even though he may possess a decided superiority of speed, when there is only two hundred and forty yards (the length of adistance) from home, as was the case in the present instance? And that there were strong grounds for the charge of foul riding, we cannot refrain from thinking, notwithstanding the decision of the stewards.

Unsatisfactory management has evidently produced disgust in the minds of the citizens of York, one of whom having thrown out a few general observations on the subject in the York Chronicle, is fiercely encountered by Mr. W. Lockwood, keeper of the match book, who, taking the charge to himself, appears, if not in the lists, at least in the York Herald of August 13; where, however, he makes but a poor figure, as he leaves the very essence of the charge untouched. From the peculiarity of the style of this composition, the vulgarity and egregious self-conceit which it manifests throughout, we should suppose "Mr. W. Lockwood, keeper of the match book," and "Alfred Highflyer" of the Old Sporting Magazine, as identified, as one and the same person. Be this as it may, on the present occasion, the writer, under the *soubriquet* of "a Well-wisher to the Races," asks what has become of the subscription (amounting to £200*l*) to the October Races last year? to which the keeper of the match book gives the following laconic, if not very pithy, answer, "George Swann, Esq., banker, was the treasurer." He might as well have said Presto! begone! Had the keeper of the match book stated from whom the sum was raised individually, and the manner in which it was afterwards appropriated, we should have had something in a tangible shape, and nothing less will appear

satisfactory to every disinterested person under whose observation the statement may fall. We regret such bickering where all ought to be harmony; we regret it exceedingly on account of its pernicious influence on the proceedings of the turf, and which if not satisfactorily silenced will prove an extinguisher to York Races at no distant period.

The ensuing Doncaster Cup is more than ordinarily interesting, inasmuch as it will bring together Touchstone and Queen of Trumps, the former the best horse at present on the Turf, the latter the most extraordinary filly that ever appeared. The former has not proved uniformly successful throughout his racing career, but whenever beaten, he was not in his "own form;" that is, not in perfect condition. Touchstone is a greedy feeder, and when trained upon the Marquis of Westminster's ground did not receive sufficient exercise, lest his legs should give way; but when, under the care of John Scott, he could take his gallops upon the beautifully elastic turf in the neighbourhood of Malton, he ran always, we believe, successfully. If this horse has never been overmarked, he has done much work; yet he has always trained on, has become large and bulky, and is a better racer at the present moment than at any anterior period of his life. His noble owner seemed to be aware of the superiority of his horse when he gave a general challenge; which, however, was not accepted.

Having remarked that Queen of Trumps is the most extraordinary filly that ever appeared, the observation is not intended to apply to the number of races in which she has appeared, nor yet exactly to her *uniform success*, (the Ainderby affair, when a bull dog was slipped at her, amounts to nothing as regards her decided superior qualities;) but from her style and manners of running, from the ease with which she has gone away from all her competitors. We confess our surprise was great when we witnessed her performance last year for the Oaks. Preserve, who had proved herself a racer of no ordinary quality, had continued the almost unapproachable favourite for the Oaks for some months up to the eve of its decision; when something was whispered about Queen of Trumps which staggered the book-men: in answer to a question which we addressed to Tommy Lye (her rider) on the eve in question, he replied, "She'll take a deal of beating." The important moment at length arrived: they started; and it became evident in a few strides that Preserve could not live with the Cambrian Queen.

Neither Touchstone, nor Queen of Trumps is an iota, we believe, worse for the work they have done; they have been kept in reserve for the Doncaster Cup; they will come to the starting post, "as fresh as paint; and we think the Queen will prove the winner.

**THE BRITON JACK'S ALIVE**

*the Property of Mr. M. M. Northcote, of Sarnon, Yorkshire, exhibited at the Meeting of the East-riding Agricultural Association, at Beverley, July 27th 1851.*

[Vol. V.

## THE CART HORSE.

(PLATE.)

No animal in the wonderfully diversified circle of creation, is more susceptible of alteration from the influence of climate and food, than the horse.—Amidst the luxuriant, and grossly succulent, pasturage of Flanders, Lincolnshire, and some other parts of this country, he attains an almost elephant-like size; but this superior bulk or ponderosity, cannot be acquired, without sacrificing the more valuable quality or texture of this noble animal. Feeding unlimitedly in the meadows or marshy grounds, where the exuberant herbage is swoln with juice, the horse attains an extraordinary size; but his bones become porous, his tendon less hard, and less elastic, his muscle soft and flabby. In that part of the extensive county of York, (in the North Riding, bordering upon Durham,) celebrated for its breed of horses, distinguished by the appellation of the Cleveland Bay, the pasture grounds consist of what are well known by the term Uplands; the herbage which they produce, is much less juicy than that of the marshes and meadows of Lincolnshire or Flanders; the horses fed upon this less exuberant and less succulent pasturage, attains a good size, but is much inferior in bulk, to the very heavy variety of the tribe previously noticed; but his bone becomes more solid, his tendon harder, his muscle more firm and more elastic: the Cleveland Bay, it has been asserted, is indigenous to this country; but such a notion will not endure the test of investigation. In Arabia, it is uniformly acknowledged, the horse attains his greatest perfection: or, in other words, the genuine courser of that country, is allowed to be superior to the indigenous horse of any other part of the world: not that he attains a large size or bulk in Arabia; on the contrary, he is light, like the people amongst whom he is produced; like them also, he is remarkably sinewy and elastic, and, speaking by comparison, much stronger than any other class of his elegant and highly useful fraternity. It is abundantly evident, that the tropical or almost scorching heat of an eastern sun, are congenial to the constitution of the horse, from which, in conjunction with the benty, hard and scanty pasturage, and dry food, upon which he is constrained to subsist in such parts of the globe, he derives that solidity of bone, that development and strength of tendon, that firmness of fibre and muscle, for which the eastern horse has always been pre-eminently distinguished.

In this slight review of the different or distinct classes of the animal under consideration, we intend our observations in reference only, to the operations of nature, without regard to that adscitious influence, resulting from human industry, and human genius. The horse may be said, to be the creature of circumstances: when left to the simple operations or unassisted influence of nature, we find him in

Flanders and Arabia presenting very different appearances; beneath heat almost insupportable to human beings, he acquires his most valuable quality, while in the milder regions, he attains his greatest size; he becomes less in the colder climates of the north, and vanishes altogether from the frigid latitudes nearer the pole.

However, in regard to that ramification of the tribe least calculated for the heavier kinds of draught, and for the purposes of husbandry in particular, which is intended to constitute the principal object of this disquisition, we feel it necessary to remark, that a very erroneous notion, originating in the grossest, if not the most sinister, ignorance, has been propagated for the last half century, and has, up to the present moment, remained uncontradicted: in describing the organization or form of the cart horse, a *straight* or *upright shoulder* has been recommended in preference to that genuine, and very natural obliquity of the parts which render this animal not only so beautiful, but so much better calculated for all those purposes to which his speed, or strength can be applied, or of which he is susceptible. Mr. John Lawrence's title to the merit of originating the spurious advocacy of the *straight* or *upright shoulder*, is indisputable: many years have elapsed since he first promulgated this most ignorantly absurd, and grossly fallacious doctrine, which has since been preached and disseminated, by a horde of minor literary quacks, whose existence forms a stigma on the unthinking liberality of the public. A *straight shoulder* in the elephant or the giraffe may be correct enough, for aught we know to the contrary; but in the horse, it becomes a mal-formation, it gives him a grotesque or unsightly appearance, and renders him incapable of exerting his strength to advantage, either with the saddle, or in gears. An upright shoulder must impede the action of the horse, "he cannot be a good walker," as was very correctly remarked by a judicious friend; while the strength or horizontal pressure, which might be otherwise thrown into the collar, is very much deteriorated, if the freedom of the animal's respiration be not affected also. As the power of propulsion in the progressive motion of the horse, is derived from his hind quarters, it will be found, even on a slight examination, that the formation which renders him so eligible for the saddle, gives him a similar advantage when applied to draught. If, for instance, we notice a draught horse exerting himself at a dead pull, we shall find that he will sometimes lift his fore feet entirely from the ground, and that too, when he is evidently applying the utmost of his force to the collar: in such case, it is clear, the upright shoulder could add nothing to the horizontal pressure, or the application of the animal's strength in drawing. When the shoulder of the draught horse is straight or upright, in the act of drawing, the pressure against the collar is spread over a more extensive surface, and consequently rendered less effective, than when, by the

obliquity of the same part, it is more concentrated, and therefore more directly applied to the purpose. Let us have a broad full bosom or breast, in the cart horse, with a corresponding development of the lower part of the shoulder; but, in the name of all that is reasonable, let the latter present that obliquity indispensable to safety in the saddle, and equally desirable for the collar.—Nothing can be more dangerous, than to put an upright shouldered horse in the shafts of a cart, since he must be liable to fall at every step; even without the slightest weight on his back, such a horse is a very unsafe goer, because his formation prevents him from lifting his fore feet sufficiently high; but when the effect of external weight or pressure, is added to that of the malformation of the shoulder, the danger is doubly increased.

The low dropping chest, and that posterior strength, so requisite in the saddle horse, and so indispensable to the successful career of the racer, is equally eligible in the draught horse, whether used for harness, for husbandry, or the slower and more heavy operations of the brewer's dray.

The Cleveland Bay, tho' well adapted for harness, as well as for the light husbandry operations of that part of the kingdom whence this class of horses derived the name, are not sufficiently bulky for heavy draught; while remarks somewhat similar, may be applied to the Clydesdale Horse, for which, it seems, we are indebted to one of the Dukes of Hamilton, who brought from Flanders six stallions of the coach kind, about the close of the seventeenth century; and crossed them with Lowland mares. The veracity of this account, however, has been impugned; and, as we should be unable to arrive at a satisfactory result, were we to place the opposing recitals before the eyes of our readers, we will abandon the more than doubtful investigation as to the origin of the Clydesdale horse; as, whatever may be the source whence he sprung, he is still to be numerously met with in Lanarkshire, and the circumjacent neighbourhood.

The Clydesdale horse is more powerful perhaps, than the Cleveland bay; but he is well calculated for the Lowlands of Scotland; he is active, capable of great muscular exertion, and is consequently very valuable in hilly countries.

The Suffolk Punch, formerly so common in some parts of this country, has become scarce. Their prevalent colour is a sort of sorrel; as their name expresses, they are compact; they present entirely the character of the cart horse, and are therefore not calculated for celerity of motion. However, it is said, they are quick walkers, draw steadily, and are remarkable for their almost invincible perseverance at dead pulls.

The Suffolk Punch gave way before the introduction of the improved Leicestershire breed of Black Horses. About a century ago, Mr. Bakewell (to whom this country is indebted for what may be called the original improvement in its breed of sheep and horned cattle), turned his attention to the improvement of the horse for heavy draught. This gentleman resided on an extensive farm, two miles from the small town of Loughborough, in Leicestershire, in the village of Disliley; and, although no doubt can be entertained as to the superiority of his judgment, as well as in regard to his laudable spirit of enterprise, the sequel proved that his anticipations were formed upon a calculation somewhat erroneous; a circumstance which can excite no surprise when it is considered that even the rudiments of the science of animal improvement were either not understood, or in a state of the most inert and helpless infancy:

Mr. Bakewell enjoyed not the least previous light from the labours of others to illumine his devious way, and therefore it is no wonder he was unable to prosecute an undertaking so arduous and so intricate with straight forward and unqualified success; nor that he should spend a fortune in the furtherance of his patriotic views. Supposing that enormous bulk was indispensable to the perfection of the heavy draught or cart horse, he turned his attention at the outset of his career to the ponderous, hairy-legged horse of Flanders, whence he imported both horses and mares, which he crossed with the large draught animal already found in Lincolnshire as well as in the midland counties of the kingdom; from which, about seventy years ago, he produced a horse, which he regarded as the best cart horse which had ever been seen, and which he sent to Hyde Park Corner for the inspection of George III. That monarch, however, did not second the views of this enterprising farmer, who nevertheless succeeded in spreading this breed of large heavy black horses throughout the midland counties. The appearance of these animals was extremely imposing upon superficial observation; they were uncommonly large and uncommonly bulky, while their long tails, and very long flowing manes, aided the effect produced by the contemplation of their extraordinary size. They were well formed; but from the abundance of hair which covered their legs, they always appeared unsightly in our estimation, and impressed the idea upon our minds of that lack of activity which posterior trial incontestably proved. However, they maintained their stand for some time; and, like our racers, many of them became celebrated for the superiority of their stock. Many of them were also extremely vicious. A favourite horse of Mr. Bakewell's could only be approached with the utmost caution, even under ordinary circumstances: one of the servants only dared to perform the operations which the health, &c., of this savage animal required; and, in the days of our boyhood, we have frequently heard this (then old) man remark, he was sometimes severely bitten, and often compelled to make his way into the manger or the rack, in order to escape from further violence or death. It unfortunately happened, that a young man from a neighbouring county (Derbyshire) offered his services to Mr. Bakewell for the purpose of attending the stallions, particularly the vicious animal of which we have been speaking, priding himself upon his superior skill or dexterity in the management of unruly horses: his offer was readily accepted, and his predecessor very gladly resigned to him an office, the duties of which were pregnant with danger; cautioning his successor of his imminent risk, and pointing out the best mode of approaching and managing the animal in question. The advice was offered from the best possible motive, but received with indifference; and the consequence was, that the horse killed him the very first day of his attendance upon him.

The influence of the celebrated James Sullivan was never tried upon this dangerous horse; nor would any proof short of what may be called ocular demonstration, have convinced us of its efficacy in the case under consideration, as well as of several others which have, at various periods, fallen under our observation. James Sullivan, we are told, was a native of the county of Cork, and an awkward, ignorant rustic; who followed the profession of horse breaking, and was distinguished by the appellation of *The Whisperer*. This *soubriquet* was bestowed upon him in consequence of a notion entertained by the vulgar, that, in his management of intractable and dangerous horses, he communicated his wishes to them in a

whisper; arising, beyond all question, from the singularity of his method of proceeding. How his art was acquired, or in what it consisted, is not known; it may be said to have expired with its original possessor: for, although his son follows the profession of the father, he is unable to exercise the same sort of magical influence over the temperament of an unruly or vicious horse. The most surprising part of his skill consisted in the short time requisite to accomplish the object, which was performed in private, and without any apparent means of coercion. Every description of horse, or even mule, whether previously broke in or not, whatever their vices might be, submitted immediately to the irresistible influence of his art, and in the short space of half an hour became as obedient as possible; while the effect, though almost instantaneously produced, was generally durable: though more submissive to Sullivan than to others, horses altogether unmanageable before this man's mysterious process was tried upon them, acquired a docility which they had previously never manifested. When he was employed to reduce a vicious horse to subjection, he shut himself up in the stable with the object of his experiment, and directed the door to be opened only when he gave the signal for that purpose. After the lapse of about twenty minutes or half an hour, during which no hostile movement, or even bustle, was heard, the signal was given; and, upon entering the stable, the horse was observed lying down, and Sullivan by his side, playing familiarly with him, like a child with a good natured dog. A proof of this man's skill was publicly given on a horse which could never before be brought to stand for a smith to shoe him. "The day after Sullivan's half hour lecture (observes the writer) I went, not without a degree of incredulity, to the smith's shop, with many other curious spectators, where we witnessed the complete success of his art. This had been a troop horse; and it was supposed, not without reason, that after regimental discipline had failed, no other method would be found availing. I observed that the animal seemed afraid whenever Sullivan spoke to, or even looked at, him."

If no charm could be found for the vicious stallions of Mr. Bakewell, every precaution was adopted to prevent the effect of their violent and savage dispositions: they were led in halters so formed, that if they attempted to bite the person leading them, he had only to hold the end tight, and they could not open their mouths.

Mr. Hood of Packington (Leicestershire) was in the possession of a stallion of the Dishley breed, which became very celebrated for the superiority of his stock; but he also became so unmanageable and so dangerous, that his eyes were either purposely put out, or he lost the sight of them in his mischievous struggles with his grooms or attendants. Even in this state, it was highly dangerous to approach him: he lived till he was eighteen years old, and continued as vicious as possible to the last.

However, notwithstanding the fame which the Leicestershire improved breed of Black or Cart Horses acquired, in the course of some years it was found that in the ardour of improvement, bulk had been increased at the expense of activity, and that the very large Flemish horse, which, by English management, had attained an enormous size, was slow, if not sluggish, in his movements or action, and not half so well calculated for the general purposes of husbandry, and the use of the farmer, as a more clean limbed and more active, yet equally strong animal, of which our embellishment presents a beautiful, if not an inimitable, sample. The very heavy and very

hairy legged Dishley or Leicestershire horse will be found, on examination, defective in the metacarpel bone, or rather those bones which form the foundation of the limb between the knee and the fetlock: they consist of three; one large before, called the *cannon* or *shank* bone, and two smaller behind, called *splint* or *splent* bones. These bones were found too small; and certainly the thinness of the leg, or rather perhaps its circumference in these huge horses, would not fail very much to surprise that person who for the first time made himself acquainted with the fact. It is said, and truly too, that tendon contributes more to strength that bone; but, inasmuch as bone forms, as it were, the hold and basis of tendon, the size of each will generally be found in corresponding unison; so that where the bone is slight, a very large development of tendon cannot be expected. In order to improve the action of the heavy Leicestershire horse, as well as to remedy the defect in question as far as possible, the Cleveland Bay, it seems, was resorted to; and as the latter possesses about one fourth genuine Eastern blood, so, what may be called the improvement upon the Leicestershire improved cart horse, is not altogether destitute of breeding, or relationship to the thorough-bred horse. Of this improvement we present our readers in the accompanying embellishment, with perhaps the most beautiful and the most perfect specimen which the kingdom affords. The artist was eminently successful in transferring his likeness to canvas, which has been very faithfully traced by the burine; so that, as we thus place an undoubted, vigorous, and almost living portrait before the eye of the reader, we will leave him to form his own opinion. He gained the prizes as the best Cart Stallion at the East Riding Agricultural Association on Wednesday July 27 of the present year.

TRUE BRITON JACK'S ALIVE is the property of Mr. Matthew Northgraves of Sutton, near Hull; he was got by this gentleman's Jack's Alive, but bred by Mr. D. Robinson of Hessle, near Hull, out of a black stout mare got by Mr. J. Wells's Old Jacob. He is seven years old, sixteen hands one inch high.

The Flemish or very heavy hairy legged Leicestershire horse, is best calculated for the brewer's dray, where the journies are generally short, the pace slow, and a large horse necessary from the form and size of the vehicle employed, as well as from the nature of the employment.

The following extraordinary feat of a draft horse has been recorded. Soon after the completion of the Surrey Iron Railway, and when it was open for the conveyance of goods from Wandsworth to Mertsam, a bet was made, that a common horse could draw thirty-six tons for six miles along this road, and that he should commence his labour with a dead pull, as well as turn it round the occasional windings of the road. A number of persons assembled near Mertsam to witness the performance. Twelve waggons loaded with stones, each waggon weighing three tons, were linked together, and a horse, taken from the timber team of Mr. Harwood, was hooked to the first waggon. He started from near the Fox public house, and drew this immense weight with apparent ease, to near the turnpike at Croydon, a distance of six miles, in one hour and forty-one minutes. In the course of his journey, he was stopp'd four times, in order to show that it was not by the acquired impetus that he performed the task. After each stoppage, a chain of four waggons was added to the train, with which the same horse set off again without difficulty, even after about fifty men had mounted the them.

A cart horse belonging to Mr. Leggat of Gallowgate street, Glasgow, had been several times afflicted with botts, and as often cured by Mr. Downie, farrier at that place. He had not, however, been troubled with the disease for a considerable time; but, on a recurrence of it, he happened to be employed one morning in College street, a distance of nearly a mile from Mr. Downie's workshop. Arranged in a row with other horses engaged in the same work, while the carters were absent, he left the place, and unattended by any driver, went down the High street, along Gallowgate street, and up a narrow lane, where he stopped at the farrier's door. As neither Mr. Leggat nor any other person, appeared with the horse, it was conjectured that he had been again attacked with his old complaint. Being unyoked, he lay down, and shewed, by every means of which he was capable, that he stood in need of Mr. Downie's assistance; and while this gentleman was in the act of administering the requisite antidote, the carter arrived in search of him.

In the spring of 1829, at the time a farm servant was engaged in harrowing, a relative who had been long abroad, serving as a serjeant in the army, returned home, his purse being well stored with cash. During his stay in the neighbourhood, he frequently regaled his old acquaintances, and seldom failed to send them home in a state of the most happy oblivious feeling imaginable. John, our hero, who had the care of a pair of beautiful Clydesdale horses, on returning home one evening, went as usual, to water and supper his horses. For the former purpose, he was in the habit of letting them loose, when they went by themselves to an adjoining stream, and, after quenching their thirst, returned to the stable, while John stood at the door to receive them. On the evening in question, John had forgot to tie them up, and shut the stable door. The dissipation of the previous night had given him a *sair head*, so that he could not get up till half past seven, two hours later than his usual time. On reaching the stable, he found the door open, one of the horses gone, and the other standing loose in his stall. In vain the man looked for the absent horse, till at length he met a boy, who upon enquiry, informed him, that at half past seven o'clock, he saw one without a halter or attendant, going into a certain field. The man hastened to the place, and found the animal standing by the harrows, where he had unyoked him the previous evening.

In the year 1828, Mr. Maclaren a farmer of Balthaly, was in the possession of a horse which had attained the great age of thirty-eight years, and which continued strong and active. He was four years old when he was purchased by Mr. Maclaren, so that, at this period, he had acted the part of a faithful servant for thirty-four years. He could still masticate his corn without difficulty, was in good working condition, and seemed to retain his sight unimpaired. As a proof of his strength and activity, it may be mentioned, that Mr. Maclaren's farm contains one hundred and twenty acres, the ploughing on which in 1827, was performed by his old favourite and another horse, without further assistance. However, it rarely happens that horses of the cart kind are fit for much work after having completed their twentieth year.

**OLD OAK.**—A large oak in the forest of Cerisy, known under the name of the Queneze, at a little distance to the right of the great road to St. Lo, is supposed, by comparing various data, to be eight or nine hundred years old. In 1824 it measured 36 feet in circumference just above the soil, and was about 55 feet high. The trunk is now hollow, and will hold from 14 to 15 persons.

## CASTRATION.

BY PROFESSOR VATEL, ALFORT.

### THE ACCIDENTS THAT MAY FOLLOW CASTRATION.

These are swelling of the sheath or the scrotum, or the spermatic cord, gangrene, hemorrhage, tetanus, hernia, and peritonitis.

**1 SWELLING OF THE SHEATH AND SCROTUM.**—These most frequently occur, and are most serious in young horses that have not yet had strangles, or that are about to have it. When it happens, yet in a slight degree, and affects only the sheath, it needs not to be regarded; for it will usually disappear about the fifth, sixth, or eighth day, and frequently sooner. Exercise is very useful in dispersing it. When, however, it is more considerable, and by a species of phymosis prevents the animal from protruding his penis; when he walks with some stiffness; and the perineum and the scrotum are distended; recourse must be had to fomentations, emollient lotions, and scarification. If the pulse is hard and accelerated, the animal should be bled, and cooling drinks and emollient injections administered.

The treatment is the same when the enlargement spreads under the belly, and there is oedema accompanied by some degree of heat. It is often useful to clean the inside of the sheath, in order to prevent the accumulation of sebaceous matter.

When this enlargement is complicated with a similar one of the spermatic cords, it is frequently dangerous. When it passes into a gangrenous state, or is accompanied by peritonitis, it is generally fatal. In the latter case the animal frequently dies at the very moment that we are beginning to think him out of danger.

**2 SWELLING OF THE SPERMATIC CORD.**—This is usually more dangerous than the preceding affection. It generally appears between the fourth and eighth days after castration. The horse betrays a stiffness of the leg on the same side as the swelling. This is easily perceived when he is going out of the stable, and it does not disappear after some minutes exercise. The animal to a greater or less degree drags the limb after him, and the back and loins are bowed on that side. When both the cords are enlarged, and inflamed, the horse walks wide behind, and the lumber region is stiff and depressed. The animal finches if the cords are in the slightest degree pressed upon, and there is more or less heat at that part.

When there is inflammation of the cord, but without any fungus growth, it will sometimes terminate in resolution, especially if emollient cataplasms are applied to the lumber region, and fomentations of the same kind to the affected parts, and emollient injections, and restricted diet, and bleeding, and little exercise; but, generally, abscess and scirrhus of the cord result.

The abscess resulting from inflammatory engorgement of the cord ordinarily appears at the groin. It is brought to maturity by applications of the ung. populeum\*; as soon as there is any fluctuation the abscess is opened, and the wound dressed with dry tow.

Swelling of the cord is often accompanied by a fungus growth at its inferior extremity, assuming

\* Made of the leaves of white poppy, belladonna, black hellebore, and black nightshade, with the buds of the black poplar boiled in lard—a favourite ointment with the French, and said to be emollient and narcotic.

somewhat the form of a mushroom, and thence deriving its name *champignon*. This enlargement sometimes appears when the wound in the scrotum is partly cicatrized, and it often adheres to the borders of the wound. There runs from the little opening which then remains, a glairy, ropy discharge, which sticks to the internal surface of the corresponding thigh. The size of this fungus varies considerably in different cases. Those enlargements which have a narrow base, and are almost hidden in the wound made in the act of castration, are the least dangerous; others with a wide base, voluminous, and complicated with scirrhus engorgement of the cord, whether at the ring alone, or penetrating into the abdomen, are attended by more serious consequences.

The small fungus growths often disperse without any other care than that which is bestowed on the subduing of the inflammatory swelling of the cord by which they are accompanied. When they are the size of a hen or duck's egg, and have a somewhat smaller pedicle, and protrude through the edges of the wound, and the cord is only a little engorged, it is easy to amputate them. For this purpose the animal must be secured as for castration: the wound must be slightly enlarged, in order that the fungus may be brought down; a hollow clam, into which a little corrosive sublimate has been put, must be fastened round the root: and on the second or third day the clam may be removed, and the fungus cut away without any danger of hemorrhage.

The ligature is sometimes used in these cases with considerable success, and especially when the fungus is large, and when it is accompanied by swelling of a portion of the cord itself, which will not permit the application of the clam sufficiently low, or which prevents the remaining portion of the cord from being handled. When the ligature is resorted to, the horse must be thrown as for the application of the clam—the tumour brought out and exposed—and then a waxed twine must be passed round the cord, above the substance of the fungus, and sufficiently tight to interrupt the circulation. A second piece of twine should be placed above this, and secured with the knot used in bleeding. The ends of the cord must be so contrived as to be near each other, in order to be twisted when the suppuration is established, or the operator wishes to procure the fall of the tumour. Some veterinarians attach a ring of lead to their ligature, by means of which they can twist it tighter every day.

The inflammatory swelling of the cord often terminates in scirrhus. This seldom exists alone, but is almost always accompanied by the fungus growths just spoken of. It is on this account that both of these states of the cord are confounded under the name of *champignon*. In this case the tumefaction extends along the cord as high as the sub-lumbar region, which may be ascertained by raking the horse. The cord becomes hard—it increases in size—it contracts adhesions with the neighbouring parts—and sometimes forms a cancerous mass from the original wound unto the sub-lumbar region. The vessels likewise become inflamed, and increase in volume. At length the cord begins to soften at different points of its extent. The animal evidently suffers a great deal of pain—he is continually standing—the lameness increases day by day—the flank is drawn up and corded—the discharge from the part increases the irritation—the horse falls rapidly away, and a continued fever conducts him to marasmus and death.

In robust and healthy horses, enlargements of a *scirrhus appearance* sometimes are found, which disappear in process of time (from six to twelve months) by means of an abundant suppuration. This favourable termination is announced by the discharge of healthy pus, and by the slow and progressive diminution of the symptoms, and of the pain. The application of the populeum ointment, emollient lotions, and gentle exercise will be favourable to this termination of the case. But it is not always that the practitioner must dare to hope for such a result; and it will be his duty, especially when the tumefaction is increasing, to remove the engorged part of the cord, by ligature, before it reaches the abdomen; for if he cannot divide the cord at the abdominal ring on a part as yet sound,—if he can only place his ligature on a substance which already is scirrhus, the disease will most rapidly spread upwards, and destroy the patient.

The animal must here also be cast. The attachments of the cord to the surrounding parts must be cut, or rather torn, as perfectly as may be without injuring the principal vessels; and then a ligature must be tied above, on a part of the cord which is evidently sound. When the scirrhus reaches the abdomen, the ligature will be altogether insufficient, and, as a last resource, the cord must be cauterized as deeply as possible. In order to effect this, the cord must be detached, as perfectly as may be, from the surrounding parts—it must be cut into inferiorly—the lips of the wound must be separated as much as possible, and then an iron, heated red hot, in the form of a sound, and sufficiently long, and as large as a finger, must be thrust up into the scirrhus substance, following carefully the direction of that substance. The suppuration which necessarily results from such an operation will sometimes *melt down* the enlargement.

## CATARACT APPEARING WITHOUT APPARENT INFLAMMATION.

(From the Veterinarian.)

On the 22nd of April, 1836, Mr. Etches of Broughall, sent for me to look at the hock of a horse that he thought was larger than what it ought to be. He had purchased the horse from a Mr. John Jones, of Llandysill, a farmer near Welchpool, who had bred him: he was five years old. I told Mr. Etches the enlargement of the hock was of no consequence. I then examined him all over, and found that he had a cataract in the off eye, at its outer angle, the size of a large coriander seed. The eye was perfectly transparent, with the above exception showed no vestige of previous inflammation, and there had not been any thing the matter with it whilst in the possession of Mr. Etches, which had been about a month. Mr. Jones was applied to respecting it, who said he bred the horse, and never knew either of the eyes to be the least inflamed or injured. It was agreed to leave it solely to two friends who knew each party well, and who decided that Mr. Jones should refund five pounds. Now, I am perfectly aware that there is great difficulty in deciding when or how this cataract was formed, and whether it was preceded by inflammation. That there was no apparent inflammation set up in the eye whilst Mr. E. had him I firmly believe; for he is a very particular gentleman, and is continually among his horses. On the other hand, it is asserted that there was none while in

the breeder's hands ; but then we all must admit the *possibility* of the horse having had some injury to, or inflammation in the eye, during the long period that he was in the breeder's possession, although not observed. That there could not have been, nor indeed is it necessary, repeated violent inflammation in the parts, we may easily believe, for there would have been disorganization or discoloration of the internal parts. Suppose the vender, in this case, would not have taken the horse back, nor have allowed any thing, would it have been possible to have recovered any thing from him by law ? I think not. The vender would have proved that there was nothing the matter (at least witnesses would have been brought forward to swear it) with his eyes up to the time of sale ; and who would there be to prove, on the opposite side, that it could not have occurred whilst in the purchaser's hands ? I would not, I am sure ; and, I fancy, few veterinary surgeons would be found to swear that the cataract was formed previous to the sale, after what has recently been brought forward on the subject. The case *Roberts v. Croft* was decided otherwise ; but would a similar one be so now ? It is, at any rate, a case which shows the absolute necessity for every purchaser to have his horses examined immediately after purchase, and which ought always to be done independent of this point.

I should be glad if Mr. Davies or Mr. Gwynn, veterinary surgeons of Welchpool, would slightly try to ascertain a little more respecting this case, as it is in their neighbourhood, and communicate it either to you or to me, as I am as desirous as any one to come at the truth of similar cases.

## ON CROSSING BREEDS OF CATTLE.

By MR. JAMES DICKSON, CATTLE-DEALER,  
EDINBURGH.

(From the *Quarterly Journal of Agriculture*.)

The chief object of breeding cattle is the acquisition of profit. The raising of them is an art ; and, like all the other arts, it is attended with labour of mind and body. The purchasing of breeding stock at the outset, and of collecting them together from different breeding districts, to one farm ; of rearing the young stock from the period of their birth to maturity ; and of disposing the surplus stock at markets, is a labour attended with considerable outlay of capital and exertion of body and mind, and no one unacquainted with all the minute details necessary to be observed in the breeding and rearing of cattle can conceive the peculiar labour of conducting this department of farm management. But the anxiety of the mind is protracted beyond the labour of the body, partly from the uncertainty whether the progeny of the purchased parents may turn out to expectation, and whether the return from the outlay of a considerable sum for at least two or three years may be equivalent to the risk, and partly from daily solicitude accompanying the progress of the young stock towards maturity, whether awakened by the risk of death or the apprehension of receiving a remunerating price for stock, upon which the breeder is conscious he has bestowed every care and attention to bring them to perfection. Were it not that the anticipation of success inspires him with hope, no man would undertake the toil of rearing live stock ; but the assurance that his efforts will place a fine stock in his possession if he pursue a proper

course of breeding, and which will remunerate him in the end, supports and encourages him to perseverance. If this assurance is well founded, which I maintain it is, the profit of the breeder will be greater or less according to the means which the breeder employs in obtaining it. If he cultivate ordinary stock, that which may come first to his hand, his profit will certainly be small, for no breeder has a right to expect great remuneration who gives himself little trouble in rearing his stock. If, on the contrary, he select his breeding stock with care and judgment, he will certainly be recompensed for his trouble. Whether, therefore, the breeder derives a larger or a smaller profit from his stock depends on his own exertions. But the breeder must not only use exertion, it is obviously his interest to secure the largest profit with the least labour. In aiming at this high accomplishment, he must select his breeding stock by which it is to be secured with much discrimination. The materials are always within his reach, he must select them with judgment. There is great difficulty, it is true, in choosing properly, but he will prove himself the most successful breeder who can select with the most correct judgment. A thorough knowledge of rearing stock is a pre-requisite, and it can only be acquired by observing, in the first instance, the operations of other breeders, and being familiarized in it by studying the nature of all the domesticated animals.

These are the principles which should guide the breeder in the rearing and cultivation of his stock. The adoption of an opposite procedure will inevitably lead him to disappointment and failure, because, being opposed to common sense, and the method which Nature adopts in regulating the increase of the animal creation, it must necessarily fail. The practice of the experienced man is a tolerably safe guide in regulating that of a beginner ; but were he merely to imitate the practice of man, his own could never rise above the standard followed. Now, Nature is a superior teacher to man, and she never fails in her object. The fruits, and flowers, and animals of her creation, are the most perfect of their kind. To follow her practice, therefore, is true wisdom. Now, the progressive variety of the domesticated animals shows that their condition may be improved, whilst their kind is preserved pure. The state and kind of wild animals is always uniform, but that of the domesticated varies, and yet the kind of the latter is always as fixed as that of the wild animals. What, then, constitutes the whole difference between the wild and domesticated animals is, that the former remains unchanged in every respect, whilst the latter remains unchanged in that respect which preserves their distinctive characters, and yet their condition may vary, to suit the wants and tastes of man.\*

\* The uniform external characters and habits of wild animals, the tendency to deviation in the external characters and habits of domesticated animals, and the failure which has attended every attempt to domesticate any wild animal, are circumstances which have led some to the belief that the races of domesticated animals were never wild. I confess I am strongly inclined to adopt this opinion. In the first place, I see no evidence of a greater number of kinds of domesticated animals now in the world, than have been from the earliest period of history ; and, in the next place, there have always existed as many kinds of domesticated animals as have been useful to man in his most civilized state. As the civilization of man increased, so have the variety and quality of domesticated animals increased, but the number of their kinds have not increased. There

The securing of the greatest profit in breeding with the least labour, consists in procuring that breed which will attain the greatest weight and maturity in the shortest time, and on the least quantity of food. On observing the progress of different individuals of the same breed of cattle, every breeder may have noticed that some individuals fatten quicker than others under the same treatment; and were the cattle of different breeds, the difference in the progress of the fatness would probably be the more striking. Results so obvious cannot fail to rouse the inquiries of the breeder. How is it that animals of different breeds, or individuals of the same breed, fatten faster than others? They all receive the same attention and care, food, and comfort. On inspecting the subject more closely, the breeder discovers that those animals which improve fastest, are the most beautiful to appearance, and most handsomely formed. Out of regard for them, he has a desire to handle and fondle them, when he makes a new discovery. He finds that their skins feel agreeable to the touch, are loose, and easily laid hold of. Their bodies are soft and fat, and he can press his fingers into their flesh, which springs back again in an elastic manner. He can also ascertain the same properties in the parents of the respective cattle which have thus exhibited them, and when he has made this observation, he has made another discovery. He thereby learns, that cattle possessing certain good and useful properties, have the power of imparting them to their progeny. He becomes convinced that good properties are hereditary, and, by a parity of reasoning and observation, he concludes that bad properties are also hereditary. He therefore retains the breeding stock which possesses the good properties, and disposes of the rest which possesses the bad, and fills up their place with animals possessing properties similar to the first. His mind having thus been awakened to the proper course to be pursued in breeding, he perseveres in the selection of the best

were horses, asses, camels, dogs, cattle, sheep, and goats in the days of Abraham, as well as now, and these constitute the largest proportion of our domesticated animals. Many attempts have been successfully made to tame single individuals of wild races, but such animals, though tamed, are in quite a different state from our domesticated animals. Some wild animals exhibit a great degree of familiarity. The swallow builds her nest in our windows, and the robin enters our dwellings; whilst the blackbird and sparrow are constantly before us. This familiarity, however, does not amount even to tameness, far less to domestication. It appears to me, that wild animals are preserved unchanged, for the great purposes of providence throughout the globe, and that Nature has presented to man only such animals as are obviously most suitable to his wants. With these he must be satisfied. What wild creature would we desire to substitute for any one of the domesticated animals? Should we desire it, Nature has placed such a barrier in our way, that it is impossible for us to make a single wild creature available to our domestic purposes. We may exercise our ingenuity, judgment, and even caprice, in moulding the habits and qualities of domesticated animals to our tastes, wants, and conveniences. There the field of experiment is open to us, not to an unlimited, but to a great extent; but Nature will not permit us to make a single predatory incursion among her wild animals. She "careth for them" in an especial manner.

animals, and, in the course of time, his experience and taste correct the defects which may exist even in the minuter properties of his animals. Some of these minute defects may not exhibit themselves for some time, even for years; but when they do appear, the animals having them are removed, and those only cherished which have preserved all the good properties to the latest period.

Having thus procured that breed which attains the greatest weight and maturity in the shortest time, and on the least quantity of food, not absolutely, but relatively to other breeds (for it is perhaps not in the power of man to fashion an absolutely perfect breed of cattle, which these qualifications would indicate) the breeder's next consideration is how he is to preserve the good properties which have been acquired in his cattle. This consideration will be early impressed upon him, for he knows that the possession of any good thing is but a fleeting acquisition; for he sees that others more than he cannot retain a good thing permanently, for every thing becomes the more evanescent the purer it is. He finds this to be true in regard to cattle. The good properties gradually disappear, one after another. The more minute properties disappear first, as it were stealthily, before he is aware of their disappearance. He finds, to his amazement and embarrassment, that his cattle are undergoing an evident change for the worse. They are becoming smaller, they are more tender, more easily hurt by change of food and weather; they show symptoms of internal disease, and some even die in spite of his attempts to preserve them. He becomes alarmed, he ascribes the change perhaps to some temporary change in the atmosphere, to some epidemic, which will pass away with the season; and, at all events, he cannot ascribe to mismanagement on his part, as a cause of the disheartening change. He is not conscious of having deviated from the exact line of conduct which has hitherto led him to prosperity and fame. He finds himself in a dilemma. If he continues as he has latterly proceeded in his method of breeding, he fears that the value of the cattle, upon which he has bestowed so much care, and of whose beautiful appearance he is justly proud, will decline every year. It is no easy matter for a breeder to extricate himself out of such a difficulty. The many conjectures which he forms to account for the unfortunate change, the epidemic among the rest, have now lost his confidence, and he begins to distrust his later management, and attempts to discover an error of judgment or of practice. But although an error of judgment or of practice had produced the effects, its immediate connexion with them may not be very apparent; and, at all events, he is reluctant to acknowledge that it is easy to account for so great a change as has taken place in his stock. He cannot conceive that a pursuance of the same plan which has perfected his animals, can at any time be detrimental to them. He resolves, however, to proceed in future with circumspection. The first precaution which he uses, is to change his breeding stock, in that line whose progeny have shown the greatest change. He purchases a bull from the best breeder in the country. This is at least a safe step. On comparison, his eyes are opened to the lamentable fact, that his present favourite bull, which has procured him his stock, is not so perfect as other peoples', nor what he has before had: he is fat enough, but seems bound together, and is small. He resolves that he shall serve no more of his own cows, but he puts him to a cow which he has bought, in order to mark the results of the double change which he is about to effect by introducing a fresh

bull and a fresh cow into his stock. The results prove better than his expectations. He tried the experiments in doubt, but he exults in the results, because he is in the way of regaining his lost stock. The fresh breed exhibits the size, strength, hardiness, all the good qualities of his best animals. He now sees the necessity of changing, at intervals, the blood in breeding cattle, in order to maintain them in that high and palmy state, which imparts the greatest pleasure and profit to the breeder. He is convinced that without a change of blood in its constitution, or, in other words, without *crossing*, no breed of cattle can maintain its health and usefulness.

Convinced though he be of this position in regard to crossing in the same breed, still he naturally asks himself, Will any kind of crossing produce similarly favourable results? Were any bull or cow used, would their progeny be as perfect as that of the crosses which he has just tried? No reasoning can satisfy any man in the matter; experiment alone must answer those questions. But having already made experiments and succeeded, he may try others. He buys a bull of any breed different from his own. He puts him to one of his best cows. The result proves almost a failure. The progeny is no doubt strong and hardy, but it is coarse, and by no means an improvement on his own breed. Such an experiment shows him that he should not rely for improvement in a confessedly inferior bull. He then finds, that the crossing of breeds must not be conducted in an indiscriminate manner, that a superior bull is necessary, and that a superior cow cannot secure him against disappointment when coupled with an inferior bull.

He will try another experiment, the converse of the last. He now buys a cow of a different breed from his own, and puts his best bull to her. The result is much superior to the last experiment. The progeny is not so fine as his own pure breed, but it is superior to its mother. It proves a rapid grower, kind feeder, has a good figure, and hardy constitution. He is encouraged to proceed a little farther. He puts a *fine bull to a cow of this cross*. He is still not disappointed; the progeny is still not so fine as his own pure breed, but it approaches nearer in similarity to it than the first cross; and proceeding in this manner for generations, he ultimately finds that the *coarse breed merges into his own*. As he is still in the field of experiment, he tries the effect of a bull of a different breed from his own with a cow which is a cross between a coarse cow and a fine bull of his own. Instead of the cross improving as it did with the fine bull, it is decidedly worse than its sire. He receives no encouragement to proceed in this direction. These latter experiments prove to him, that, were it possible, from the course of events, that no superior cow could be obtained, a superior bull would in time raise a stock similar to himself from a cow of a different breed; and that this cross should either remain as it is, because it is certainly a good cross, or it will merge, by means of a superior bull, into his own pure breed; but that by an inferior bull the cross degenerates at once.

I have thus endeavoured to trace, by the supposititious case of a breeder, the natural progress of breeding; and I have farther carried the supposition to the extent that the same breeder had experienced all the changes incidental towards the acquirement of a perfect breed, in order not to break the regular and necessary connexion in the progress towards perfection. This supposition has served to simplify the description of the proper process of breeding; but it must not to be taken for granted, that breeding

up to the attainment of a perfect breed is really a simple matter. It is only possible for any man in a long lifetime to acquire all the experience which the above supposition exhibits. One man's experience is generally limited to a few circumstances; but he must observe the operations of others, and profit by them as well as his own. In this manner, the results of the experience of many breeders are introduced into the above supposition. It is therefore not imaginative, but a view of the actual progress of particular breeds. For instance, the breed which is represented as having been brought to the highest degree of perfection, is the short-horned; and its degeneracy is indicated by pursuing the breeding too near akin. Its recovery is ascribed to an intermixture of the same kind of blood, derived from a different source; and this process is recommended to be occasionally resorted to, in order to preserve the tone of breeding in vigour. Hence crossing is recommended to preserve the purity of blood; because this intermixture of the same bloods is nothing more nor less than crossing; but crossing of any kind must be conducted on judicious principles, and not at random. It will not conduce to improvement to cross a fine short-horn cow with a bull of inferior breed; for we have seen by the supposition, that the progeny could only be superior to the male, but inferior to the female parent. On the other hand, a short-horn bull will improve the progeny of any other breed. Why that should be the case, it is impossible to explain. It probably arises from the high tone of blood which the short-horns possess, but how this high tone of blood in them operates as an improver of the qualities of other cattle, I pretend not to explain. The explanation must be left to physiologists. It is sufficient for all practical purposes, that the case is as I have stated; for knowing the fact, the breeder possesses all that is requisite for the improvement of any breed in the country. This property of the short-horn bull I conceive to be an invaluable one, as we shall have occasion to see in the sequel.

#### EAST RIDING AGRICULTURAL ASSOCIATION.

The Third Annual Show of the East Riding Agricultural Association took place at Beverley, on Wednesday, July 27. The meeting of the Association was held at nine o'clock in the morning, at the East Riding Sessions House, when the ordinary business was transacted. The members then proceeded to the election of a president and vice-president for the ensuing three years, (in the place of Richard Bethell, Esq., M.P. and the Rev. W. R. Gilby, whose term of service was expired), when the Hon. Chas. Langdale was chosen president, and Robt. Dennison, Esq. of Kilwick Percy, vice-president.

The field which was appropriated to the reception of the stock at the last meeting, was again put in requisition on this occasion. Portions of ground, suitable for the accommodation of each different species of stock, were fenced off in the same manner as at the last show, and large placards announced the description of animals, cart-horses, roadsters, hunters, &c., contained within each enclosure. There were placed on the ground, for the inspection of the visitors, a number of agricultural implements, — threshing-machines, ploughs, harrows, &c., of an improved construction, manufactured by Mr. Crosskill, of Beverley, and Mr. Dale, of Bridlington.

The judges who awarded the prizes to the competitors were:—Mr. Edward Baxter, of Burton Pidsea; Mr. John Johnson, of Cayton Carr; Mr. John Taylor, of Burnham, near Barton; Mr. Phillips, of Helmsley; Mr. C. Angus, Neswick; and Mr. George Wood, of South Dalton.

The show of stock, in regard to the breed and condition of the animals was most splendid. It was stated by the judges, that in their opinion so good a collection of animals was never shown. The show of tups and sheep, it was stated, far exceeded that of last year. The only deficiency mentioned was in the three-year-old coaching colts; only one was shown, and the prize was of course awarded to it.

In the course of the day we observed upon the ground a number of the principal geatry of the riding. Visitors were admitted into the field on payment of one shilling each, and throughout the time the stock was exhibited the ground was thronged. We were informed that the sum taken at the gate during the day was upwards of 130*l*, so that the number of persons who visited the "show" was about 2,600.

The following is a list of the number of the respective descriptions of stock which were exhibited on the ground:—

Bulls of any age from any part of the kingdom, 10; bulls aged, 9; bulls yearling, 7; cows, 15; heifers, 2 yrs old, 9; heifers, yearling, 4; tups any age, 15; tups aged, 11; shearing tups, 18; ewes breeding, 4 pens; shearing wethers, 1 pen; shearing gimmers, 4 pens; coaching mares, 27; hunting mares, 10; roadster mares, 15; cart mares, 14; boars, 6; sows, 10; coaching colts, 3 yrs old, 3; coaching colts, 2 yrs old, 7; yearling coaching colts, 5; coaching fillies, 3 yrs old, 9; hunting colts, 3 yrs old, 1; coaching stallions, 19; hunting stallions, 3; roadster stallions, 5; cart stallions, 8; yearling stallion colts by Merrylegs, 6; foals by Commodore, 9.

The following are the premiums awarded by the judges to the successful competitors:—

	£. s. d.
To the Labourer in Husbandry (who has no occupied more than half an acre of land) who has brought up and placed out to service the greatest number of children, without receiving parochial relief:—Alexander Kiddey, 14 children.—34 years in the service of R. Dennison, of Kilwick Percy.....	5 0 0
The Second ditto—Charles Foster, of Tibthorpe, 12 children. ....	1 0 0
To the Servants in Husbandry, being unmarried persons, will be extended to those who have lived in several places, provided they have lived not less than four years in each service; to produce certificates from their masters or families; or, in case of their death or removal, from two respectable persons of each service—John Petty, 14 years in the service of Lawrence Stephenson, of Eske.....	4 0 0
The Second ditto—No competition.....	3 0 0
The Third ditto— Ditto.....	2 0 0
The Fourth ditto— Ditto.....	1 0 0
To the Female Servant who has lived the longest time in service, of not less than four years in each service, with a good character,—Hannah Wilson, 18 years in the service of Lord Hotham.....	3 0 0
The Second ditto—No competition.....	1 0 0

	£ s. d.
To the Female Servant who has lived the longest time in farming service, of not less than four years in each service, with a good character—Ellen Linton, 45 years in the service of Mr. T. Moody, of Holme-upon-Spalding-Moor.....	3 0 0
The Second ditto (not living in service as house-keeper)—No competition.....	2 0 0
The Third ditto— Ditto.....	1 0 0
To the shepherd who has reared the greatest proportionate number of Lambs, from not less than 100 ewes—William Witty, 182 Lambs from 110 ewes, belonging to Mrs. Whiting, of Leven.....	3 0 0
The Shepherd who has lived the longest time in one service—William Withill, 33 years shepherd to Sarah Clark, of Goodmanham.....	3 0 0
Best Bull, of any age, from any part of the kingdom,—To Mr. R. Iveson, of Hedon.....	10 0 0
Best two-year old or aged Bull—Ditto..	5 0 0
Best yearling Bull—To Mr. Robinson, of Carnaby.....	3 0 0
Best Cow in milk, or in a breeding state—To Mr. Edwards, of Market Weighton.....	5 0 0
Second Best—Ditto.....	3 0 0
Best two-year old Heifer—To R. F. Shawe, Esq. of Brantinghamthorpe.....	3 0 0
Best Yearling Heifer—Ditto.....	3 0 0
Best Tup, of any age, from any part of the kingdom, (5 <i>l</i> by the Association, and 5 <i>l</i> added by Yarburgh Greame, Esq. of Sewerby)—To J. Greame, Esq. of Sewerby.....	10 0 0
Best aged Tup—Ditto.....	5 0 0
Best Shearing Tup—To Mr. Edwards, of Market Weighton.....	5 0 0
Best pen of five Breeding Ewes—To Mr. Dawson, of Sewerby.....	3 0 0
Second best ditto—To Mr. Edwards, of Market Weighton.....	1 0 0
Best pen of five Shearing Wethers—To Mr. Lowish.....	3 0 0
Best pen of five Shearing Gimmers,—To Mr. Kemp, of Hempholme.....	3 0 0
Second best ditto—To Mr. Edwards, of Market Weighton.....	2 0 0
Best Coaching Mare—To Mr. Richard Stephenson, of Hollym.....	5 0 0
Second best ditto—To R. Denison, Esq. of Kilwick Percy.....	2 0 0
Best Mare for breeding Hunters—To Mr. Thomas Jackson, of Barmby-Moor....	5 0 0
Second best ditto—To Mr. J. Witty, Middleton.....	2 0 0
Best Mare for breeding Roadsters—To Mr. Lee, of Gardham.....	5 0 0
Second best—To Rev. F. Best, of South-Dalton.....	2 0 0
Best Cart Mare—To Mr. W. Butterill... ..	3 0 0
Second best ditto—To Mr. John Foster, of Gauton.....	2 0 0
Best Boar—To Mr. David Dickinson, of Patrington.....	2 0 0
Second best ditto—To Daniel Sykes, Esq. ....	1 0 0
Best Sow—To Mr. David Dickinson....	2 0 0
Second best ditto—To Mr. James Stephenson, of Arras.....	1 0 0
Best three-year old Coaching Colt—To Penrose, of Gribthorpe.....	3 0 0
Best two-year old ditto—To Mr. Wm. Watson.....	3 0 0

	£	s.	d.
Best yearling Coaching Gelding—To Mr. Robert Danby, of Routh . . . . .	2	0	0
Best three-year old Coaching Filly—To R. Denison, Esq. of Kilnwick Percy . . . . .	3	0	0
Best three-year old Hunting Colt—Ditto. . . . .	3	0	0
Best Stallion for getting Coach Horses—To Mr. Micheal Taylor, of Skerne . . . . .	5	0	0
Best Stallion for getting Hunters—To Messrs. Crump and Lee . . . . .	5	0	0
Best Stallion for getting Roadsters—To Mr. Phillip Ramsdale, of Market Weighton . . . . .	5	0	0
Best Stallion for getting Cart Horses—To Mr. Matthew Northgraves, of Sutton . . . . .	3	0	0
Best yearling Stallion Colt, by Merrylegs, (given by Robert Denison, Esq. of Kilnwick Percy)—To Mr. Joseph Hudson, of Hemsley . . . . .	5	0	0
Best foal by Commodore, (given by Mr. Witty, of Lund)—To Mr. Thomas Clark, of Watton . . . . .	1	0	0
Second best (given by Mr. George Witty, of Lund)—To Mr. Brandham, of Weel . . . . .	0	10	0

## SWEEPSTAKES.

Best Bull, 2 subscribers at 10s each—To Mr. R. Iverson, of Hedon.
Best Cow, 2 subscribers at 10s each—Mr. Edwards of Market-Weighton.
Best yearling Heifer, 3 subscribers at 10s each—R. F. Shawe, Esq. of Brantinghamthorpe.
Best Fat Steer under four years old—No competition.
Best aged Tup—No competition.
Best Shearling Tup, 6 subscribers at 10s each—Mr. Edwards of Market-Weighton.
Best Pen of Five Suckling Ewes—No competition.
Best Pen of Five Shearling Gimmers, for Breeding—No competition.
Best Pen of Five Wethers—No competition.
Best Pen of Five Shearling Wethers—No competition.
Best Boar, 2 subscribers at 10s each—Mr. D. Dickinson, of Patrington.
Best Sow, 4 subscribers at 10s each—Mr. D. Dickinson, of Patrington.
Best two-year old Coaching colt, 3 subscribers at 10s each—Mr. John Swaddle, of Killing-Graves.
Best three-year old Coaching Colt, bred by, or the bona fide property of the shewer twelve calendar months previous to the show; with 10 <i>l</i> added by James Hall, Esq. of Scarborough—No competition.
Best two-year old Coaching Filly, 4 subscribers at 10s each—Mr. William Hood, of Catwick.
Best three-year old Coaching Filly, 3 subscribers at 10s each—R. Dennison, Esq. of Kilnwick Percy.
Best two-year old Hunting Colt, 7 subscribers at 10s each—Mr. G. Scott, of Market-Weighton.
Best three-year old Hunting Colt, 2 subscribers at 10s—R. Dennison, Esq. of Kilnwick Percy.
Best Coaching Mare, 3 subscribers at 10s each—Mr. R. Stephenson, Hollym.
Best Hunting Mare, 3 subscribers at 10s each—Mr. Thomas Jackson, of Barmby-Moor.
Best Mare for Breeding Roadsters, 3 subscribers at 10s each—Mr. Wm. Lee.
Best Cart Mare, 5 subscribers at 10s each—Mr. Simpson, of Walkington.
Best Stallion for getting Coach Horses, 3 subscribers at 10s each—Mr. Michael Taylor, of Skerne.
Best Stallion for getting Hunters—No competition.
Best Stallion for getting Roadsters, 4 subscribers at 10s each—R. Dennison, Esq., Kilnwick Percy.

Best Stallion for getting Cart Horses—No competition.  
 Best Yearling Stallion Coaching Colt, 7 subscribers at 10s each—Mr. Isaac Hairsine, of Holme.  
 Best Yearling Colt by Napoleon le Grand, 3 subscribers of 10s each—with 5*l* added by James Hopkinson, Esq. of Billings-hill—Mr. W. Jackson, of Routh.

## DINNER.

In the afternoon, about four-hundred and fifty gentlemen, consisting principally of farmers, sat down to a cold dinner, at the Assembly Rooms.

RICHARD BETHELL, Esq. M. P. of Rise, the president of the association, occupied the chair, and we observed in the room a number of the leading gentry, magistrates, &c., of the neighbourhood. After the cloth was drawn—

The Chairman gave in succession—

The King.

The Queen.

The Princess Victoria, and the Royal Family.

The CHAIRMAN then said—Gentlemen, I have now the honour to propose to you, “The Agricultural Association of the East Riding of Yorkshire.” I can assure you it is with great satisfaction that I have had an opportunity on this day of meeting so many of you who are so deeply interested in the success of the association around this board. I regret that it has never been in my power to meet you before; but the duties which I have had to perform in the station I have held through your kindness, have hitherto prevented my attendance. (*Cheers.*) I need not say that the exhibition which I have seen this day, must be most gratifying to me, and to the country at large. I think I may say that no district of this kingdom can produce a show of the various descriptions of animals, which have this day signalized the system of breeding in this country, to equal the one which you have this day witnessed. (*Loud Cheers.*) I feel that I should be ill performing my duty to those gentlemen by whom I am surrounded, if I could upon this occasion encourage any feeling of despondency. Gentlemen, difficulties have, and may be felt, in the concerns of the agricultural interests of this country; but whilst I see the exertions which have been made in the stock which has been produced—whilst I see around me the gradual and constant improvements taking place, I will not despond of your interests. (*Cheers.*) There is, gentlemen, that energy and that buoyancy in the character of Englishmen, in whatever concerns they are engaged, which will, I am sure, gather strength even from momentary depression; and I know not why the same may not be predicated of you, who are engaged in so honourable and useful a pursuit as that of agriculture. Intimately associated as I am with the concerns of that interest, you may depend upon it nothing will ever be wanting on my part, which can by possibility promote its prosperity. I am sure I should make a bad claim upon your time, if, upon this occasion, I was to enter upon any long details of the benefits which arise from associations and meetings of this kind. I may be allowed, however, to mention, that nothing can be more desirable than that all the different grades of gentlemen, and of others who are engaged in the concerns of agriculture, should meet together upon those occasions. Such meetings tend to promote a kind, a friendly, and a courteous disposition between all ranks of the people;—(*Cheers*) and I trust that the information which is attained by mutual communication,

and by the opportunity that has been afforded to you this day of seeing such splendid instances of improvements in breeding in all its branches, will tend to the general benefit of the community. (*Cheers*). Perhaps I shall not wander out of the duty which is imposed upon me, if I take this opportunity of stating to you, that—as a law, which I trust will be highly beneficial to the community at large, has at this particular moment been brought under the notice of the country,—I felt it my duty to communicate with gentlemen who reside in districts of the kingdom, where the New Poor Law has been carried into complete execution, who state it is their general opinion that the greatest benefits have arisen from it, (*hear and applause*)—not only as diminishing the weight and amount of their poor-rates; but as having most materially improved the situation of the labouring classes. (*Cheers*) I am certain that no person whom I now see around me, would wish that so useful and meritorious a class of people should suffer for their private emolument—(*loud cheers*).—but I am assured by all who live in districts where the poor laws have been worse carried into effect than in any other part of the country, that the improvement produced has been most striking and beneficial. Fortunately in this county we have never known the existence of the evil, and therefore, I think we are in a peculiarly fortunate situation for the introduction of that law into this county. If it be tried with moderation, with temper, and with care, I have no doubt the same beneficial effects will be felt here. Gentlemen, it is not my intention, nor is it necessary that I should detain you upon this occasion. I am sure you are all deeply sensible of the benefits arising from meetings of this description; and indeed, the continued attendance you have given to-day proves that circumstance much more forcibly than anything I could adduce. I will now give you—

Prosperity and success to the Agricultural Association of the East Riding of Yorkshire. (3 times 3.)

The Hon CHARLES LANGDALE said—Gentlemen, I rise to propose to you a toast, and I do so with the greatest satisfaction to myself, and I am sure it will meet with the unanimous approbation of the present company. I feel a considerable degree of difficulty as to how to express myself with regard to the toast, because I know nothing so difficult as to speak in approbation of any gentleman in the presence of that individual. I am also sure that nothing is so painful to an ingenious mind as to have his public and private virtues brought forward as a subject of panegyric in his presence. (*Cheers*.) But, gentlemen, I feel myself relieved in a very great degree by the conviction that anything I could say would be wholly worse than useless upon the present occasion. I am about to propose to you the health of an individual who needs not any panegyric from me, to secure to the proposition of his health the full approbation of all who are now assembled together. (*Cheers*.) I will only at once say that I am about to propose the health of our president, Richard Bethell, Esq. (*Loud and continued cheers*.) Gentlemen, we all know the variety of different situations which he has filled as a public character. Upon an occasion of this sort it is very properly determined that anything of a political character shall be utterly excluded. (*Loud cheering*.) We are here met—men of all descriptions—men of all parties—Whigs and Tories—Conservatives and Radicals, (*Laughter and applause*),—and, therefore, when I pass over the high situation Mr. Bethell fills as the re-

presentative of the Riding, I do not mean in any way whatsoever on that account to disapprove as a public man of his conduct. (*Hear and cheers*.) I am sure, gentlemen, that in fulfilling the duties of that situation he is actuated by the same disinterested principle, the same high sense of duty—which actuates him in all his other relations of life. (*Cheers*.) Neither, gentlemen, is it my present object to bring him before you in the capacity which he so honourably to himself fulfils, in this immediate neighbourhood, as Chairman of the Quarter Sessions of the East-Riding. Those whose duty brings them into contact with him upon those occasions, feel how highly gratified they are by having such a chairman to assist them. But, gentlemen, on the present occasion it is more in his private individual character as a country gentleman,—it is as the friend of the farmer—as the patron and protector of agriculture,—it is, in fine, as the President of the Association of the East-Riding of Yorkshire, that I now beg you to do honour to this toast. (*Continued cheers*.) Gentlemen, I feel I should show bad taste myself, I feel that I should be doing an injustice to my honourable friend who is beside me—I should be doing an injustice to your feelings—were I to suppose it necessary that I should at any further length dilate upon this subject. I shall therefore no longer trespass upon your attention, but beg you will do honour—that honour which I am sure your feelings will prompt you to do—to the toast I now propose:—

The health of the President of the East-Riding Agricultural Association, Richard Bethell, Esq. (3 times 3, and “one cheer more.”)

Mr. BETHELL, on rising, was greeted with loud applause. He said—Gentlemen, there are moments which I am sure every person who has at all moved in public life must have experienced, when it is most difficult to give vent to the feelings which animate his breast. If ever that occasion has arisen, I am now placed in that situation. My honourable friend who has done me the honour of proposing my health, has accompanied it with remarks which I feel I am very little entitled to. I certainly have felt it my duty, placed in the situation in which I am, to endeavour, to the best of my abilities, to discharge the various duties arising out of it. If I have in any measure been able to fulfil them to the satisfaction of the country, I am amply—and more than amply—recompensed, (*loud cheers*) and I trust, gentlemen, that the expression of your favourable opinion will still encourage me to discharge those duties to the best of my abilities, as long as my health and strength will enable me to do so. (*Cheers*.) I trust, gentlemen, I shall often meet you upon these occasions, and that we shall hereafter have an opportunity of seeing the duties of the situation I now hold much more honourably, and much better, and more ably discharged. (*No*.)

The CHAIRMAN said he had now to propose a toast to which they should all pay due honour;—it was the health of those gentlemen who had on this occasion undertaken the very difficult situation of acting as judges. He trusted and believed they had performed that duty in a manner perfectly satisfactory to every gentleman present. It had been remarked in another place, that there were two classes of persons who were placed in a very invidious situation—the judges, and the successful candidates. He believed, however, from the feelings which prevailed there, that they were not placed in that situation,—that whilst the

were anxious to pay all due honour and respect to the opinion of the judges, those who had been so fortunate as to bear away the honours of the day would be judged by every person to be well deserving them, and he trusted no unkindly or bad feeling would be engendered. He gave—

The health of the Judges, and thanks to them for the manner in which they have discharged the onerous duties imposed upon them.

Mr. TAYLOR, of Burnham, (Lincolnshire,) returned thanks.

Mr. Wood, of North Dalton, proposed—

#### The Unsuccessful Candidates.

The CHAIRMAN said they were obliged to those gentlemen who had sent their stock, and though they had not been successful, it was some honour even "to fall from great attempts."

The Hon. CHAS. LANGDALE said, as an unsuccessful candidate he had to return thanks for the honour done to himself and his colleagues in drinking their health. He could answer for himself—and he thought he might answer for his colleagues—that however happy they might have been to receive the prizes for their different produce, yet they felt no degree of jealousy at seeing the premiums distributed to animals more deserving of approbation. (*Applause.*) For himself he must say, that in bringing animals to the show, it was not so much from a desire to gain the premiums, as from a wish to give animation and spirit to the scene. (*Applause.*) He believed there had been but one opinion as to the impartiality of the judges. (*Applause.*)

J. R. PEASE, Esq., said—Mr. Chairman, with your permission, and that of this company, I beg leave to propose a toast. We have been greatly indebted, while you were absent in London, attending your parliamentary duties, to a gentleman who has more than once fulfilled the duties of president; and I think we should ill discharge our duty, if we did not take this opportunity of returning him publicly our thanks, and drinking his health. I beg to propose—

The health of the Rev. Wm. Gilby (3 times 3.)

The Rev. W. R. GILBY said—Gentlemen, I beg to thank you for the honour you have just done me—it was totally unexpected by me, and it has fallen upon me absolutely like a thunder-clap. I did not think I should be called for an instant from my place on this occasion. I have, it is true, been instrumental in the formation of the society; and delighted I am, when I review the past, to see to what an issue our, at first, feeble efforts, have now come, in the splendid spectacle of the company before us on this occasion. It is very true, gentlemen, that I have felt most deeply for this association, I trust that I have not been altogether an inactive member of this association, in endeavouring first of all to nurse it under its swaddling clothes, to bring it forth to its youth, and now my honourable friend Mr. Bethell—whom I delight to see in his place—has the delightful scene to-day, of witnessing it in its full manhood. (*Applause.*) Gentlemen, anxiously have I looked for this year. (*Cheers.*) There is no need now of exhortation; the time has come when we view and see our success—when, instead of being a small body doubtful as to whether we could stand for a single year, here we are, upon—I will not say a par—but with the full challenge of all England to match with the stock we produce. (*Loud cheers.*) Yes, it is indeed most gratifying

to think that the few gentlemen who joined me, and who are now, with me, going out of office, should, in these few years—three short years—be enabled to offer to your notice such a scene as was presented on the entrance to Westwood to-day; where many of the gentry of the county, and numbers of the finest and boldest yeomanry any portion of England can boast, were assembled. (*Cheers.*) Gentlemen, under these circumstances, I am delighted to see that our offices are about to pass into the hands of individuals who, I am sure, will feel no less zeal than those who have nurtured the infant institution,—who will feel incumbent upon them the strong duty of not letting it abate a single instant of its splendour and efficiency, but who will carry it on, and see the landed interest protected in all its powers and vigour. Gentlemen, when we commenced our association, we were in a state of depression; we were threatened with repeals of the corn laws; on all hands—throughout all parts of the country—petitions were sent up against us, and it was on the ground of defence only that we started before you, to ask for union and defence in behalf of your common interests, and that you should not be borne down by base and vulgar cries. Gentlemen, your voice has been heard, and not a whisper has been uttered within the walls of parliament for these two last sessions, which has dared to breathe a word against your undoubted rights and privileges. If that whisper comes, be straightway at your posts, as men who, though asleep, have their arms beside them. (*Cheers.*) The hour of depression, I hope, is passing away. At our first meeting, we had to lament it; at our second meeting, we had still further to lament the increase of that depression; but I hope that now the times are brightening upon you, and you can enjoy your cheerful glass amongst us this evening without the dark forebodings which were upon us before. (*Cheers.*) But when I say that, what can I do other than compliment you?—compliment you, did I say? nay, I would rather view your conduct as an instance to render me more proud of my country! Shall we not be proud of the splendid energy, the indomitable perseverance, which has maintained this the best part of our population—the great sinews of our land? (*Cheers.*) You have yielded to no despondence and fears, but you have gone bravely on through all the worst times of depression, not yielding when the times actually pressed most your stock, your land, or your agriculture; and here you are, just coming out of those times, more splendid in your display of stock than ever you have been before. (*Applause.*) Yes, gentlemen, after scenes, and after such circumstances, an Englishman may well boast of being proud of his country, and I am indeed delighted to have met you on this occasion. All now looks better around us; the agricultural interest looks up, and this day all is congratulation—all is triumph—with respect to our association. Let us go on and prosper; let us keep the line to which we have adhered; let us steer clear of every object, but that main one—the encouragement of agriculture, and the stern undeviating protection of its interests. Act upon parliament as you have a right to act—through your representatives—through such representatives as you have—through such representatives as, I trust you will ever maintain, the stern unflinching friends of the farmer, and you will prevail—your interests will remain steady and unshaken. (*Loud cheers.*) With these sentiments I sit down. You may depend upon it, that

while breath breathes in this body, the same sentiments will ever animate me—the same feeling on behalf of the farmer—the same resolution to attempt, in every way, to unite him against all efforts which would compromise his interests. (*Loud cheers.*)

The CHAIRMAN gave—

The successful Candidates.

R. F. SHAW, Esq., of Brantingham, returned thanks. He stated that it was his intention to return to the society the premiums he had received. He suggested that a handsome premium should be given to any person who invented a machine of any description useful for agriculture.

The CHAIRMAN said it now became his duty to propose the health of the gentleman who had been selected to fill the important office he now held. He was sure every gentleman feeling any interest in the prosperity of agriculture would heartily join with him in applauding the selection made for the ensuing three years. He gave—

The health of the Hon. C. Langdale, President of the Association for the ensuing three years. (*Three times three.*)

The Hon. C. LANGDALE acknowledged the toast in a long address, which from a press of other matter we are unable to report at any length. A gentleman at some distance from him (Mr. Gilby) had stated the reasons for which this institution was first established. They knew that all other branches of the community had their associations, and were enabled to act more in unison than the agricultural interest. The agriculturists were dispersed over a large extent of country, and it particularly behoved them to form associations of this description. He was one who believed that the interests of the manufacturing, commercial, and agricultural classes were intimately connected. The speaker directed the attention of the meeting to the enquiries which had been conducted before a committee of the House of Commons into the alleged grievances of the farmers. That committee had closed their labours without making any report—without expressing an opinion one way or the other. The conclusion he drew from this was not that the committee found no remedy could be devised, but that their opinions were so different that no part of the committee was strong enough to draw up any specific plan of relief. He observed that an immense body of evidence had been laid before the committee, and he suggested that the more important parts of that evidence should be published for the perusal of farmers and those connected with agriculture.

DAVID BURTON, Esq., of Cherry Burton, gave—

The health of Robert Denison, Esq., Vice-President of the East Riding Agricultural Association for the ensuing three years.

ROBERT DENISON, Esq., said he thanked them for the very kind and indulgent manner in which they had drunk his health. As one of the vice-presidents for the next year, he felt that he, as well as those with whom he was associated, would succeed those whom they could never hope to emulate. It was their predecessors who had carried through the arduous undertaking in which they had been engaged, and it would be to himself and colleagues not a work of trouble, but one of ease and of pleasure. (*Applause.*) Not having been in parliament—(*laughter*)—he was not able—nor did he wish so to do—to introduce to their notice anything about what parliament might do for them; but if any one could mention any subjects

that would be of benefit to the farmer as a private individual, those were the topics to be admitted at such meetings as the present. He wished it, however, to be understood, that he did not mean to say that they ought not to hear everything that could be alluded to in regard to the agricultural interest as a public concern. He would suggest that the lists of candidates for premiums should be closed sometime before the annual meeting—say a month—which would prevent much inconvenience to the candidates. He thought that was a subject which should be taken into the consideration of the committee. He could only say the existing rule had hindered him from bringing some stock, because he did not know whether there would be any animals to compete with them. He thought a very good resolution had been passed by the committee to-day—that of not allowing any person to receive a premium for the same animal twice. Mr. D. then observed—"I have travelled a good deal lately, and in noticing agriculture in some counties I saw one point which I thought might be of benefit to the agriculturists of the East Riding—that is, the power of sowing winter tares in the warmer soils directly the wheat crop is taken off. As far as my humble opinion goes, the best way of getting that, would be to plough the stubble up the moment the wheat is got out, then to work it with the presser, and then to sow the tares; if the management is not sufficient, the light expense of sowing these tares would bring them sufficiently forward for sheep-stock to be fed upon them, and you could get your turnip-crop afterwards. Where the soil is sufficiently warm to enable you to do it, it would give such an enormous increase of food for sheep in the East Riding, as you have very little idea of." There was another point he would allude to. He certainly never thought that he should have entered into competition with a person who had done so much in improving implements of husbandry, as Mr. Crosskill, of Beverley. He was delighted to hear the proposal of Mr. Shawe to give a premium for the most useful implement of agriculture, and he would challenge Mr. Crosskill himself, and try if he could not invent something to surpass him,—(*laughter and cheers*)—he would here challenge Mr. Crosskill, for he was determined to produce something, and if it was unworthy of their notice they might laugh at him. (*Cheers and laughter.*)

The Rev. W. R. GILBY, said, he had heard that one or two observations had been made that in his previous address, when he mentioned the corn laws, he was touching upon politics. (*No, no.*) He contended that was a subject directly connected with the agricultural interests, and the sole object in forming this association was for their protection, and for the expression of their sentiments on such questions as this. He was persuaded that question is not dead, but sleepeth; it will be revived whenever an opportunity arises. Before he concluded, he wished to give a toast—the health of the committee, by whose labours, and with whose aid they had carried the association to its present summit. He hoped and trusted it would still continue to flourish, not only as showing the fairest results of agriculture, but as one of the sternest and most determined protectors of the agricultural interest. He gave—

The health of the Committee.

The CHAIRMAN said he had a toast to propose, which he was sure they would all drink with due honour; it was the health of an officer of great importance to the association. He gave—

The health of the Secretary, J. B. Bainton, Esq.,  
(*Three times three.*)

J. B. BAINTON, Esq., said—He was sure he should be very much devoid of feeling if he did not rise immediately, after the spontaneous manner in which his health had been drunk. So far as his exertions had gone, he had endeavoured to do what had been consistent with the feelings of the association. If any merit at all was due to any persons, it was to the Committee of the Association, and not to himself. He had only endeavoured to follow up the recommendations of the committee, and if in doing so he had met with their approbation, he was most thankful. (*Cheers.*)

E. W. SMITH, Esq., of Routh, said he had not intended to address them, but he could not let Mr. Gilby depart from the room, with the impression on his mind that he had said anything contrary to the rules of the association. When he (Mr. Gilby) touched upon the corn laws, he touched upon the very corner stone on which the association was founded. When they met here year after year they could not but see that every year the association was rising in consequence, although at the outset many persons tried to cast upon it a political stigma; and though many of the landowners, and others who should have joined them, held aloof, and treated it with apathy and shyness, yet he thought the time had now arrived when they would see these gentlemen join the association with joy and gladness; and more particularly when they saw the selection this day made of a president and a vice-president, for the ensuing three years. Politics could no longer be said to be the guide of their foot-steps, for they had now got for their president and vice-president two gentlemen, who in politics were diametrically opposed to each other. (*Cheers.*)—He was sure, however, the meeting would agree with him in saying that both those gentlemen were good landlords—that they both had the interests of the farmer and of the labourer at heart—and that they would take care to have the interests of the landowner at heart too. They might therefore confidently hope that when those who had hitherto held themselves aloof from the association saw that they steered clear of all political animosities, they would enrol themselves as members of the association. He was sure that no mere visionary speculator of the day could get up and taunt them by asking—“Where is your distress, or your call for inquiry?” They had shewn their strength by their complaints and petitions; the legislature had considered them a body worthy of notice; and as long as they made their appeals through such associations as this, so long would they have a voice in the country. Such men, when they taunted the agriculturists, taunted them without a cause. It was through the able assistance of Mr. Gilby that this society was so well formed. On behalf of the meeting he apologised to Mr. Gilby for the observations said to have been made respecting his speech.

The Chairman quitted the room soon after seven o'clock, and the company separated soon afterwards.

ROBERT DENISON, Esq., of Kilwick Percy, gave a premium of 5*l*. for the best yearling roadster stallion colt, by Merrylegs exhibited at the show next year. John Greame, Esq., returned the sum of 5*l*. from the premiums which he obtained, and Daniel Sykes, Esq., returned the sum of 1*l*. a premium awarded to him, to be applied to the general purposes of the association. R. F.

Shawe, Esq. of Brantingham Thorpe, returned the premiums awarded to him, to be presented to the individual who shall invent the most useful piece of machinery applicable to agricultural purposes.

After the splendid show of stock produced by the East Riding Agricultural Association on this occasion, we may venture to predict an equal, if not an increasing, excellence in the show of the next year.

## ON WOOD-EVIL, OR PANTAS, AND MOOR-ILL.

BY MR. W. COX, LEEK, STAFFORDSHIRE.

(*From the Veterinarian.*)

I have been on the look-out for some time, for a distinction in *The Veterinarian*, between those diseases in cattle called the wood-evil and moor-ill: I am not aware that a proper one has hitherto been drawn by any writer. For this reason I am induced to take up my pen, not only because I flatter myself that I am able to give a few hints as to the causes, symptoms, and method of cure of the above diseases, but with an intention to rouse a spirit of inquiry amongst my intelligent veterinary brethren, and particularly among those of the northern districts.

THE WOOD-EVIL, OR PANTAS.—This disorder is most prevalent in woody districts, or low meadow or pasture land, where there are many crabs and black willow trees, which the cattle will sometimes eat with greediness, and become obstinately sapped. I have one case in particular in my memory, in which it took nearly four pounds of Epsom salts in order to open the bowels: many also of the cattle that had eaten of the willows required almost as much to purge them.

THE MOOR-ILL.—This disease is wholly confined to moors, and commons, and poor lands. It is very prevalent in the north of Staffordshire, and is called by some farmers, the over-country disorder.

As to the cause of this complaint there is a great variety of opinions among the farmers; some say it comes on in the winter, and trace it to the hay being mixed with a herb in it, which is called mountain flax: others say that the fault is in the water: other very intelligent farmers tell me that they have watched it very closely for some years, and that it always begins in the summer, and more so in dry summers, when the beast does not obtain sufficient nourishment to supply the wants of nature. This disease is nearly or wholly confined to milch cows.

*Symptoms.*—The first appearance of it is a kind of grunting, to which succeeds a stiffness of the limbs and body, and mostly of the fore extremities and thorax. Sometimes the cow will be one whole mass of stiffness, and her joints will rattle when she walks, like the breaking of rotten sticks. The pulse is seldom much affected, the appetite not at all, and the milk is little, if at all, diminished in quantity or quality. There is no swelling of any part; and thus the beast will remain month after month, and sometimes year after year, if a cure is not effected.

As to the cure, bleeding and purging have always been found injurious. A seton of hellebore in the dewlap, and one purge mingled with some diuretic medicine, should lay the foundation for that tonic or cordial plan which will always have the desired effect, providing the beast is removed

to a better situation. A cow that has once had this complaint will be liable to a relapse if returned to her old situation and exposed to the same exciting causes.

Will not some of our country correspondents accept the challenge, and prove whether Mr. Cox is right or wrong in the distinction which he draws? It is an important subject, and, if we mistake not, one that is much misunderstood.—EDIT.

### RECEPTION OF THE DUKE OF RICHMOND ON HIS SCOTCH ESTATES.

Tuesday was a gala day at Huntly. At an early hour the town presented a lively appearance. The inhabitants and a great concourse of strangers were, about mid-day, seen wending their way toward the Battle-hill, to wait the arrival of his Grace the Duke of Lennox and Richmond. His Grace's tenantry of the Aberdeenshire estates rode about five miles to meet his Grace; then drew up in line, we think, at Newtongary. On his arrival there the President of the Strathbogie Club, Mr. Stewart, said, "My Lord Duke, we are now on the eastern boundaries of your Grace's possessions in Aberdeenshire. I, as President of the Strathbogie Club, accompanied by the Vice-President and Secretary, and deputed by the tenantry in your Aberdeenshire estates, beg to be permitted to read to your Grace this address from them":—

TO HIS GRACE THE DUKE OF RICHMOND, &c. &c. &c.

We, your Grace's tenants of your estates of Aberdeenshire, approach your Grace for the purpose of offering our sincere and hearty welcome upon your first arrival among us as our landlord.

Many of us were born and have grown old under the protection of the family of Gordon. Our fathers have enjoyed their friendship and support; and while we experience unfeigned and deep regret for the loss we have lately sustained, at the same time we cannot fail to express the confidence with which we hail, as our future landlord, a nobleman so deservedly high in the estimation of his country.

Not with expressions of adulation, but with feelings of sincere respect, we approach your Grace, looking forward to a continuation of the bond of union which has connected us with our former landlords, with an earnest desire to cherish towards your Grace and family the same attachment which we entertained towards that branch of your ancestors under which we have lived.

We would beg permission to offer our most respectful welcome to her Grace the Duchess of Richmond and your family.—23d August 1836.

The President further said: "My Lord Duke, regard for the feelings and respect for the memory of your Grace's noble relative, the late lamented Duke of Gordon, prevent us formally from giving expression to our feelings in any other way than by offering this respect and welcome, which your Grace may be assured is not the less sincere on that account."

The tenantry then filed past, and formed behind the train of carriages. The following is the order in which the procession arrived on the square of Huntly:—The inhabitants of the town and neighbourhood four abreast on foot. They marched round the market-place; then formed a hollow square, Captain Gordon, of the Royal Artillery, and the Rev. Mr. Walker, standing in the centre. A party of soldiers, in full uniform, marching two abreast, followed next, and immediately in front of his Grace's carriage. On its arrival at the centre of the square Dr. Bremner presented the following address:—

TO HIS GRACE CHARLES GORDON LENNOX, DUKE OF LENNOX AND RICHMOND, K. G., &c.

We, the feuars and inhabitants of Huntly, beg to offer your Grace our sincere congratulations on this your first visit to your extensive and valuable domains in this part of the kingdom.

Yet we cannot refrain here from expressing to your Grace our feelings of deep regret for the loss of your noble relative, George, the last Duke of Gordon, our late superior.

Confident, however, that we welcome in his successor a nobleman every way worthy of the line from which he is descended, we would assure your Grace that the feuars and inhabitants of Huntly shall always feel proud to stand in that relation towards you and your family which cordiality of feeling, and unity of purpose render alike honourable and advantageous to all parties.

We would likewise beg to convey our respectful welcome to her Grace the Duchess of Richmond and the other members of your noble family.

In name and by the appointment of the feuars and inhabitants of Huntly. J. BREMNER.

His Grace, addressing himself to Dr. Bremner said—"Sir, it is with much pleasure I receive this address, and I beg to assure you that it will ever afford me great happiness to meet the people of Huntly on all occasions. This is a day of pride and satisfaction to me, the more so when I see so many smiling faces around me, and I trust we shall often meet, and under as happy auspices as we have done on the present occasion." His Grace then alluded to the late Duke of Gordon and said that, "he would ever make it his endeavour to ameliorate the condition of his tenantry." The procession moved on again; the tenantry mounted on horseback to the number of about 400 brought up the rear. They rode three abreast. In front of the Royal Oak there appeared what we supposed a representation of the tree of Liberty. At the southern entrance to the market-place there was a triumphal arch, with the word "Lennox" fancifully formed of flowers, and a similar one with the word "Richmond." The tenants having escorted the Duke to the north-western boundaries of his Aberdeenshire estates, Mr. Stewart of Cocklarachie, in a short speech, begged, in the name of the others, to take leave.

In the evening there was a dinner, to which about 200 sat down; James Stewart, of Cocklarachie, in the chair. The greatest cordiality and good feeling prevailed throughout the evening.

BRISTOL.—BRITISH ASSOCIATION.—At Section D (Zoology and Botany), held at Colston's School, the commencement of a paper was read from Dr. Richardson, on the Zoology of North America; and from Mr. Rootsey a description, accompanied with a living specimen, of the *aranea avicularia*, a monstrous species of spider, that sometimes entraps small birds, brought over alive from South America amongst logwood. The same gentleman also communicated some observations on the growth of mangel wurzel, with the mode of obtaining sugar and malt from it, considering that there were certain geological situations particularly fitted for its growth to the extent of about 500,000 acres in the kingdom. A specimen of sugar candy, from the *rhododendron ponticum*, was likewise exhibited, and some observations were read from Mr. Webb Hall, descriptive of the acceleration of growth in wheat on light silicious sands, by exposing them to heat in water; and Dr. Daubeney described some effects of arsenical compounds in vegetation, and on the growth of wheat in soils in which this was largely impregnated.

ENTOMOLOGICAL SOCIETY.—The ordinary meeting was held on Monday evening, when an interesting conversation took place on the ravages of a new species of aphid, described as a new blight by the market-gardeners in the vicinity of the metropolis, which attacked principally the cabbage and brocoli plants. In the course of the observations, it was stated that the best remedy that had been proved was equal parts of an infusion of tobacco and lime-water, frequently injected over the plants. Some account was also given of the new silk-worm, recently introduced to the notice of the members; and a memoir was read upon some Indian insects, in a letter addressed by Mr. Benson to Mr. Kirby.

**A CURE FOR THE SMUT IN WHEAT.**

The following experiments in the preparation of wheat for seed from a *mutty sample*, were made on the 15th of October, 1835, in the middle of an eight acre field—a clover layer. The results have been communicated to us by Mr. Smyth Lungley, of Church Hall, Kelvedon. We have no doubt but the information thus conveyed will be acceptable to our agricultural readers, coming as it does from an authority so highly respectable:—

No. 1.—Washed three times in clean water, and skimmed every time, then dipped in wood-ashes lees with 2lb of arsenic boiled in 20 gallons of the liquor, after which, the wheat well limed and sown. No bladders or smutty ears.

No. 2.—Not washed; steeped in the liquor and skimmed, and well limed. About 1,500 bladdered or smutty ears to the acre.

No. 3.—Not washed; wetted with lees and no arsenic, but *sulled* instead, and limed. About 2,250 smutty ears to the acre.

No. 4.—Washed as the first, in three clean waters; no arsenic, no salt, but dipped in the lees, and well limed. About 2,250 smutty ears to the acre, the same as No. 3.

No. 5.—Steeped in lees only for about four hours and limed; not washed; nor any arsenic or salt. About 4,500 smutty ears to the acre.

No. 6.—Sown *perfectly* dry. About 11,500 smutty ears to the acre.

No. 7.—The seed wheat rubbed well in the hands with a quantity of bladders or smut balls, of course not washed, but dipped in the lees and arsenic, and well limed. About 18,750 smutty ears to the acre.

No. 1. ....	0	.....	smutty ears.
2. ....	1,500	.....	ditto.
3. ....	2,250	.....	ditto.
4. ....	2,250	.....	ditto.
5. ....	4,500	.....	ditto.
6. ....	11,500	.....	ditto.
7. ....	18,750	.....	ditto.

250 average ears of wheat threshed is a pint measure.

- No. 1.—No loss or waste or damage by smut.
- 2.—5½ pints loss per acre, and wheat injured.
- 3.—11 ditto ..... ditto.
- 4.—11 ditto ..... ditto.
- 5.—22 ditto ..... ditto.
- 6.—36 ditto ..... ditto.
- 7.—67 ditto loss to the acre, or about one bushel, and wheat much injured.

In the field where the experiment was tried, there were 750 sheaves to the acre on the average. The smutty ears were gleaned from several sheaves, which in No. 7, averaged about 25 smutty ears to the sheaf, which makes the above quantity. The other sheaves were gleaned accordingly.

It is not the loss of smutty wheat altogether (which amounts to a bushel in No. 7) but the damage done to the wheat that goes to market. When good wheat is worth 12/ 10s per load, if wheat is much smutty it will lessen the value 50s a load.

In some fields this year from 50 to 100 smutty ears may be gleaned out of one sheaf; that is from two to four bushels per acre waste.

**GAMBIA GOOSE.**—A new section has been formed in the sub-genus *Anas*, by M. de la Fresnaye, having for its type the Gambia goose, or the goose with a double spur. Baron Cuvier had already observed that, in the genus *Anas*, there were some birds, who, to the beak of a duck, joined legs higher than those of a goose, and who perched and built their nests upon trees. Having, however, only seen them after being stuffed, and not having been able to get information respecting their habits, he did not separate them from the rest. It is now known that the Gambia goose is much more

slender, and rises higher from the ground than a swan, a goose, or a duck; it perches on trees, is a courageous and even fierce bird, and, when irritated, it opens its wings and strikes with its spurs. When it swims, the shortness of its sternum in front, joined to the length of its legs, forces it to plunge the fore part of the body and the base of the neck deep into the water, so that the water flows over its back. Its beak is flattened and spatula shaped, like that of the duck or swan; it does not graze like the goose, but seeks the banks and shallow parts of rivers or ponds, where it delights in dabbling like a duck. It is neither swan, goose, nor duck, but approaches nearest to the duck; its feet are semi-palmated.—M. de la Fresnaye proposes to call this section *Cuadrus Echassiers*, or *Anatigralle*, and to place it at the head of the Palmipedes, and after the Flamingos and Avosets.

**THE MOSS ROSE.**—Very little faith is to be placed in the assertions of persons ignorant of gardening and botany, as to the date of the introduction of particular plants; as a proof of which may be given the remarkable fact, that Madam de Genlis, when she was in England, saw the moss rose for the first time in her life; and, when she returned, took a plant with her to Paris, in order to introduce it into France; though the fact is, that it was originated in Provence. The musk rose, Hakluyt tells us, in 1592, was first obtained from Italy; and it also was common in the time of Gerard. The single yellow rose was known to Gerard, but not the double, which was brought to England from Syria before 1629.—*Arboretum Britannicum*.

**TENACITY OF LIFE IN PLANTS.**—The roots of many plants are very tenacious of life, and intense temperatures do not destroy their vitality: the roots of the *river agnus castus* will not be affected though immersed in boiling water; and boiling water may in many instances be applied to the roots of plants without injury. Again, if a mass of roots be divided into two parcels, acetate of lead in solution being absorbed on one side may be evolved again by the second parcel on the other side. Certain plants may absorb some poisons by their roots with impunity, which would be destructive to others.—*The Naturalist*.

**GIGANTIC CORN.**—On the farm of Mr. W. Atkinson of Kilmore, near Richhill, six stalks of corn, this season, sprung from a single grain of seed, each stalk measuring about six feet in length, and the whole containing 475 grains of corn, being the produce of the one original seed! The entire field from which this gigantic stalk has been taken was sown with the old Irish Potatoe Oats in the beginning of March last, and the crop is in general of the height mentioned. The field in question was nearly barren some years ago, but through the management and superior skill of its owner, it has been brought to its present state of fertility. The extraordinary specimen above referred to has been left at our office for inspection.—*Belfast News Letter*.

**IMPORTANT DECISION OF THE POOR LAW COMMISSIONERS.**—A decision, which deserves publicity, has been recently made by the Poor Law Commissioners. A pauper of the parish of Chilton, in the Hungerford Union, who had for the last ten years received regular weekly parochial pay, had resided during the whole of that period with the approbation of the overseers of Chilton, with her daughter, in the parish of Huish, in the Pewsey Union. *Up to the day of her death*, the pay was continued by order of the Hungerford Guardians; who, however, declined to defray, or in any way to contribute to, the expenses attending the *burial* of the deceased pauper. The case has been laid before the Poor Law Commissioners, who state, that the conduct of the Hungerford Union, with respect to the pauper in question, as regards burial, "entirely accords with the Commissioners' views;" thus leaving the burial of all paupers to those parishes in which their decease shall have happened.

## ON BREAKING YOUNG HORSES.

No irritable or passionate person should be employed in forming the rudiments of the education of the horse:—whoever undertakes the business of horse-breaking should be systematically cool and deliberate: further, he should possess a tolerably accurate knowledge of the nature or physiological disposition of the animal which he undertakes to instruct, and to reduce to the servitude of man. I am well aware that horse breaking is generally placed in the hands of men whose education is not sufficient to enlarge or elevate their intellect; yet, after having served an apprenticeship or two in the stable, they would be dull and stupid indeed, if they could not form a tolerable notion of what I have just stated. However, if a horse-breaker could be found whose education raised him above mediocrity, I should prefer him, since the human understanding cannot fail to derive essential assistance from the science of philosophy.

The temper of the horse, like that of the breaker, is an important object of consideration: in which there is as great a variety as in human nature. And, as like produces like, good and bad temper will be frequently found to descend from the progenitors to the offspring. Hence it will be very easily perceived, that in the operations of horse-breaking, the temper and disposition of the animal should be well considered, and the mode of proceeding influenced accordingly—always bearing in mind, however, that severity or coercion is never to be called into action, when the object can be effectively accomplished by persevering mildness.

I have frequently seen professed horse-breakers placed upon the back of a restive horse for the purpose of curing him of such an unpleasant vice. The man has displayed much boldness, but no science; by mere dint of whip and spur he has, at length, compelled the horse to submit; whereas had he understood the correct operation of the hands—had he been aware of the masterly and effective manœuvre of twisting the horse round, he would not only have accomplished the object in a quarter of the time, but with much less danger, and with infinitely more effect. A friend of mine applied to a professed horse-breaker, in a small market town, in Lancashire, respecting a restive mare which had fallen into his hands. The breaker advised him to sell her for any price, as he said it “would get all the flesh off her bones, by knocking her about, to cure her!”

It is stated by naturalists that the horse does not arrive at complete maturity till he is seven years old—the mare a year earlier, which is correct: and, although I am a strong advocate for commencing the education of the horse at an early period, I would by no means have him put to great or severe exertions till he has acquired sufficient strength to go through them without injury to himself.

When the foal is weaned, I would begin to handle him. Being placed in an open stable or building (if with other steady horses so much the better,) I would visit him frequently with hay or corn and water; he should be approached with the greatest mildness and caution, so as to neutralize or subdue his fear and jealousy and render him familiar. If there be any old horses with him, they may be fed from the hand, which will be a great inducement for the foal to partake with them. He will approach with jealous caution, and therefore you should be mindful not to alarm him. Proceeding with gentleness, in a few days, he will allow you to pat and caress him, and at length to place a halter on his head, which must be accomplished by the use of a soothing tone, coaxing, and caresses: nothing should be attempted in haste, nor the least harshness employed in any form. At the same time it is necessary to remark, that the animal should not be rendered a sort of pet by continual caresses, or he will be more difficult to manage afterwards. The foal should be treated with all possible mildness, but never played with. The head of the halter which is placed upon the foal should be formed of web, which will be easier than cord. He may be led a little in it, but the halter should not be taken off, or at least the head of it, but so secured as to be perfectly easy and no way to incommode the animal. As soon as he leads pleasantly, I would remove the halter from his head.

When the foal became a year old he may be bitted and ridden by a *feather*, (that is, a very light lad) but not ridden violently; and if he afterwards take occasional exercise of this sort, he will give much less trouble afterwards in completing his education.

In general, however, young horses are not broke till they are two years old, and at this period they ought not to be put to severe exertion. I am aware it is the custom to work them at this age, and hence arises splents, curbs, &c., so that comparatively few horses are met with whose legs are perfect.

When it is deemed necessary to break the colt, a cavisson must be placed on his head. The cavisson should have an iron nose band, having a joint in the centre, and a loop to which the rein is buckled. The edges of the band, on each side the joint, are turned in, a little serrated, and operate severely if the horse makes resistance: two other joints, one on each side, from which the iron part is continued smooth and flat, from three to five inches, according to the size of the cavisson: at the termination of which there are eyes for the purpose of fixing a leather strap on the near side, and a buckle on the off side, which buckles under the jaw: two other eyes are made in the iron strap, close to the joint for fixing the head stall. A rein, twelve or fifteen feet in length, is fastened by a buckle to the nose-band.

Proceed to put on the cavisson with all the coaxing and gentleness already mentioned

for the halter; and in order that you may not disgust the colt, and cause him to take a dislike to you, do not plague or tease him too long at a time.

When the cavison is properly adjusted, if the colt should endeavour to disengage himself, you can hold him securely by the cavison rein, but avoid if possible, inducing him to make any such attempt. You may lead him, holding the rein short in your right hand, which should be done by coaxing rather than compulsion, and you should often stop and caress him. But, should he endeavour to disengage himself, you must be prepared to hold him fast, and sufficiently short that he cannot turn his hind quarters towards you, lest you should not be able to hold him. Keep his side towards you, and he cannot disengage himself. Avoid irritating or provoking him, and in a short time he will run round you at the extremity of the longeing rein. Use him with all gentleness, and when he proceeds pleasantly load him with caresses. Never provoke him to resistance; and should his temper become ruffled, seem to take no notice of it, and his irritation will soon subside.

Thus continue, letting him work round you for a few days; but be careful of fatiguing him too much. He will soon become sufficiently familiar to allow you to put on the longeing tackle without much difficulty.

Placing the crupper under the dock requires great caution. Place yourself forward, raise the dock with your right hand, and pass the crupper under the tail, letting the tail down gently, lest he commence kicking. Buckle the crupper that it may not be removed, and adjust it properly. The longeing tackle\* should not be drawn too tight at first, and should be frequently moved and adjusted (though it may be quite correct) for the purpose of accustoming the colt to it, and rendering him steady.

Work him in circles in the slow trot, and urge him not beyond his own inclination. Work him to both hands, and for this purpose, stop him frequently, and on these occasions soothe and caress him.

Young horses are generally longed in the open air—a school or building with a clay floor is preferable if such a place can be conveniently obtained: otherwise, good level elastic turf.†

When the colt has become accustomed to his tackle, the reins should be shortened by degrees, till the head becomes properly placed; that is, his nose should not be brought to his chest, nor yet carried poking out; common sense must be used on these

occasions. Attention must be paid to the form of the animal, and also to his mode of going. If the colt's shoulders are placed well back, possess the true declining position, his neck long and arched, he can scarcely avoid carrying his head in a correct and beautiful position. If the shoulder be too upright the forehead will be low; if the neck be short and straight, the nose will be carried high, consequently, the more awkward the form, the more judgment will it require to place the head properly. Let it be well remembered, however, that nature points out the situation in which every horse should carry his head, and therefore the restraints or alterations imposed by art should never counteract her efforts, nor indeed exercise even a preponderating influence. Let nature and art go hand in hand. The head cannot be properly elevated in the longe, but it may be too much drawn down, which should be cautiously avoided.

The *cross-tree* is a useful instrument, inasmuch as it enables the breaker to place the head of the animal with the greatest ease and the greatest nicety; it is much more effective than the common method. However, it ought never to be forgotten, as I have already observed, that nature and art should go hand in hand. The head should be brought into place gradually; and where the animal happens to be thick in the upper part of the throat, (where the head and neck join) nature should be accommodated accordingly—his nose should not be too much drawn in, lest *roaring* (and perhaps other disease) be the consequence. Where a horse happens to be thick in the part just noticed, he must be suffered to carry his head accordingly.

Be mindful to keep him in a true and regular trot, letting him extend his pace by degrees, and invite him to raise his head by occasionally shaking the longeing reins, particularly if you observe that he lolls his head down, bearing on the bit. Let the lash of the whip follow him to press him on, but not to urge him to the gallop. When you throw the lash at his hind quarters, let it be done lightly, and if he kicks at it, give him the lash smartly to make him sensible of having done wrong.

The precise time for mounting a colt cannot be described, as this will mainly depend on the disposition of the animal; but as soon as he becomes familiar to handle, and works freely in the longe, he may be mounted. But for a few days previously he should be longed with the saddle on his back, that he may be accustomed to it. When you stop or halt for the purpose of changing or altering the reins, &c., embrace the opportunity of patting the saddle, pulling the stirrup-leathers, &c. &c., and as soon as he appears reconciled to the saddle, and the dangling of the stirrups, he may be mounted.

Prepare to mount by taking the reins and a lock of the mane in your hand, and handling the stirrup. If he moves, coax him with all gentleness till you induce him to stand quiet.

\* The longeing tackle consists of the bridle and running reins, the roller and crupper.

† If horses go too near the ground, and be thus liable to come down, longeing them upon a rough ploughed field will induce them to raise their feet and go safe. But this is not recommended in breaking a colt, as it would be too fatiguing; he would be also liable to strike the inner fore feet against the outer, and cause splents, &c.

If you proceed in a proper manner, he will, by degrees, allow you to place your foot in the stirrup, and to stand upright in it, for which you must not fail to caress him. Repeat this till he seems perfectly reconciled to it, when he may be completely mounted. For this purpose you will require assistance, and commence by longeing the colt, and continue till he works cool and steady. Let the assistant place himself before the head of the colt, having the longeing whip in his left hand, and the cavison rein coiled in it also; and let him soothe and caress him while the person is mounting. He who mounts must proceed with all possible gentleness, and accomplish the object by degrees. Raise yourself repeatedly in the stirrup before you attempt to carry your leg over; and when you actually cross your leg over, be careful not to touch any part of his hind quarters, the cantle of the saddle, &c., but place yourself lightly in the saddle. Separate the reins, taking one in each hand. Let not your legs touch nor your thighs to press, but sit loose and motionless, waiting to observe the temper and disposition of the animal. Should he cringe his tail and set up his back, you may expect that he is about to plunge; but avoid taking firm hold with your knees and legs till you find yourself compelled to do so, lest the colt should be prompted to it. The assistant should speak kindly to him, and caress him, which may divert him from his purpose, and in a short time the assistant may invite him to move, leading him in a circle to the left (being the easiest) holding him short by the cavison rein, and watching him, particularly the expression of his eye. If he blows in his nostrils, if his tail be up, and he moves gently, they are signs of good disposition, and the man at his head may gradually lengthen the rein and the rider may collect his reins gently, and feel his mouth as lightly as possible.

If there be a suspicion that the colt will plunge, of which those that have attended him will be able to form an opinion, it will be advisable to have the reins received through the rings fixed to the head-stall of the bridle, which will assist in keeping his head up, without the rider's hands being raised. He will first attempt to force your hands, in which if he succeed, and your hands are high, your body will be drawn forward, and you will be in danger of a fall. Should the colt get his head down, he will most likely begin to plunge; to prevent which as much as possible, the assistant should have the cavison rein short in his hand, and check him with it; and if he can lay hold of the cheek of the bit with his right hand, he can shake his head up, and prevent his violent plunging.

When a horse plunges he holds his breath all the time, (as previously noted) swelling himself out to break the girths, crupper, &c., and he will if possible continue to plunge till he is under the necessity of standing still to breathe; and when this occurs, let him remain a minute, but neither sooth nor caress

him. Should he renew the combat, be prepared to check the violence of it; but by no means provoke it by menace of any kind or angry words. He will not continue the battle long; when over, he must be led in circle, and as he will continue out of temper for a little time, be prepared for another trial. Mild treatment, however, will gradually dissipate his ill humour, when you may relax the strictness with which you hold him, and allow him liberty in proportion to his behaviour. Always finish the lesson in good humour with each other.

The colt will give up the contest after a trial of two or three days, and you will perceive him relax in his efforts each time. He must be continued in this way till he goes steadily at the full length of the longeing rein, and can be turned and directed quietly:—when this is the case, finish the lesson by taking away the cavison rein and riding him without his being led.

The colt will be awkward for some time, and he must be treated with mildness and patience. Animate and aid him gently with the voice, and a slight pressure of the legs, which may be gradually increased, together with slight applications of the whip; but the spurs should not be used till he is reconciled to be ridden. In fact, spurs had better not be worn in the first instance; it will be soon enough to place them on the heel when it becomes necessary to use them.

The colt will go with an unequal step, which a little practice will correct. He should be ridden in a moderate trot, the operation of the hand being delicate, feeling every advance, and thus endeavouring to bring the colt's mouth to correspond in a correct appui. Colts in general require the application of the leg frequently in order to urge them into the hand for the purpose of forming the mouth. Colts with low and heavy forehands are inclined to be heavy on the hand, and dead in the mouth; to remedy which the bit should be frequently moved by the opening and shutting of the fingers, and also by raising the hand a little to induce them to raise the head, the legs applied at the same time. Longeing will be discontinued.

Horses which have been placed in improper hands, after having been ridden for some time, for years perhaps, are again placed in the hands of a breaker, for the purpose of finishing their education; and, as it frequently happens in these cases, that the instructions which they had received were rudimentally incorrect, they require some trouble to divest them of bad habits. It is advisable to longe them; and when a horse of this description has been sufficiently extended, suppled, and bent by the action of the trot, he may be put to the gallop in the longe, finishing his lesson by riding at large to prevent his head being habitually drawn down.

Should it be wished to make a horse gallop with the right foot, to which the left had become habitual, he should be particularly

bent and worked in the trot to the left, in order to retain the left shoulder and extend the right; and when he is sufficiently suppled, put him to the gallop to the right without bending him; and, with a little practice, he will freely take the right foot. It is seldom, however, that all this is requisite for the purpose of inducing a horse to alter his foot, as, by drawing his head a little and pressing the leg behind the girth to the opposite side, when you put him to the gallop, will answer the purpose. Practice will render it familiar to the horse, and he will not require drawing to one side.

As to *making a horse's mouth*, it may be done by riding him in a quick or extended trot, and stopping him suddenly by pulling him together sharply, by which the horse is liable to sprain his houghs or fetlocks, if it be not skilfully managed; and therefore the rider should first ascertain the force which the horse opposes to the hand, that he may not apply too much strength in pulling him together. Let him be reined a step backward before he advances again. I have seldom met with a horse, however, whose mouth could not be rendered pleasant by the judicious operation of the hand without resorting to so violent an expedient as that just described. Hard mouthed horses should be ridden with a sharp twisted bit to the bridoon rein; the curb should be so placed (by means of the curb chain) that a slight feel of the hand has a powerful operation, when, by the light, lively, and judicious operation of the hand, the mouth may be brought to the requisite feeling or sensibility.

Hard mouthed horses should be put on the bit in the stable: for which purpose a common bit, wrapped round with flannel or wool, thus making it tolerably large, will answer the purpose.

Uniting a horse, after the manner directed by manege riders, is crippling the horse by throwing all the weight possible upon the hind quarters, by compelling him to place his haunches and feet as far as he can under him—placing him, in fact, in a situation the very reverse of that which nature intended. If it be desirable to make a horse raise his fore-feet in his paces, riding over a rough ploughed field or uneven ground will very well answer the purpose. Or, if the rider wish to carry this business farther, let him trot the horse out; and then, keeping up the action by the pressure of the legs, the hands must retain the horse and shorten his step.

#### TEACHING THE HORSE TO LEAP.

It is a remark common enough among sportsmen that all horses will leap (or *jump*, to use the modern phraseology of the field) and so they will; yet some of them are much apter scholars than others; and I have seen some which appeared awkward at first, and afterwards became excellent performers.

I have not unfrequently heard it remarked also, that thorough-bred horses seldom leap so well as those which possess a portion of

inferior blood; such an idea has arisen from observation, I have not the least doubt, and the notion has been hastily impressed upon the mind, without endeavouring to ascertain the cause. Some few years since, I saw the horse, Mercury, several times ridden by Mr. Wicksted with his own and also with Sir H. Mainwaring's hounds, and he certainly could not be distinguished as a leaper. Now, this same Mercury had been for several years a successful runner for what are called *Cocktail Stakes*, and was consequently named as not thorough-bred; I feel well convinced that this was a gross falsehood, though a cunningly fabricated pedigree supported the nomination. Similar observations will apply to the celebrated cocktail, Tawpy; after being on the turf for some years, he was purchased by Lord Robert Grosvenor (the hon. Mr. Grosvenor,) but did not become remarkable as a hunter, particularly in that essential quality leaping.

But this is not surprising. These horses had been trained for the course from the earliest period of their lives, they had continued to race for some years: and the mode of going on the course, being ill calculated for the hunting field, the horses appeared in the latter under great disadvantage. On the race course, the horse is thrown forward, and extended to the utmost, for the purpose of acquiring the greatest possible speed, and this mode of action is not calculated for the chase: the racer should be a *daisy-cutter*. Something very different to this is required in the hunter; his action should be more lofty and more united: therefore to enable the thorough-bred horse to shew his powers to the greatest advantage in the field, he should be trained to it, and not allowed to race; and, under such circumstances, I have not the least doubt he would manifest his superior power or ability as a leaper.

A leaping bar is so well known, that any minute or very particular description would appear ridiculous. I would not, however, have the bar so fixed that if touched by the horse, it would fall; since, as soon as the horse has discovered this circumstance, he will not be anxious to clear it:—he will rather try to knock it down. Some persons wrap gorse or hay round the bar, for which I am of opinion there is not the least occasion: the gorse is intended to act as a stimulus to make the horse clear his leap, but it is inconvenient when first teaching a horse to leap. The hay is for the purpose of preventing the horse rubbing the hair off his knees or other parts: I do not recollect ever observing a horse rub the hair off his knees in the act of leaping the bar, nor do I think the hay necessary. If hay or other soft material is to be wrapped round the bar, let it be covered with strong leather stuffed. Boards which are sometimes seen under bars are not requisite; they are injurious rather than otherwise. I would recommend a plain simple bar, eight or nine feet long, and that would not fall when leaned against or touched by the horse.

In teaching a horse to leap, let it be recollected that no horse ever leaps willingly at the bar; those well practised to it, approach it reluctantly; and, although the leaping bar is absolutely necessary in the riding school, a horse may be taught to leap much better in the field than in the school, as will be shown hereafter. However, I will describe the mode of teaching a horse to leap the bar. In the first place let the bar be fixed very low; and let the horse be coaxed, rather than compelled, to leap; in every thing relative to this beautiful and generous quadruped, never resort to severity till every milder method has been repeatedly tried in vain.

Horses unaccustomed to the sight of the bar approach it with suspicion, and some are so alarmed that it is not without trouble they can be got near it. In such cases, it is advisable to remove the bar, and walk the alarmed animal through the pillars till his fears completely subside. Then lay the bar on the ground, between the pillars instead of placing it in them, and coax him to walk over it. After he has passed over it repeatedly, fix the bar in the lowest hole, and walk him to it; if he steps over it, instead of jumping, there is nothing wrong; but if, in this trilling operation, you stop when you are over, and turn to look at him, he will be very likely to stop also; therefore walk on till he becomes quite reconciled to this probationary step.

In teaching the horse to leap, an assistant is requisite. When the bar is raised so high that he cannot walk over it, he must be coaxed or invited to rise at it. The person who leads the horse over must take tolerably short hold of the reins with his right hand, and endeavour to prevent him from coming too near the bar. The operation of the hand is intended to draw the nose in; if you raise your hand under the idea of inducing him to rise, you will cause him to raise his nose, in which position he cannot mite, or bring himself together for the purpose of rising. Therefore, if he presses too close to the bar, let the operation be downward and rather back; thus coax him to rise, in which continue the support of the hand, as he should not be suffered to spring with his hind legs till his fore-feet are considerably raised. An assistant should be behind him with the longeing whip, holding it up, or throwing the lash towards him. When the horse rises, ease your right hand, in order to give him liberty to clear his leap.

The person who uses the whip must be mild; he must not hurry the horse, lest he move from one end of the bar to the other, and endeavour to avoid it. The click of the tongue should be tried before the whip is used, and the whip, in the first instance, should be held out rather than applied. The stimulus must be increased according to circumstances; and if the horse obstinately refuse, severity must be ultimately resorted to, and he must be compelled to perform that which he refused to entreaty and solicitation. He will most likely not leap well, but make

an awkward, blundering business of it; yet he should be caressed rather than corrected, in order to encourage him to better performance. However, if a horse that has been in the habit of leaping well, blunders over the bar through reluctance or heedlessness, moderate correction, instantly applied, will be serviceable.

There are horses which leap so sluggishly as not to clear their hind legs; but if the whip be applied a second or so before he springs, it will make him clear his hind legs.

If a horse is very impatient and eager to leap, the person who leads him over must prevent him leaping till he rises sufficiently before, as the horse, under these circumstances, intends to break or carry away every obstacle before him.

But on no account hurry a timid horse. I have seen many good tempered, though high spirited, horses approach the bar in a timid fearful manner, which have put their heads down over the bar, and smelt at the ground, accompanied by blowing in the nostrils and snorting. You cannot caress such a horse too much. Let him satisfy himself completely, and he will not give much trouble afterwards.

Horses will be met with which will endeavour to break away from you in defiance of the whip behind them and of anything else. If they should succeed, they will persist in this species of obstinate rebellion. As I have already observed, where gentle means will accomplish the object, I would not resort to severity. In some cases, however, resolute measures are indispensable, and this is one of them. Put on the cavison, which will enable you to enforce his obedience assisted by the whip behind.

Let it be well impressed on the mind, that the horse is never to be kept long at any one of his lessons, or he will become disgusted. If he clears the bar fairly six or seven times, it is quite sufficient, and, if he performs well, fewer will answer the purpose; and the horse will not be put out of temper. Further, if the horse clears the bar well, do not be in a hurry to raise it a hole higher; nor indeed would I ever put a horse to a leaping bar more than three feet or three feet and a half high, as they never leap willingly at a bar; I would leave them to attain excellence in the field, where they are animated to the highest degree by the music and emulation of the run, and take their jumps with the utmost possible spirit and eagerness. All that I should be anxious for them to acquire in the school, would be the style in which they cleared the bar, and not the height of the leap. In finishing the lesson, leave off, if possible, at the moment he has performed well, which will afford a good opportunity for caressing him; he will retire in good temper, and return to the bar with much less reluctance than if he had finished his lesson under less favourable circumstances.

When a horse has been sufficiently practised in hand, so that he leaps in a good form

and steadily, clearing the bar well at a moderate height (three feet, for instance) it will be time to ride him over; for which lower the bar considerably. The lesson should finish with the horse being ridden over. For example, when the horse has cleared the bar well, in hand, three or four times, he may be ridden over as many, after the bar has been lowered.

**THE FLYING LEAP.**—When a horse has learned to bend his knees and to leap standing, he attains the flying leap by a little practice. Let a long rein be buckled or fastened to the snaffle, and securing the bridle reins about the horse's neck, to prevent their impeding or balling him, work him in circle, in such a manner that his progress round will bring him each time in contact with the bar, and in consequence in every circle he describes he takes a leap. The bar should be placed quite low at first; the horse should trot; and if he has been used to leap standing, he will most likely pause on approaching the bar, and make a sort of standing leap of it. Be it so. Let him pass over a few times in this way, when you may quicken his pace a little, and he will fly it. Trotting the horse at first enables him to notice the bar, and also to determine where to take his spring, regulate his step, and quicken his pace to give himself force and velocity to clear his leap. If the horse leaps willingly, and is not hurried, he will very soon acquire the method of measuring his distance and clearing the bar.

A horse that leaps reluctantly will require the application of the whip, and he will be very liable to make blunders; but if the bar does not give way, it will not be long before he will correct himself—he will find it pleasanter to clear the bar than bruise and hurt himself against it.

When a horse, in the flying leap, endeavours to escape the bar, an assistant must place himself near the post with a whip in his hand to deter him; and when the horse leaps, he must pass under the rein, and wait for the horse coming again.

As soon as the horse leaps safe and well in hand, finish the lesson by riding him over, lowering the bar, however, for that purpose.

A horse must be practised in the field to finish his education as a leaper; nor indeed is a school education indispensably requisite for a hunter.

A few years since, I purchased a beautiful and a very powerful bay horse, nearly thorough bred, of Mr. Lloyd, of Cefn, near St. Asaph. I purchased him expressly for the purpose of hunting; but, as the horse had not the most remote idea of jumping, it became necessary to give him an opportunity of acquiring that art. Indeed, I had every reason to suppose, from the horse's manner that he had been placed in very improper hands for the purpose of breaking. He was very high spirited, but very good tempered. After riding him as a hack for some weeks till the harvest was got in, I took him into the fields, and having

a long rein fixed to a common snaffle, I placed him at a small fence, having sent a man over with the long rein in his hand. With a little patience and coaxing he scrambled over, without the least application of the whip; and I succeeded in getting him over half a dozen times, at different places, but all of them very low. I caressed him and both the horse and myself were very well pleased. I never gave him more than one short lesson in one day, and the horse improved amazingly. At length I put him at a blind place and he fell and rolled on his back in the ditch: this made him careful, and he soon jumped steadily and well. I then rode him over, instead of leading him; not only over low hedges, but low rails, increasing the height of his jumps very gradually. As I was frequently at some miles distance from home, on my return I left the road about a mile from home and took the horse into the fields; still, however, setting the horse's head homewards, which induced him to take his fences very freely, and I thus crossed the fields home. As soon as the hunting season commenced, I met the harriers of Sir John Gerard; and, although he was rather impetuous at first, he carried me uncommonly well, and, in the course of half an hour, very steadily. He became very soon one of the best hunters I ever rode.

In teaching a horse to jump in the fields, he is put to a fence, a sight which is familiar to him; and at which therefore he is no way terrified. The leaping bar alarms him, as I have already shown; and even when he has become familiarised to it, he never approaches it half so freely as he does a fence. Moreover, when a horse is taught this part of his business in the manner just described, it is precisely the manner in which he is afterwards to practise it. The bar is one regular set thing, which always presents the same appearance; in hunting, scarcely any two jumps are alike, and the horse has to accommodate himself accordingly; consequently, if a horse be taught precisely the system which he is afterwards to practise it is preferable to any other.

**VAN DIEMEN'S LAND AGRICULTURAL COMPANY.**—On Thursday a meeting of the proprietors of shares in this company was held in Old Broadstreet. The chair was taken by J. Cripps, Esq., the governor, who stated that despatches had been received from Van Diemen's Land to the effect that remittances would be made for a dividend before the expiration of the year. The balance in the colony was 6,000*l.*, comprising bills and cash, and by the disposal of wools, the produce of the flocks of the company, 1,200*l.* were expected to be realized. Agricultural produce in the settlement was high—steers fetching 10*l.* per head; cows, 12*l.* to 14*l.* each, and working bullocks from 30*l.* to 35*l.* per pair. Wool was at from 1s 6d to 1s 8d per lb. These advanced prices were beneficial to the shareholders. In answer to a question the proprietors were informed that the dividend would be about two and a half per cent. upon the subscribed capital. In the room of J. Pearse, Esq., deceased, J. Cripps, Esq., was elected governor.

COMMITTEE OF THE HOUSE OF COMMONS ON THE STATE OF AGRICULTURE. — MR. SHAW LEFEVRE'S REPORT.

(From the *Mark Lane Express*.)

We have received a pamphlet from the pen of Mr. Shaw Lefevre, member for North-Hampshire, which has been published in the shape of a letter addressed to his constituents. It will be recollected that Mr. Lefevre was Chairman of the Agricultural Committee of the House of Commons, and that considerable disappointment was experienced by many persons, upon the determination of the committee to close its labours without making any report being made known. A reference to the columns of this journal will show that we never anticipated any essential benefit to the *tenant farmer* from the inquiries of any committee. We prognosticated not precisely what has happened, for we gave it as our opinion, that the committee would on the approach of the Michaelmas rent day make a report, and that the *report* would be *all* the aid which the tenant farmer would receive towards his Michaelmas rent. This has turned out not to be strictly true, for the committee has made no report, but that is the only difference. Mr. Lefevre says, "that the mis-statements which have appeared in various newspapers, respecting the draft of a report which he submitted to the committee, have induced him to give a brief statement of his opinions on the present state of the agricultural interest, founded in a great measure upon the evidence given before the Agricultural Committee." If it be in reality to these "mis-statements," that we are indebted for this letter to the electors of North Hampshire, we heartily rejoice that they have been made. And we trust that its contents will not be confined to the electors of that county, but that the agriculturists throughout the kingdom will possess themselves of, and give it a diligent perusal. The soundness of the principles upon which his conclusions are based, borne out as they are in the main by the evidence given before the committee, bespeaks a more than ordinary acquaintance with the subject. Whilst he does not hesitate openly and honestly to disclose his views upon some most important points connected with the well being of the British farmer, it is manifest that he feels the tenderness of the soil upon which he treads. He is well aware of the benighted condition of a very considerable portion of the tenantry, a condition from which we are happy to say they are rapidly emerging, and is therefore cautious of awaking their prejudices, and he is fully sensible of the wild theoretical notions entertained by some of the better educated, whose views if carried out, though they might be productive of a transient prosperity would speedily terminate in still more severe distress and disappointment. The low price of wheat has been a heavy source not only of complaint, but in many instances, of real distress. We have ever contended that that low price was ascribable to an increased home supply. It matters little whether it arises from increased importation from Ireland, from an extension of the convertible system of husbandry or from the bountiful harvests during the last four years, to which ever of these causes it be ascribable whether to one or all, we still maintain that the

low price of wheat is owing to an increased supply, as the high price of barley has been occasioned by an inferior produce in point of quantity and an increased demand. Let us see what Mr. Lefevre says upon the head.

"In connection with the low price of wheat, I must here mention the great change which has taken place in the agriculture of this country within the last few years. In some counties extensive tracts of wold, fen and heath land, heretofore considered unfit for cultivation, have been redeemed; in others old grass lands have been ploughed up, and that which was formerly sown with flax or hemp, has been devoted to wheat, and by the introduction of the turnip system of husbandry, the poor light lands are made to produce wheat at a less cost to the cultivator than the more tenacious soils, and thus the clay lands, which were considered the ancient wheat lands of the country, have to enter into competition with the lighter soils, and are no longer able to maintain their superiority. Whilst this addition has been made to the productive soils in the kingdom, its acreable produce has been materially increased by the operation of draining, and the employment of artificial manures; and to these causes, coupled with the circumstance that an unusual breadth of wheat was sown in 1833, 1834, and that its average weight and consequently its capability to produce human food has increased under the influence of three unusually fine seasons, may be attributed that abundant supply which has produced so remarkable a depression in its price. Some witnesses have attempted to account for this excess by importations from Ireland and Scotland, and by a decrease in the consumption of wheat by the labouring classes, in consequence of the increased growth of potatoes. It appears, however, from a return which was presented to the Committee, that on an average of the three years ending January 1833, 553,274 quarters of wheat were annually imported from Ireland; and that on an average of the three years ending January, 1836, 761,827 quarters were imported from that country, making an excess in the average supply of the last three years of only 208,553 quarters. The imports from Scotland in the three years ending in January, 1833, were, on average, 48,508 quarters of wheat, and in the three years ending January 1836, only 23,622; whilst the quantity of wheat shipped coastwise from England to Scotland, on an average of the last three years, has been 31,202, being an excess of 14,972 above the average of the three preceding years.

"As there has been little or no importation of wheat from abroad during the last three years, it is evident that our markets have been mainly supplied by wheat of English growth, and by referring to the number of quarters sold in those towns whence the returns regulating the averages are sent to the Board of Trade, we find, comparing the average amount of quarters sold in 1829, 1830, and 1831, with those sold in 1832, 1833, 1834, there is an excess of 713,011 quarters of the latter period over the former; and although there may be doubts whether this return is strictly accurate with respect to the exact number of quarters of wheat sold in any one market, it is considered by some of the best informed witnesses to present a fair measure of comparison between the quantities sold in all the towns included in this return at any two given periods since the passing of the last corn law. There does not appear to be sufficient ground for the supposition that potatoes are used to any considerable extent, as a substitute for wheat bread, by the labouring classes; there can be no doubt, therefore, that the late depression in the price

of wheat has arisen almost entirely from a super-abundant supply."

Mr. Lefevre goes on to state that the consequence of the very low price of wheat to the cultivators of the clay soils, upon which, before a new and improved system of husbandry was introduced, the largest proportion of wheat used in the kingdom, was grown, must have been severe in the extreme, and he expresses his regret that the *tenantry* should have been misled by the expectation held out to them, that relief would be obtained at the hands of the legislature. If by improvement, lands hitherto incapable of producing wheat shall have been rendered fruitful in the growth of that species of grain, and the price being reduced, the cultivation of clay lands has become utterly unprofitable, can there be a greater absurdity than to expect that the country should legislate so as to keep up the price, for the purpose of enabling the cultivation of such land to be continued. Let us for an instant look to the consequences of such a step, supposing it to be within the power of the legislature. If wheat can be produced upon light soils with more advantage, than upon heavy lands, at a low price, every shilling per quarter rise in price upon that article will operate as a premium for the still further growth upon the light land. There is however another and more powerful cause of the distress of the tenant farmer, one upon which we have often dilated, and which has brought down upon us the abuse of interested parties, namely—high rents. Upon this subject, Mr. Lefevre observes,

"In some districts, and more particularly in the case of farmers of small capital, distress has been aggravated by a continuance of high rents, and it is matter of deep regret that owing to the expectations held out by the Corn Law of 1815, that permanent high prices could be obtained by legislative enactment, neither landlords nor tenants were prepared for that satisfactory adjustment of rent which ought to have been made at the termination of the war. There is evidently no want of sympathy on the part of the landowners for the condition of their tenantry. Reductions in rent have been made from time to time, limited as was supposed by the necessities of the tenant; whereas, if considerable abatements had been made at once at that period, less upon the whole would have been required, the capital of the tenant would not have been diminished, and much of the present distress might have been averted."

Let the *tenant farmers* of Great Britain, "read, mark, learn, and inwardly digest" that paragraph. They will find more pith and marrow in it, more substantial relief than in all the reports of all the Agricultural Committees that ever sat, with the resolutions, manifestoes and meetings of the Central Agricultural Society into the bargain. If indeed "considerable abatements had been made in the year 1815." If landlords generally, had done as Mr. Knight of Downton Castle, in Herefordshire, did at that period, not forget the useful assistance of the land surveyor, whose valuation in fixing warrents, was found so efficient, but had a second time called in his aid in making an equitable adjustment commensurate with the reduction in the price of agricultural produce, then indeed like him they might have tenants thriving and prosperous, estates flourishing, and in good cultivation, rents well and punctually paid, and tenants

happy and contented. We know that some landlords have adopted this course, and in so doing, they have consulted their own interests. Under such landlords, "the capital of the tenant has not been diminished." They are not of the class which for twenty years, has been receiving "rents out of the capital of the tenants," and not until lately when their capital was absorbed, have themselves "felt the grinding ruin." It is our intention to offer some further observations on the several points treated upon in Mr. Lefevre's pamphlet; but in the mean time, we trust that such landlords as are not suffering under the effects of "the grinding ruin," will purchase and circulate it among their tenantry. It may be had at the cheap price of 3s per dozen; and a cheaper threepenny worth of sound substantial matter, we have never yet seen offered to the public in any shape or upon any subject.

NEPAUL WHEAT.—We understand that several trials of this new variety of wheat have been made by agriculturists of this county this season, and the result is likely to substantiate its claims to the attention of the tenantry. Mr. Turnbull of Bellwood has tried a small field with it this year, and it is now a good crop, and nearly ready for the sickle. It was sown in the middle of May; and, if reaped in the course of next week, will only have been three months in the ground! The soil is one of the latest and poorest on his grounds, and the result would seem to point to its chief advantages being experienced by the upland farmer, and in the Highland districts, where from the nature of the soil and the climate, rapidity of growth is of the greatest consequence. Being a native of one of the mountainous districts of India, there can be no doubt of its hardihood; and the trials already made in this county confirm that opinion. The only question remaining is, as to the quality of the grain, and its suitability for domestic use or distillation; as, although termed wheat, the appearance of the grain seems mors akin to the barley of this country. It is to be hoped that the result of the trials made in the various quarters in the country will be laid in an authentic form before the public—for which purpose, the AGRICULTURAL MUSEUM was admirably adapted; and we trust that, however mortifying the little support that institution has met with from the agriculturists of the county hitherto, Mr. Turnbull will be encouraged to make one more trial for the credit of the county, and we hope, eventually his own remuneration.—*Perth Courier*.

EFFECTS OF LIGHTNING.—M. Baric, of La Haye, has communicated to the French Academy of Sciences the remarkable growth of a poplar which had been struck by lightning. It grew in an avenue belonging to him. The lightning broke some of the branches at the top, and the fluid ran along the trunk, from the top to the bottom of the northern side, without injuring the bark, went into the ground at the root, and turned up two large masses, each nearly a cubic foot in size. The tree at that time measured twelve inches in circumference, and it was in the month of July that the circumstance occurred. In the following April the trunk had exactly doubled its size, while the trees close to it retained the same girth; and the sap flowed in such abundance as to force its way through the bark.

ETHIOPIAN WILD BOAR.

London, Published by J. B. G. in 17<sup>th</sup> 1860.

## THE ETHIOPIAN WILD BOAR.

(PLATE.)

This animal is a native of the hotter regions of Africa, and inhabits the wildest and most uncultivated parts of that dreary continent. It is also found on the island of Madagascar. It grows to a very large size, and differs from the wild boar (and also from the domestic hog) found in other parts of the world in the form of its head. Its snout, instead of being taper and resembling a proboscis, is, on the contrary, very broad and square at the end. It has small eyes, placed at a very little distance from each other, level with the surface, and near the top of the forehead. On each cheek a very thick cartilaginous skin projects horizontally, being about three inches long and as many broad. At first sight, these excrescences might be regarded as ears, particularly as the real ears of the animal are small, and partly obscured by a mane of bristles, in colour red, brown, and greyish, and of a considerable length. The boar has four tusks, two in each jaw; the upper ones seven or eight inches long, very thick at the base, and terminating in an obtuse point, grooved and assuming a sort of half perpendicular position as they rise from the lips. The lower tusks are smaller, and when the mouth is shut appear so close to the upper ones that they seem almost joined together. The head in fact is a hideous object, almost as much so as that of the hippopotamus, to which at first view it presents a strong resemblance. Notwithstanding its broad muzzle, it plunges up the earth to seek for roots, on which it principally feeds. It is very active, though large and bulky; so much so, indeed, that in southern Africa, the Hottentots give it the name of the *Rummer*. Like the common wild boar, it strikes with its tusks, when attacked or pursued, and rushes on its adversary with great force and spirit.

A boar of this species was, in 1765, sent to the Prince of Orange, by the Governor of the Cape of Good Hope. From confinement and attention, he became mild and gentle, except when offended; in which case, even those persons to whose care he was entrusted were afraid of him. In general, however, when the door of his cage was opened, he came out in perfect good humour, gaily frisked about, and greedily devoured whatever was given to him. He was one day left alone in the courtyard for a few minutes, and on the return of the keeper was found busily employed in digging into the earth, where, notwithstanding the cemented bricks of the pavement, he had made a large hole, with a view, as was afterwards discovered, of reaching a common sewer that passed at a considerable depth below. It was not without much trouble, and the assistance of several men, that his labour could be interrupted. At length, however, they forced him into his cage.

He would allow himself to be rubbed, like our domestic hog, and, like him, seemed to be delighted with rough friction. When rudely pushed or provoked, he always retired backward, keeping his face towards his assailant, and shaking his head or forcibly striking with it. When, after long confinement, he was set at liberty for a little while, he appeared very gay, and leaped about in an entertaining manner. On these occasions, he would sometimes playfully pursue the fallow deer and other animals.

He was fed principally on grain and roots, and was so fond of rye bread that he would run after any person who had a piece of it in his hand.

When Sparrman was in Africa, he pursued se-

veral pigs with the old sows, with an intention of shooting one of them; but though he failed in this object, their chase gave him singular pleasure. The heads of the females, which had before appeared of a tolerable size, seemed on a sudden to have grown larger and more shapeless. This momentary and wonderful change astonished him so much the more, as, riding hard over a country full of bushes and pits, he had been prevented from giving sufficient attention to the manner in which it was brought about. The whole of the mystery, however, consisted in this: each of the old sows, during its flight, had taken a pig in its mouth; a circumstance which also explained to him another object of his surprise, which was, that all the pigs which he had just before been chasing along with the old ones, had vanished on a sudden. But in this action we find a kind of unanimity among those animals, in which they resemble the domestic species, and which they have in a greater degree than many others. It is likewise very astonishing, that the pigs should be carried about in this manner between such large tusks as those of their mother, without being hurt, or crying out in the least.

The flesh of this animal resembles that of the German wild boar.

The Ethiopian wild boar is a mere variety of the hog tribe, of which the common wild boar may be considered as the parent stock. The wild boar is a native of almost all the temperate parts both of Europe and Asia, as well as of some of the upper parts of Africa.

Hunting the wild boar was formerly a favourite amusement amongst the great in this country; and the chase of it is thus mentioned by an old writer: A wild boar is called a pig of the sounder the first year of his age; a hog the second; a hog's steer the third; and a boar the fourth; when leaving the sounder, he is termed a singler, or a sanglier. The common age of the boar is twenty-five or thirty years; they go to rut about December, and their great heat lasts about three weeks.

It is easier to take a boar in a toil in April or May than at any other season of the year, in consequence of their sleeping more soundly at that period, which is caused by their eating of strong herbs and buds of trees, which moistens their brain and causes sleep.

A boar most commonly lies in the strongest holds of thorns and thick bushes, and will stand at bay before he will forsake his den.

If he is hunted from a strong thick cover, he will be sure to go back the same way he came, if possible; and when he is roused, he never stops until he comes to the place where he thinks himself most secure.

If it so happen that there be a sounder of them together, then, if any break asunder, the rest will run that way; and if he be hunted in the hold or forest, it will be difficult to force him to quit it. Sometimes he will take head, and seem to go drawing to the outsides of the cover; but it is only to hearken to the noise of the dogs; for he will return again, and will be hardly forced to break away before night: however, having broken away, and gone on ways, he will not turn aside for man or beast, by voice, blowing, or any thing else.

A boar will not cry when he is killed, especially a great boar; but the sows and young ones will. In flying before the dogs, he neither doubleth nor crosseth, nor useth subtleties as other beasts of chase do, as being heavy and slow so that the dogs are still in with him.

If you strike at him with sword or boar spear, do not strike low; for then you will hit him on the snout, which he values not, since he watches to take blows on his tusks or thereabouts; but, lifting up your hand, strike right down, and have a special care of your horse; for, if you strike and hurt him, so will he you if he can; therefore, in thus assaulting boars, the hunter must be very careful, for he will rush upon him with great fierceness.

However, he very rarely strikes a man till he is first wounded himself; but afterwards it behoves the hunter to be very wary, for he will run very fiercely, without fear, upon his pursuers; and if he receive not his mortal wound, he overthrows his adversary, unless he falls flat on the ground, when he needs not fear much harm; for his teeth cannot cut downwards but upwards; but with the female it is otherwise, for she will bite or tear any ways.

The best places to wound him are the middle of the forehead, between the eye-lids, or else upon the shoulder, either of which is mortal.

To come to modern times. The wild boar, though extinct in this country, continues to be hunted in France and in most parts of the continent; but the chase of this animal, like some other departments of field sports, has partaken of the improvements of more modern times; and, though he may still be roused by dogs, the gun has been substituted for the boar spear. The method at present frequently adopted for the pursuit of the wild boar, particularly in France, is by sending small noisy dogs into their woody retreats, while the hunters lie in ambush to shoot them as they pass along their different tracks; and on these occasions the sportsmen are frequently assisted by the neighbouring peasantry, as, from their local knowledge, they are enabled to place the hunters in the most advantageous situations. This method of pursuing the chase is distinguished by the name of *La Trac*.

Hog hunting in India is a favourite diversion of the British officers, as well as the other Europeans residing in that part of the world. The wild swine in Hindostan are smaller than those which are found on the European continent. The sportsmen are mounted for the chase, and, with the assistance of dogs, pursue the hog (or wild boar) armed with a sort of javelin, which practice enables them to throw with almost unerring certainty. When a hog is roused, the hunters pursue him, and the first who comes up with the chase throws his javelin: should he miss his aim, the hog is still pursued by others, armed in the same way, until he is killed. The hog, on being roused, makes off as fast as possible; but he no sooner perceives himself attacked, than he turns upon his pursuers; and though the hunters themselves seldom receive much injury in the conflict, it is no uncommon occurrence for the horse to be killed. When the boar turns upon the hunter, the horse is very apt to rear, and he thus affords the boar an opportunity of wounding him in the belly with his tusks. There are other dangers, however, to be apprehended when following this diversion in India, as the sportsman is never secure from the sudden attack of ferocious, lurking wild beasts with which that part of the world abounds, particularly the tiger. The flesh of the Indian wild hog is highly esteemed, and is said to resemble the flavour of venison.

On the chase of the wild boar in France, Colonel Thornton makes the following observations:—

“The equipage destined for the chase of the wild boar is denominated *vautrait*. In great hunting establishments, it forms a separate department, in which, particular officers and attendants are employed. Large equipages for this sport are usually attended by a pack of 15 or 20 couple of hounds. The huntsmen and whipper-in ought to be extremely expert. The chase is very fatiguing. The huntsmen are obliged to shout incessantly, to make the dogs follow, as they are frequently discouraged, especially if they are pursuing an old boar. It requires mettlesome and vigorous horses, and the riders must not be afraid of the branches in the thick recesses of the forest, into which they are obliged to penetrate.

It is extremely difficult to procure hounds well trained for hunting the boar, and this instruction requires great patience and attention; not that a young hound will not at first pursue the animal, but his scent sometimes disgusts, and the country, covered with thickets and morasses, discourages him. A boar is not so easily hunted down as a stag; and, let the establishment be ever so excellent, the chase seldom lasts less than four or five hours. Sometimes the animal is checked by firing a gun, as he is also by being pursued by mastiffs and greyhounds. Chases have been known to last two whole days; and at last the hunters could not have taken the boar but by shooting him on the third day.

When the boar finds himself driven to the last extremity, he does not run forward, but frequently turns, keeping for a considerable time near the same spot, and seeking to make the dogs start some other game. When he is done up, he foams much, advances only by leaps and bounds, throws himself into some marsh, or sets his back against a thicket, facing the dogs, and defending himself with incredible fury. It is then that the whippers-in must give effectual support to the dogs, and endeavour to dislodge the animal; but if he keep at bay, it is proper to prevent the dogs from approaching too near. The whippers-in enter the thicket with precaution: one of them alight, approaches the boar, and plunges his hunting knife into the small of his back. The man who inflicts the wound must be very alert, and instantly run off in a contrary direction, as the boar always turns to the side on which he feels himself wounded. If, however, he should prove so furious as to endanger the sportsmen and the dogs, the best way is to kill him with a gun or pistol: this is a privilege or law reserved for the leader of the company, and is resorted to only at the last extremity. The whipper-in then sounds the death of the animal and encourages the dogs to trample on him. Having cut off the testicles, which would cause the flesh to contract a very disagreeable smell, and a fore foot, which is given to the huntsman, who presents it to the leader of the company, the boar is carried off. Before they return, the dogs are inspected, and those that have received wounds are dressed, as the huntsman ought to be provided with needles, thread, and every thing necessary for that purpose.

Dogs no not eat the flesh of the boar with so much avidity as that of the stag, nor must it even be presented to them raw. All that is in general given to them is the shoulders and the intestines cut in pieces, and boiled in water.

In some parts small bells are fastened round the necks of hounds that hunt the boar and the wolf. If it is not intended to hunt down the boar, but only to shoot him, an equipage becomes per-

fectly useless: one or two blood-hounds, and a few good hounds, are, in this case, quite sufficient. Nay, you need then only employ the mastiffs with which the gamekeepers traverse the forests where the boars couch, and drive them towards the spot where the hunters are posted.

In Germany, and occasionally in France, very fine sport is obtained by hunting of boars and likewise of stags, with toils. An enclosure is formed with rods and pitchforks round the thickets into which the boars have been driven. A huntsman sets his blood-hound upon the scent, and follows him till he has reared the game. Five or six hounds are then slipped; this number is sufficient to hunt a large boar, but, if there are several, the whole pack is taken.

In the first case it is proper to accompany the hounds with a few dogs produced by crossing the mastiff with the hound; these animals, which are extremely ardent, will closely press the boar, and drive him round the enclosure. The dogs are powerfully supported with the voice and the horn, and are followed close to prevent the boar making head against them. After the chase has continued some time, the large mastiffs and greyhounds are slipped, and these rush upon the boar with fury. The huntsmen advance: one pierces the animal with his hunting knife in the small of the back; the others, armed with sticks, are ready to receive him in case he should make towards the person who wounded him, and strike him upon the head, keeping him off with the ends of their sticks till they have dispatched him. When the proposed number of boars are taken, the dogs are called off.

In writing to a friend, Colonel Thornton observes:—"I sent you a paper which contained something about a noble wild boar which I ordered to be hunted; and, when killed in Chambord, to send it here at my expense; and thus to try to let such sportsman here (London) as never saw one be able to judge for themselves. Accordingly, it being arrived, every person that heard of it came to see it. It was hung up at a venison dealer's in Old Bond-street. The concourse of people was so great that the man could not get out of, or others enter, his shop. He is by no means the largest boar I have killed; but he is a terrible looking fellow, more dangerous than one much older, for then their tusks grows thicker, become curved, and the animal is more inactive. He wounded many of the hounds, but only killed, I believe, three. A couple of vermin terriers plagued him the most, as he could not get his tusk to bear upon them. The last final shaft was a *lingo*, which, I see, broke three of his ribs and passed through him. The number of balls he received I shall examine and relate. I understand he stood a run of full forty miles. But I am sure I ran one at least one hundred and forty, and then he was not done up, though constantly viewed from half-past eleven till half-past ten the next day, relays of hounds being uncoupled close at him every three or four hours. What other animal can show such game and bottom?"

"We dine to-day a party on his loin or saddle, which was where he received his death wound. The wound as I have already observed, was inflicted by a *lingo*, which is a piece of iron or lead, formed something like a weaver's shuttle, of the weight of two or three balls, and made to fit the calibre of the gun. It is a sort of bolt, which, if it strike into the flesh, it goes deeper; if it touches a bone, it then turns itself broadways: and thus,

though a ball would only have broken one rib, it broke three close up to the back. The number of balls he received shall be the subject of my next letter. The boar was three years old, was run by fleet fox-hounds, and during the progress of the chase crossed four rivers!"

The wild hog may be said to offer a different object for contemplation, according to the climate of the country in which he is found; while the Pecuary, the smallest and fiercest variety of the tribe, would seem to form the last or conclusive link in the varied or successive chain. The habits and manners of the whole are similar, and they all agree in one remarkable peculiarity: while all the other inhabitants of the forest (the Secretary Falcon and a few other birds excepted), fly from the various serpents with which the warmer regions of the globe are generally stocked, the hog hears the hissing of the reptile with delight; he hastens to the spot where the sound proceeded, and eagerly seizing the snake devours it as greedily as possible. It amounts to nothing that it should prove the cobra de capallo, the rattle snake, or any other venomous serpent, the hog unhesitatingly seizes it, nor was he ever known to suffer the least injury from that which would cost the life of most other animals.

The wild boar of Germany and the forests of Europe, differs in appearance from the hog of the Indian jungle, and the smaller and more beautiful variety of the tribe met with in China; while such of these animals as are found in a state of unlimited freedom in America and the West India Islands, inasmuch as they have originated from the European domestic hog, presents a character for observation, differing in some degree from that of every other variety. Though sufficiently wild to disdain human protection, these animals are less anxious to avoid the contact of man than their more suspicious brethren in the other parts of the world, and instead of attempting to fly from the pursuit of a dog, they turn and face him; placing their hind parts against a tree, they lower their snout, and wait for the attack: woe be to the dog if he face the hog thus prepared to receive him! he is sure to be ripped up with his tusks. These hogs are very common in some of the West India Islands, where the inexperienced terrier (taken from this country in great numbers for the purpose of destroying the rats with which these colonies are very much infected) frequently falls a victim to his own temerity, and the extraordinary defensive capacity of the animals under consideration.

The West Indian wild hogs, as well as those found in a similar state on the American Continent, are further remarkable for their unusual length of leg and snout.

About twelve years ago, the present Earl of Derby (then Lord Stanley) procured several peculiarities from America, under the idea of crossing them with the domestic hog; but the attempt proved utterly abortive.

That our domestic swine were originally derived from the wild boar, admits of no doubt; but, were we to form an opinion of the latter from the varieties which are constantly presented for observation in all parts of the country, as well in the farm-yard as in the streets of many of the large towns throughout the kingdom, we should be very much led astray. Like the bull, the sheep, and many other animals reduced to subjection by man, they lose those powers of active locomotivity which in a wild state were indispensable to their subsistence as well as to their safety. The enormous

white hog of this country, which sometimes attains the weight of forty score, is a very different animal from the wild boar of the continental forest, which, as previously stated, can stand before hounds for hours together.

However, if in different parts of the world, the wild hog differs in size as well as in appearance, the domestic varieties of this animal, like those of the dog, appear interminable; or, in other words, the different classes have been so blended or intermixed as utterly to extinguish any thing like distinct ramification. In fact, the impression made upon the physiology of the hog, and the genius and perseverance of man, forms a striking proof of the "influence of art in promoting the operations of nature," as well as of the almost illimitable resources of the human mind.

### SCIENTIFIC NOTICES.

(From the Leeds Mercury.)

We have been favoured with the following Scientific Notices by John Murray, Esq. F. R. S.—

**BET-ROOT SUGAR.**—You have stated in a recent number of the *Mercury*, that the field of Waterloo is now converted into manufactories for Beet-root sugar. At this moment, it is calculated that no less than 20,000 *hectares* is under cultivation in France for this exclusive purpose. Amiens and Lille are distinguished for the immense quantities of Beet-root reared in their environs; and about a month ago I was informed that there were, in the vicinity of the former city, not less than sixteen *manufactories* of Beet-root sugar in active and successful operation. I send you a specimen of refined Beet-root sugar, by which you will perceive it may challenge competition with the best quality of sugar obtained from the sugar cane. A very beautiful *sugar-candy* is prepared from the Beet-root sugar, and the expressed pulp is found to be most valuable for feeding and fattening cattle. I brought with me to England a packet of "coffee," prepared from the Beet-root, and monopolized—"par Brevet d'Invention."

**PAPIER CARBONNE.**—This name has been applied to a species of paper highly charged with pure charcoal, pronounced to be invaluable as a disinfectant, and is highly recommended by the medical profession of France. It is employed instead of the usual dressings to correct the fetor of putrescent wounds. As I am anxious to make my humble services useful to my country and the cause of humanity, I brought a packet of it with me, and will now take the freedom of sending it to you, not doubting but through your interest it may receive a fair trial in the Leeds Infirmary.

**COW CABBAGE.**—I send you a little of the genuine Cow Cabbage seeds, having brought some with me, from its original home, the Island of Jersey, from which I have just returned and where it is called "Jersey kale." I found it cultivated in almost every garden, and was informed of one specimen cut down in that island last year, which had attained the goodly stature of TWENTY FEET. You have no doubt heard that the *quackery* lately practiced has been completely exposed in the *Mark Lane Express*, &c. I heard the person in question publicly accused in a coffee room in London of having bought the seed from Mr. Edmonds, a respectable seed-sman in the Strand. Certainly, there are two specimens of the stems of Cow Cabbage exposed to public view in the Bedford Conservatories, Covent Garden, as well as those exhibited in Cheapside, where I, in common with others, have seen them. It requires, however, a *bold front* to venture to resist the *formidable argument*, by which the pretensions of this individual are sustained. He constantly carries in his hand "a sprig of *sillelah*," which consists of a stem of the said Cow Cabbage, and conceals a *subre*; on the top is a snuff box, tipped with silver. "Nil disputandum," thought I, as he drew the glittering weapon from the Cow Cabbage scabbard, to the astonishment of the inmates of the coffee room.

13th August, 1836.

J. MURRAY.

### THE SHEEP.—No. V.

#### THE WOOL TRADE CONTINUED.

(From the Dumfries Herald.)

Till the fifteenth century our wool was sold in the fleece to such as came to buy it. Among the principal of our customers were numbered the Flemings and Brabanters, and particularly the merchants of Ghent and Lonvain, who took off vast quantities to supply two manufactories that had flourished in those cities from the tenth century, and had furnished the greatest part of Europe and even England itself with every kind of woollen cloth. Thus they might have continued to the great loss of our island, had not the hands employed in these manufactories repeatedly revolted, having refused to pay certain taxes, and being at length punished and dispersed, found their way in no long time to Holland. While in this last place the spirit of sedition still being dominant, some of their party attacked and killed several of the civil authorities, for which they had to make a precipitate flight to England, where they settled as peaceful citizens, and instructed our people in the working of wool. This occurred in 1420, from which time neither skill, money, or enactments have been spared to enable us to retain in our possession so valuable a trade, in so much that in the reign of Edward III. every pack of English wool when exported was liable to a custom of 50s, a goodly sum in those days, and one which brought the yearly revenue of 250,000*l*. This excessive custom, added to the above-mentioned opportunities, in a manner compelled the people to manufacture for themselves, in which they so well succeeded as to render, in the sixteenth century, during the reign of Elizabeth, a law against the exportation of live sheep and wool absolutely necessary, and this on pain of having the right hand struck off.

By these wise, though severe regulations, during the reign of that Queen, an amazing quantity of woollen cloth was made in England, and its exportation was so increased as to amount in a few years to a million and a half annually. It does not appear that this enactment was ever repealed, though supposed to be so by the 12th of Charles II. chap. 32, sec. 3, which, without taking away the penalties imposed by former statutes, imposes a new penalty, viz., 20s, for every sheep exported or attempted to be exported, together with the forfeiture of the sheep and of the owner's share in it.

By the 14th of Charles II. chap. 18, the exportation of wool was deemed felony, and punished accordingly, a circumstance that tended nearly to the total defeat of the ends intended, by hindering all that were not cold-blooded indeed, or troubled with conscientious qualms, from bringing to justice the actors in so trifling an offence; this was seen through and corrected by the 7th and 8th of William III. chap. 23, sec. 4, by which it was declared that, "Whereas the statute of the 13th and 14th of King Charles II., made against the exportation of wool among other things in the said act mentioned, doth enact the same to be deemed felony, by the severity of which penalty the prosecution of offenders hath not been so effectually put into execution; be it therefore enacted, by the authority aforesaid, that so much of the said act which relates to the making the said offence felony, be repealed and made void."

Adam Smith, when commenting in his "Wealth of Nations" on the laws relating to wool, rebukes severely the ill-judged compliance of our Government in yielding to the solicitation of our merchants, and allowing them to sway with iron rule the commerce of the world. "The severity of many of the laws which have been enacted for the security of the

revenue, is very justly complained of as imposing heavy penalties upon actions which, antecedent to the statutes that declared them to be crimes, had always been understood to be innocent. But the cruelest of our revenue laws, I will venture to affirm, are mild and gentle in comparison to some of those which the clamour of our merchants and manufacturers has extorted from the legislature for the support of their own absurd and oppressive monopolies. Like the laws of Draco, these laws may be said to be all written in blood."

About the middle of the seventeenth century, the exporting of wool was made a capital crime. In spite, however, of the vigilance of our Government, a contraband trade in wool was long carried on between the inhabitants of the French and English coasts, especially those of Sussex, by a class of men termed Owlars, from their only venturing abroad in the night, and who were tempted to despise the penalty, with an intrepidity that astonished the rest of Europe, by the high prices that were sure to be afforded to them in the Gallic market.

The wools of England have always been in the highest repute, and that more abroad than at home. Their fineness and plenty are ascribed by many to the sweet short grass on most of our pastures and downs, and to the sheep having the privilege of feeding all the year round without being shut in folds, but it cannot be denied that though food may have much to do in the matter, yet that climate, and the unflinching persevering industry and attention with which an Englishman devotes himself to what is once determined on, have more than any other circumstance tended to the advancement of our wools, and woollen manufactures, and to the consequent prosperity of our island.

The reason of the existence of so many laws on this subject is, that wool continued for ages to be the principal commodity of the country, meeting all demands for the support of armies and payment of public revenues, and affording aids to the Crown, which were in general granted therein. The scarcity of money in England before the discovery of America, rendered it necessary to levy taxes frequently in kind, and as wool was abundant, it often figured as the representative of a more portable commodity. Thus Edward III. in attempting during the 12th year of his reign, (1333) to wrest the Crown of France from the house of Valois, procured a grant of half the wool in England, amounting to 20,000 packs, which taking it as valued by some authors at 40*l* a pack, must have brought the enormous sum of 800,000*l*, while part of the 300,000*l* demanded at a more remote period by the Emperor of Germany, as the ransom Richard I. was raised by a loan of wool. During the reign of Henry I., a sheep, in consequence of the scarcity of specie, was only valued at four-pence. Edward I., the great reformer of our laws, imposed a duty of 6*s* 8*d* on every sack of wool exported, and the like sum for every 300 wool-fells; but afterwards, when his necessities demanded a more productive revenue, he laid those additional duties on foreign merchants, which afterwards became the tonnage and poundage so famous in England's history, and among others, increased the former taxes on wool and fells by forty-pence, while like other monarchs of the period, he occasionally, with other appendages of his income, received subsidies of wool.

From the income of the Crown in 1433, during the reign of Henry V., we find that the customs on wool brought no less than 50,000*l*, and passing on to the time of Elizabeth, we notice the importation of Spanish wool among the number of monopolies

that were but too frequently granted to the minions of her Court as a recompense for their servility.

It was owing to this method of paying in kind, that the ancient kings of England had so frequently to change their place of abode. The apology for money being too bulky to be forwarded to the Treasury, they carried their Court from one place to another, that they might consume upon the spot the revenue of their several demesnes.

Commerce and industry were at a very low ebb during the time of Edward III., the principal export being wool, which only brought into the kingdom about 450,000*l*.—50,000 sacks were annually exported, as appears by the Parliament remonstrating in 1349, that the king, by an illegal imposition of forty shillings on each sack, had raised 60,000*l* a year. Each sack contained twenty-six stone, and each stone fourteen pounds (34, Edward III., cap. 5), and was not, on an average, valued at more than 14*l*. or 15*l*. a sack. Edward promoted the woollen manufacture by bringing, in 1331, John Kemp and seventy other Walloon families, weavers, from Flanders, and gave every possible encouragement to foreign weavers (11, Edward III., cap. 5), owing to the want of native skill in this department, while Parliament, in an ill-judged moment, prohibited the exportation of woollen goods, certainly an injurious step so long as unwrought wool was allowed to be exported. A further encouragement was given to the home manufacture by the enactment of a law (11, Edward III., cap. 2), which prohibited every one from wearing any cloth but of English fabric.

The staple or market of wool was fixed by act of Parliament (27, Edward III.) in particular towns of England, but was afterwards removed by law to Calais; and English merchants were prohibited from exporting any goods from the staple, or, in other words, foreign navigation was abandoned.

On the introduction of the Flemish weavers, Kendal became the metropolis of this branch of industry, and was soon equalled by many other towns, as Norwich, Sudbury, Colchester, and York, in the extent of its manufactories, while woollens were spun and wove in Devonshire, Worcestershire, Gloucestershire, Hampshire, Berkshire, Sussex, & Wales.

The progress which this manufacture made in a very short time may be well illustrated by the following table of exports and imports in woollens, about the middle of the 14th century, or twenty years after the importation of John Kemp and his establishment:—

EXPORTS.			
	£	s.	d.
Thirty-one thousand, six hundred and fifty-one and a half of wool, at 6 <i>l</i> . value each sack . . . . .	189,909	0	0
Three thousand, thirty-six hundred and sixty-five fells, at 40 <i>s</i> . value, each hundred at six score . . . . .	6,073	1	8
Whereof the custom amounts to . . . . .	81,624	1	1
Fourteen last, seventeen dicker, and five hides of leather, after 6 <i>l</i> . value the last . . . . .	89	5	0
Whereof the custom amounts to . . . . .	6	17	6
8,061½ of worsted, after 16 <i>s</i> . 8 <i>d</i> . value, the price is . . . . .	6,717	13	4
Whereof the custom amounts to . . . . .	215	13	7
<hr/>			
Summary of the out-carried commodities in value and custom . . . . .	£285,635	17	2
IMPORTS.			
1,832 cloths, after 6 <i>l</i> . value each . . . . .	10,922	0	0
Whereof the custom amounts to . . . . .	91	12	0
<hr/>			
Summary of the in-brought woollens in value and custom . . . . .	£11,013	12	0

That the imported cloths were much finer than the exported may be inferred, from their comparative value in the above tables, and we conclude pretty justly, that the fabrication of coarse cloths exclusively occupied the manufacturers of Britain, while the finer fabrics were still imported from abroad, and the wants of the people were the regulators of British industry.

Much wool was also at this period exported, as our manufactories were not then sufficiently extensive to employ all that was produced. Manufactories, however, increased, and early in the reign of Edward IV, the importation of woollen cloths and caps was prohibited.

The laity granted to the king the one-half of their wools throughout the whole realm, during the summer of 1339, a grant his Majesty is said to have received most graciously, but of the clergy he levied the whole, causing them to pay nine marks for every sack of the best wool. Knighton, who held an office in the abbey of Leicester, says, that that house alone furnished 18 sacks. He then took a fifteenth of all the commonalty of his realm in wool, rating the price of every stone of 14 lbs. at 2s., although in the previous November he had sent the Bishop of Lincoln and the Earls of Suffolk and Northampton, with one thousand sacks of wool into Brabant, which being sold at 40l. a sack, procured him 400,000l.

Edward was apparently not very sure how his people would submit to so sweeping a taxation, as we find him addressing a letter, dated Berwick-upon-Tweed, March 28, 1338, to the Archbishops of York and Canterbury, desiring the favour of their prayers, and that they would excuse him to his people on account of the great taxes he was obliged to lay upon them. The revenue officers appear to have exercised their calling with great strictness during this reign, and to have interfered in an especial manner with the secret trade of the inhabitants of Bristol, but this was terminated by the king granting a license, dated Langley, November 25, 1339, to their weavers, allowing them "to make woollen cloth, without being liable to any molestation from the king's officers," (*Acta Regia*, Vol. I., p. 313.)

Richard II., whose reign was characterized by unequal taxation and rebellion, managed to procure from a garbled parliament a grant of subsidies on several articles for life, and among the rest one on wool and wool fells, forming the first instance of so dangerous a transaction, and a baneful precedent for the future.

The occupation of a merchant did not become honourable till the reign of Edward III., when they were placed on a footing with landed proprietors, and those who had five hundred pounds value in goods and chattels were permitted, by the statute of apparel, to use the same dress as squires of one hundred pounds a-year, and those who were worth more than this might dress like men of double that estate.

To the custom of taking subsidies in kind we may trace the principle of those multifarious regulations which fix the staple or market for wool in certain towns, either in England or more commonly on the Continent, and to the varying state of politics we may ascribe the shiftings these staples so frequently underwent; but it is not easy to see the drift of many of the provisions relating to it, some of which tend to the benefit of foreign rather than of British commerce. In 1449, English cloths having been prohibited by the Duke of Burgundy, our legislature wisely enacted, that until he should repeal this ordinance, no merchandize from his dominions should be admitted into England.

During the bloody and destructive wars of the

white and red roses, when success graced the arms alternately of York and Lancaster, commercial enterprize was almost at a stand, yet this unhappy period brought with all its evils blessings in its train, and Henry VII, did more for the advancement of the wool trade than his predecessors, and gave it greater vigour than it ever had before. Fine cloths were much improved in his reign, and luxury began to be looked to at that early period in an article which, till then, had only been rendered amenable to comfort. The ostentatious reign of Henry VIII, gave an additional impulse to the woollen trade, and cloth was sold in 1512 for five marks, which fifty years before would only have brought about forty shillings, while, in consequence of increasing wealth, population, and consumption, the demand was materially increased. Edward VI., or rather his ministers, for he was then a minor, attempted to lay a poll tax upon sheep, every ewe kept in a separate pasture being charged threepence, every wedder twopence, and all sheep kept on commons three halfpence, but it was found to be so oppressive, so annoying to the people, and so difficult to collect, that it was repealed during the next year.

In this reign England made a distinguished figure as a commercial nation—the manufacture of woollens was raised to a great height, cloth, besides, being exported to Flanders, found its way to Holland, Hamburgh, Sweden, and Russia, where coarse warm stuffs were very much wanted, and the trade wore such an air of affluence, that a tax of eightpence in the pound was laid upon all cloth made for sale in England. This, however, was speedily repealed, a very short trial serving to point out, that though made for an endurance of three prosperous years, yet that the people who were galled by a trifling impost on their sheep, would not, unless in very favourable circumstances, submit to burdens on fabrics which they wore.

Elizabeth made an attempt to rescue this important trade from the hands of the merchant adventurers, but they instantly conspired and ceased to make purchases of cloth, and the queen was obliged to restore the patent.

Elizabeth extended her protection to the Protestants, who fled from the persecutions of the Duke of Alva, in the low countries, and the woollen manufactories became more flourishing than ever,—so much so, that although in 1552 a large quantity of the raw material was exported, yet in less than thirty years, Germany, Poland, France, Flanders, Denmark, and Sweden were covered with British cloths; and, though the price was nearly tripled, yet two hundred thousand pieces were annually sent to those countries. At that time the processes by which woollens are rendered beautiful were unknown in England, and as our exports consisted in white undressed cloth, the profits upon dyeing and finishing, amounting to about a million a-year, were lost. This was attempted to be remedied by prohibiting the exportation of white cloths, but the Dutch and Germans, who benefitted by the dyeing processes, forbade the entrance of any English woollens dyed in the piece into their territories, and the export, consequently fell immediately from 200,000 to 60 pieces, and then it was found necessary to take off the restrictions. This gave rise to the fabrication of medley cloths, or mixtures of wool dyed of different colours, and wrought into the same web. The long parliament promoted, and gave fresh activity to the manufacture by a law enjoining the exclusive use of woollen in burials.

Though nine-tenths of the commerce of the kingdom consisted in the time of James I., in woollen goods, wool was allowed to be exported till the nine-

teenth year of his reign, when it was forbidden by proclamation, though never strictly enforced. The cloth was very little admired even at home, and though it was the staple commodity of the kingdom, a company of merchant adventurers were allowed by a patent to possess the sole disposal of it.

A board of trade was brought together by the king in 1622, and one of the purposes contemplated was to remedy the low price of wool, which was leading the people to complain of the decay of the woollen manufacture; but Hume supposes, and with every appearance of probability, that this fall of prices proceeded from the increase of woollens.

Charles I., after the example of his father, prohibited the exportation of wool by proclamation, that the benefits to be obtained from it might fall to the lot of the people, as it was at that time dear; and he also made regulations concerning the company of merchant adventurers, which, as they still left a monopoly gave little satisfaction.

By the great act of tonnage and poundage, passed in 1660, or the restoration of Charles II., taxes were imposed, among other things, on the exportation of woollen manufactures, and it was not till the reign of William, that the wretched policy of such regulations was discovered, and a law was passed in 1700, by which the duties on woollens were abolished, because in the words of the act (11 and 12 William III. chap. 20.) "the wealth and prosperity of the kingdom doth, in a great measure, depend on the improvement of its woollen manufactures, and the profitable trade carried on by the exportation thereof."

In the time of Charles II., an act was passed for the erection of manufactories (Par. 1, Sess. 1, Cap. 40.) by which it is enacted that no native or stranger is to export wool nor skins with wool upon them, until made into work, or put to the best advantage under the pain of first value thereof, half to the king, and half to the informer. It is also, in this act, ordered, "that none forestall the mercat of wooll, nor keep up the same to a dearth, under the pain against regrators and forestallers, and that for escheving the deceit of putting stones, or the like stuffs therein, no wooll be wrapt up in the fleece, under the pain of confiscation, half to the king, and half to the discoverer and pursuer, declaring always that the Exchequer may licence the export of wool and skins, as they shall see cause."

By the 18th of Charles II., the importation from Ireland into England of great cattle, sheep, and swine, beef, pork, and bacon, and shortly after of mutton, lamb, butter, and cheese, was declared a common nuisance, and forbidden, on pain of forfeiture. Thus the principal resource of a poor country, in the neighbourhood of a rich one, was unfeelingly denied to it till the reign of George III., when the hateful edict was repealed.

The Scots appear to have been very tenacious of any advantages they may have possessed, more especially in regard to their English neighbours, as by an act of Queen Mary, it is ordered (Par. 6, Cap. 45.) that wool and wool fells be not carried to England, under pain of escheat thereof, or of the value, and the transgressor to be punished in his person.

In the reign of James VI. (Par. cap. 113.) an act entitled "against the excess of coastly clothing, and transporting of wooll, quhairby the pure may be the better halden in warke," was framed and subjoined to the regulation then made of men's apparel, by which the transportation out of the kingdom was forbidden, under the pain of confiscation thereof, and of the whole permanent goods of the owners and transporters. It was found necessary afterwards to

issue another edict, (Par. 12, cap. 151.) declaring that wool was not to be transported into England, nor sold to any Englishman in Scotland, who transported the same, under the pain of escheat thereof, and of all the moveables of the actual transporters.

The manufactures of the Hollanders were first established about 1636, or 1637, by one hundred and forty English families who went from Norfolk and Suffolk, to settle at Leyden and Alkmaer. Their manufacture of fine woollen cloths was, however, commenced much earlier, or about 1624, at which time they began to interfere with the English cloth trade in the Netherlands; insomuch that in the twenty-second year of the reign of King James I., a certificate was given to the parliament of 25,000 cloths having been manufactured in that year in Holland, upon which the House of Commons resolved,—1st, "That the merchant adventurers setting imposts upon our cloths is a grievance, and ought not to be continued; and that all other merchants promiscuously, as well as that company, may transport every where northern and western kersies, and new draperies." 2dly, "That other merchants, besides the merchant adventurerers' company, may freely trade with dyed and dressed cloths, and all sorts of coloured cloths into Germany, and the low countries." The English were for long much annoyed at the progress which continued to be made by the woollen manufacturers of Holland, so much so, that a curious speculation was proposed in 1651—a project was laid before the English commonwealth for obtaining, from the court of Spain, the pre-emption of all the Spanish wool. The projector observed, "That this proposed pre-emption would totally dissolve the woollen manufacture of Holland, which, by means of that wool (Spanish) hath of late years mightily increased to the destruction of the vent of all fine cloths of English manufacture, in Holland, France, and the east country, and hath drawn from us considerable numbers of weavers, dyers, and cloth workers, now settled at Leyden, and other towns in Holland, by whose help they have very much improved their skill in cloth, and have made, in that one province, (one year with another) 24,000 to 26,000 cloths yearly. That the Hollanders have of late years bought and exported from Biscay four-fifth parts, at least, of all their wools, and have sold there proportionally of their own country stuffs." This was certainly a novel method of accomplishing an end, by a sweeping monopoly, but the theory was too fine spun ever to be reducible to practice.

In 1607 France supplanted England in many foreign markets, by the care that Colbert, at that time, took to bring the French woollens to perfection. The English, however, immediately turned their attention to other manufactures in which, as in that of paper, they quickly excelled, and thus compelled the French to abandon markets, in which they had long remained without a rival. The former law for burying in woollen (13th Car. cap. iv.) not being well observed, it was repealed by an Act of Parliament in the thirtieth year of that king, (cap. 3.) which enacted a register to be kept in every parish by the incumbent, or his substitute, that every thing about the corpse of the deceased was made of sheep's wool, of which an affidavit shall be made by the relation of the deceased, and lodged with the incumbent, under the penalty of 5*l*. a moiety whereof to go to the poor of the parish, the other to the informer. This was but a poor check, as vanity was so predominant among the rich and great, that they paid the penalty, rather than want the pleasure of adorning their deceased friends with lace and fine linen. The French refugees, in 1635, brought money and talent into

England, and contributed greatly to the erection of manufactories for *slight* woollen stuffs, and other French fabrics, never before made in England. About 1698, a problem was started concerning the manufactures of the country, whether or not a general linen manufacture would prove beneficial to England? As London, at this time, abounded with new projects and schemes, all promising, as new projects generally do, a hoard of wealth, the question caused much excitement. It was at last determined that a novelty of this kind would lead to the sowing of a great quantity of flax in England. The neglecting of the woollen manufacture, which would inevitably follow, might probably lower the price of land; as they said at the time, "it requires about twenty acres of land to breed wool, for setting on work the same number of hands which one acre of flax would employ; and yet, in the end, the woollen manufacture will be found to employ, by far, the greatest number of hands, and yield the most profit to the public, as well as to the manufacturers." In the same year, the English House of Peers addressed King William, with the view of inducing him to discourage the woollen manufactures of Ireland, which, in spite of many restrictions, still continued to give much vexation to the monopolizers of England. The address ran thus:—"The growing manufacture of cloth in Ireland, both by the cheapness of all sorts of the necessaries of life, and the *goodness of materials for making all manner of cloth*, doth invite his subjects of England, with their families and servants, to leave their habitation to settle there, to the increase of the woollen manufacture in Ireland, which makes his loyal subjects in this kingdom very apprehensive that the further growth of it may greatly prejudice the said manufacture here; and praying that his Majesty would be pleased, in the most public and effectual way that may be, to declare to all his subjects of Ireland, that the growth and increase of the woollen manufacture there, hath long and will ever be looked upon with great jealousy by all his subjects of this kingdom." A similar address was presented by the Commons, and the most liberal and enlightened monarch of the age was pleased to answer, "*Gentlemen, I will do all that in me lies to discourage the woollen manufacture of Ireland.*" This was certainly altogether a strange proceeding, especially when viewed in conjunction with the cruel prohibition already mentioned as relating to that country; but much of the poignancy and crushing animosity of the request are lost, when we consider the encouragement that was at the same time given by England to the manufacture of Irish linen, his Majesty being desired, in the same address, to forward that manufacture, pursuant to an Act of Parliament, anno 1696. Nay, some are of opinion that these measures were dictated from the soundest views of the relative situations of the countries, and that the prudent tenor of English enactments was never better exhibited than in the discouragement of the woollen, and encouragement of the linen manufactures of Ireland.

There were 12,000,000 sheep and lambs in Britain in 1699, and the yearly increase was supposed to be about 5,600,000. The value of each sheep, besides the skin, was 7s 4d. The stock was valued at 4,400,000. The value of the wool yearly shorn, at 3s 4d per fleece, came to about 2,000,000l. The skins over and above the wool were valued at 2,400,000l. The woollens manufactured in Britain amounted in value to 5,000,000l. per annum, while our yearly exports of the same were valued at 2,000,000l. Many were at that time afraid of the sinking of the woollen manufactures, because the accounts of the fine draperies exported were larger

than usual; "but," says an anonymous essayist of the time, "such do not contemplate that though the old may have lessened, what is commonly called the new draperies have increased, consisting in bays, serges, and stuffs. So that, upon the whole, infinitely more of the material of wool has of late years been wrought up for foreign use, than in former times, and herein our merchants have been only forced to follow the modes and humours of those people with whom they deal, and the course they have pursued has hitherto not been detrimental to the public. \* \* \* " 'Twere better, indeed, that he call from abroad were only for the fine draperies, because then we should be, in a manner, without a rival; no country but England and Ireland having a sward or turf that will rear sheep, producing the wool, of which most of our draperies are made. 'Tis true, the wool of Spain is fine above all others; but 'tis the wear only of the richer sort, and of Spanish cloths not above nine thousand pieces are sent abroad communibus annis."

In 1700 an English statute (cap. xi.) was passed to admit foreign bone lace, and needle work, three months after the prohibition of the English woollen manufactures in Flanders should be taken off. This prohibition had been found very detrimental to us, and we were therefore obliged to repeal it, in order to save our trade in woollens. Another act was passed (cap. xx.) for taking away the duties on a number of our exports, and, among others, on woollens. In 1703 the treaty, so famous for its conciseness, was entered into between Great Britain and Portugal, much to the benefit of both nations. Peter, King of Portugal, stipulated both in his own name, and that of his successors, to admit for ever hereafter into Portugal "the woollen cloths, and the rest of the woollen manufactures of the Britains," but upon the condition "that her royal Majesty of Great Britain shall in her own name, and that of her successors, be obliged for ever hereafter to admit the wines of the growth of Portugal into Britain," without demanding anything more by the name of custom "than what shall be demanded for the like quantity or measure of French wines, deducting or abating one-third part of the custom or duty,"—leaving it, however in the power of his sacred Majesty of Portugal, to prohibit the entrance of woollen goods on the slightest infringement of the treaty.

Before the peace of Utrecht (1713) we had no rival in the woollen manufacture but the Dutch, over whom we had many natural advantages, such as situation, goodness of our ports, and excellence of the principal constituents of the manufacture. They were obliged to furnish themselves with the materials at second hand. When the woollen trade was properly set afoot in England, during the long and happy reign of Elizabeth, the interest of money was pretty much the same in both countries; but the Dutch were engaged in a bloody and hazardous war, and in establishing their Commonwealth and East India trade, and therefore had not much time to think of improving any manufacture. Owing to these circumstances we came into possession of all the principal marts for woollens, both in Asia and Europe, and retained them till the beginning of the war with France and Spain; we then prohibited trade with both these countries. Before the revolution the people of Turkey, Spain, Portugal, and France, had become so accustomed to the wearing of English cloths and stuffs, that they could ill brook the prohibitions we at that time placed upon our commercial intercourse with them.

In the seventeenth century the Dutch improved their sheep by bringing a peculiar breed from the

East Indies, which thrive remarkably well about the Texel and East Freiseland, and afforded wool so fine and silky as to pass in some instances for that of England. The Dutch permitted the Flemings to transplant this breed to the neighbourhood of Lisle, where they succeeded so well as to take the name of Flemish sheep. The Swedes, though situated in a more severe climate, tried the same experiment with some English sheep, and with so much success that in 1765 they could boast of wool of their own growth equal to that of England or Spain itself. About the year 1720, our exportations of cloth, stuffs, and other woollen manufactures to Sweden amounted to 50,000*l*. The Swedes, however, erected manufactories for themselves, and we were compelled to relinquish a market we had long held to our profit and advantage.

About 1725, when the people of Kirkcudbrightshire neither wore shoes, nor stockings, nor snirts, such clothing as they had was made of cloth manufactured at home; and the fine wool was bought up by strangers, who sent it abroad with great profit. The women also were clothed entirely in woollen, the luxury of linen being unknown till many years after. The woollen cloth was manufactured from the raw material of its natural hue, that intended for men's coats being, in general, made of a mixture of white and black wool, which gave the fabric a very mottled appearance. Their surplus garments were sold, for some time, at the commencement of the eighteenth century, to their less industrious neighbours. The people in the parish of Minnigaff gathered an excrement, which grew on the crags, and with it dyed a purple colour, which they called cocklit, and used also a substance called woodrow, which appeared on the roots of some of the trees, for dyeing a kind of orange colour.

In the 12th year of King George II. it was enacted by a statute (cap. xxi.) "That whereas the taking off the duties upon woollen or bay yarn, imported from Ireland, may be a means to prevent the exportation of wool and of woollen manufactures from Ireland to foreign parts, and may also be of use to the manufacturers of Great Britain, that from the 1st of May, 1740, the same shall be no longer payable; excepting only the duties upon worsted yarn of two or more threads twisted or thrown, or on crewel imported from Ireland." At this time more than 1,500,000 people were employed in our woollen manufacture, and were supposed to earn, one with another, sixpence per day for 313 working days, amounting in all to 11,737,500*l*. The importation of woollen broad cloth, of the manufacture of France, into ports of the Levant, on behalf of British subjects, being not only prejudicial, by discouraging the woollen manufactures of Great Britain, but likewise a means of affording relief to an enemy, and discoveries having been made of British subjects fraudulently shipping from Leghorn quantities of French woollen goods for Turkey, under the denomination of British, to the great detriment of the British woollens, an act was passed in the 23rd year of King George II., by which provision was made against these and other fraudulent practices.

At the commencement of the reign of George III. the woollen manufactures advanced with a rapidity almost unparalleled in modern times as regards other branches of trade. Till about the year 1770 most of the processes were conducted by hand, and the wool was spun by various persons at scattered residences, the manufacturers receiving the yarn periodically from the various spinners—an arrangement causing much loss of time, and giving rise to frequent squabbles between the masters and workmen. In fact, all

the operations were tardy in the extreme—a circumstance more than sufficient to prevent the advancement of the manufacture, by waste in the numerous and tedious processes, and a consequent sluggishness with which a supply answered to a demand. But at this period the spirit of public and private enquiry was happily directed to our deficiencies in the machinery of manufactures, and by gradual steps inventions of great beauty and ingenuity were brought forward to facilitate our commercial acquirements, by which means human labour has been alleviated and abridged, while at the same time a greater number of hands than at any past period have been profitably employed, and an excellent lesson afforded to the lovers of use and wont, which will not speedily be forgotten.

By these improved means the cloth is possessed of greater evenness, less injury is sustained in the dressing and shearing, and greater beauty is imparted to the appearance, while the master, knowing the exact duration of each process, can time his goods for any hour or market, and is enabled to circulate his capital with a degree of dispatch formerly looked upon as quite impossible. A few years ago the late Sir John Throckmorton sat down to dinner dressed in a coat, the wool of which on the same morning was on the sheep's back. The animals were sheared, the wool washed, carded, spun, and woven; the cloth was scoured, fullled, sheared, dyed, and dressed, and then made into a coat. All these complex operations were gone through without hurry, and without deducting from the work any part of the time usually allotted to similar fabrics. So great was the advantage derived from the application of machinery to this branch of industry, that in the year 1800 the produce was three times larger than in the year 1739, though the number of the persons employed was the same in the one year as in the other.

For three centuries a free importation of foreign wool was permitted by our government, and it was not till 1803 that any one thought of laying a duty upon it. This duty was at first comparatively light, amounting only to a halfpenny a pound, and it continued under a penny a pound till 1819, when Mr. Vansittart raised it to sixpence. The impolicy of this measure is very evident when we consider that we were losing our ascendancy in this manufacture, that our export in woollen goods had been declining for three years previous to 1819, and that the competition was becoming every moment more severe. But its effects are best exhibited by its disastrous influence on the foreign trade in woollens, which fell off about a fourth in value almost immediately after the imposition. This tax was much dreaded by our merchants, who, clearly perceiving the state of matters, warned Mr. Vansittart, and represented to him in the strongest terms the fatal influence it must have upon our trade. The following table will set the effects of this mismanagement in the clearest point of view:—

Declared value of woollens exported.

1816	£9,387,455
1817	7,817,360
1818	7,177,355
1819	8,145,327
1820	(duty increased) 5,939,622
1821	(ditto) 5,367,733
1822	(ditto) 6,165,938
1823	(ditto) 5,490,451
1824	(ditto) 5,645,716
1825	(ditto) 6,045,210

The opinions of our merchants ought to have formed the best of all beacons in pointing the course to be pursued by Mr. Vansittart, but even if they had been

silent on the subject the evidence of Mr. Bainbridge before the committee of the House of Commons, appointed in 1820 to inquire into the state of the foreign trade of the country, might have informed him of the true position of the wool trade, and directed him in so momentous an undertaking. When Mr. B. was asked whether he thought that an increase in the means of paying for our manufactures would produce an increased consumption of them in Russia, Sweden, and Prussia, he replied:—"I believe the woollen manufactures in Prussia are in such a state as to be able to compete with us completely; I speak of it particularly, because we are in the habit of having transactions with the United States of America; and I find that a very considerable proportion of fine wools and stuffs are absolutely shipped from the Netherlands, and from ports contiguous, part of which I understand to come from the interior of Germany, and from Saxony in particular; so that a portion of the trade which we have been in the habit of transacting with the United States is finding its way from the north of Europe. I therefore conceive that their manufactures are competing very much with the manufactures of this country; and consequently they would not come to us to receive a supply of those articles which they can purchase from their own manufactures at home.

In 1825, at the earnest and obviously well-founded representations of the manufacturers, Mr. Huskisson reverted to the old system, and it was then wisely enacted, that all foreign wool imported for home consumption of the value of 1s a pound and upwards, should pay a duty of 1d per pound, but when the value of foreign wool was under 1s the duty was reduced to a halfpenny a pound. A boon was at the same time conferred upon the agriculturists by the introduction of a new system with respect to the exportation of British wool, the growers of which were allowed, for the first time, to export it to foreign markets on payment of only a penny per pound.

The importation of wool was therefore very much increased, and with it the consumption of our wools by foreign nations; the wool of our own gradually augmented flocks being inadequate to the demand, and that of Spain having been absorbed by our manufactories, large quantities were imported from Prussia, Saxony, and many parts of the continent of Europe, from which antecedent to this run little had been drawn. The average annual importation for the years 1765-66-67 was 4,211,361 pounds—the average annual exportation of woollens during the same period was 4,630,381l; while the average annual importation of wool for the years 1822-23-24 was 13,884,876 pounds, and the average annual exportation of woollens during that time was to the value of 6,200,548l, showing that the importation of foreign wool was absolutely necessary for the well-being of our manufactures. The importation of forty-four millions of pounds weight in the year ending 5th of January, 1826, must be ascribed as much to the spirit of overtrading, that then affected every branch of industry, as to the reduction of the duty, but the large importations during 1827 gave an additional proof of the necessity of foreign wool to the successful prosecution of almost important department of national industry. Mr. Gott, of Leeds, in his evidence before the Lords' committee, on being asked if he could carry on an export trade to the same extent as at present, if he manufactured his cloth of British wool, replied, that in certain descriptions of cloth "he could not make an article that would be merchantable at all for the foreign market, or even for the home market except of foreign wool." He then proceeds to state, that though the competition is very strong in every

department of the manufacture, yet that foreigners are decidedly superior to us in some descriptions of low cloths. The following question was then put and plainly and emphatically answered—"Speaking of the fine cloth is the competition such as to render an additional duty on the importation of foreign wool likely to injure the export trade? I have no doubt, speaking on my oath, that it would be fatal to the foreign cloth trade of the country. I would further say, that it would be equally injurious to coarse manufactures of all kinds made of English wool. The competition now with foreigners is as nearly balanced as possible, and the disturbing operation of attacks of that description would necessarily enable the foreigner to buy his wool cheaper than we should do it in this country; the result would be that foreigners would, by such a premium be enabled to extend their manufactures to the exclusion of British manufactures of all descriptions." In another part of his evidence Mr. Gott says, "If two pieces of cloth, at 10s a-yard, were put before a customer, one made of British wool, the other of foreign wool, one would be sold and the other would remain on hand; I could not execute an order with it. If any person sent to me for cloth of 7s or 8s a-yard, and it were made of English wool, it would be sent back to me, and I must resort to foreign wool, or foreign mixed with British, to execute that order." In fact the British wool could not be got rid of without a copious importation of foreign wool to aid the manufacturer in his disposal of it, for fine cloths are so much better and more durable in their wear than coarse cloths, that they are coming more and more into demand to the almost total exclusion of the latter. Moreover, the good old custom of making home-spun cloth is reviving among our farmers, and as it is excellently suited for work-day wear, though necessarily of an inferior gloss, such cloths will almost cease to be the concern of our manufactures. The only cloth, indeed, which the bulk of the people will require will be a finer material to form the garb for Sunday and holiday recreation.

The latest tabular accounts on which any dependence can be placed, are to be found in McCulloch's Commercial Dictionary, but of these we are necessarily compelled to offer only an abridgment, and in general nothing but the sum total of his detailed statements. The number of short-woolled sheep in England in 1800 was 14,854,299; the number of long-woolled sheep in England in the same year was 4,133,308. The quantity of British wool in 1800 amounted to 325,269 packs, while in 1808 it had increased to 414,502 packs. The sheep and lambs' wool imported into Great Britain from foreign parts in 1810 was 10,914,137 lbs.—in 1815, 13,640,375 lbs.—in 1820, 9,789,020 lbs.—in 1825, 43,795,281 lbs.—in 1830, 52,313,059 lbs. The increase here observable in 1825 is accounted for above in our notice of the state of the taxes before and at that period. The exports of British sheep and lambs' wool in 1830 amounted to 2,951,103 lbs.; those of woolled and worsted yarn to 1,108,023 lbs. By far the larger proportion of these exports was intended for France and the Netherlands. The number of persons employed in the manufacture is estimated at from 480,000 to 500,000, and their wages at 9,600,000l. The value of the raw material is calculated at 6,000,000l; the total value of the manufactured articles at 18,000,000l, and the interest on capital, sum to replace wear and tear, and manufacturers profits at 2,400,000l. To conclude, much might have been said in the above of a light and amusing nature, but want of space has precluded the possibility, and the romance of history has been compelled to give place to statistical brevity.

## COMPARATIVE STATE OF FARMING.

*(From the Chester Chronicle.)*

The substitution of green crops for fallows, on all but stiff clay lands, has been the greatest of all improvements ever made in agriculture, and has effected as great and beneficial a revolution in it as the introduction of the steam-engine, and of the spinning-frame has done in manufactures. There is abundant evidence to show, that the culture of the turnip, as a field crop, was carried on to some extent in several English counties, in the latter part of the 17th century. But the practice spread only by slow degrees, and it was not till its introduction into the county of Norfolk, in the reigns of George First and Second, when it was prosecuted on a large scale by Lord Townshend and others, that its signal importance became obvious. At the period referred to, the whole north-western part of that county, which has long been one of the best cultivated districts of the empire, consisted of mere sandy wastes, sheep-walks, and warrens, worth little or nothing. They were converted into a highly productive arable land, by enclosing, marling, and the aid of the turnip husbandry, which is as it were the corner-stone of the Norfolk or improved system of husbandry. The same practice that had produced such splendid results in Norfolk—that had made sandy wastes yield the most luxuriant crops of wheat and barley—has been gradually extended with similar effects to many other parts of the kingdom.

It is well known, that on an average, the weight of cattle and sheep has been a good deal more than doubled since about 1750; so that a stock of 5,000,000 head of cattle at present would be more than equal to one of 10,000,000 cattle at that epoch. But the number as well as the weight of cattle having been very materially increased in the interval, the supply of butcher's meat must have increased in a corresponding proportion, or been at least trebled. There has also, owing to the same cause been a very great increase in the product of wool. Taking the increased weight of the carcass and the increased weight of the fleece into account, sheep are believed to be more profitable than at any former period, and for the last few years they have been the most productive species of stock kept in the kingdom.

Mr. Culley, the Northumberland farmer, was of opinion, that "of all animals of whatever kind, those which have the smallest, cleanest, and finest bones, are in general the best proportioned, and covered with the best and finest grained meat; and no doubt they are also the hardiest and healthiest, and most inclinable to feed; able to bear the most fatigue while living, and worth the most per pound when dead."

The construction of new and comparatively smooth and level roads, canals, &c., did much to annihilate the difference in the rate of prices, and conferred on the more distant parts of the country advantages that have been hitherto engrossed by the districts in the immediate vicinity of large towns. A spirit of emulation and improvement has been in consequence universally diffused; routine practices have been thrown aside, and all classes have begun to make the most astonishing efforts to outstrip each other in the career of improvement. Among the principal of these may be specified improved drainage, a better rotation of crops, the general use of bone manure, and the opening of new channels of communication by steam boats. But of all the recent improvements in agriculture, the introduction and general use of bone manure is perhaps the most important. It

first began to be employed on a large scale in Yorkshire and Lancashire, and in the latter particularly its influence has been all but miraculous. Since the use of bones in the wolds of Lincolnshire and Yorkshire have become general, the turnip crop has been in many instances tenfold, and in few less than four or five-fold its former bulk. All the succeeding crops of grain and seeds have been amazingly increased; and upon the four or five shift system there is no doubt the land will go on progressively improving, requiring a less quantity of bones annually, from its increased fertility and power. From the comparative facility with which it is conveyed to rugged lilly tracts it enables estates to be improved and fertilized that must otherwise have remained in a state of nature. Besides large quantities of bone dust imported, bone mills are now constructed in the vicinity of every considerable town for the preparation of this most valuable manure. The application of steam to navigation has given to a voyage by sea the expedition, and almost the certainty of mail-coach travelling, at comparatively little cost; and steam packets for the conveyance of bulky and heavy articles as well as passengers are now established all along the coasts. The markets of London and Liverpool are thus brought as it were almost to the door of the occupier in the remotest districts. Formerly it was the practice for farmers in Scotland to send up cattle and sheep half-fed to the Norfolk fairs, where they were bought by graziers to fatten for the metropolis. But this practice is already much fallen off, and will at no distant period be known only by report. Cattle and sheep are now fattened at home, and are sent up from the eastern ports either alive or slaughtered to London, by steam. The advantages of this are great. The crops of turnips acquire a new and greatly increased value, and their culture is in consequence much extended. Nor does the cost of conveying the full-fed animal to its destination amount to a fourth-part of what it formerly took to convey the half-fed animal to Norfolk. This stimulus will, it is probable, be still farther augmented by the formation of railroads. It is clear indeed, that contiguity to market has already become of comparatively little importance. At no distant period, means will be afforded for bringing the most remote and secluded districts fairly into competition with those that are most favourably situated. The productive energies of both will in consequence be more fully developed; nor is it easy to conjecture what the result may be.

Hennlan, Deabigh.

J. O'NEATH.

IRISH WASTE LAND IMPROVEMENT SOCIETY.— On Tuesday a general meeting of the directors and shareholders of the Irish Waste Land Improvement Society was held at their offices, 57, Old Broad Street, City, in conformity with the terms of their act of incorporation, and also for the purpose of hearing the first report of the society's proceedings. — Staples, Esq., having been unanimously called to the chair, the secretary read the report, from which it appeared that the original capital proposed was 500,000*l*. in 10,000 shares of 50*l*. each, and that 6,975 shares have already been subscribed for, which are enough to enable the society to carry the objects of their incorporation into extensive and beneficial effect. The directors are about to send a deputation of their own body and their secretary to Ireland, to place them in communication with the proprietors of the uncultivated lands who have offered, and to arrange with them negotiations now pending. The report was unanimously received, and there being no other business to transact, the meeting separated.

## REMARKS ON THE PRESENT STATE OF AGRICULTURE.

By C. S. LEFEVRE, ESQ. M. P.

TO THE ELECTORS OF NORTH-HAMPSHIRE.

GENTLEMEN,—After the discussions with reference to the proceedings of the Agricultural Committee, which have lately taken place in Parliament, and the misstatements which have appeared in various newspapers respecting the draft of the Report, which I felt it my duty as Chairman to submit for its consideration; you will naturally feel anxious to know more of that document, and how far the recommendations it contained were likely to conduce to those interests which, as the representative of a purely Agricultural County, I am bound to promote.

These considerations have induced me to give to the public a brief statement of my opinions on the present state of the agricultural interests, founded in a great measure upon the evidence received before the Agricultural Committee; and the substance of that Report which was in possession of the Committee when they came to the determination to report their evidence, without observations to the House."

The Committee commenced its sittings in February last. All petitions which have been presented to this House relative to agricultural distress were referred to it, as a matter of course; and I believe every one of the members in common with myself, entered upon the investigation with an earnest desire to ascertain the true cause of those complaints which resounded from all parts of the country.

It was objected to the Committee of 1833, that too much reliance was placed on the evidence of Land Agents and Corn Factors; and that if persons more directly engaged in agriculture had been examined, some practical measure of relief might have been suggested.

You will observe, by a reference to the Reports, that the Committee of 1836 took an entirely opposite course. The principal witnesses who appeared before it were actually engaged in agriculture; and the early part of the enquiry was devoted to those particular counties from which petitions had emanated complaining most loudly of agricultural distress.

At the different County Meetings which were held in various parts of England, previously to the session of Parliament, several schemes were brought forward for improving the condition of the farmers; and when I unexpectedly found myself Chairman of the Agricultural Committee, it was my earnest desire that every opportunity should be afforded for the development of those plans which seemed calculated to effected so desirable an object.

It is therefore my intention to put you in possession of all the suggestions which were offered to the Committee, with my comments upon them; and if you have felt the least disappointment at the result of our labours, you must not consider me individually responsible for it. The draft of my Report was read to the Committee on Saturday, July 9th, and taken into consideration on the following Thursday, and it was perfectly open to any other member to have moved some resolution by way of amendment to that Report, if the conclusion to which I had arrived on a consideration of the evidence were unsatisfactory to him, and if he was of opinion that the evidence would warrant his proposing some specific measure of relief.

I proceed therefore to explain my views upon this interesting subject; leaving you to draw your own conclusions from the absence of any recommendation; which I attribute, not to any want of consid-

ration in the part of the Committee for the interests of the farmer, but entirely to the impossibility of advancing any proposition which would meet with the concurrence of a majority of its members.

In most of the petitions which were presented to the House this session, the pressure of Tithe, and those local burthens to which the agricultural interest is liable, such as, County Rate, Highway Rate, Poor Rate, formed the great subject of complaint; and the attention both of Government and Parliament having been particularly directed to these points since the report of the Committee in 1833, it may be useful to consider, in the first instance, what steps have been taken towards the alleviation of these acknowledged grievances.

Tithe, from its tendency to check improvement, has operated most prejudicially to the interests of agriculture. But a bill has just passed the legislature for its permanent commutation; tithe in kind has been abolished, and it will henceforth be charged on the estate of the landowner; and the farmer, having once made his arrangements with his landlord, may invest any portion of his capital in the improvement of his farm, with the certainty that he will derive the full benefit of its expenditure.

The County Rate has already been the subject of enquiry before the Committees of the Houses of Lords and Commons, and as a member of the latter Committee, and also of a commission, appointed to consider especially what reductions can be made in that portion of the rate which is expended in prosecutions, I may state, with confidence, there is every prospect, when our recommendations can be carried into effect, of this tax being so far reduced, that its pressure will be but lightly felt by the agriculturist.

The cost of maintaining the highways, whether contributed in kind or in money, has hitherto been borne, in much too large a proportion, by the Agriculturists. The object of the Act of Parliament, which passed during the last session, is to distribute that burthen more equitably between all classes of the community; and I have no doubt, when the provisions of the act come into full operation, and a better system of Road Management is introduced, the roads will be materially improved, whilst the expense of maintaining them will be considerably lessened.

The Poor Rate has hitherto been a great burthen to the farmer, in those districts in which agriculture has been depressed from other causes. Whenever an opportunity offered for obtaining satisfactory evidence of the working of the New Poor Law Bill, the Committee did not fail to take advantage of it; and it is gratifying to learn, from various parts of the country, that the effects of this measure have exceeded the anticipations of its most sanguine advocates. Admitting the last eighteen months to have been a period peculiarly favourable to the trial of this experiment, owing to the low price of provisions and the great demand for labour, the saving under the head of poor rate has been far greater than could have been expected in so short a time, and if any portion of this amount has been spent in additional labour for the cultivation of the soil, a double benefit, must have ensued, both to the labourer and his employer.

But the moral effects of this important measure will be yet more beneficial to the agriculturist than the pecuniary relief; the agricultural labourer is already aware, that under the new system of administering relief, the parish must, in future, be his last, instead of his first resort, and there has consequently, arisen in his mind, a strong desire to find work, and remain in the service of his employer;

this has increased the industry, and improved the conduct of the labourers, and their services have in consequence become far more valuable to the farmer, than the reluctant labour of those, who, from the certainty of obtaining ample assistance from the parish funds, had scarcely any stimulus to exertion.

Notwithstanding this diminution in these local burthens, it appears from the concurrent testimony of many witnesses, examined before the Agriculture-Committee, that in various parts of England the farmer's capital is gradually sinking, and that at the low price of wheat which prevailed a few months ago, it is not possible for him to continue the profitable occupation of his farm. There is every reason, I hope for believing that the pressure of this distress is in a great measure confined to the occupiers of cold tenacious soils, and to those farmers who rely upon their wheat crop as their main source of profit.

In connection with the low price of wheat, I must here mention the great change which has taken place in the agriculture of this country within the last few years. In some counties extensive tracts of wold, fen, and heath land, heretofore considered unfit for cultivation, have been redeemed; in others old grass lands have been ploughed up and that which was formerly sown with flax, or hemp, has been devoted to wheat, and by the introduction of the turnip system of husbandry, the poor light lands are made to produce wheat at a less cost to the cultivator than the more tenacious soils, and thus the clay lands, which were considered the ancient wheat lands of the country, have to enter into competition with the lighter soils, and are no longer able to maintain their superiority. Whilst this addition has been made to the productive soils in the kingdom, its acreable produce has been materially increased by the operation of draining, and the employment of artificial manures; and to these causes, coupled with the circumstance that an unusual breadth of wheat was sown in 1833, 1834, and that its average weight and consequently its capability to produce human food has increased under the influence of three unusually fine seasons, may be attributed that abundant supply which has produced so remarkable a depression in its price. Some witnesses have attempted to account for this excess by importations from Ireland and Scotland, and by a decrease in the consumption of wheat by the labouring classes, in consequence of the increased growth of potatoes. It appears, however, from a return which was presented to the committee, that on an average of the three years ending January 1833, 553,274 quarters of wheat were annually imported from Ireland: and that on an average of the three years ending January, 1836, 761,827 quarters were imported from that country, making an excess in the average supply of the last three years of only 208,553 quarters. The imports from Scotland in the three years ending in January, 1833, were on an average, 48,508 quarters of wheat, and in the three years ending January, 1836, only 23,622: whilst the quantity of wheat shipped coastwise from England to Scotland, on an average of the last three years, has been 31,202, being an excess of 11,972 above the average of the three preceding years.

As there has been little or no importation of wheat from abroad during the last three years, it is evident that our markets have been mainly supplied by wheat of English growth, and by referring to the number of quarters sold in those towns whence the returns regulating the averages are sent to the Board of Trade, we find, comparing the average amount of quarters sold in 1829, 1830, and 1831, with those sold in

1832, 1833, 1834, there is an excess of 713,011 quarters of the latter period over the former; and although there may be doubts whether this return is strictly accurate with respect to the exact number of quarters of wheat sold in any one market, it is considered by some of the best informed witnesses to present a fair measure of comparison between the quantities sold in all the towns included in this return at any two periods since the passing of the last Corn law. There does not appear to be sufficient ground for the supposition that potatoes are used to any considerable extent, as a substitute for wheat bread, by the labouring classes: there can be no doubt, therefore, that the late depression in the price of wheat has arisen almost entirely from a superabundant supply.

The abundant crops of wheat of the last three years may in some measure have made up for the deficiency in price, but wherever that has not been the case, the consequence to the cultivator of heavy soils, where it is the custom to grow wheat after a fallow, and where the fixed charges upon the land, such as rent, rates, &c., for two years are thrown upon that crop, must be ruinous. It is not therefore a matter of astonishment, that those farmers who are unfortunately placed under these circumstances, should be loud in their complaints of agricultural distress, and it is only to be regretted that they have been taught to look to parliament for that relief which can only be obtained by a reliance on their own resources, and by an improved system of cultivation.

In some districts, and more particularly in the case of farmers of small capital, distress has been aggravated by a continuance of high rents, and it is matter of deep regret that owing to the expectations held out by the Corn Law of 1815, that permanent high prices could be obtained by legislative enactment, neither landlords nor tenants were prepared for that satisfactory adjustment of rent which ought to have been made at the termination of the war. There is evidently no want of sympathy on the part of the landowners for the condition of their tenantry. Reductions in rent have been made from time to time, limited as was supposed by the necessities of the tenant; whereas, if considerable abatements had been made at once at that period, less upon the whole would have been required, the capital of the tenant would not have been diminished, and much of the present distress might have been averted.

It has generally been supposed that excessive rents are only injurious to tenants under lease; but a moment's reflection will show that a tenant at will, who, owing to a fall in prices, cannot realize the same amount for his stock as when he entered upon his farm, is quite as dependent upon his landlord as a tenant on lease, and that he will rather submit to the payment of too high a rent, in the hope of a recurrence of high prices, than hazard the loss of a considerable portion of his capital by a sale. Whenever rent begins to encroach upon the capital of the tenant, it becomes impossible for him to attempt any improvement on his farm; nor can he employ the labour necessary for its due cultivation; the land by over-cropping becomes gradually less productive, and is at last reduced to such a state of exhaustion, that it will scarcely repay the expense of cultivation, without leaving any surplus for rent or profit.

These observations are only applicable to those cases where farms have continued in the occupation of the same tenants at war rents, where the land has not been permanently improved by the expenditure of capital either on the part of the landlord or tenant,

or where it has been taken under the expectation that an higher average price of wheat would be maintained than has been realized under the corn laws of 1823. They will not, of course, apply to a large and most respectable class of agriculturalists who farm their own estates. If these individuals have been led by the high prices of agricultural produce during the war to adopt a more expensive style of living, if they have mortgaged their estates, or contracted engagements which they are no longer able to fulfil, their case is altogether without remedy. But if, in common with the great mass of the tenantry of this country, they are suffering merely from that competition to which I have before adverted, or from the late (I may almost say accidentally) low price of wheat, their distress is merely temporary.

The evidence which the Agricultural Committee received from Scotland is abundantly sufficient to prove with what success the cultivation of the soil can be carried on, even at low prices, by an improved system of management: and I alluded to it not for the purpose of drawing an invidious distinction between the farmers of the two countries, but to show with what beneficial results capital and skill can be applied to land, especially where the occupying tenant is relieved from the payment of tithe in kind.

The following statement, derived from the evidence of both English and Scotch farmers, is deserving of attention:

NAME of WITNESS.	Rent, Tithe, and Parochial Burthens.	Annual Average Expence per Acre.	TOTAL.	Quality of Land estimated by ave- rage Pro- duce per Acre in Wheat.

Although the rent paid by the Scotch farmer appears in some instances to bear a higher proportion to the quality of the land than that paid by the English farmers, the difference in the cost of cultivation is far more remarkable; and it will be seen, by an attentive perusal of the evidence given by all the Scotch witnesses, that they turn their attention to the breeding, fattening, and general management of stock to a much greater extent than is usually done by the English farmer. The productive powers of the land are increased by the additional quantity of manure thus raised, and it suffers less exhaustion by

the less frequent recurrence of the grain crop: and to this circumstance their comparative prosperity may in a great measure be attributed. Where the same practice prevails in England, as will be collected from the evidence of Messrs. Bennet and Crowther, it is attended with an equally favourable result.

It appears that the practice which prevails in Scotland, of letting farms on a long lease\* and at a corn rent, has tended very much to encourage agricultural improvement in that country; and a corn rent must be particularly favourable to tenants in those seasons when crops are sufficiently abundant to lower the market price of corn. In years of scarcity, on the other hand, they cannot be of equal advantage to the farmer; and, perhaps, the most perfect system would be, to allow a portion of the rent to vary with the price of that description of corn which forms the ordinary produce of the farm, and the remainder to be a fixed money payment.

In many parts of England there exists a strong prejudice against long leases, and in those districts there does not appear to be any want of confidence between the landlords and tenantry, as farms are frequently held by one family for generations without a lease. But although, in cases where no extraordinary outlay is required on the part of the tenant, leases may not be requisite; it must be conceded, that without the security which they necessarily afford, a tenant would hardly be justified in making any large investment of capital in the permanent improvement of his farm; and on that account leases are well deserving of encouragement in those parts of England where the land is impoverished by previous bad management, or where it requires extensive draining to make it productive.

On the subject of draining, the Agricultural Committee received very interesting evidence both from England and Scotland. In Kent and Sussex, and several other counties, the clay soils have been much improved by the use of Pearson's draining plough. But the system of thorough draining adopted in Scotland is very far superior, and is an improvement well worthy the imitation of English farmers. The most astonishing effects, however, appear to have been produced by a new agricultural implement, the invention of Mr. Smith, of Deenster, near Stirling, called the sub-soil plough. This machine is a necessary accompaniment to draining, but when that is done effectively, it seems calculated to render the most sterile and unproductive soil fertile and profitable. There is no difficulty more fatal to the practical farmer than that of cultivating a thin shallow soil with a stiff retentive subsoil. Whatever pains may be taken with the tillage of the former—however expensive the dressing which may be used in its cultivation—the nature of the sub-soil will always counteract its beneficial effects. Many persons have endeavoured, by trenching, to obviate this difficulty; but where the sub-soil is of that sterile nature, and requires exposure to the atmosphere for so long a period to make it productive, few farmers have been bold enough to repeat the experiment. Mr. Smith's most ingenious invention (which is admirably described in his evidence, to which I beg to refer you for a more complete explanation of its principle,) by breaking the sub-soil without bringing it to the surface, renders it pervious both to air and water. The same chemical changes which take place in a fallow, owing to its exposure to the action of the wind and rain, are thus brought into operation in the sub-soil, whilst the

\* Mr. Hope's rent is a corn rent, calculated with wheat at 50s. per quarter. Messrs. Hope, Bell & Robertson have not only been farming profitably for the last three years, but have spent large sums in furrow draining.

† Tithe free.

\* Usually for 19 or 21 Years.

upper is in the ordinary course of cropping, and when, after a few years, by a greater depth of ploughing, the sub-soil is mixed with the upper, it is found to be so completely changed in its nature, as to be capable of producing every description of corn. The advantage of this system of husbandry are so apparent, that no farmer will be at a loss to appreciate the merit of the invention. I believe it to be quite as important an improvement in the management of clay lands as the introduction of the turnip system has been with reference to the light soils; and, as the experiment has been tried for twelve years, and with uniform success, I cannot but anticipate its ultimate adoption in those districts of England, where, from the cold retentive nature of the soil, the greatest extent of agricultural distress has hitherto prevailed, and where draining is essential to preserve them in a state of cultivation.

The principal suggestions for the improvement of agricultural interests offered to the Committee, were:—the introduction of poor laws into Ireland; the allowing farmers permission to malt their own barley for consumption on their farms, free of duty; and a reduction of the malt duty. The remission of the duty on foreign seeds, was also proposed as a measure of relief, in particular districts; but the effect of such an alteration of the law, would be to derange the culture in many counties where such produce is raised, and where it furnishes, at this moment, a great demand for labour.

The condition of the poor in Ireland is so intimately connected with the state of its agriculture, that the latter has formed a distinct branch of the enquiry assigned to the Irish Poor Law Commissioners; and for this reason, the Committee did not consider it necessary to examine many witnesses from that country. It appears, however, that the tenantry of Ireland has not retrograded within the last three years, and that the condition of the larger farmers is decidedly ameliorated; considerable improvements have been made in the breed of sheep and cattle, by crossing them with the best English stock; and the landlords have exerted themselves in draining and reclaiming bog land. In some parts of Ireland, in proportion as the farmers have become wealthy, they have given up tillage, laying down their land in pasture; and the extreme humidity of the climate offers every inducement to the adoption of this change of system.

In the counties of Armagh, Tyrone, and Cavan, according to the evidence of Mr. Blacker, who is the manager of very considerable property in those districts, the condition of the tenantry has been greatly improved. This may be attributed in a great measure to the substitution of the flax for the wheat crop, and to the high price of flax, owing to the failure of that crop, on the continent last year. It appears to have been a common practice in the north of Ireland to cultivate a succession of corn crops until the land became exhausted, and then to allow it to remain in grass until, by a certain degree of rest, it had regained its fertility; but this practice has happily given way to a more systematic rotation of crops, owing to the encouragement given to the tenantry to rely more upon the green crops and the profits of stock, than on the cultivation of corn. It is impossible, however, that agriculture as a system can be carried on in Ireland until the farms are consolidated, and provided with buildings necessary to the successful management of land.

In reply to those persons who complain that the want of Poor Laws in Ireland gives an undue advantage to the Irish farmer, who is thereby entitled to undersell them in the English market; and that ow-

ing to the miserable condition of the labouring classes less wheat is consumed there in proportion to the population, and a greater surplus remains for exportation to this country; it may be observed, that even supposing the absence of poor rate, not to be made up for by an increase of rent, the Irish farmer has many difficulties to contend with to which the English farmer is a stranger; and, however desirable on other grounds the introduction of Poor Laws into Ireland may be, it by no means follows that its effects would be to diminish the supplies of corn or cattle from that country, when the natural fertility of its soil is more fully developed by a judicious application of capital in an improved system of husbandry.

With respect to the second proposition: the privilege of malting of barley free of duty does not appear, even according to the calculations of its most intelligent advocates, of sufficient importance to render its adoption expedient, at the risk of rendering the collection of the revenue less secure, as shewn by the testimony of Mr. Hetherington; to say nothing of the expense which the employment of a great many additional officers would entail upon the country, and the dissatisfaction which such an inquisitorial supervision on the part of the Excise would naturally excite, which are in themselves insurmountable objections to the trial of the experiment.

It is impossible not to admit that any reduction of the malt duty, which cause an increased demand for barley would operate most beneficially on the interests of agriculture. It would not only encourage draining, and the improvement of clay-land, from which most important results may be anticipated, but it would check the over-cultivation of wheat, lead to a better rotation of crops, and also to a greater reliance on the profits of stock. The reduction of the malt duty is, however, so completely interwoven with the question of the Corn Laws, that I should not have felt justified in suggesting any proposition with reference to this important subject, were it not for the evidence of some of the best informed persons connected with the corn trade, and some of the most intelligent agricultural witnesses, who agreed in recommending an alteration in the existing Corn Laws.

It appears from the Fifteenth Report of the Commissioners of Excise Enquiry, confirmed to a great extent by the evidence of Mr. Dunlop, formerly one of the most extensive distillers in Scotland, and now residing at Wandsworth, that with a lower rate of duty, a much greater quantity of malt would be used in the manufacture of beer and spirits; that many of the oppressive regulations which at present interfere with the process of malting might be dispensed with; that an increased quantity of barley, now fraudulently malted, would be brought to charge, and that the revenue could, at no distant period, regain all that it might at first lose by the reduction of the duty. It is therefore well deserving of consideration, whether, if greater facilities could be given to the trade of the maltster, there is not every reason to expect that (provided the price of barley was not enhanced) the price of malt would be reduced below the amount of duty remitted; and barley of an inferior quality would thus be malted for the purpose of feeding cattle; which is an advantage not calculated upon by the Commissioners.

The number of quarters of malt made in the year ending January 5, 1836, were,

In England	- - - - -	1,509,357
Scotland	- - - - -	57,114
Ireland	- - - - -	224,265

5,361,306

Allowing for a small increase in bulk during the process of manufacture, it would require 5,000,000 quarters of barley to produce the present amount of revenue, at 20s. 6d. per quarter; and of course the same number of additional quarters to produce the same amount of revenue at 10s. 4d. per quarter. The Commissioners, however, have stated with great justice, that if this demand for barley should tend to increase its price, the increased consumption which they anticipate as likely to result from a reduction of duty would be counteracted. This can only be obviated by an extensive importation of foreign barley; and as the present price of barley appears to be sufficiently high to afford the farmer a fair remuneration for the capital employed in its cultivation, it is equally important to him, as well as to the public, that the scale of duties on the import of foreign barley should be so regulated as to admit the supply the necessary for so increased a consumption, without raising its price above the present level. In the year 1831, when the average price of barley was 38s. per quarter, and the rate of duty 6s. 4d., less than 370,000 quarters were entered for home consumption; and the effect of that demand for barley was to raise the price of it, at Hamburg and Dantzic to 22s. and 18s. 4d.; 14s. 7d., and 14s. 1d., being the average price of barley for the ten years preceding. The cost of transport, &c. at that time must have been 9s. or 10s. per quarter; and as there is always great risk in carrying barley, owing to its liability to heat during the voyage, it is not reasonable to expect that it can be brought to this country on much more favourable terms: whatever, therefore, may be the extent to which eventually the growth of barley may be increased in this country, it is evident that during the time which it will require to improve the quality of clay lands a considerable quantity must be imported from abroad; and if the demand is to be supplied without raising its price, it will be necessary to reduce the rate of duty at which foreign barley can be entered for home consumption.

With a view to illustrate the effect such a measure would produce upon the interests of agriculture, let us suppose that a demand is created for only 2,500,000 additional quarters of barley in England, the produce of from 600,000 to 800,000 acres; this land would necessarily be withdrawn from the cultivation of wheat; and assuming that 600,000 acres, producing at present 20 bushels of wheat per acre, to be so withdrawn, and that only in very favourable seasons (which is quite borne out by evidence), the population of this country is independent of foreign supply; it is clear that it will be necessary to import a quantity of wheat annually, never less than 1,500,000 quarters, for the consumption of this country.

Assuming, therefore, that the necessary consequence of a great increase in the demand for barley would be to induce farmers to cultivate that description of corn on the inferior soils, and to confine the growth of wheat to land of a superior quality, it would be no longer necessary to retain the same amount of duty on foreign wheat for the protection of the farmer. But the present enormous amount of the duty on malt constitutes in itself (more especially since a diminution has taken place in local taxation,) one of the principal grounds on which the British agriculturist can establish his claim to protection from foreign competition; and considering that the effect of all restrictions upon foreign importation must be to raise prices at home, which is directly at variance with the interests of the consumer, it is obvious that any attempt to re-

tain a monopoly, without the means of justifying it, would be to place in peril not only the present system of Corn Laws, but any system whatever which may be designed for the protection of the agricultural interests. But if, apart from these considerations, it were attempted to reduce the malt duty one-half, without any alteration in the existing Corn Laws, the effect would be to create such a demand for barley as would raise its price (until fresh lands could be brought into barley cultivation) to an average at which foreign barley might be admitted at a mere nominal duty. The sudden admission of any great quantity of barley, at any one time from abroad could not be otherwise than prejudicial to the farmer; for even supposing that all that might be admitted under these circumstances should be unfit for the use of the malster, it would be purchased by the miller and distiller, and compete, most injuriously to the interests of the producer, with the second and third rate qualities of barley; and after the price of barley had been reduced by an extension of its cultivation, that portion of the agricultural interest would alone be gainers (during, that is to say, the existence of their present leases) who grow wheat upon good soils, in whose behalf the Legislature is not called upon to interfere. On these grounds, I venture to recommend that the present scale of duties on the import of foreign corn be reduced, and one-half the malt duty remitted at the same time; a measure calculated, in my opinion, not so much to remedy existing distress, as essentially and permanently to improve the interests of the agriculturists.

I am quite aware of the jealousy with which a proposition of this nature will be received by a numerous body of farmers; and to those gentlemen I would address myself, whilst I endeavour to shew that the Corn Law of 1828 has been a delusion, and that under an altered system, an equally high average during a series of years would in all probability be maintained. The avowed object of the Government who proposed that law was to secure a steady range of prices, varying (in wheat) from 60s. to 64s.; whereas it will be seen by a reference to the returns which have been laid before Parliament, in six years ending January 1836, the average price of wheat has not exceeded 54s. 7d.; and on an average of the last three years, 46s.; a variation in price that must have been ruinous to all farmers who have contracted engagements on the faith of the present law.

The following table will shew the rate of duty at which corn was entered for home consumption, from 1828 to 1834, inclusive; since which period there has been no importation of foreign corn worth recording:—

Date.	Total Quantity Entered.	Date of Entry.	Rate of Duty.	Quantity entered at Lowest Duty.	Quantity entered at Duty below 17. 1s.
1828	748,749	December ..	s. d.	724,228	725,649

It appears from this statement, that in the four

years ending January 1832, 4,592,607 quarters were entered for consumption, out of which 2,658,037 were admitted at a duty averaging only 1s. 5d. per quarter; and that in seven years ending January 1835, the latest period to which these accounts have been completed, 4,758,762 quarters were admitted, of which only 297,620 quarters paid a duty above 21s. per quarter. Mr. Sandars, an eminent corn-merchant at Liverpool, who had previously been examined at great length before the Committee, in a letter addressed to myself as Chairman, dated May 16, 1836, recommends that, "the pivot price of wheat should be reduced 10s. per quarter. As a friend to both landlord and tenant, I should rejoice to see public expectation promptly and fairly met. If no anticipatory measure be adopted, and a period of excitement and high prices should arrive, there will be hasty and probably bad legislation on the subject." In another part of the same letter he adds, "The main defect of the present law is, that though it gives moderately high, and at the same time steady prices under import, it does not prevent them going ruinously low in periods of abundance; it therefore appears to me to deserve consideration, whether at any time the duty on wheat should ever be permitted to go below 4s. or 5s. per quarter. The amount of that duty might be kept as a reserved fund for a bounty on export, when prices fell to a given low rate. If the holder of bonded wheat have the option of a shilling duty, it is manifest that when the wants of a country are imperative, he will never pay 5s.; a minimum duty of 5s. therefore will be no tax on the public, but a reduction of his profits. The objection to the average system on the grounds of frauds said to be practised would be removed by striking out London, Liverpool and Wakefield from the list of towns now making returns, and substituting a larger number of others. It is only in those three large markets that fraud has the slightest chance of being practised with impunity and success."

Nothing can be more fruitless than any attempt to ascertain what may be considered a remunerating price to the farmer. In 1814, 96s. and 80s. per quarter were considered the lowest average prices at which wheat (vide Report, Committee on Corn Laws,) could be grown. We now find that it may be grown to a profit, according to the testimony of some persons, at 40s.; and several witnesses of great intelligence concur in considering a price varying from 50s. to 56s. to be quite sufficient. Every thing, however, must depend upon the skill of the farmer, the productive quality of the soil which he cultivates, and the rent he binds himself to pay.

Were the suggestion of Mr. Sandars adopted, the probability is that an average varying from 50 to 56 might be sustained without difficulty, and if accompanied by the repeal of half the malt duty, and a certain demand created for wheat from the Continent, it is more than probable that this average would be greatly augmented; at the same time it would afford a stimulus to the manufacturing interests, insuring increased prosperity to the operative classes, and a greater consumption of all other articles of agricultural produce. But let it not be supposed that it is for the interest of the farmer that the price of corn should be very high. It is infinitely more important to him that it should be steady, with as little fluctuation as possible beyond what must always necessarily follow from the effects of favourable or unfavourable seasons, and that the labouring population should be abundantly supplied with the first necessary of life, insuring as this must do, a lower rate of

wages and a better rate of profit, both to the agriculturist and the manufacturer, whose interests are indissolubly united.

The tendency of the present Corn Laws has been to raise prices unnaturally during years of import, and at the same time to expose the agriculturist to a large influx of wheat (which happened in 1831) immediately before the harvest, when the price is usually the highest; but this supply is not in the smallest degree regulated by the wants of the public; it is probably the accumulation of months, which the merchant has been induced to withhold until it can be introduced at a mere nominal duty.

In the event of a favourable harvest succeeding a large admission of foreign corn, the farmer has to struggle against a depreciation of his produce, beyond what is the natural result of an abundant season; on the other hand, if the harvest prove unfavourable, the natural rise in price which should compensate him for the deficiency in his crop, is checked by the presence of a large quantity of foreign corn in the home market.

If the fluctuating scale of duties be continued, and the price lowered 10s. per quarter, the duty would be fixed at 4s., when the average price of wheat was 63s., and it would so far be an approximation to a sound principle; but even with that alteration the scale of duties would be unnecessarily high.

By a reference to the prices of wheat at Dantzic and Hamburg\*, the former being the port whence wheat of the finest quality, and the latter whence the greatest quantity of inferior wheat is imported, it will be seen that the decennial averages were 52s. 10d. and 30s. 2d. respectively. If we add 7s. for the expense of freight, insurance, &c., which although below the calculation of Mr. Sandars, is above that of other experienced corn-merchants, who appeared before the Agricultural Committee, we shall have 39s. 10d. and 37s. 9d. as the lowest prices at which Dantzic and Hamburg wheat could be sold in England, duty free. But the effect of a demand for

1835	15 0

wheat in this country in 1828, 1829, 1830, 1831, was to raise the price of wheat at Dantzic more than 9s., and at Hamburgh more than 7s. per quarter above the decennial average, which would give us as the prices of wheat, duty free, from those two ports, 49s. and 44s. If we look to the prices at Rotterdam, during the same period, we find a decennial average of 37s. 9d., and the average of 1828, 1829, 1830, 1831, 41s. 8d.

Supposing, therefore, the charges for freight, &c. to England not to exceed those to Rotterdam, we arrive precisely at the same conclusion, and it would not have required a higher duty than 10s. per quarter to have secured as high an average price as has been maintained, under the present Corn Laws, during the last six years.

The finest malting barley is brought down the Elbe from the interior of Germany to Hamburgh, whence it is exported to this country. The decennial average of barley ending with 1835 was 16s. per quarter; the price in the year 1831, the only year in which there was a considerable importation into this country, was 22s. The risk attending the transport of barley must always be considerable, and it is not too much to assume that the freight, insurance, &c. will amount to more than 7s. per quarter, which will make the price, duty free, in England 29s. per quarter, whenever there is a steady demand for barley in this country, so that a fixed duty of 3s. or 4s. would be a sufficient protection against foreign competition in barley.

There are two objections which have been urged against a fixed duty which ought not to pass unnoticed: the one is, that if there were a constant demand for corn in England, it would effect so great an encouragement to the foreign growers, that we should be exposed to an inundation of foreign corn at a price far below the present prices on the continent. The other, that in seasons of scarcity, when the price was exceedingly high, the duty could not be levied.

It is fair to conclude that the prices of corn at the outports on the continent have not been more than remunerating, or there would have been an abundant supply from the interior to have reduced them to their proper level, so that no very serious error will be committed, if our calculations are based upon the average of the continental prices at those ports for a long series of years. In seasons of scarcity it is an undoubted fact, that it would be impossible to levy a duty of 10s. per qr if the price of corn should rise to an extravagant height; but under these circumstances it is clear that as far as the interests of the farmer are concerned, a duty would not be required, and the government might be allowed to dispense with it for a short period, under certain restrictions. The case would be a special one, for which no rule could be provided; for under ordinary circumstances, if the ports were always open at a fixed duty, corn would flow in gradually from abroad in proportion to the demand, and prevent any sudden or unnatural rise in price.

It will be collected from these observations, that my own opinion is decidedly in favour of a fixed duty: but if it were found impossible to overcome the prejudices of those who entertain other views, the nearest approximation to a fixed duty will be the system next to be preferred;\* and whatever alte-

\* Another plan, formed somewhat after the model of the Corn Law of 1804, and possessing all the supposed advantages of a fluctuating duty, is well deserving consideration, and appears calculated to secure greater steadiness of price, viz.—

When the price of Wheat is above 60s.—duty on

ration is adopted should be accompanied by a remission of at least one half the present duty on Malt.

Had the duties on foreign corn been thus regulated in 1828, we should never have experienced the high prices which prevailed in our markets in the three following years, and there would not have been the same inducement to the undue cultivation of wheat, which, coupled with the favourable nature of the harvests in subsequent years, produced so alarming a depression in its price.

It is in vain to say that with an average price, not much exceeding 50s., any considerable extent of land will cease to be cultivated; the energy and skill of the British farmer will enable him to overcome this difficulty; and as the population of the country increases, and the consumption of malt, hops, and animal food becomes greater, in proportion as the price of bread is reduced, an improved system of cultivation will be introduced, yielding a higher profit to the tenant, and a better rent to the landlord; and as the surplus population of the rural districts becomes absorbed by increased demand for labour at our manufactories, the farmer will be no longer driven from the use of mechanical power in reducing the costs of cultivation, by the threats and intimidation of an unemployed peasantry.

Before I quit this subject, I should state that two corn inspectors were examined by the Committee, for the purpose of ascertaining whether an improved mode of taking the averages might not be adopted, by obliging the seller to make returns to the inspector, as well as the buyers. There does not, however, appear to be sufficient grounds for making this alteration, which would be productive of serious inconvenience, without a corresponding benefit. The proposition of Mr. Sandars, which has been already quoted, would remove all chance of fraud; but it is doubtful whether so fair an approximation to the true average price would be obtained, if the three most important markets in England were excepted from the weekly returns. The Committee also inquired into the Scotch mode of striking the fiars; but the system, upon examination, did not turn out so perfect as it had been represented to be.

It was impressed upon the Committee that it would be of infinite importance to have accurate statistical information at some of the Government offices, for instance at the Board of Trade, of the quantity of land in each parish employed in grain cultivation, stating the number of acres sown with wheat, barley, and oats, and the probable produce of the next harvest. I fully concur in this opinion; and I conceive that such a plan may be advantageously grafted on the present division of England into parochial unions, and may also be adapted to the Scotch counties, and baronies in Ireland, and that intelligent officers could be found who might furnish this information at a comparatively trifling expence.

The publication of these returns periodically in the London Gazette, for the information of persons engaged in the corn trade, would tend to lessen speculation, and to regulate the supply according to the demand, thereby reducing those elements of fluctuation in price which are so fatal to the interests of the farmer.

Several petitions were referred to the Agricultural Committee by merchants, and others interested in the corn trade, at Liverpool and Plymouth, praying for a renewal of the "Grinding Act," (5 Geo. 4. c. 70.)

Foreign Wheat, 5s.; above 50s. and not above 60s.—15s.; below 50s.—20s. When the price of Barley is above 30s.—duty on Foreign Barley, 2s. 6d.; above 20s. and not above 30s., 5s; below 20s.—15s.

or, that for every barrel of British flour exported the merchant should be entitled to a certificate, authorizing him to release, at any future time, as much foreign grain as could be liberated by the amount of duty payable on the import of a barrel of foreign flour at the time when the export was made. It appeared from the evidence of those witnesses who were examined on this subject, that America alone supplies upon an average a million barrels of flour annually to the West Indies, and South America; and that owing to the advantage the English vessels possess of back carriage when they go out for sugar and colonial produce, flour is not unfrequently sent in large quantities from America to Liverpool, for the purpose of shipment to the West Indies in British vessels. There is every probability, therefore, that if the English merchants could compete with the Americans in the flour trade, a very large export would be made from the English ports direct to the West Indies, and especially during the winter months, when the Baltic ports are closed. There also appears to be a considerable export, annually, of biscuit and flour from Hamburgh, Dantzic, and Copenhagen to Newfoundland; and it is found that all ships which take in their cargoes at those ports, supply themselves at the same time with beef, pork, and other provisions, and with various articles of German manufacture, all of which would be purchased in this country with great benefit to the English farmer and manufacturer, if the English merchant were enabled to make use of foreign flour in the manufacture of biscuit, or by means of a bounty to export British flour at the same price as foreign flour.

Any plan which would thus relieve the country of its surplus corn in abundant seasons, must tend to promote that steadiness of price so desirable to secure to the utmost possible extent.

Some persons, however, have objected to the renewal of the Grinding Act of 1824, owing to the supposed difficulty of ascertaining the exact quantity of flour to be returned into warehouse, which must vary in different seasons with the weight of the corn, and although fraud may be scarcely practicable, it might diminish the confidence of the farmer in the amount of protection afforded him by the Corn Law, which would in itself be a great evil. There can be no objection to corn being ground under lock, and one of the witnesses, Mr. Freen, admitted that he was not unfavourable to that plan, although he stated that it could be done cheaper by substitution.

In my opinion, the plan suggested in the Liverpool petition might be adopted without prejudice to the agricultural interest, more especially if it were to accompany the proposed alteration in the corn laws. It is evident, as the flour exported will have to compete with American flour, it will not answer the purpose of the merchant to export any but the produce of the best wheat; and Mr. Saunders has justly stated, that, "It will be a bounty on exportation when prices are very low, and if that had been the law, we never should have had wheat at 36s a quarter."

There was one other subject very frequently urged upon the attention of the Committee, during the progress of this investigation.

The existence of distress in the agricultural districts, was in a great measure attributed by several most respectable witnesses, to the resumption of cash payments in 1819, and to an undue contraction in the currency, which, with the exception of those years in which there was an extensive issue of one pound notes, has prevailed since that period. It was stated that wheat, when at 35 the bushel, had attained

the highest price it can be expected to command on an average of years under the present standard; that the prices of barley and other grain have been enhanced by unfavourable seasons and other accidental circumstances; that the high price of wool is to be attributed less to the demand which has been created by the prosperous state of our manufactures, than to the rot which occurred five or six years ago, and that we must expect the prices of all other agricultural produce, at no distant period, to sink to the level of wheat. It was also asserted that the farmer is deprived of that accommodation from the country banker which he so extensively enjoyed during a depreciated currency, and is on that account less able to contend against the low price of corn, or any other untoward circumstances.

These opinions were met by contradictory testimony, and after the most patient attention to the evidence which was adduced in their support, I was unable to arrive at the same conclusion. Whatever may have been the consequences of the Act of 1819, aggravated, as they undoubtedly were, by the sudden transition from war to peace, and by the restoration of manufactures on the continent; however seriously this extensive change in the monetary system of the country, may have affected all persons who were bound by fixed engagements, landlords with settled property, tenants under lease, and debtors of every description, these difficulties are rapidly passing away; and the only question now to decide is, whether any depreciation of the currency should be attempted, with a view to the improvement of the present condition of the agricultural classes. As far as the landlord would be affected by such a measure, it is evident that unless his rents were raised in the same proportion as the prices of all articles of consumption, he would decidedly be a loser by the change. The occupier of the soil, if he had the good fortune to be under lease at a fixed money rent, might gain to a certain extent, although entirely at the expense of his landlord, but in no other respect would it be an advantage to him, unless with regard to those trades, which owing to the monopoly they enjoy in agricultural villages, are still enabled to maintain the prices of certain articles, which form a small portion of the outlay of the farmer, above their natural level. The costs of cultivation, and the wages of labour, would eventually rise in proportion to the extension of the circulating medium; and, were this not the case, the blow would fall with the greatest weight on the most numerous and not the least meritorious class of those engaged in agriculture, the labourers in husbandry, a consequence which must be deprecated by all persons anxious for the general welfare of the community.

It has been shown, by the most satisfactory testimony, that where a farmer is in possession of capital, whether in England, Scotland, or Ireland, he has no difficulty in obtaining pecuniary assistance; nor would it be beneficial to him, that any measure should be adopted which would afford encouragement to bankers to grant more liberal accommodation on inadequate security. This question, however, has been so long settled, that it cannot again be entertained without serious danger to every interest in the State; and, it is impossible for one moment to suppose that the legislature would sanction an alteration, which derange all the existing contracts in the country, more especially at a time when, although the agricultural interest is partially depressed, trade and manufactures are flourishing, the labouring classes prosperous and well employed, and enjoying a greater command over the comforts and necessaries of life, than at any former period. It is true, that it might

lessen in some degree the weight of taxation, but this relief would not be enjoyed exclusively by the farmer, and could only be purchased at the expense of the public creditor, and at the entire sacrifice of national good faith.

Having now placed on record the opinions contained in that report which was not fortunate enough to meet with the approbation of the Committee, with the addition of such observations as appeared necessary for the more complete illustration of my argument; I consider it due to others, as well as to myself, after the unfounded statements which have been circulated in some of the public journals, to add that the report was drawn up without consulting any member of the Government, or any of those gentlemen with whom I had the honour of being associated in this protracted investigation.

To some of my agricultural constituents I fear it may give dissatisfaction, because it does not point out a specific remedy for existing distress. To others it may cause alarm because it proposes an alteration in those laws which have long been considered the key-stone of agricultural prosperity. But however my friends may differ from me on these points, I do not feel the less inclined to place my opinions before them, firmly believing them to be founded on just principles, and to a great extent borne out by the evidence received before the Agricultural Committee.

In conclusion, I would recommend those persons who feel disposed to question the utility of an enquiry which is said to have been productive of such barren results, to read with care and attention the evidence which has been collected. It is true that it contains nothing to flatter with delusive hope the farmer who has neither skill, energy nor capital. But to one who takes the conduct of a farm, with a determination to apply to it those improvements, which the progress of science has extended to agriculture: and who, possessing industry and intelligence, has also the means by which alone they can be made available to him, the perusal of this evidence will afford abundant encouragement. Still greater benefit will be derived from the enquiry, if it does but convince any numerous class of agriculturists that the best thing which the legislature can do for them, is to free their trade from the shackles imposed upon it by impolitic laws—that the relief afforded by the new Poor Laws, and the Tithe Commutation Act, is the principal benefit which can be derived from Parliamentary interference—that any attempt to keep up artificially the prices of agricultural produce, for any length of time, must lead to delusion and disappointment; that looking forward in future years to a moderate price of wheat, the farmer must regulate all his contracts accordingly, and instead of constantly appealing to the legislature for succour, he must rely upon his own industry, which, under Providence, will not fail him. But above all things, he must regard with suspicion, any attempt, come from whatever quarter it may, to separate the interests of the farmer from those of all other classes of the community. “They must wax and wane together;” and it is impossible for the commercial, manufacturing, and trading classes to enjoy a long continued increase in wealth, and the agricultural interest not to have its full share in the general prosperity of the country.

To you, gentlemen, who are so deeply interested in the consideration of this subject, I offer these remarks freely and without reserve, knowing them to be quite consistent with my own experience as a practical farmer, and believing them calculated to benefit that important class of the community, with

which, by every feeling of individual interest and political consideration, I am proud to be connected. I entertain no gloomy anticipations for the future, even with regard to those districts where distress unfortunately exists at present. The remedy is within the farmer's own power; industry and good management on his part, combined with a generous forbearance on the part of his landlord, will produce that result which it is in vain to seek (because not in their power to grant) from the government or the legislature; and if I can only succeed in convincing you of this one fact, I shall be amply rewarded for the anxious share which I have had in the labours of the Agricultural Committee.

With every wish for your future welfare, and that the prosperity of the farmer, and the comfort and independence of the labourer may progressively increase,

I remain, gentlemen,

Your obliged and faithful servant,

CHARLES SHAW LEFEVRE.

London, Aug. 1836.

BREEDING FLOCKS. — “In the *Annales de l'Agriculture Française*, vols. xxxvii and xxxviii, some very interesting experiments are recorded, which have lately been made in France, on the Breeding of Live Stock. M. Charles Girou de Buzareigues, proposed, at a meeting of the Agricultural Society of Séverac, to divide into two equal parts so that a greater number of males or females, at the choice of the proprietor, should be produced from them. Two of the members of the society offered their flocks to become the subjects of his experiments, and the results have now been communicated, which are in accordance with the author's expectations.—The first experiment was conducted in the following manner:—He recommended very young rams to be put to the flock of ewes from which the proprietor wished the greater number of females in their offspring; and also, that during the season when the rams were with ewes, they should have more abundant pasture than the other; while to the flock from which the proprietor wished to obtain male lambs chiefly, he recommended him to put strong and vigorous rams, four or five years old. The following tabular view contains the result of his experiments:—

Flock for female Lambs. Age of the mothers.	Sex of the lambs.		Flock for male Lambs. Age of the mothers.	Sex of the lambs.	
	Males	Fem.		Males	Fem.
Two years . . .	14	25	Two years . . .	7	3
Three years . . .	16	29	Three years . . .	15	14
Four years . . .	5	21	Four years . . .	33	14
Total . . . . .	35	76	Total . . . . .	55	31
Five years and older . . . . .	18	8	Five years and older . . . . .	25	24
Total . . . . .	53	84	Total . . . . .	80	55

“The general law, as far as we are able to detect it, seems to be, that when animals are in good condition, plentifully supplied with food, and kept from breeding as fast as they might do, they are most likely to produce females. Or, in other words, when a race of animals is in circumstances favourable for its increase, Nature produces the greatest number of that sex which, in animals that do not pair, is most efficient for increasing the number of the race. But if they are in a bad climate, or on a stinted pasture, or if they have already given birth to a numerous offspring, then nature setting limits to the increase of the race, produces more males than females. Yet, perhaps, it may be premature to attempt to deduce any law from experiments which have not yet been sufficiently extended. M. Girou is disposed to ascribe much of the effect to the age of the ram, independent of the condition of the ewe.”

## NORTHAMPTONSHIRE FARMING AND GRAZING SOCIETY.

The annual show of this society took place on Wednesday, Sept. 14, on Earl Spencer's farm, at Chapel Brampton. The day, notwithstanding an unpromising morning, was pleasant, and a large and very respectable company assembled on the ground. The show of cattle was very short in comparison with the shows of previous years, owing to the great scarcity of keep. The sheep on the contrary were excellent and numerous.

At four o'clock, a highly respectable party, consisting of 114 persons sat down to dinner at the George Hotel, in this town, C. Hillyard, Esq. in the chair. Among the company were Earl Spencer, Stafford O'Brien, Esq., E. Bouverie, Esq., J. Nethercoat, Esq., Langham Christie, Esq., W. Harris, Esq., High Sheriff of the County; R. Heygate, Esq., E. Pell, Esq., G. Peach, Esq., J. Percival, Esq., and a large body of eminent agriculturists of the counties of Northampton, Warwick, Bedford, Buckingham, Hereford, &c.

The cloth having been withdrawn, Mr. Hillyard proposed "The King." This, he said, was the only health which he should propose to accompany with three cheers. The practice of cheering other healths was inconvenient in many respects, and tended greatly to interrupt the proceedings of the meeting.

The health was then drunk with the usual honours; and was followed by "the Queen and Royal Family"—"Success to the Farming and Grazing Society." Mr. Hillyard here produced his "dessert"—mangel wurzel, Swedish turnips, and carrot.

In proposing the next toast, the Chairman observed that it was an old proverb, that good wine needs no bush; and with equal truth it might be said that a good toast required no preface. He should therefore content himself with proposing health and long life to the noble patron of the Society, Earl Spencer. *Enthusiastic applause—the company disregarding Mr. Hillyard's salutation—and simultaneously rising, and giving three cheers.*

EARL SPENCER, in returning thanks, said he was quite aware the meeting felt, that in promoting as he had promoted the interests of this Society, he considered that he was contributing to the benefit of the country at large, but more especially to the benefit of the agriculturist. Its object was to promote good farming and grazing, and the good stock which was generally exhibited at the shows led him to think that it had not been without the desired result. He was sorry to see so small a show of cattle to-day; but he hoped it was to be attributed to no other cause than the dryness of the season. He was very unwilling indeed to think that the graziers of this county were slackening their interest in the Society. For his own part he would do his best towards a better exhibition next year, and so he was sure would several other gentlemen whom he saw around him. (*Cheers.*) His lordship then said he was desirous of saying a few words about some of the premiums which he had been induced lately to offer. In the first place he would allude to the prizes for the best sorts of grain. *He thought it highly desirable to encourage improvements in the growth of grain,* quite as much as to encourage improvements of live stock. (*Cheers.*) He should like to see persons who wished to procure the best samples of barley and wheat come to Northamptonshire for them. (*Cheers.*) He was anxious therefore to see the Northamptonshire farmers competing for this prize. With reference to the prize to the sheep-shearers, he was aware that the fine sort of shearing required by the conditions might not be exactly what was required by the farmer. But he was of opinion that the shepherd who sheared best in this manner, was able to shear in the best manner for the farmer. He wished too to excite emulation among the shepherds, and he had succeeded. The first year he thought he had a good number of competitors. But he had then only 19, while in the very next year he had 37. Then there was a very manifest improvement in the shearing. In the first year there was a great number of sheep well shorn; but this year

they were nearly all well shorn. He believed that if he could induce the labourer to make himself a good sheep-shearer, he would always find employment. (*Cheers.*) The necessity for the hedge-cutting prize had, he thought, been pretty clearly shown by the circumstances connected with the competition. Last year there was a great number of competitors, and the work was remarkably ill done. Now this plainly showed two things; first that the men were willing to exert themselves—the next that they greatly wanted improvement. As a proof of what he had said about the inferiority of the work, he would observe that a whole drove of oxen went through the hedge which was cut on his farm. One thing indeed was to be considered, the time for contending for the prize was fixed at too late a season, last year. This year it would be earlier; namely, on the 23rd of November. In addition to these prizes he proposed in future to offer a prize for mowing. The conditions would require some consideration, because it would be very difficult to test good mowing. This would be another prize for the labourers. He was desirous of offering prizes to labourers as well as to their employers—(*Cheers.*)—for he believed that they not only tended to the great improvement of the labourer, but were the means of inducing a good feeling between the employed and the employer. (*Cheers.*) As he had had before said, he was anxious for the success of this Society, because he was anxious to promote good farming and grazing, by which alone the success of the agriculturist could be insured. He hoped that on this ground he should have the strenuous support of the farmers of Northamptonshire. (*Cheers.*)

MR. HILLYARD then proceeded to read the list of awards, as follows:—

The Silver Cup, given by Sir W. Wake, Bart. Edward Bouverie, Esq., and the President of this Society, to the farmer of this county, or a farmer's son, not exceeding 25 years of age, who shall plough in the best manner, with two horses abreast, without a driver, and within three hours and a half, half an acre of land, not less than four inches and a half deep, was won by Mr. J. Vials, of Harleston; but in consequence of Mr. Vials being older than the prescribed age, the prize was awarded to the next best candidate, Mr. Edward Underwood.

To Thomas Gadsou, ploughman to Mr. Shaw of Cotton End, the Society's prize of two guineas.

To Charles Hine, ploughman to Mr. W. Shaw, of Huntsbury Hill, one guinea.

To John Cox, ploughman to Mr. Vials, of Harleston, 10s 6d.

To Wm. Freeman, shepherd to Edwd. Bouverie, Esq., for rearing at the rate of 23 9-10 of lambs to the score of ewes, two guineas.

To James Jones, shepherd to Mr. Richard Linnell, of Stowe, for rearing 23 1-3 of lambs to the score of ewes—one guinea.

To Thomas Crick, shepherd to Mr. Wm. Slaw, of Cotton End—10s 6d.

A prize of two guineas to the unmarried man who had lived the longest time in the house of a member of this Society as a farming servant.—No claimant.

A prize of two guineas to the unmarried woman living in a farm house under the same conditions, to Lucy Rigby, for 12 years service with Mr. Bartlett Miller, of Chapel Brampton.

To Aaron Wilson, labourer to John Manning, Esq., of Harpole, for 31 years' service, two guineas.

To Wm. Irons, labourer to John Manning, Esq., for 31 years, one guinea.

To Joseph Pell, labourer to Mr. Joshua Cooch, of Harleston, for 25 years, 10s 6d.

Three prizes offered to the labourers in husbandry employed by members of the society, who had supported and were then maintaining the largest number of children, or who were respectively possessed of property to the amount of ten pounds, the result of their earnings, besides household goods, were all unclaimed.

Earl Euston's premium of three guineas, offered on similar conditions, but not restricted to persons employed by members of the Society, was also unclaimed.

A premium of two guineas, by John Percival, Esq., to Robert Grose, of Moulton, he having brought up three children.

A premium of one guinea, offered by Mr. Percival to the labourer with not less than two children, was unclaimed.

By S. Percival, Esq.—One guinea to Geo. Trasler, a youth under 20 years of age, for seven years servitude with Mr. Rd. Linnell of Stowe.—A second premium of one guinea was unclaimed.

#### EARL SPENCER'S PREMIUMS.

CLASS 1.—Premium of ten sovereigns—Earl Spencer's Durham ox, four years and six months old, bred by his lordship.

2. First prize of 7*l* to E. Bouverie, Esq. of Delapre Abbey, for his Durham ox, four years and six months old, bred by Mr. Bagshaw, of Newton, near Kettering.

Second prize of three sovs. to C. Hillyard, Esq. for his Durham ox, three years and nine months old, bred by Mr. Ellis, of Clipston.

3. First prize of seven sovs. to Stafford O'Brien, Esq. of Blatherwick Park, for his half-bred cow, three years and four months old.

Second prize of three sovs. to Mr. T. W. Bosworth, of Spratton, for his aged cow.

4. First prize of seven sovs. to Mr. T. W. Bosworth, of Spratton, for the best pen of five long-woolled ewes.

Second prize of three sovs. to Mr. Payne, of Hardington.

5. First prize of seven sovs. to Mr. John Scriven, of Harpole, for the best pen of five long-woolled heaves.

Second prize of three sovs. to Mr. Mark Sharman, of Great Harrowden.

6. First prize of seven sovs. to Mr. W. Askew, of Norton, for the best pen of five long-woolled shearhogs.

Second prize of three sovs. to Mr. T. Grose, of Harleston.

7. A prize of ten sovs. to Mr. Jno. Manning, of Orlingbury, for his shearing long-woolled tup, bred by himself.

Mr. Bliss's tup, shown in this class, was highly commended.

8. A prize of ten sovs. to Mr. John Manning, of Orlingbury, for his three-shear tup, bred by himself. All the sheep in this class were commended, but particularly Mr. Bliss's three-shear sheep, and Mr. Redgrave's shearing tup.

A prize of three sovs. for the best sample of wheat, and another of the same amount for barley, were both awarded to Mr. H. Sanders, of Harleston.

A similar prize for the best sample of oats, was unclaimed.

#### SIR J. H. PALMER'S PREMIUM.

Five sovs. to E. Bouverie, Esq. for his three-year and seven months' old Hereford ox, bred by the late Hon. G. Germaine.

#### THE HON. E. S. PERY'S PREMIUMS.

Five sovs. to Mr. Payne, of Hardington, for his pen of five long-woolled wether lambs.

A premium of five sovs. for the best fat ox was unclaimed.

#### STAFFORD O'BRIEN, ESQ'S PREMIUM.

Five sovs. to Mr. Samuel Sherman, of Milton, for his 17 years' old Durham bull.

Mr. Underwood's bull, shown in this class, was commended.

#### SIR FRANCIS LOWLEY'S PREMIUM.

Ten sovs. to Mr. John Tunnell, of Dallington Grange, for his three-year-old grey colt.

The sweepstakes of two sovs. each for the best pair of Hereford steers, bred in the county, were adjudged to Edwd. Bouverie, Esq., for his pair of Hereford oxen.

Mr. HILLYARD then proposed the health of the successful candidates.

E. BOUVERIE, Esq., returned thanks. He had no objection to being successful, but he did wish he had had to contend with better and more numerous competitors. Next year he trusted that the show would be larger.

Mr. HILLYARD said the next toast he had on his list was the health of the Donors of the prizes.

EARL SPENCER begged to propose, as one of the donors the health of their worthy President. It was not however only as a donor that they were indebted to him. To his unwearied exertions, they must all be aware, the Society chiefly owed its origin, and in a great measure its continued success. No gentleman who heard him, would, he was sure, not join gladly in drinking the good health of Mr. Hillyard. (*Cheers.*)

Mr. HILLYARD returned thanks. Annually for many years, he had had the gratification of rising to return thanks for a similar compliment. So many times, indeed, had he risen, that he ought to know better how to express his acknowledgements. But he knew he should never be able to express all he felt, and therefore he would cut the matter short, and simply say—"I thank you." So long as he lived, so long should his poor services be devoted to promoting the interests of the Farming and Grazing Society of Northamptonshire. (*Cheers.*)

Mr. HILLYARD, in proposing the next toast, the health of Sir J. H. Palmer, regretted that ill health prevented his attendance. He was indeed absent from the country. The healths of Earl Easton, the Hon. E. S. Pery, Sir F. Lawley, and Stafford O'Brien Esq.

STAFFORD O'BRIEN, Esq., returned thanks. He had been a member of the Society for some years, although this was the first time he had had the honour of attending the annual dinner, and he could not but feel greatly obliged by their courteous reception of his health. With respect to the show, he must admit that he had been disappointed at seeing so few beasts exhibited, knowing how beneficial the society must be, not only to this county but to the whole country. He was satisfied that more was to be learnt from such meetings as those of this society in a single day, than could be gleaned from books on the same subject in a year. He was hardly gratified at being the winner of this prize, for his was a half-bred animal, and seven guineas was a great deal of money for it. (*Laughter.*) He sincerely hoped they should do better next year; he would try to do better himself, and it would highly gratify him to lose the prize. (*Cheers and laughter.*)

Mr. HILLYARD then proposed the health of Sir William Wake. (*Cheers.*) He was at the sea-side; or he would certainly have attended the dinner.

Mr. HILLYARD would now propose a toast, which he was sure would be highly acceptable to the meeting; the health of the Hon. Captain Spencer. (*Great Cheering.*) The Hon. Captain had recently entered upon agricultural pursuits, and he rejoiced at it—first, because he was sure he would derive from it a vast deal of pleasure; and secondly because he would be a valuable accession of strength to their body.

The Hon. Captain SPENCER said he was elected a member of this Society only at the last meeting. He had hoped to have been among the competitors at this day's show, but he found it was rather early for so new a beginner to compete with the eminent agriculturists whom he saw about him. He should, however, certainly try next year, and with the advice of his friend by his side, he did not despair of doing something.

Mr. HILLYARD proposed the healths of three gentlemen who had undertaken a very arduous and not always very pleasant office. He alluded to the three judges, and he defied any county in England to show him three more efficient or impartial men. (*Great cheering.*) The healths of Messrs. Chaplin, Burgess, and Senior were then drunk with much cheering.

MR. CHAPLIN returned thanks.

The healths of the gentlemen who had favoured them with their company from distant counties. MR. BARNETT rose to return thanks, when Mr. Hillyard suggested that if all the gentlemen included in the toast would oblige them by rising also, the company would be able to see how greatly they had been favoured. A large number of gentlemen accordingly stood up in

compliance with Mr. Hillyard's request and were cordially cheered.

MR. BARNETT then returned thanks. He said he had been greatly gratified by the show, although as a whole, it was not equal to some previous ones. He saw, however, a very great improvement in the Tups shown by the Noble Lord. He concluded by hoping that he should have the pleasure of seeing his Northamptonshire friends at the Bedfordshire Agricultural Meeting which was fixed for the first Tuesday in Oct.

MR. HILLYARD then produced his bag of turnip seed, for which a great scramble took place amidst much laughter. He observed that one of the advantages of these turnips, was, that they would not run to top if allowed to stand late in the year. He had seen turnips in April run to top till they resembled a painter's brush. As an evidence that they were really worth attending to, he would mention that some time ago, he was walking over a turnip field in a distant county, when he perceived that the turnips were exactly the same sort as those he was now showing. Upon mentioning the fact to the owner of the field, he confirmed it, adding that his son had obtained one of the seeds handed round by him (Mr. Hillyard) after the dinner of the Society; that he had sown it and liked it so much that he had preserved the produce and had now his farm stocked from that insignificant origin.

The healths of the Judges of the Ploughing, Messrs. John Price, Reynolds, Grantham, Berkeley, R. Heygate, Kitelee, S. Bennett, Thomas (of Lidlington), the Stewards, and the High Sheriff, Wm. Harris, Esq. followed. We regret that a want of space compels us to throw aside the report which we had prepared of this part of the proceedings.

W. Harris, Esq. and Mr. Barwell were then elected members of the Society, and shortly after eight o'clock Earl Spencer left the room, amidst cheers, and the company broke up.

The following sweepstakes are open, to be decided at the next annual meeting:—

Five sovereigns each, for the best ox, under five years old, fed without restriction. Spencer.

Three sovereigns each, for the best ox or steer qualified for the 2d class in the Christmas Smithfield Show, 1836. Spencer.

Two sovereigns each, for the best Hereford steer, under three years and a half old, and qualified for Lord Spencer's prize (No. 2) for a fat ox.

John Slater.

Three sovereigns each, for the best pair of steers, of any breed, under four years old.

Spencer—E. Bouverie.

Two sovereigns each, for the best pair of Hereford steers fed in the county, under four years old.

E. Bouverie.

Three sovereigns each, for the best steer of any breed, under three years old. Spencer.

One sovereign, for the best Durham steer, not exceeding four years and nine months old, or 100 stone.

Spencer.

One sovereign, for the best pair of Hereford steers, not exceeding three years and a half old.

E. Bouverie.

One sovereign, for the best steer under two years old.

Spencer.

Five sovereigns each, for the best bull which has served 25 cows. John Beasley.

Two sovereigns each, for the best breeding cow, in calf. Stafford O'Brien. W. F. Wratlaw.

Two sovereigns each, for the best cow or open heifer. Stafford O'Brien. W. F. Wratlaw.

Three sovereigns each, for the best pair of Scots. Spencer. Wm. Bailey.

Five sovereigns each, for the best tup of any age. Spencer. — Inskip.

Two sovereigns each, for the heaviest crop of mangel wurzel, of not less than three acres.

Spencer. C. Hillyard.

Two sovereigns each for the heaviest crop of Swedish turnips, of not less than five acres.

Spencer. C. Hillyard.

## NETHERBY FARMER'S SOCIETY.

This Society held its Sixteenth Annual Meeting and Cattle Show, at Longtown, on Tuesday, September 13. The various descriptions of stock exhibited were numerous, and considered to be particularly good, and the breeds are certainly improving, although the season has been unfavourable. After the field business of the day was over, the President of the institution, the Right Hon. Sir James Graham, Bart., with his son, Mr. Frederick Graham, Major Graham, the Rev. Mr. Moor, of East Lothian, and a number of the gentlemen and agriculturists of the neighbourhood, accompanied by a large party of the farmers of Netherby and their friends, sat down to a very excellent dinner provided by Mr. Braithwaite, of the Graham Arms. Sir James occupied the President's chair, and Mr. Thomas Wilkin and Mr. Gibbons acted as Vice-Presidents. The healths of the worthy baronet, of Lady Graham, the Patroness of the institution, and her beautiful family, and of every branch of the good old tree of Netherby, were drunk with the greatest enthusiasm. Many appropriate speeches, toasts, and healths followed, and the evening, until a late hour, was passed in the most happy manner, and with that spirit of good will, kind intercourse and conviviality which characterises this well-conducted society, and augurs well for its continued prosperity and great utility.

Immediately after dinner, the President read over the award of the Judges, and the prizes were immediately paid to the following numerous competitors by Mr. Yule, of Fergushill, the Secretary.

1. To the best managed First Class Farm, a Silver Tea-pot of Ten Pounds value. Mr. John Birrell, of Rosetrees.

2. To the best managed Second Class Farm, a Silver Tea-pot of Ten Pounds value. Mr. William Graham, of Cubby hill.

3. To the best managed Third Class Farm, cash, Four Pounds. Mr. Thomas Little, of Heathery-knowe.

4. To the best managed small possession or croft, the farmer of which may be occasionally employed off his Farm, cash, Four Pounds. Mr. John Carruthers, of Yulescroft.

5. To the best managed ditto ditto, on which the farmer does not reside, under the same conditions as the last, cash, Three Pounds. Mr. Robert Plenderleath, Longtown.

6. For the best executed Draining, by stone or tile, laid on slates or stone, the quantity of land laid dry and fit for aration to be compared with the extent of the farm, without reference to the rent.

First Prize, Five Pounds. Mr. Thomas Davidson, of Arthurscross.

Second Prize, Two Pounds Five Shillings. Mr. G. Carruthers, of Station.

7. To the Tenant who shall produce the best lot of Five Galloway Cows in Milch, *bona fide* his own property, the first choice of a Galloway Bull Calf; or a Heifer Calf, if the President or Vice-President think fit, from the Netherby Stock. Mr. Gibbons, of Mossband.

8. To the Tenant who shall produce the best lot of Two Year Old Galloway Cattle, male or female, not less than five in number, bred on his farm and *bona fide* his property, the second choice of a Bull Calf from the Netherby Stock, or a Heifer Calf, at the option of the President or Vice-President, as above. Mr. James Graham, of William and George Town.

9. To the ditto who shall produce the second best

lot of Five Year Old Cattle, male or female, under the same conditions as the last, the third choice of a Galloway Bull Calf, or a Heifer Calf, without choice, from the Netherby Stock, as above. Mr. Hislop, of Moat.

12. To the best managed Ancient Meadow upon the Estate, upon which either Lime, Short Dung, or Compost shall have been applied for the current crop, in proportion to the extent and capability of the farm, cash, Two Pounds. Mr. James Little, of Batenbush.

13. To the best managed Meadow, formed from Lands not originally Meadow, and improved since the year 1824, under the same provisions as the last, cash, Two Pounds.

14. Among the best kept, neatest, and cleanest Cottages and Gardens upon the Estate, Lady Graham gives prizes to the amount of Ten Pounds in money, to be awarded according to merit, by the Judges of the Netherby Farmer's Society.

First Class,—John Fergusson, Lynemoor, and six others.

Second Class,—John Leftry, Beck.

Third Class,—Tibby Little, Englishtown, and ten others.

Premiums offered by the Netherby Farmer's Society to the Tenantry and Cottagers of the Right Hon. Sir J. R. G. Graham, Bart., M.P., independent of the Prizes offered by Sir James and Lady Graham. Crop and year 1836.

1. To the best managed, manured, and cultivated Turnip Crop, upon the whole Estate, the extent of the farm and the nature of the soil being considered. Not to be under ten acres, Three Pounds. Mr. Wilkin, of Guards.

2. To the best managed Turnip Crop, under the same conditions, but not exceeding ten acres, One Pound Ten Shillings. Messrs. Tinning, of Chapleton.

3. To the best ditto ditto Potatoe Crop, on the same conditions, Three Pounds. Mr. Saunders, of Ridings.

N. B.—The successful candidates for Sir James's Prizes, Nos. 1 and 2 not to compete for these two last-mentioned Prizes.

4. For the best Bull of the pure Galloway Breed, *bona fide* the property of a Netherby Farmer, and to serve Cows upon the Estate until the 1st of September, 1836, at not more than 2s. 6d. each Cow, but after receiving this prize, the Bull may be sold if he has already remained three years on the Estate for the purpose of breeding, Five Pounds. Mr. Wilkin of Bush.

5. For the second best ditto ditto on the same conditions, the Bull to be two years old, Two Pounds. Mr. Wilkin, of Mossband Hall.

6. For the best Cow of the Galloway Breed, *bona fide* the property of a Member: the Cow to be in milk at the time of showing, One Pound. Mr. Fergusson, of Englishtown.

7. For the best Galloway Heifer bred upon the Estate, two years old past on the 1st of March, 1836, One Pound. Mr. Johnson, of Pedderhill.

8. To the best ditto ditto, one year old, Ten Shillings. Mr. Johnson, of Pedderhill.

9. To the best Cart Stallion, of the pure Scotch breed, to serve in the district, and give every satisfaction during the season to the Committee and Judges appointed by the Society, Five Pounds. Mr. Robert Broatebe's Horse Champion.

10. To the best Brood Cart Mare, of the pure Scotch breed, Two Pounds. Mr. Wilkin, of Guards.

N. B.—This Prize to be held by the Treasurer un-

til the Mare produce a Foal, if she has not already produced, but she must be stinted.

11. To the second best ditto ditto, on the same conditions, One Pound Ten Shillings. Mr. Wilson, of Cowrigg.

12. To the best three year old Cart Horse, Mare, or Gelding, of the pure Scotch breed, bred at Netherby, Two Pounds. Mr. Hislop, of Most.

13. To the best two years old Horse, Mare, or Gelding, of the pure Scotch breed, One Pound Ten Shillings. Messrs. Tinning, of Chapeltown.

14. To the best year old ditto, One Pound. Mr. Graham, of Cubbyhill.

15. To the Best Bear, Two Pounds. Mr. Little, of Guardsmill.

16. To the second best ditto, One Pound. Mr. Birrell, of Rosetrees.

17. To the best Sow, One Pound. Mr. Wright, of Oakbank.

18. To the Man or Woman servant in Husbandry, for the longest term of service with one master, but not less than seven years, One Pound. William Scott 18 years servant to Mr. Wilkin, of Bush.

19. For the best pen of five yearling Cheviot Wedders, One Pound. Mr. Gibbons, of Burnfoot.

20. For the best ditto of five yearling Half-bred Wedders, One Pound. Mr. Wilkin, of Bush.

AGRICULTURAL SALE.—The sale of farming stock at Athelhampton, late the property of J. G. Balston, Esq., deceased, took place on Friday last, by Mr. L. S. Green, of Wareham. A very numerous and most respectable company attended from various parts of the kingdom. The arrangements for the sale gave the highest satisfaction. After the usual conditions of sale had been read, the auctioneer addressed the company in a neat and appropriate speech, observing on the great superiority of the stock exhibited, and the opportunity afforded to agriculturists to improve their stocks, as he was instructed to sell without reserve. About three hundred gentlemen partook of a cold collation, which was served up in very good style by Mr. Bailey, of the Bear Inn, Wareham. Annexed are prices the stock realized:—

	s.	d.	s.	d.		
Full-mouthed Ewes, from ..	32	0	to 40	0 per head.		
Six-teeth Ditto .....	37	0	..	67 0		
Four-teeth Ditto .....	36	6	..	43 6		
Two-teeth Ditto .....	36	6	..	45 6		
Lambs .....	26	0	..	33 0		
	£.	s.	d.	£.	s.	d.
Rams .....	3	5	0	to 17	0 0	
Ram Lambs ....	2	5	0	..	15 10 0	
Yearling Heifers ..	5	10	0	..	9 2 6	

We congratulate our agricultural friends on the improvement their flocks must derive from the above sale, affording, as it has to them, an opportunity which may never again occur.—*Dorset County Chronicle*.

In a bushel of Wheat of average quality, there are contained about 500,000 grains; and if this number is divided by the number of square yards in an acre, one bushel sown on an acre, gives 103 grains and 3-10ths on each square yard and on each square foot, 11½ grains, therefore each square space measuring 3½ miles would on an average have one seed deposited in it, from whence is adduced the following table:—

bushels.	Number of Grains.	Grains on a sq. yard.	Grains on a sq. foot.	One grain on a square of
1....	500,000	103, 3-10ths	11½	3½ inches
2....	1,000,000	206, 6-10ths	23	2½ Do.
2½....	1,250,000	258, 7-10ths	28½	2¼ Do.
3....	1,500,000	300, 9-10ths	34½	2 Do.
3½....	1,750,000	361, 3-10ths	40½	1 9 10th Do.

## WEST SUSSEX ASSOCIATION,

FOR THE ENCOURAGEMENT OF MERITORIOUS AND  
INDUSTRIOUS AGRICULTURAL LABOURERS.

The principal meeting of this Association took place at Goodwood on Wednesday Sept. 7, and was successful beyond the most sanguine expectations of its supporters. The exertions which have been made during the last few months by the originators of this most useful society have tended to excite very considerable interest throughout this rich agricultural district, and we are pleased to say that they have been crowned with the most complete success.

Its object was at a time when the Poor Law Amendment Act was first coming into operation, to ascertain the moral and pecuniary condition of the labouring population, or, at least, of that portion of it which has been struggling for many years with honest pride to maintain themselves and families independent of parochial assistance. This end has been most fully answered and the result must be highly gratifying to all those who are interested in this most important question. The society was enabled, by the liberality with which it was supported, to offer nearly forty premiums to the different classes of servants engaged in agriculture, both male and female, for which upwards of eighty candidates competed. Class A.—the most important, perhaps, of all, viz.: for labourers who have brought up large families with the least amount of parochial relief, the certificates produced to the Committee most unexceptionably signed—included those of many labourers who, with a family of eight or ten children, had retained situations for periods varying from twenty to thirty years, and who had received no parochial relief whatever, or only during periods of sickness. As an encouragement, also, to those labourers in whose department skill and experience are of the utmost consequence sheep-shearing and ploughing matches were held out as a means of affording them an opportunity of displaying their talents, and of receiving a suitable reward. The particulars of the first, which was in June last, were given in a former number of our paper, and the ploughing match, which was the chief attraction on Wednesday, took place in a large field adjoining Goodwood Park, and presented a most pleasing and interesting scene. The judges were Messrs. Ellman and Putland, who kindly came from Lewes to officiate on the occasion, and a very large concourse of persons assembled to witness it. Nineteen candidates started, each being required to plough half-an-acre, with two horses and reins, but without a driver. The task was completed in some instances in little less than an hour and three quarters, and the latest only just exceeded two hours. Among the competitors there were two lads, both under sixteen years of age, to both of whom, we are pleased to say, premiums were awarded.

After the conclusion of this match, there was a show of stock sheep for premiums offered by the Cattle Show Club, in Goodwood Park, but owing, we understand, to the jealousy which exists between the breeders of sheep, it did not fill well.

The premiums to the breeders of the best pens of South Down six-tooth, four-tooth, and two-tooth ewes, were awarded to Messrs. Huskisson, Mr. E. Wyatt, and Mr. A. Wyatt; and to the breeder of the best four-tooth South Down ram, to Mr. Charles Duke.

An interesting scene took place after dinner when the prizes were given to the successful candidates, their names and services being read out by the Chairman, and, when they retired after having received

this honourable and to them valuable proof of their merit, many of them were loudly cheered by the numerous company present.

Shortly after three o'clock a highly respectable party, consisting of about 150 gentlemen connected with agricultural pursuits, sat down to an excellent cold dinner, provided by Mr. Ballard, of the Dolphin Inn, Chichester. His Grace the Duke of Richmond, was only prevented by his absence in Scotland from presiding over this meeting of an Association of which he is so eminent a Patron. His place was, however, ably supplied by His Grace's brother, Lord George Lennox, who proved his interest in the welfare of the Agricultural interest of Sussex by coming expressly from France, where he had been staying with his family, to place himself at the head of those gentlemen who have distinguished themselves by a similar spirit. His Lordship was supported on his right by Mr. Putland, of Fittle, and on the left by Mr. Scrase Dickens.

Among the gentlemen present we noticed—Gen. Crosbie, C. S. Dickens, Esq., J. Ellman, Esq.,—Putland, Esq., Richard Hasler, Esq., W. L. Woods, Esq., C. Osborn, Esq., John Barton, Esq., James Hack, Esq., T. Humphry, J. Rusbridger, Esq., &c. &c.

On the removal of the cloth, the toasts of "The King," and the "Queen and the rest of the Royal Family," were given from the chair.

Then followed the distribution by the Chairman of the prizes awarded to agricultural labourers both for their moral conduct during a long term of years, as well as for a display of superior skill in their peculiar art. Each claimant, on his name being called out, proceeded to the head of the table, where he received the reward of his merit, which was accompanied by a few words of congratulation from Lord George Lennox, with a hope that they would continue to pursue that path of honesty and industry which had hitherto characterised their career, and which was the cause of so much honour being shown to them that day. Loud shouts of applause followed the perusal of the documents proclaiming the meritorious conduct of these men, and few could help envying their feelings at seeing themselves thus held up as patterns of good behaviour and probity, and examples worthy to be followed in every age, society, and country. Those who pretend that virtue in humble life is but a name—those who boast so much of bye-gone times to the prejudice of the present—should have been present on this occasion; they would have seen enough to convince them that, when a desire is manifested on the part of any body of men to encourage worth and merit, it is by no means a difficult task to discover it, and that, too, in classes where they would, perhaps, through ignorance, last look for it.

On the conclusion of this agreeable duty, the Chairman rose and said that he was sure the company would share in the pleasure he took to drink the healths of those worthy individuals to whom prizes had just been awarded.

The names of those female servants whose conduct had been thought such as to merit recompense were then read, and the premiums received by their masters.

The successful competitors in the ploughing match were proclaimed, and received the reward of their skill.

Mr. BARTON called on Mr. Ellman to explain to the company why the number of premiums originally fixed upon had been exceeded.

Mr. ELLMAN was very happy to answer the call of Mr. Barton. A mistake had arisen in consequence

of his thinking that four premiums were to have been given away in the ploughing match, he had been glad to find that there were four very superior ploughmen, to whom prizes could be given; afterwards, however, he discovered his mistake, and that there was the number of premiums to be conferred, and therefore it was necessary that one man should be excluded; the doubt rested between Nos. 13 and 16, but as the difference between them was very slight, the former having finished only a short time before the latter, it had been determined to extend the number of premiums from three to four, and thus reward both the men. Slight recompenses had also been conferred on several others.

The CHAIRMAN, before reading the names of the successful sheep-shearers, would tell them that he was much interested in their exertions. He had laid a bet on them against all the fine flock-shearers of Mr. Ellman, and he was confident they would return from East Sussex with all the prizes.

Mr. JAMES HART called attention to this subject, which he wished the more to do from having been laughed at so on this head by their friends in East Sussex. They had been challenged by them to come to their ploughing match, on the 26th of Sept., and he hoped that the Committee of this Association would appoint two or three men to go there.

Mr. RUSBRIDGE would second this proposition.

Mr. ELLMAN hoped that, after they had laughed at him, they would allow him to say five words in reply. He begged to say that the premiums in their ploughing match on the 26th of Sept. were open to all Sussex, but their manner of ploughing was very different from what he has seen this day, and which appeared to him extremely easy. However, he should be delighted to have the West Sussex men, and should be equally delighted not only to see themselves beaten in ploughing but also in sheep-shearing, for such a rivalry would be productive of good to both parties. By the Reform Bill the county had been divided into two divisions, and returned four Members of Parliament, and he hoped that one of the Members of the Eastern Division of the county would come and preside over them, with the same eloquence as one of the Members of West Sussex had displayed this day. He was glad to see that the proposition he had made last year had produced so much mirth at the present meeting. He would conclude by proposing the health of the Noble Chairman, than whom no one was more capable of presiding on this occasion.

Mr. POSTLETHWAITE concurred with Mr. Ellman in his eulogium on Lord G. Lennox, and mentioned several circumstances in which the activity of the Noble Lord had been exercised to the advantage of the county, and that, too, in a time when the state of the agricultural districts was most critical. He proposed that his health should be drunk with three times three.

The Noble CHAIRMAN said that he was aware it was difficult to make himself heard in so large a room, and, if it were smaller, he should find the same difficulty to express his feelings of gratitude for the manner in which they had drunk his health. He trusted they had been acquainted with him long enough to know that his words came from his heart. Though he did not reside with them at present so much as usual, it was a great satisfaction for him to find that, when he did come among them, they received and treated him with so much warmth and affection, and, if he were less with them on ordinary occasions, he hoped he had not deserted his duty where he was so much required—in the House of Commons. To do this was the only pledge he had

given, and, for a proof of his having kept his word, he would refer them to his votes in Parliament, which would show that during the whole Session he had not been absent more than fifteen days. Mr. Postlethwaite had alluded to circumstances which had occurred some years ago, and in which he (the Noble Lord) had acted as he thought proper, but he was certain the establishment of Societies, such as the present, would do more to stop such proceedings than any private exertions. These meetings would do more to check the spirit of in-subordination which unfortunately existed at the period alluded to than all the laws. The landlord, the tenant, and the labourer, had only to mix with and know each other to become aware of the fact that their interests were the same. Mr. Ellman had said that, in the recent ploughing match, they had not properly buried the stubble: he would answer that, when they went to East Sussex, they would not only properly bury the stubble, but the labourers also; and, as their manner of ploughing was so very easy, he would advise Mr. Ellman to send some of his ploughmen over to learn it, and the West Sussex ploughmen would prove to them that they could also do the most difficult; and whatever they did would be done in a fair and honest way. He concluded by drinking their very good healths.

The CHAIRMAN, in proposing the health of the Judges, said they had a deep debt of gratitude to pay to Mr. Ellman and Mr. Putland, and, whatever might have passed between him and the former, he was sure that that gentleman would see it was only a friendly rivalry.

Mr. Ellman, in returning thanks, said he was glad at having had an opportunity of witnessing the ploughing of West Sussex in the same manner as he had been a spectator of their sheep-shearing. With regard to the latter, he was inclined to think that the East Sussex men were superior, judging from a meeting which he had previously seen. The ploughing match of his division of the county would be on the 26th of September, and he would promise the West Sussex men fair play, and should even be glad to see them carry off the prize; but he could not see great difficulty in the ploughing that had taken place that day. If they considered the piece of ground chosen uneven they would find much more uneven ground in the other division of the county. In fact, they considered their ploughing as only capable of being performed by four horses, but, notwithstanding, should feel extremely happy to see it performed by two. Even the ground they ploughed was such as to render the use of horses impossible, and oxen were resorted to. He knew the land, for he had used it twenty years. Having stated this much with regard to the ploughing, he would now speak of the sheep fair. In the first case of the three year old ewes they had had some difficulty to decide. It would be remembered that, at the last show of sheep at Chichester, some sheep had been put aside, they not being the proper stock for flock-sheep. To-day they had found one pen of sheep much superior to the others. They inquired the reason and found that their lambs had been weaned the 1st of May, and the others the 1st of July, which accounted for their superiority. There had existed some difficulty with regard to another class, and to decide they had called in a third judge. He was happy to attend this day, and would do so again if his services were required.

Mr. J. HIDE proposed the health of the Duke of Richmond—three times three.

The CHAIRMAN was confident that if his brother had not been far distant he would have been glad to

have met so respectable a body. They knew where he was, and he (the Chairman) thought that, in a short time, they would not only have to send ploughmen to the eastern division of Sussex, but also to teach them to plough in Scotland. He should like to bear a part in the expense which would attend a competition with East Sussex. He could not say that he would send men over like the horse Elis, which had just left Goodwood, but, if he were beaten, he would send a better the next year. He would bear half the expense if Mr. Rusbridger would bear the other.

Mr. S. DICKINS proposed the health of a gentleman who had been mainly instrumental in founding this Association, and who had also established a similar one in Hampshire. Every one would drink with pleasure the health of Mr. C. Osborn (of Hayling Island) and to the success of the West Sussex Association.

Mr. OSBORN expressed his gratification at the honour done him. He could not take the credit of having founded this Association; for, if his feeble efforts had not been followed by liberal public support, it would have fallen to the ground.

The CHAIRMAN stated that a prize of 10*l* had been awarded, though not by this Society, to Mrs. Huskisson. That lady had accepted it with pride as having gained it, but he was authorized to say that she begged now to resign it for the benefit of this Association. If they looked back at the name of Huskisson they could only expect this liberality from one whose husband had always been distinguished by this quality. They would, he was sure, all join with him in drinking the health of this lady.

The CHAIRMAN felt satisfied that, in announcing the next toast, he had only to make known the name of the Nobleman in whose honour it was to induce them to rise and drink it with enthusiasm. It was one who had for many years filled with honour the important post of Lord Lieutenant of the County, and whose support had never failed to be conferred on all deserving objects who stood in need of it. He meant the Earl of Egremont—three times three.

The CHAIRMAN proposed the health of a very useful officer of the Association, the Secretary. Every person who was acquainted with him knew him as a gentleman, who, on all occasions, filled his office with zeal and talent.

Mr. W. H. MASON, in returning thanks, expressed his gratification at the kind manner in which His Lordship had proposed his health and the company had received it. When he had accepted the situation of Secretary to the West Sussex Association he was doubtful of his capacity to fulfill its duties, from his total ignorance of agricultural matters, but he had used every exertion, and, he trusted, with success. He hoped likewise that the exertions of the friends of this Association would not relax, that they would not fall off from their subscriptions, on which it mainly rested. Mr. M. concluded by thanking them for the honour they had done him in drinking his health.

The healths of the Vice Presidents of the Association, Messrs. Hasler and Dickens, were drunk with three times three.

Mr. HASLER returned thanks and expressed his opinion that this Association would serve to establish a better connexion between master and man, and would mainly contribute to the improvement of agriculture.

Lord George then left the room amidst loud cheers, accompanied by a considerable portion of the assemblage, and soon after the meeting broke up.

## EAST SUFFOLK AGRICULTURAL ASSOCIATION.

The cloth having been removed, and the usual loyal toasts given from the chair, the President, (the Earl of STRADBROKE,) rose to propose "Prosperity to the East Suffolk Agricultural Association." The object of this Association has now been fully developed and it is highly gratifying to observe the satisfactory progress which it has made in promoting the interests of the poorer classes. (*Cheers.*) Not five years have elapsed since much apprehension was felt on account of the unemployed poor; the cause was owing, unfortunately, to discontent and poverty; but I feel confident that the members of this Association, by mixing themselves up with the wants and necessities of the poor,—(*cheers.*) did mainly contribute to alleviate their distress, and to set a commendable example, which has been followed in many parts of the British Empire. (*Loud cheers.*) Do not let it be supposed that I am anxious that we should take to ourselves the credit of too great a share of this national prosperity. Full well do I know, that the Poor Law, where it has been carried into effect, by Guardians of calm mind and of sound understanding, divested of prejudice, has in its operation, contributed greatly to the relief of the poor, and has been the means of increasing the demand for labour, without in the remotest manner diminishing the wages of the employed. (*Cheers.*) Nay, gentlemen, it has done much more than ever this: it has restored that mutual confidence between master and man, which former bad management had nearly extinguished. (*Continued Cheers.*) One of the main objects of our meeting together, upon this occasion, is to discuss the merits of the various stock that has been exhibited. I may say, with much truth, that it has never been equalled in any former year, and that it does the greatest credit to those gentlemen who have sent it to form the show. We can never forget, that the quality of the stock, and the great quantity of it upon a farm, are the first and best proofs of the ability of an agriculturist (*Cheers.*) This leads me to a subject which I have before touched upon, but which I cannot too often bring under your notice, namely, the absolute necessity which exists of every possible endeavour being made to improve the implements of agriculture. Let us look around, and observe where the greatest prosperity prevails. We find it in the manufacturing districts, where almost every day the improvements effected in machinery bring increased wealth to its owner, and promote the happiness and comfort of those who depend upon him for employment and support. Whilst they progress in the arts, shall we be content to stand still? (*Cheers.*) Shall we proceed with the implements of our forefathers, or shall we, assisted by the spirit of the age, do every thing in our power to improve those implements and thus reduce the enormous expense of cultivation? (*Loud Cheers.*) It is not very long since I ventured to hint upon the probability that a steam plough would be invented and well do I recollect, that a portion of a most enlightened company entertained a doubt whether such a project could be accomplished; the majority thought it impossible, and I am not sure whether the remainder did not receive the idea with ridicule. Notwithstanding this, however, a steam plough has been invented, and introduced, and with a very small alteration it is likely to be brought into general use. I mention this only to show how necessary, and how advantageous it will be, to give this subject our deepest and best attention. (*Cheers.*) Gentlemen no person can have the interest of agriculture more

at heart than myself: and I am convinced that means like those, to which I have alluded, are the soundest and the best that can be devised, by which our difficulties can be removed, and by which we can hope to see the day arrive when we shall become an exporting rather than an importing nation. (*Cheers.*) I now propose, that we drink "Prosperity to the East Suffolk Agricultural Association." *Three times three, and "one cheer more.*

The next toasts were "Sir E. Kerrison and the Army;" "The Navy;" "The Noble Chairman:" "The Lord Lieutenant of the County."

Mr. CORNELIUS WELTON, the Honorary Secretary, then read the list of the prizes awarded, which were received with loud tokens of approbation.

"Mr. Archdeakne, and the Successful Candidates."—Mr. ARCHDECKNE returned thanks.

"The Members for the County."

"Lord HENNIKER in returning thanks, observed that he had then the honour of meeting them for the fourth time, and he must take shame to himself for not having been able to send a specimen of the produce of—(Sir Thos. Gooch exclaimed "High Suffolk!")—High Suffolk, as the Hon. Bart. had designated his place of residence; but he had always understood it to have been designated as a *terra incognita* but he was not ashamed to say he was one of its inhabitants. (*Loud laughter.*) He would not make any political allusions, but he hoped a day of greater prosperity than hitherto seen was dawning upon the farmer, and he hoped that they might now entertain a well founded expectation that the difficulties which have assailed us are nearly at an end. (*Cheers.*) With respect to the Poor Laws, he did think that there had been an earnest anxiety on the part of both the Commissioners and the Board of Guardians—at least on the part of those with whom he was personally acquainted—a disposition to act with leniency towards the poor man, to reward the honest and industrious and to correct the idle and profligate. (*Cheers*) In corroboration of what had fallen from the Noble Chairman, on the subject of Steam Ploughs, he begged to state that he had received a letter from a friend in Lincolnshire, who informed him that they were capable of barrowing 30 acres and ploughing 8 acres per day. (*Applause.*)

Sir CHARLES VERE, M. P., was also favourably received. He said, I am quite sure that if parties, who have cast reflections upon the motives and intentions of those who are engaged in promoting the interests of agriculture, could have witnessed what we have seen in the course of this day, and given their attendance at this meeting, they would at once be satisfied, that the agriculturists have no selfish ends of their own to advocate—that they require no benefits at the expense of any other portion of the community; and that the situation of the labouring classes, comes under the fullest, the best, and the most anxious consideration. (*Loud cheering.*) I will not say anything regarding the nature of those duties which his noble Colleague and himself had imposed upon them during the last few months, and the questions that had come before them as representatives of the Eastern Division of this county. It had been our endeavour to take that course which should be most beneficial to the land, and to its interests; and if we have been disappointed in our expectations, in some respects, still I am quite sure that an impression had been made upon the reasonable, the thinking, and the reflecting portions of the community; as well as upon the minds of those who manage the public affairs, of the actual state and circumstances in which we are placed: and we are now in their estimation, placed in a more favourable

light and in a better situation, than the one in which we stood and occupied before. (*Loud cheers.*) It is quite evident to those who are accustomed to observe and reflect, upon what we have done, that the farming interest, requires nothing but what it had fairly a right to ask—(*cheers*)—and indeed it would be very wrong, on our part, to allow it to be supposed, that anything except what is fair towards every other class of the community, is required in behalf of the agriculturists. That such is our desire is strongly evident, both from the patience with which we bear our disappointments, and the moderation of our tone in asking for redress; and I can only repeat, that all who view our situation with impartiality and without prejudice, will do us the credit to believe, that we ask only what is just and compatible with the public interests. (*Cheers.*) Having the honour to represent an agricultural county, I feel that, whilst I ask for what is fair in behalf of agriculture, I am only asking for what is fair towards the community at large. So thoroughly blended is the prosperity of the manufacturing with the well being of the landed interest, that if the latter, only ask for, and receive, that fair proportion of relief, to which it is entitled, I am quite sure, it will always conduce to the prosperity of the country at large. (*Cheers.*)

"The health of the Bishop and Clergy of the Diocese."—The Hon. and Rev. F. NOTHAM returned thanks, and was followed by Dr. Etough, who spoke of the advantages accruing from cottage allotments. On the health of "Mr. Shawe and the other Vice Presidents" being proposed,

R. N. SHAWE, Esq., rose and returned thanks. When this Institution was first established, he went on to observe, some prophet of evil, alleged that before it had been in existence two years, we should all separate by different ways—that we all entertained different opinions, and that the Society would be of no practical use whatever. I congratulate you however, upon this our fifth anniversary; for you have had a better show of stock, and have now a more full attendance at this table, than were ever seen at any previous meeting. (*Loud cheers.*) It may be asked how does this arise? The whole secret is told in two words: you have adhered to the original plan upon which this institution was established: you have endeavoured to improve the breed of stock: you have rewarded the labourer for due and proper attention to his service: and by the premiums awarded you have awakened active exertion, and stimulated the industry of the farmer. These principles you have followed up, you have also evaded all party politics: and we meet here united as a body, to do the best we can by individual efforts to promote the interests of agriculture. (*Loud cheers.*) In the first instance, it was said that Suffolk could not bring forward the best breed of stock. It is true, that, till lately, under the fostering influence of this Association, due attention was not paid; but now, we are exporting the best sheep into other counties; and those counties, therefore, from which we formerly were accustomed to make our purchases, have now become our customers. (*Cheers*) This is important in another point of view. It seems that we have hitherto pursued a wrong course:—that we have depended entirely for our remuneration from the plough; it is now our duty however, in consequence of the low price of wheat, to pay more attention to stock. But it seems that some anticipations are entertained, about a steam plough, which has been invented. I only hope and trust that your Lordship's prophecies or predictions may be perfectly realised, and that, by means of steam, you may so lower the cost of production, as that the farmer may

derive a remunerating profit from his labour; but in the mean time, I think a considerable period must elapse before a steam-plough can be brought into practical operation, and it becomes us agriculturists to see, what we can do, till the invention is brought to maturity. (*Loud cheers.*) I learn, from the report of the evidence given before the late Agricultural Committee, that the Scotch farmers do, in point of fact, cultivate their land at very much less cost than ourselves. How that is effected I know not. I attribute it not to the want of skill, attention, or industry on the part of the Suffolk farmer: but the fact is broadly stated in the report; and if it be so as represented, I think it would be worth while if this institution were to turn its attention to the point, and send some of its own members patiently to inquire into all the causes, and to ascertain whether some mode of cultivation used by the Scotch, and at present unknown to us, might not be adopted in our own county. The evidence in the report confirms the opinion that, if the low price of wheat be caused by superabundant growth in our own country, it is impossible that any remedy can be provided by legislative enactment. The Committee which sat in 1821, of which Sir Thomas Gooch was Chairman, made a report to that effect, and we see that opinion confirmed by the evidence given in 1836. It has been observed that grass land bears no proportion to the quantity of arable; and I believe if you look over the farms in Suffolk, you will not find more than one-fifth in grass. Now, that small proportion certainly does not enable the farmer to carry the stock which he ought to do; and it is to the latter alone that the farmer must look for adequate profit upon the investment of his capital. I know, in addition, that wherever marsh land is brought into the market for hire, persons run after it, and offer from 2l. to nearly 3l. per acre. (*Cries of "No, no."*) It is quite impossible not to see, that unless we turn round with the times, and we have turned with them before, the agriculturist interest of this country will not be in a flourishing condition. I say this because I see some persons are disposed to lay down their land into grass, and it is absolutely necessary that it should be done; for, suppose the remuneration to be small which the farmer receives from the produce of his farm, how does he remove the difficulty? First, he tries to diminish his expenditure, and, if that fail, he diminishes the quantity grown. You must turn your attention to stock; you must lay down your land into grass; and if you do this, you will find the landlords of Suffolk ready to assist you in your undertaking. To return to the point from which I started. After the exertion used by yourselves to endeavour to place yourselves in a different position, there are other things that may be done by the Government. Only three years ago, nearly all the county of Suffolk was mad about the repeal of the malt tax; but a few months afterwards, it was told that the tax was not worth being taken off, and that it was of no importance to the farmer. Now, if you proceed in the question, you will eventually be relieved, and if you ask that the tax be reduced to 10s. a quarter, I feel certain that you will obtain what you require. a reverend gentleman has alluded to the cottage allotment system. I have practically adopted it for a number of years, but I have found it beneficial only to a certain extent. It is of great advantage to the able-bodied labourer, who has a large family of children to maintain. The noble Lord in the chair alluded, in his opening speech, to the poor laws. I know that the most exaggerated opinions have gone forth upon that subject: one party alleges that there has been a

great saving, and another, that there has been no saving at all. We must believe neither—and as to the savings that arise from it, considering the value of the measure as a whole—I say the proportion of savings sink into perfect insignificance. I speak this upon the authority of many gentlemen, who in the first instance were opposed to the principle of the measure, and who now tell us that the labourers can find work, and that masters are glad to afford employment. This, therefore, is a benefit, morally and physically, to the labouring classes; and of more value to the community than any saving which may be derived from the measure.

Mr. Shawe sat down amidst loud cheering. (Owing to some confusion between a waiter and some of the party, Mr. Shawe was repeatedly interrupted.)

The health of "Sir T. Gooch, Bart."

Sir T. Gooch said, allusions had been made in the course of the evening by certain gentlemen, to the New Poor Law Bill, and he professed his adhesion to the opinions therein given. It had given him much pain to observe that in some places where meetings had been held upon the subject, objections had been thrown out against the Bill on the ground that the measure tended in a very remarkable degree to grind down the poor. It was his opinion that the Bill had an entirely contrary effect—it was calculated to raise the poor—enabling the poor man to get his living independently, and to obtain his bread as he ought to obtain it, without the assistance of the parish. He had no doubt that most of the gentlemen present had found out long ago that he (Sir Thomas Gooch) was no Whig; it was also known, that the Poor Law Bill was brought in by the Whigs, but he would say, so high an opinion did he entertain of the measure, that if it had been introduced by the bitterest Radical that ever lived, he would have given him willingly the credit he deserved.

A. ARCADEKNE, Esq., having given up the prizes obtained by him for stock, to the funds of the Society, was presented with a silver medal. He returned thanks accordingly.

The health of "J. Moseley, Esq., and the Committee." J. Moseley, Esq., returned thanks.

The CHAIRMAN gave the healths of the Secretary (Mr. C. Welton, Wickham-market) and the Treasurer (Mr. J. Wood, Woodbridge). Mr. Welton's health was drank with three times three.

Mr. WELTON returned his best thanks for the honour which the noble President had conferred upon him in proposing his health to the meeting, and he begged to assure them that if his (Mr. Welton's) public services had been in any way instrumental in aiding the establishment and increasing the prosperity of the East Suffolk Agricultural Society, it was owing to those services having been directed and supported by the knowledge and condescension of the Noble Earl who presided over the institution. He (Mr. Welton) would always continue to labour in the same cause as he had always done, with the strictest integrity and with increased zeal.

Mr. J. WOOD (Treasurer) returned thanks.

The CHAIRMAN gave the health of the Judges of the Stock—Mr. Boys and others.

Mr. BOYS (Waldersham) begged to return most heartily and sincerely his best thanks for the compliment conferred upon him, and if he ever at any period of his life lamented his inability to express his feelings adequately to the occasion, it was at the present moment. He had attended at the meeting to perform one of the most unthankful offices to which a man could be elected—that of a judge upon the

merits and demerits of the stock exhibited that day. He trusted that every gentleman was satisfied that he had been treated fairly, and he sincerely hoped that the want of success of some would only act as a stimulus to exert themselves on other occasions. It had been his fortune to have been brought up under one of the best judges of sheep, and the best of men, the well-known Mr. Ellman, and therefore he (Mr. Boys) thought it more than probable that he had imbibed from him some of those sound principles of judgment which were universally acknowledged and unrivalled. He would impress upon the agriculturists of this country, and indeed all other parts of the country, the advantage that would accrue to them by paying the most minute attention to the breeding of their stock. What, he would ask, had produced the celebrity which had attached itself to the Roast Beef of Old England, but that attention to the breeding of stock which had made 2lbs. of meat grow where 1lb. had grown before? Let the agriculturists remember that—let them never forget that the art of breeding consisted in great attention, in the first place to selection. It was a principle laid down as an unerring truth, that "like would beget like." An animal to be perfect must be symmetrical—symmetry would show constitution—a good constitution induced a disposition to fatten—then meat was produced, and meat they all knew was profit. He begged all agriculturists to reject the breeding of imperfect animals. Mr. Boys also informed the meeting that Mr. Coke, of Norfolk, had tried many experiments on the crossing of the breed of sheep, but they had all failed to produce the desired result, and that he recommended all farmers to study the breed of Southdowns, in preference to Norfolds, or any other breed, and they would then improve also their quality of wool. He (Mr. Boys) had asked, not long since, one of the greatest buyers of wool in the world, Mr. Lagg, of Bournemouth, why he did not come to Suffolk to buy wool, and he informed him that he did not like the wool produced there, there was too much grey and black in it to suit his purpose. He (Mr. Boys) begged them, as they valued good breeding, to reject in future the whole race of black-faced sheep. He heartily wished the highest success to the East Suffolk Agricultural Association. By the opinions and sentiments thrown out at meetings similar to the present, much good and advantage accrued to the farmer. He recollected his father telling a story, that many years ago, when attending one of the Woburn Agricultural meetings, on his road home, he met an old farmer, who, taciturn to a degree, refused for some time to answer any questions that were put to him. On being asked what he was thinking about so deeply, the man replied that he was endeavouring to discover the use of the meeting which they both just had left. His (Mr. Boys) father immediately observed, that the use of such meetings was to set such men as him (the farmer) and others interested in agricultural pursuits, thinking upon the subject, with which answer the farmer was well pleased; and if he (Mr. Boys) had said anything that evening which would have the effect of inducing any gentleman present to think on the subject upon which he had so briefly and imperfectly addressed them, he should feel himself well rewarded for his trouble (*Cheers.*)

The CHAIRMAN said that he could not concede to all the opinions which Mr. Boys had given in his very excellent speech. Out of the breed of sheep which Mr. Boys had spoken of, from 468 ewes he had got 776 lambs. His ewes, when sold, produced, with their wool, 31s. 6d each.

Mr. Boys expressed his astonishment at the

prices; but said his Lordship did not inform them if the buyers improved upon his bargain, nor did he give the weight of the animals.

Sir T. GOOCH said, that he wished to inform Mr. Boys that he got 42s. for the flock wool and 56s. for hogget. The question appeared to him to lie between purity and impurity, and though he (Sir T. Gooch) was generally considered a moral man, he thought that this time he should take the part of impurity. (*A laugh.*)

The health of "Mr. T. Lawson," a member of the Yorkshire Agricultural Society.—MR. LAWSON returned thanks.

The Noble President then quitted the chair and the company soon after left the scene of festivity.

## AN ACT TO REGULATE PAROCHIAL ASSESSMENTS.

[19th August, 1836.]

*All Rates to be made on the net annual Value of the Property.—Proviso.*

Whereas, it is desirable to establish one uniform mode of raising for the relief of the poor throughout England and Wales, and to lessen the cost of appeal against an unfair rate: be it enacted by the King's most Excellent Majesty, by, and with the advice and consent of the Lords spiritual and temporal, and Commons in this present Parliament assembled, and by the authority of the same, that from and after such period, not being earlier than the twenty-first day of March next, after the passing of this Act, as the Poor Law Commissioners shall by any order under their seal of office direct, no rate for the relief of the poor in England and Wales shall be allowed by any Justices, or be of any force, which shall not be made upon an estimate of the net annual value of the several hereditaments rated thereunto; that is to say, of the rent at which the same might reasonably be expected to let from year to year, free of all usual tenants, rates, and taxes, and title commutation, rent-charge, if any, and deducting therefrom the probable average annual cost of the repairs, insurance, and other expences, if any, necessary to maintain them in a state to command such rent: Provided always, that nothing herein contained shall be construed to alter or affect the principles or different relative liabilities (if any) according to which different kinds of hereditaments are now by law rateable.

*Rates to be made in a given Form.—Nothing herein to prevent Owners from compounding for Rates.*

II. And be it further enacted, That every such rate made after the said period shall, in addition to any other particular which the form of making out such rate shall require to be set forth, contain an account of every particular set forth at the head of the respective columns in the form given in the Schedule to this Act annexed, so far as the same can be ascertained; and the churchwardens and overseers, or other officers whose duty it may be to make and levy the said rate, or such a number of the said churchwardens and overseers or other officers as are competent to the making and levying of the same, shall, before the rate is allowed by the justices, sign the declaration given at the foot of the said form; and otherwise the said rate shall be of no force or validity: Provided always, that nothing herein contained shall be construed to prevent the owners of tenements from compounding for the rates to be assessed on the same, in such manner as they were by any statute or statutes enabled to do before the passing of this Act,

so that the gross estimated rental of the hereditaments compounded for, be entered on the rate in the proper column.

*Power to order new Survey and Valuation.*

III. And be it enacted, That when it shall be made to appear to the poor law commissioners by representation in writing from the board of guardians of any union or parish under their common seal, or from the majority of the churchwardens and overseers or other officers competent as aforesaid to the making and levying the rate, that a fair and correct estimate for the aforesaid purposes cannot be made without a new valuation, it shall be lawful for the poor law commissioners, where they shall see fit, to order a survey, with or without a map or plan, on such scale as they shall think fit to be made and taken of the messuages, lands, and other hereditaments liable to poor rates in such parish, or in all or any one or more parishes of such a union, and a valuation to be made of the said messuages, lands, and other hereditaments according to their annual value, and to direct such guardians to appoint a fit person or persons to make and take every such survey, map or plan, and valuation, and to make provision for paying the costs of every such, survey, map or plan, and valuation either by a separate rate or by a charge on the poor rates, as they may see fit; but in case of such charge being made, then provisions shall be made for paying off not less than one-fifth of the sum charged on the rates, and such interest as may from time to time be payable in respect of such charge or any part thereof, in each succeeding year, till the whole is repaid.

*Power for Surveyors to enter and examine Lands, &c., for purposes of Survey and Plans.*

IV. And be it further enacted, That for the purpose of making every such survey, map or plan, and valuation, it shall be lawful for the person or persons so to be appointed for making the same respectively, together with their and every of their assistants and servants, at all reasonable times, until the same respectively shall be completed, to enter, view, and examine, survey and admeasure, all and every part of the messuages, lands, and other hereditaments aforesaid, and to do or cause to be done any act or thing necessary for making such survey, map or plan, and valuation: Provided always, that any map, survey, plan, or valuation made previously to the appointment of such person or persons which shall be tendered to him or them, and which shall be in his or their judgment and to his or their satisfaction a just and true map or survey, proper for the purposes aforesaid, may be used for such purposes.

*Power to take Copies or Extracts of Rates gratis.—Penalty for Refusal to permit.*

V. And be it further enacted, That it shall be lawful for any person or persons rated to the relief of the poor of the parish in respect of which any rate shall be made, at all reasonable times, to take copies thereof or extracts therefrom without paying anything for the same, anything in any Act of Parliament to the contrary notwithstanding; and in case the person or persons having the custody of such rate shall refuse to permit or shall not permit such person or persons so rated as aforesaid to take copies thereof or extracts therefrom, the person or persons so refusing or not permitting such copy or extract to be made shall forfeit and pay any sum not exceeding five pounds, to be recovered in a summary way before any justice of the peace having jurisdiction in the parish or place.

*Justices acting in Petty Sessions to hold Four Special*

*Sessions in the Year to hear Appeals.—Seven Days Notice to be given of Objections.—Proviso.*

VI. And be it enacted, That the justices acting in and for every petty sessions division shall four times at least in every year hold a special sessions for hearing appeals against the rates of the several parishes within their respective divisions, and shall cause public notice of the time and place when and where such special sessions will be holden to be affixed to or near to the door of the parish church of the said parishes, twenty-eight days at the least before the holding of the same; and such special sessions shall and may be adjourned from time to time by the justices there present, as they may think fit; and at such special or adjourned sessions the justices there present shall hear and determine all objections to any such rate on the ground of inequality, unfairness, or incorrectness in the valuation of any hereditaments included therein, which decision shall be binding and conclusive on the parties, unless the person or persons impugning such decision shall within fourteen days after the same shall have been made cause notice to be given in writing of his, her, or their intention of appealing against such decision, and of the matter or cause of such appeal, to the person or persons in whose favour such decision shall have been made, and within five days after giving such notice shall enter into a recognizance before some justice or the peace, with sufficient securities, conditioned to try such appeal at the then next general sessions or quarter sessions of the peace which shall first happen, and to abide the order of and pay such costs as shall be awarded by the justices at such quarter sessions, or any adjournment thereof; and such justices, upon hearing and finally determining such matter or appeal, shall and may, according to their discretion, award such costs to the party or parties appealing or appealed against as they shall think proper, and their determination in or concerning the premises shall be conclusive and binding on all parties, to all intents and purposes whatsoever: Provided always, that no such objection shall be inquired into by the said justices in special session unless notice of such objection in writing under the hand of the complainant shall have been given, seven days at least before the day appointed for such special session, to the collector, overseers, or other persons by whom such rate was made: Provided also, that the said justices in special session shall not be authorized to inquire into the liability of any hereditaments to be rated, but only into the true value thereof and into the fairness of the amount at which the same shall have been rated.

*Justices may act with all the Powers of Justices in Quarter Sessions.*

VII. And be it enacted, That the justices present at any such special or adjourned session shall for the aforesaid purpose have all the powers of amending or quashing any such rate so objected to of any parish or other district within their division, and likewise of awarding costs to be paid by or to any of the parties, and of recovering such costs, which any court of quarter sessions of the peace has upon appeals from any such rate, except as herein excepted: Provided always, that no order of the said justices shall be removed by certiorari or otherwise into any of his Majesty's courts of record at Westminster: Provided also, that nothing in this Act contained shall be construed to deprive any person or persons of the right to appeal against any rate to any court of general or quarter sessions: Provided also, that no order of the said justices in special session shall be of any force pending any appeal touching the

same subject matter to the court of general or quarter sessions of the peace having jurisdiction to try such appeal, or in opposition to the order of any such court upon such appeal.

*Act confined to England and Wales.*

VIII. And be it enacted, That this Act shall extend only to *England and Wales*,

*Act may be repealed this Session.*

IX. And be it further enacted, That this Act may be repealed or amended by any Act which shall be passed in this session.

**TITHE COMMUTATION ACT.**

The following forms, with accompanying directions, have been forwarded to the churchwardens and overseers of the various parishes in England and Wales, for the use of those parties who may be disposed to take steps to effect a voluntary commutation.

The commissioners recommend that the churchwardens should call a vestry for the purpose of communicating to the titheowners and landowners the receipt of the inclosed forms.

*Form of Notice calling a Parochial Meeting to consider the propriety of a Voluntary Commutation of Tithes, when such Notice is given by Landowners.*

We \* the undersigned being Landowners, or duly authorized Agents of Landholders, within the Parish of \_\_\_\_\_, in the County of \_\_\_\_\_ whose interest is not less than one-fourth part of the whole value of the lands subject to Tithes, in the said Parish, do by this notice in writing, under our hands \*, call a parochial meeting of Landowners and Tithowners, within the limits of the said Parish, for the purpose of making an agreement for the general Commutation of Tithes within the limits of the said Parish, pursuant to the provisions of an Act passed in the 6th and 7th years of the reign of His present Majesty, intituled "Act for the Commutation of Tithes in England and Wales." And we \* do hereby also give notice that such meeting will be held at † in the said Parish, on ‡ the § day of || at the hour of ¶ in the \*\* noon. Given under our hands \*, this †† day of †† 183 ††

Directions to be observed with respect to the above form.

- \* If one person only sign the notice, the singular must be substituted for the plural throughout the notice, at the several places marked \*
- † Here state the place of meeting distinctly.
- ‡ The day of the week on which the meeting is to be held.
- § The day of the month, not being less than twenty-one clear days from the date of the notice.
- || The month.
- ¶ The hour of meeting.
- \*\* Say "fore" or "after."
- †† Date of month, month, and year.

*Form of Notice calling a Parochial Meeting to consider the propriety of a Voluntary Commutation of Tithes, when such Notice is given by Titheowners.*

We \* the undersigned being Titheowners \* or duly authorized Agents of Titheowners, within the Parish of \_\_\_\_\_, in the County of \_\_\_\_\_ whose interest is not less than one-fourth part of the whole value of the Tithes of the said Parish, do by this notice in writing, under our hands \*, call a parochial meeting of Landowners and Titheowners within the limits of the said Parish, for the purpose of making an agreement for the general Commutation of Tithes within the limits of the said Parish, pursuant to the provisions of an Act passed in the 6th and 7th years of the reign of His present Majesty, intituled "An Act for the Commutation of Tithes in England and Wales." And we \* do hereby also give notice that such

**SCHEDULE to which this Act refers.**  
**Form of Rate.**

An Assessment for the Relief of the Poor of the Parish of *Merton* in the County of *Surrey*, and for other Purposes chargeable thereon according to Law, made this *Thirtieth* Day of *March* in the Year of our Lord One thousand eight hundred and *thirty-seven*, after the Rate of *Sixpence* in the Pound.

No.	Arrears due, or if excused.	Name of Occupier.	Name of Owner.	Description of Property rated.	Name or Situation of Property.	Estimated Extent.	Gross estimated Rental.	Rateable Value.	Rate at 6d. in the Pound.

*Declaration of Overseers and Churchwardens.*

We, \_\_\_\_\_ do declare the several particulars specified in the respective Columns of the above rate to be true and correct, so far as we have been able to ascertain them, to which end we have used our best endeavours.

Thomas Jones, Overseer.  
John Thomas, [Churchwarden, &c. &c.]

meeting will be held at † in the said Parish  
 on ‡ the § day of ¶ at the hour of ¶  
 in the \*\* noon.

Given under our hands \* this †† day of ††  
 183 ††

Directions to be observed with respect to the  
 above form.

\* If one person only sign the notice, the singular  
 must be substituted for the plural throughout the  
 notice, at the several places marked \*.

† Here state the place of meeting distinctly.

‡ The day of the week on which the meeting is to  
 be held.

§ The day of the month, not being less than  
 twenty-one clear days from the date of the notice.  
 ¶ The month.

¶ The hour of meeting.

\*\* Say "fore" or "after."

†† Date of month, month, and year.

*The attention of persons giving the notice is espe-  
 cially called to the following points:—*

This notice must be signed either by landowners  
 whose interest comprises a full fourth of the value  
 of the lands of the parish subject to tithes; or by  
 titheowners whose interest embraces a full fourth  
 of the tithes; or by the duly authorized agents of  
 such parties.

And the interest by clause 19 must be ascer-  
 tained by the poor rate, if any exist in the parish,  
 which should be carefully examined before the no-  
 tice is affixed, in order to ensure its accuracy in  
 this respect; or if there be no such rate, the pro-  
 portional interest must be estimated according to  
 the rules by which property of the same kind is  
 by law rateable to the relief of the poor.

It must be fixed on the church doors, or on  
 some other public place within the parish where  
 notices are generally fixed, at least twenty-one  
 days before the day of meeting.

It must also be advertised twice during the  
 21 days in some newspaper in general circulation  
 in the county where the parish is situated. The  
 advertisements will not be chargeable with any  
 stamp duty.

The commissioners also require that a copy of  
 the notice should be sent to the post on the day  
 of its being affixed, addressed to "The Tithe  
 Commissioners for England and Wales, London."  
 There must also be annexed to the copy, when the  
 meeting is called by landowners, a schedule con-  
 taining the particulars required in the form on the  
 other side; but the notice advertised in the news-  
 paper need not contain the whole of the particu-  
 lars in the schedule; it will suffice if the names of  
 the landowners, or their duly authorised agents,  
 appear at the foot of the advertisement.

And on the copy so sent to the commissioners  
 should be endorsed a memorandum of the day and  
 hour of affixing the same, and of the place where  
 the same is affixed, which memorandum must be  
 signed by the person affixing the notice; such  
 person must also preserve a duplicate copy, with  
 a like memorandum, to produce to the parochial  
 meeting, in order to prove that the notice has  
 been duly given.

When the meeting is called by titheowners, to  
 the copy of notice should be annexed a statement  
 of the value of the whole tithes of the parish, and  
 the proportional interest therein, which is held by  
 the parties calling the said meeting.

The newspaper, with the notice twice inserted,  
 must also be produced at the meeting; and should

be preserved, as should the power of attorney by  
 which any agent is authorised to act on behalf of  
 any landowner or titheowner; such power, or an  
 attested copy thereof, must be appended to any  
 agreement which may be come to.

The power of attorney may be in the following  
 form, namely:—

"I, A. B., of \_\_\_\_\_ do hereby appoint  
 C. D., of \_\_\_\_\_ to be my lawful attorney  
 to act for me in all respects as if I myself were pre-  
 sent and acting in the execution of an Act passed in  
 the sixth and seventh years of his present Majesty,  
 intituled 'An Act for the Commutation of Tithes in  
 England and Wales.'"

It will be advisable that all such powers of at-  
 torney should be attested by one witness.

If, when a parochial meeting has been duly as-  
 sembled, an adjournment of the said meeting shall  
 be desired by a majority of the persons attending  
 such meeting, the chairman may adjourn the same  
 to any time or place then by him to be declared;  
 and so from time to time in like manner; notice  
 of every adjourned meeting, signed by the chair-  
 man, must be affixed conspicuously on the outside  
 of the building in which such meeting, or the last  
 adjournment thereof shall have been holden. (See  
 the 20th section of the Act.)

SCHEDULE.

Parish of \_\_\_\_\_  
 County of \_\_\_\_\_

Names of Land owners sign- ing the Notice of Parochial Meeting here- unto annexed.	Names of Oc- cupiers in respect of whose Lands the Notice is signed.	Amount of Assessment of each Oc- cupier in the Poor-rate.	Remarks.

 above notice .....

Date .....

N. B. If there be no poor-rate in the parish, then the  
 proportional interest of the landowners signing the no-  
 tice must be estimated according to the rules by which  
 property of the same kind is by law rateable to the re-  
 lief of the poor.

EXTRAORDINARY FACT. — It is not generally  
 known that a spadeful of coals, daily mixed up as ordi-  
 nary food, has been found to be the best method in the  
 world of fattening swine. A gentleman in this vicinity  
 has for some time practised it with eminent success! —  
*Elgin Courier.*—[It would be well if our contemporary  
 could get this fact confirmed by the gentleman himself.  
 —Ed. M.L. F.]

## ON UNDER-GROUND DRAINING.

Most occupiers of land are fully aware that the first and greatest improvement of wet land is draining; but they do not agree as to the most proper means for effecting that desirable object. So much depends upon soil, subsoil, and other localities, no positive rules can be given for the draining process. Experience is the best guide, and the tact or art of effecting the most good, at the least comparative expense, can only be acquired by extensive practice, close observation, and correct calculation. Hence young practitioners frequently commit great errors, lose much valuable time, and expend large sums of money to little good purpose. But although no positive rules can be given, a few general remarks and practical hints from an old drainer may be of service to the inexperienced: and with that view the present communication is made, by one who has had long and extensive practice in land-draining. As the writer does not pretend to advance anything new on the subject, his remarks may not be interesting to old practitioners; but as he will endeavour to point out prevalent errors, with instructions for improvement, he is not without hopes his effort in that way may be of some service to young beginners; and to such he begs leave to address himself.

Extensive bogs are usually drained under the direction of professional scientific men, and any criticism upon their operations would be superfluous in this place. Neither will it be necessary to remark upon open or surface drains, ditches, or water-furrows, as these are generally well executed by attentive farmers; but under-draining of springy land in all its varieties of broken measure, and upon other land retentive of wet, though carried to a great extent by farmers and other land occupiers, is not generally so well conducted by them as surface-draining. The following remarks will therefore be confined to under-ground or covered drains, commencing with those usually called

**FURROW-DRAINS.**—Much injury has been done, and serious loss sustained, from the imprudent practice of levelling and straightening high crooked ridges upon retentive subsoil, without taking the precaution of draining the furrows in the first instance. In such cases, the only sure remedy is by opening the ground in the lines of the old furrows, and putting covered drains into them. Cross drains do not effect so perfect a cure as furrow-drains upon land so mismanaged.

In setting covered drains of every description, whether with tile, stone, brushwood, turf, or any other material, particular attention should be paid to securing an open space at the bottom of every drain for a water-channel. Many farmers are not aware of the propriety of that measure, and others too negligent to attend to it. They fill their drains with stones or other material, thrown in promiscuously: those are called rubble-drains; and the farmer feels satisfied of their efficacy, because he sees water oozing out at their ends. It is true, water percolates through the material in the rubble-drains, but at different levels, seldom at the bottom, and sometimes at the very top of the rubble; consequently, they are entirely deceptive in effect. Any person entertaining a doubt on the subject, may readily satisfy himself, by opening a short space by the side of a rubble-drain in wet weather. He will then see the water issue out of the rubble, and rise in the

opening, before he has dug near to the bottom of the drain—a clear proof it does not work well, and that the water being so obstructed in its course, stagnates in the drain, and saturates the adjoining land; whereas, had the drain been set open at bottom, the water would have had a free passage, and the land been relieved from superfluous moisture. Obvious as this must appear to every unprejudiced person, it is quite surprising with what tenacity some farmers, even at the present day, maintain a contrary opinion. The writer of this article has frequently met with such instances of perverseness, nor could he by any means induce the sceptics to prove the fact by the simple means here recommended. The advocates of rubble-drains argue—"That water runs out at the ends of such drains, which is quite sufficient; and that, were they to set drains open at the bottom, rats and moles would creep into them, and stop them up." Without doubt such vermin do occasionally creep into drains, but are not likely to stop them up, as they will not lodge in a water-course. But even if they did so, the stoppage could only be temporary; for the water in the drains would rise up to the level of the loose material, above the tiles or set stones, percolate between them, and drop into the drain below the obstruction, which would soon be washed away, and the water-course be again left clear.

Tiles, properly made and well burned, are not only handiest, but the best material for setting in the bottom of drains. They ensure a clear water-course. A drain two feet deep, set open at bottom, is more effective than one four feet deep, filled with rubble, and is not half so expensive. Small stones, or other loose rubbish, should be laid above the drain-tiles, or set stones, to act as conductors of wet. In most cases, about one foot deep of such material is thought sufficient. Some farmers fill their drains with small stones and other rubbish so high, that the ploughshare touches the material in its operations; and the farmer thinks it indispensably necessary the drains should be so filled, under an idea that the top-water would not find its way into the under-drains by any other means. That is a bad practice, prompted by error in judgement, and effected at great unnecessary expense.

It is quite obvious, where the ploughshare disturbs the material in under-drains, it opens a passage for surface-water into the drains; but the advocates of this measure should recollect, that water so admitted into a drain carries much earth with it, and soon chokes the drain up. Surface-water will find its way into under-drains without the aid of the ploughshare. An old draining adage says, and says truly, "If one drop of water finds its way down, two will assuredly follow." When water is drained off at bottom, it gives place to moisture descending from above. "You cannot put more liquid into a barrel already full of it; but draw from the tap-cock, you may then pour into the bung-hole." These sayings, though homely, are applicable to the case in point.

The operation of opening furrow-drains is greatly facilitated by commencing with a common plough, going once about, and throwing out a good furrow on each side. Two cuts or grafts with the spade will then, in most cases, be a sufficient depth. The curved grafting-tool is more effective in cutting out strong subsoil than the common garden-spade. A conic-shaped grafting-tool answers best for cutting out the bottom drain. Furrow-drains should be cut narrow, the

bottom of just sufficient width to receive the draining-tiles. When the cutting is finished, the loose earth should be carefully cleared out of the bottom, with a scoop made for the purpose. Great care and attention should be paid to setting and filling the drains. The tiles being laid in a line along the side of the drain, the workman stands in the bottom of the drain, having one foot placed immediately behind the other; he reaches one tile at a time, and lays it firm on the bottom before him; he then moves his feet back, places another tile, and so on to the end of the drain. Small stones, or other loose rubbish, are then put over the tiles, and a layer of turf or sprinkling of litter is put over the rubbish, to prevent the earth sinking among it. Where no small stones or other loose rubbish can be procured to lay upon the tiles, turf or litter should then be laid immediately above the tiles, and the drain be filled up with surface-soil, that being generally more porous than clay or tile dug from the bottoms of drains. Horses should not be allowed to tread upon new-made, shallow-covered drains; neither should cart-wheels pass along or over them.

When furrow-drains are intended to be set with stones, is not necessary, in all cases, to cut the drains so wide at bottom, as to admit of stones being set square on the sides, and have broad covers placed over them as in deep drains. Stones may be set to give a free water-course in drains cut as narrow at bottom as from drain-tiles. The workman places himself in the drain in the same form as when laying tiles, and the stones intended for setting being laid along the side, he reaches them as required. There are various methods of setting stones in the bottoms of narrow drains. One only shall be described here. It answers best in strong clay. The drain being five inches wide at bottom, place one end of the set stone in the angle at the bottom on one side, and lay the other end against the opposite side of the drain; the set stones being, eight or nine inches long, will then leave a clear triangular-shaped aperture for a water-course at bottom. The workman then selects other stones, and places them above the first setters, so as to form another triangular opening on the opposite side of the drain; thus forming a secondary water-course, if the first should be either obstructed or overcharged with water. Small stones are then put over the set stones, and the drain finished in the same manner as in tile-draining.

Shallow under-drains in the alignment of the ridges, called furrow-drains, are more effective than deep cross-drains upon strong land, impervious subsoil, and where there are no springs, spouts, or oozings of water from broken or irregular measures in the land. The depth of furrow-drains should vary according to the nature of the soil, and other circumstances; average depth about two feet, and, as before observed, they should be cut narrow.

Furrow-drains should not be formed to empty singly at the bottom of open ditches, as they would be liable to be choked up by the treading of cattle and accumulation of weeds and rubbish in the ditches. It is a better plan to collect a number of furrow-drains into larger and deeper cross under-drains, made at a distance from the lower parts of the fields. Those receivers discharge the collected waters into open ditches or water-courses, and are not so liable to be choked up as furrow-drains emptying singly. These receivers should not be made to discharge the water

at the bottoms of open ditches. The water should be made to fall from one into the other, as will be more fully explained in the next section, when treating of

**DEEP CROSS-DRAINS.**—Cross-draining is more difficult than furrow-draining, and great errors are frequently committed in the practice. It is customary in this description of draining, to commence operations at the lowest parts of the fields, and where there are no side ditches for the cross-drains to discharge into. A main, or leading drain, is carried up from the lowest to the highest level. The depth of the drain is generally settled in the first instance, without previous investigation of the nature of the soil and subsoil. As the main drain is under operation of being carried up the field, numerous cross-drains are made to lead into it. Those are frequently cut in straight lines, as that suits the workman's convenience, and sometimes at regular distances, whatever the nature of the soil or subsoil may be. In this manner a cure is sometimes effected, though at a great unnecessary expense. But the result is more generally a total failure, when the occupier consoles himself under his disappointment, with a belief that the failure was entirely owing to the nature of the soil, and impediments in the locality of situation, which could not possibly be overcome.

An experienced drainer, professional and practical, proceeds with greater circumspection in his operations, and he seldom fails of success: he, in the first instance, takes a minute view of the field to be drained; he inspects all the spouts or breakages of water in it; he decides upon the different levels of the ground, and facilities for carrying the water off; he then sets down his marking sticks for the workmen's direction, not always in straight lines, but bending round the inequalities of the ground, and immediately above where the water-spouts or oozings shew on the surface; he then takes other views of the lines of the stakes, to satisfy himself the water in the drains will have proper falls, and when he entertains a doubt on that point, he proves it by the spirit-level. These preliminaries settled, he ascertains the nature of the subsoil, by digging holes in the lines of the projected drains. These shew the strata in which the water flows, and the nature of the obstruction which forces the water up to the surface of the ground, and the depths of the drains are regulated accordingly. The digging of try-holes, technically called "feeling the way," is a simple and safe process, and should never be dispensed with where there is a variation in the stratification.

In some fields, where the soil and subsoil vary in texture, and are irregularly disposed, springs as oozings of water, though they appear on the surface at various levels, not unfrequently arise from the same source, near the top of the field. Where the water issues from crevices in rocks, from loose gravel, or from other broken or loose matter, or alluvial deposit, the water filters through such measures, until obstructed by impervious subsoil. It is then forced up to the surface, over which it runs in the declivity of the ground, and when it reaches more porous subsoil, it sinks into it, percolates through it, until it again meets obstruction, and is forced up to the surface, and forms the second line of water-breakages; and a third and fourth line of these water-spouts may be formed from similar causes in the same field. These receive the sev-

ral local appellations of springs, spouts, oosings, sloughs, quagmires, &c. In a field so circumstanced, it is advisable to cut the upper cross-drain in the first instance. It should be cut immediately above the first breakage of water, near the top of the field, and be made to discharge into a side-ditch, or into a leading drain, carried up for the purpose of a receiver. The effect of that cross-drain will be proved in one year, and when found necessary, other cross-drains may be cut at lower levels in subsequent years. It is frequently seen, where the draining operations are commenced, by cutting cross-drains at low levels; such drains collect, and discharge a great deal of water in the first instance; but when other cross-drains are afterwards cut at higher levels, the first are laid entirely dry, and the money which had been expended in making them lost, without rendering any benefit to the land; it is therefore advisable to cut an upper cross-drain first, prove its effect, and then proceed with the others at the lower levels, as may be deemed expedient.

The bottoms of drains, when not cut deep enough, are sometimes soft and poachy, and the draining material liable to sink into the mud. In such cases, plain tiles, or flat stones, should be laid in the drain bottom, for the drain tiles, or setting stones to rest upon. And in quagmires, or loose running sand, it is advisable to drive short wooden piles into the drain bottoms; those ensure good foundations, however soft and poachy the subsoil may be.

It may be thought unnecessary to again mention the propriety of securing open water-courses at the bottoms of covered drains. But that is a leading principle in draining which cannot be too frequently inculcated, nor too positively insisted upon; and it is of still greater consequence in deep drains than in shallow ones.

When water springs up in the bottoms of drains, it indicates obstruction at lower levels. The boring-rod should then be applied, to give vent to the pent-up spring. Every extensive drainer should be provided with a light boring-rod, called "a churn-drill." It is made of round bar-iron, half inch diameter, and about eight feet long; the ends beat flat into chisel form, one inch broad, and steeled. In using the churn-drill, the workman stands in the drain; he holds the rod upright with both hands, raises it perpendicularly, and drops it into a hole in the bottom of the drain, and at every movement he shifts his hands, and in so doing he turns the rod a little, so as to make the bore-hole round, and prevent the chisel wedging in the hard substratum. In working this implement, the motion is something like that of the stick or handle of an upright butter-churn, and hence its name. When the bottom is dry, as is sometimes the case before the springs are tapped by the rod, the bore-hole should be kept moist by pouring water into it. The churn-drill, though simple, is powerfully effective when properly applied in boggy or springy ground, and frequently saves the expense of cutting additional drains. The great boring-rod, with its appendages, is still more effective; but it is too complicated, and too expensive for common use in land-draining, and is only used in extreme cases.

Some persons who think it necessary that cross-drains should have rapid falls, cut them in straight lines at considerable declivities, and by that means frequently miss the water-spouts they intended to cure. This is a great error in practice, for it is by no means necessary, nor is it at all

times prudent to give water in under-drains a rapid fall, particularly in loose subsoil, liable to gutter and sludge up. The bad effects of rapid falls for water are exemplified in arable land furrows, and other surface-drains on hilly land. These are frequently sludged up in heavy rains, the water is thrown over the surface, and its current diverted into other channels. Attentive farmers, therefore make cross-furrows, or drains, with easy falls, to collect and carry off, without injury to the land, the surplus water from the furrow-drains. The same rule applies, and similar precaution should be taken, wherever there is expectation of much water in under-drains. It is not necessary to cut cross-drains in straight lines: they may be made to bend in any direction, to cross the water-spouts intended to be cured. But care should be taken in cutting, not to lose the water-level in any one place. The workman can readily guard against that error; he has only to see that the water in the bottom of the drains runs from him, and does not come back among his feet.

It has been heretofore remarked, that under-drains should not be made so deep as to discharge the water at the *bottom of open ditches*, but should have a fall into them for the purpose of preventing their choking up, by the treading of cattle or otherwise. Many farmers commence their draining operations by cleaning out and deepening the open ditches into which they purpose the covered drains to discharge. The object of that deepening is to get additional fall for the water from the drains. The design is good, and would answer the intended purpose if those ditches were regularly cleaned out afterwards; but, unfortunately, that is seldom or never the case, for the farmer's attention being called to other important concerns, the drains, being out of sight, are soon out of mind,—the ditches are neglected,—leaves, coarse grass, and other rubbish, accumulate in them,—cattle get into them and poach them up, and the mouths of the drains are stopped up;—the water stagnates in them, and the land again becomes saturated with wet. It is therefore not advisable to gain fall for covered drains by deepening open ditches, when it can possibly be obtained by other means.

Cross-drains should not be made to join the receivers, whether open ditches or covered drains, at right angles, or nearly so, as they generally do. Neither should they be cut so deep by some inches as the receivers; and with a view to ensuring a free discharge of water from the cross-drain into the receiver, it is advisable, at a point a few yards distant from where the junction would be formed in the usual way, to give the cross-drain a sharp bend towards the declivity of the ground, and make it join the receiver in an acute angle, as it then would do, at a lower level. This practice ensures a good fall, and prevents choking up, as the weight and force of water from the bend of the drain effectually removes obstruction at the point of junction, and keeps the mouth of the drain open.

F. B.

The absence of discussion upon the subject of the Islington Market might have led to the supposition that its advocates were either inattentive to its interests, or considered its establishment hopeless. We have much satisfaction in being enabled to state that the assiduity and perseverance of the

individuals who have succeeded in bringing it to its present state, continue unabated, that trustees have been named, and a Committee appointed for the purpose of forming a Company, to which the Market should be conveyed by the proprietor. The details of the scheme have been announced by advertisement in some of the provincial papers, and from the list of names which will be found heading the scheme, we entertain no doubt of its success. The grazier, the cutting butchers, and the consumer, are all interested in the condition of the animals at the time of their being slaughtered. The grazier is interested in preventing any unnecessary degree of fatigue and ill-usage to his cattle, as tending to destroy their appearance, and reduce their value. It is the interest of the cutting butcher and the consumer, that the animals should be as free from fever and irritation as possible, the fatigue and worrying which they undergo, necessarily hastening decomposition of the flesh when slaughtered. Municipal Reform has not yet reached the City of London, or we should not see such an abomination as Smithfield Market continued, when a situation so much more eligible is offered, and when even looking at the question in a pecuniary point of view, the present site of Smithfield might be applied to purposes which would equally well remunerate its present owners.

## CULTIVATION OF SMALL FARMS.

BY W. BLACKER, ESQ.

1st. The ground must be thoroughly drained. For this purpose it is not sufficient to cut drains in the low grounds; but the springs must be sought for as high up as any symptoms of them can be discovered, and the water conveyed from them, and not allowed to force its way through the soil; in which case it will destroy the effect of any manure which may have been applied. In proof of which, you may always observe, in such situations, the grain in that part of the field ten or fourteen days later than the rest of the crop, and in very late seasons it may, perhaps, not ripen at all.

2dly. The weeds must be destroyed; which in a little time will be accomplished by proper attention in collecting, as far as possible, all weeds, before putting in the crop, and by sowing the green crops in drills, and carefully weeding them afterwards; and they may even be made worth the expense of gathering, as they will yield a valuable addition to the manure heap, if applied as bedding in the cow-house. For this purpose, they should be collected before flowering. It is shameful to see, in many fields, the quantities of rag-weed ripening to seed, and impoverishing the ground as much as a crop, which might, if usefully applied, as above directed, have brought nourishment to the soil, in the place of exhausting it.

3dly. All cattle must be fed in the house or straw-yard, upon good food; such as rape, cabbage, turnips, or mangel-wurzel, potatoes, clover, and vetches, in proper succession, will abundantly supply, according to the nature of the land; there being no farm in which some of these crops may not be raised in abundance, with the aid of manure, which the practice of home-feeding produces.

4thly. Never take two crops of the same kind

in succession off the same land, although this is sometimes done with potatoes, to reclaim land that has never been in cultivation; but in other cases this is not advisable; and, in particular, two grain crops cannot be taken in succession without injuring the soil, and in the end a manifest loss arises from the practice, in place of that advantage which the needy farmer looks for; because, by interposing a green crop, such as clover, &c., full as many grain crops may be had off the same piece of land and from the same manure, in any given number of years, by taking them in rotation, as by taking them in succession. But the rotation system has this advantage, that while you get as many grain crops, you keep the land always in good heart, and between the crops of grain you get green crops equally valuable. This is accounted for by considering that no two crops derive the same particular nourishment from the land. The roots of some sink deep, and draw their nourishment from the bottom, while others spread on the surface; and it is generally believed that plants derive their food and support from as different ingredients in the earth, as the different kinds of cattle derive their food upon the surface. Horses will eat grass which cows reject, and so with every description of cattle; and supposing the analogy to hold good in plants, it is easy to conceive that a change of crop may find the soil abundant in that kind of nourishment which it requires, although it might be, at the time, exhausted of that kind required by the crop which had gone before; and thus the ground may be as much restored by the introduction of a green crop after a grain crop, as if the field had actually lain fallow; and experience, in a great degree, justifies this reasoning.

I am fully sensible, however, that a system of over-cropping with grain will extract every kind of nourishment from the soil, and leave it so that it will not even yield grass. This is the case with the land which is left to rest, as it is called by those who take three or four grain crops in succession; and the phrase is well applied, for the land is really not fit to do any thing. The error of this class of persons is, that they turn the land to grass at the end, in place of the beginning of their course. Had grass-seed been sown with the first crop of grain, there would have been a good crop of hay, and good after-grass, and the second crop of grain would have been as good as the first; and this is what ought to be done by those whose land is not suited to clover, or who, from poverty are not able to buy the clover seed; and even where two grain crops have been taken, it would be better to sow it with rye-grass, which will yield a crop on very poor land, rather than leave the ground to be possessed by weeds and such herbage as may naturally rise. The fact is, the last exhausting crop should only be put in upon that portion of the farm which is intended for potatoes, and other green crops, the succeeding year, which crops then give the manure to restore it to a productive state; and by this means there is no land at all lost by what is called resting it.

5thly. The place for manure should be contrived so, that it should not be exposed to any accumulation of rain water, but should receive the contributions from the sewers of the house, stable, cow-house, &c. The bottom should be paved, so that the drainage of the manure should run into a small cask or well adjoining it. Fresh earth should be regularly brought and spread over the manure, and the liquid in the well should be thrown over

it; by which means the whole compost will be equally rich, and the quantity increased to any extent that could be required; and the steam or smoke which arises from the stable manure, and which is the very richest part of it, would be kept under and imbibed by the earth so laid on, and the quantity of earth should be proportioned to the strength of the dung with which it is mixed. While speaking of manure, it may not be amiss to remark the great loss arising from the practice of letting off the water in which flax has been steeped, which, if sprinkled over clover, or made into compost with fresh earth, would be found most valuable.

6thly. It should be the object of the farmer, as soon as he possibly can, to have his fences made in straight lines, and of as great length as the farm will conveniently admit of. It is almost inconceivable the quantity of time lost by the frequent turning of the plough, and the quantity of land thrown out of cultivation, by having a crooked irregular fence, the bendings of which the plough cannot follow.

7thly. A farmer who has any understanding must perceive, the moment it is mentioned, that every unnecessary ditch is so much land actually lost, and that his care ought to be to have as few of them as possible; and it will, therefore, occur to him, that if he feeds his cattle in the house, almost all his ditches may be dispensed with, except the mearing ditches, which are necessary to keep out those of other people; but he has evidently no occasion to prepare a fence against his own, for he keeps them at home, and this circumstance would enable him to raise hedge-rows, which can never be done if the cattle are turned out, the value of which, for shelter to his crops, and supplying him with timber for all country purposes, is most important. The loss of land from useless fences is greater than any one would suppose who has not considered it: and I would almost venture to say, there are farms in this country of twelve acres, in which the ground lost between the trench or gripe, and the backs of the ditches, together with that lost by the crookedness of the line, would amount fully to one acre, or one-twelfth part of the whole. Now, supposing a farmer to pay thirty shillings an acre for his land, he of course loses thirty shillings annually by this waste of the surface, which is equal to two shillings and sixpence an acre upon his entire farm. It is quite evident, therefore, that these ditches should be piped and levelled in, which would have the additional advantage of relieving the crops from the vermin to which those ditches afford a shelter.

8thly. It requires a farm of full fifty acres to give sufficient employment to a pair of horses; perhaps sixty would be nearer the truth; and, therefore, if a farmer even ploughs in partnership, he ought to have twenty-five or thirty acres. I here speak of those who have no other employment for their horses than what the cultivation of the farm affords. There are, however, cases where the distance of fuel, and distance of lime, may make a horse necessary when it might not be otherwise. All *small* farmers ought to use the spade, for many reasons. It costs but little more, even if he has to hire assistance, and does the business better, and the crop is better. In all drill crops also, by using the spade, he may be put in a quicker succession of crops, and have one coming forward as the other is ripening. In wet seasons he can dig, when he cannot plough; and its value, in turning up stiff clay lands in autumn,

and exposing the soil to the frost and snow, is scarcely to be imagined; and in all such lands *this plan* should be pursued where no winter crop is put in.

9thly. In all wet lands, and where the clay is retentive, the ridges should be narrow, which may, indeed, be almost laid down as a general rule, in a climate so moist as this: but where the land is sufficiently dry, the broad ridge is preferable.

10thly. No straw whatever should be sold off the farm. In England this is strictly forbidden by lease, and the tenant who did so would be supposed to have an intention of running away. If the cattle are home-fed, as here recommended, all the straw the farm can be made to produce will prove little enough; and for this reason, as soon as the farmer is in circumstances to enable him to do so, it would be his interest to slate his house and out-buildings, which, in the end, would be found the cheapest roof, and would preserve, for the use of the farm, the large quantity of straw which is annually consumed in repairing the thatch.

## CONDITION OF THE AGRICULTURAL POOR.

(To the Editor of the Morning Chronicle.)

SIR.—I had little hopes that the sufferings of the poor in the neighbourhood of Dunmow would have obtained publicity through your paper, or you would long since have heard from me. For years the infamous system of paying part of the wages out of the poor-rates, had not only been going on, but also sanctioned by the magisterial clergymen, who farmed their own glebe, until the Poor-law Bill came into active operation. The consequences are, that while the wages of 6s and 7s a week have, in no instance to my knowledge, been increased, the allowance from the poor rates have been discontinued. The sufferings, the heart-rending sufferings, of many poor families in that neighbourhood beggar description. Upon my inquiring of the inmates of two cottages, which they rent from me at 60s a year, why they had not had some windows repaired, they most pathetically showed me their wretched condition; and when I even reduced the above trifling rent, while they gratefully acknowledged my kindness of intention, they confessed it was not a relief adequate to their necessities, in consequence of the action of the Poor-law Bill reducing wages a fifth. In the neighbourhood of Marlborough the same circumstance occurs. I lately visited a parish near Salisbury, where there is not a labourer who receives more than 7s a week; and, in the neighbourhood of my own estate in Dorsetshire, the wages do not average 8s. The country gentlemen first procured a reduction in the price of labour, by a portion being paid out of the poor rates, and then obtain an Act of Parliament which destroys such arrangement, without giving to the poor man compensation.

My tenants are honest hard-working men, with families too young to render any assistance to their fathers, who each receive 7s a week, and are better off than others. Lord Maynard, who shows a most kind feeling towards the labouring poor, has allowed, as lord of the manor, other labourers to bring the poor land adjoining their own cottages into cultivation. Now, Sir, I request you to inquire whether his Lordship has by means of his steward a right or intention to claim that land so brought into cultivation. At present, these poor bondsmen as they feel themselves, are obliged to accept anything upon any terms, until the storm, which is silently gathering, bursts forth, unless, indeed, the good sense of the present Administration avert it, and, at least, fix a minimum price of labour.

I am, Sir, yours, &c.

London, Sept. 10.

## ON THE WINTER MANAGEMENT OF POTATOES.

BY MR. TOWERS, AUTHOR OF THE DOMESTIC GARDENER'S MANUAL.

(From the Quarterly Journal of Agriculture.)

A great deal has been written upon the failure of potato crops, and many contradictory opinions have been hazarded. The fact appears simply to be this: if failure from disease have taken place, the evil has been local, or nearly so, from a species of *endemic*, whose ravages were confined to certain districts, and dependent upon causes not in general operation. I have never witnessed such a failure; nor have I seen, nor correspond with, any person who has traced its effects; but one solitary instance of a total loss of a variety occurred to me in 1835, under circumstances so extraordinary, that I think it desirable to describe them before I enter upon the consideration of the chief subject of this article.

In 1834 I received from a friend three or four potatoes, which were said to be well adapted to garden culture, but not very suitable to the field. The skin was almost black, in some parts approaching to a deep mulberry tint; the form very good, round and perfect; the tuber was tolerably well supplied with eyes, but the size of it was rather small. The potato, when boiled, was good flavoured, mealy, and its colour almost white. The four potatoes yielded a crop sufficient to plant one entire row, about seven yards long, the tubers being uncut, and placed six inches apart. The soil of the plot (it was in a garden) was a sandy loam, strong, and naturally binding, which texture, my experience teaches me, is always found whenever a very large proportion of coarsish, gravelly sand exists in a soil that contains more chalk than alumina (the matter of clay). The purest and most unctuous loams appear, by my analysis, to abound with fine soft sand (siliceous earth), and but little coarse gravelly matter. However, the loam I employed, which had been trenched some years ago to the depth of twenty inches, and manured in routine sufficiently for most crops, was exceedingly suitable to the potatoe, and was planted with three early varieties of that vegetable, to the right and left of the row which contained the black tubers alluded to. The rows were formed about one yard asunder, and thus every variety may be said to have been planted in the same soil, and subjected to the same treatment.

The plot was planted very early in the season; and this leads me to remark, that no advantage appears to be derived from such a practice, for the tubers remained long inert, and did not vegetate till the usual period, when the sun acquired power, and produced that degree of moist temperature which the potatoe requires; in fact, I found that those tubers which were put into the ground late in March, or early in April, were excited equally soon as others which were set in February.

All the varieties, however, rose with equally apparent strength and vigour; and the blacks produced as perfect and well developed a row of shoots as any of their competitors; and these continued to thrive till they attained the height of five or six inches, then a change of colour became manifest, and the leaves, instead of retaining the dark healthy hue natural to the variety, assumed that of a sickly yellow; growth ceased, the plants stood still, and, though they appeared to live during two months, dwindled gradually, and at length died away, and vanished. In the mean time, every ordinary care was employed to excite vegetation; the ground was lightly digged,

hoed, kept clean; and a portion of light earth brought up to and about the stems: but all was to no purpose. The other early varieties progressed luxuriantly, and yielded fine and healthy potatoes, during July and August. When, however, the ground occupied by the diseased roots was examined at the period of the final digging, *not a single vestige* of a potatoe could be traced—all had vanished; and thus the destruction was found to have been complete. The phenomenon—for such I regard it—appears inexplicable; I do not perceive a cause whereby to account for it; it is involved in mystery; for although the drought of summer produced the effect of diminishing the yield of *all the late crops*, I had not in any part of my grounds another instance of failure from disease.

If the destruction complained of in the north of England, were not caused by a peculiar local agency, it had its origin, I presume, in some improper treatment of the seed potatoes at the time of digging, or during the succeeding winter. If a potatoe crop ripen late in October or in November, there exists a great probability that the tubers will be exposed to some degree of frost; and if, after a fine clear day, when a considerable quantity has been dug up and lies exposed, the thermometer, about sun-set, fall to a degree or two below *thirty-two*—the freezing point—the skin of the potatoes being in a moist state, will be covered with frosty rime, and after a very short exposure become decomposed. This accident occurred once to me when I was taking up a valuable seed-stock of several new varieties which I had received from the President of the Horticultural Society, and wished to retain in separate heaps till they could be stored away and properly marked. Three degrees of frost took place before the twilight set in, and though every exertion, consistent with the required attention to sorting, was made to house them, numbers glittered with frosty crustation. In the ensuing season, when we began to plant, I found the cuticle gone or abraded, and the pulp rotten in many places. The eyes of potatoes so decomposed become effected; they are either inert, or protrude poor weakly sprouts, which never succeed in their future growth, and cannot possibly yield healthy tubers. I am certain that numbers of frosted defective sets are planted; and if it so happen that the whole of the seed-stock be more or less affected, it will always be wise economy to plant the potatoes entire; for though three-fourths of the germs may be inert, one or two that are sound may remain; whereas blanks must occur in the rows where cut sets that have diseased eyes shall be employed.

In collecting a large plot of potatoes, the judgment of the farmer must direct him in employing an appropriate method of protection; but as a perfectly dry condition of the skin is the greatest means of security, the roots ought to be placed under cover of an open shed, if possible, till the moisture evaporate; a common sheet let down in front of the opening during a keen night will effectually secure the potatoes, because they cannot be kept too cool, provided they be screened from actual frost.

Heat and moisture are the agents which stimulate vegetation; light is the element of colour and maturity; these are facts now acknowledged by the wisest physiologist, and confirmed by the experience of every day: hence we are taught that preservation of potatoes, designed either for food or future cultivation, must depend on the absence of these stimulating agents. It appears, probable, therefore, that the ordinary practice of "pitting," that is, of burying the store in broad trenches, coated with straw and covered with a ridge of earth, is very far from judi-

cious. The ground is always more or less moist, it is also warm enough to produce some degree of stimulus; and thus, after the ridges have been exposed to the rains of an entire winter, and the earth on every side becomes saturated by water, it is evident that the lining of straw, or other vegetable decomposable matter, will be acted upon, and tend to produce heat. The potatoes therefore push, and it is no uncommon circumstance, at the opening of a pit, to see the whole surface of the potatoe stock covered with a matting of long white shoots, every one of which has been protruded at the expense of the pulpy nutritive substance of the roots. If pits be employed, it would always be wise to dig them in a dry spot of ground, protected by a covering roof of some kind or other. Water should be excluded, and the roof will also prevent much of the operation of frost; but the greatest security will be obtained by excavating the dry earthen-floor of some barn or out-house, prepared for the express purpose; if the potatoes be laid upon dry ground, a little below the surface level, and covered with a few inches of perfectly dry litter or sand, no frost of ordinary character can injure them. In fact, the potatoe will support a great degree of cold, as I have amply proved during the last fitfully severe winter. I deposited my seed-store of early kidneys at first in a temperate cellar, but perceiving that the eyes began to break, though the heat was seldom above 45 degrees, I had them removed to and laid on the floor of a barn; before they were properly secured, frost of extreme severity occurred, the mercury descended 15 degrees below the freezing point, and some of the exposed roots were more or less coated with rime. They were then covered with straw and sacks; some also were put into chests with dry hay; but every precaution was employed to prevent the accession of heat. The atmosphere of the barn (which was frequently open during six hours of the day) was on several occasions cooled far below the freezing degree of Fahrenheit, yet when the tubers were examined in March, they were found in so perfect a state that I hesitated not to plant the whole of them; all, however, were put into the ground entire, and they vegetated with extreme regularity.

We cannot, perhaps, refer to Mr. Cobbett as to an unquestionable authority; but he resided so long in America, that his evidence, when it accords with that of others, must be received as adding force to the facts adduced. Now, he states, that apples frozen as hard as stones by the severe frosts of the climate, receive no injury provided they be subsequently thawed in the dark. An observant gentleman, who was for years a surgeon in the army, and served in Canada and the neighbouring States, assured me that a linen sheet thrown around the fruit, so as completely to cover it, was found effectually to secure it in situations wherein the severity of the frost could not be guarded against by any number of blankets. In France, also, where the winters are extremely keen, but not damp, as those of our islands, apples are placed upon shelves ranging one above the other, in cold barns or other erections, capable of being ventilated at pleasure. A curtain is let down in front of these shelves, so as entirely to screen them and the fruit, and the latter is effectually preserved. Linen or silk is to be preferred to cotton or woollen; but *how* a fabric so thin in texture can act, is a subject which merits the attentive investigation of the philosopher. I recite the fact on the authority of the gentleman above alluded to, because he witnessed the practice during the march of the British forces through the south and west of France in 1814.

I am unable to speak confidently of the success which would attend a similar method applied to the preservation of potatoes; apples are matured *fruit*; potatoes are a sort of underground receptacles of *systems of life*; each eye is endowed with the vital principle; but certain I am, that these eyes have endured, and will support a degree of cold, which is scarcely a degree above the freezing point of Fahrenheit. The great points to be observed, are a degree of cold which shall keep the eyes or buds silent, with entire absence of moisture. In some future paper of my horticultural series, I propose to describe a method of planting which I have adopted with all my early crops of the present year, in order to provide for a due and complete protection from spring frost, and from drought during the succeeding summer; it has answered my most sanguine expectations to this time, but it would be premature to write more confidently till I witness the final result.

Potatoes are so extremely valuable to the farmer, to the cottager, and to the public at large, that it behoves every one who is in any degree taught by experience, to communicate, as far as his abilities may enable him to do so, any mode of culture or of keeping the root during winter, which he has found to increase the *yield*, or to secure the *store* in a sound and healthy condition. Much has been conjectured and written concerning atmosphere, predisposing causes of decay, of deprecations by worms or other insects, of diseased seed-stock, and so forth. Each of these causes, and many others, may have operated injuriously in some places, and under certain peculiar circumstances; but to me it appears highly probable, that injury from frost prior to housing, and subsequently, the exposure to too great a degree of heat in moist situations, have generally been the proximate causes of the mischief complained of. If the farmer could be prevailed with to change his practice in the field; to carry his crop, in detail, before the hour of sun-set to some dry airy shed or shieling; and, after the potatoes have become perfectly dry, to store them up in a building similar to that employed by the best gardeners in large establishments for the preservation of apples and pears, one which is walled round, and roofed so as effectually to prevent the ingress of actual frost, but latticed for the admission of air and the obstruction of light, he would find his account in the alterations.

I have said enough upon general principles, and any man of acute observation may improve upon them as far as concerns local conveniences; in the mean time, it would gratify me very much, could I induce Mr. A. Gorrie to take up the subject: he is well acquainted with the climate of Scotland, and is intimately versed in the practical science of gardening, as respects North Britain. No one can peruse his papers without deriving pleasure and instruction from them; and, individually, I have been so flattered by the expression of his kindly feeling, that I am induced to hope he will, at my appeal, come forward to investigate a subject which cannot fail to excite the liveliest interest in the mind of every one who has the welfare of the labouring population at heart; for next in order to the cereal crops, the potatoe claims the utmost care of the patriotic agriculturist.

---

A GIGANTIC CABBAGE.—On Saturday se'nnight a cabbage, of the drumhead kind, was exhibited on Llanely market, weighing no less than 25lbs and measuring between the inside leaves upwards of 4 feet in diameter. It was grown in the garden of Mr. Evan Evans, merchant, of that place.

## AGRICULTURAL REPORTS.

## LINCOLNSHIRE—NORTH AND EAST.

The fine rain, which was the subject of my concluding report for the last month, did much good to the pasture land, and gave it a start towards growing, which the succeeding week of warm weather continued to promote. The first week in September proved the best of the harvest season, and much of the wheat and oats were carried in good condition. On the 6th equinoctial gales commenced, attended by cold rain, and continued up to the 20th, during which time no harvest work could proceed; and though the cold prevented the barley from sprouting, it has got much stained, and its malting properties considerably impaired. On the high Wolds much remains uncut, and a large quantity far from ripe, not having made any progress during the last fortnight. We have now had a few days dry and fine, and the barley which stood out the gales has got cleared off the land, and some progress been made in what remained standing. The beans are nearly all cut down, and produce a very light crop. The red clover left for seed has been out during the stormy period, and if not otherwise injured will have lost its bright colour, and show a dull sample. Fat cattle and sheep retain a high price for this late period of the grazing season, which must arise from a thin supply compared with former years. Score beasts that are low in condition sell heavily, but sheep of all kinds bear an excellent price. Lambs, from 20s to 29s; store ewes to 38s. The turnips have not improved the last month equal to expectation, and the black caterpillar still continues his depredations in some situations. The eddishes have much improved, as well as grass land, but on the whole, food for the winter is scarce and dear. The wool trade continues steady at former prices, without any bustle or eagerness to purchase. We have no corn markets for any thing in quantity, but wheat, which has not in this county kept pace with London and Liverpool. Many small farmers who watched their opportunity got their wheat tolerably dry, and by immediately thrashing, have met the millers with a sufficient supply for immediate consumption, when mixed with their stocks of old not yet exhausted, from which cause old is not much inquired after, and the new sells from 44s to 48s, and a few choice samples of white up to 50s per qr.

**THE BLACK CATERPILLAR.**—The most effectual recipe to destroy the black caterpillar, we find is to mix quick lime, in powder, *four pecks with one pound* of white arsenic. Sow this mixture over an acre of plants while wet with dew, or after a shower of rain, and it will generally succeed.

Spilsby.

G. B.

## OXFORDSHIRE.

As stated in our last, harvest here became general about the 12th of last month, and with favourable weather; still the progress made was by no means equal to that of former years, owing to the wheat and barley not being sufficiently ripe. But what was cut might have been housed in capital order, had common patience and prudence been exercised; but unfortunately such was the haste manifested by many farmers to carry their wheat in less than the usual time after cutting (when it required double) that much of the crop

is unfit for present use and must stand over until spring. Barley, as was expected, proved to be rough and high coloured; still the early sown does not weigh amiss. There is in this and the adjoining counties a considerable breadth to cut, and containing (as it does) so many green ears will require a deal of field room. Though thinly planted, the ear is long, and will yield well from the straw; nevertheless, the crops on the thin stone brash soils was so light and full of weeds, that it must fall far short of an average produce. Beans prove to be by far the worst crop, and perhaps never were stacked in less room; we consider them on the whole as well ended, there doubtless are some exceptions; the quality though not so superfine as last year, will be good. Peas of all kinds we consider to be a full average; we have heard of some few complaints of failures, we put those against a large breadth where they proved most abundant and of good quality, moreover well got up. The turnip crop turns out to be exceedingly various; here and there we have some few capital plants of Swedes, while in many others there is scarcely a plant to be seen, and owing to the unusually cold nights we have for some time experienced, the late sown ones, which escaped the fly, have made little progress and are never likely to be worth hoeing; the loss will be sensibly felt towards spring, especially as the meadows and pastures are already eaten barer than we often see at this early period of the autumn. The prospect of a want of keep has had an effect on the sale of slow stock, but more particularly sheep, which have been a drag in some of our recent fairs and markets. Mutton is also reduced in price. Beef supports late prices. Fat pigs have become scarcer, and an advance in price has been the consequence of a short supply. A large quantity of winter vetches will be sown this season; they yield well, and the price, as well as the superior quality, will induce many to sow largely, the more so, as the trifolium incarnatum proved a failing crop, owing to the severe frost in the spring. But we are pleased to learn that, notwithstanding the disappointment last season, much has been sown, the price, 25s to 28s per cwt., being tempting; the high price of hay (from 5l to 6l per ton) may also have had an effect. Wool will soon be in but few of the growers' hands, and has been selling at from 42s to 48s per tod. We anticipate a dearth of employment during the winter months; the thrashing will be next to nothing as compared with last year, and it looks ominous to see crowds on the roads breaking of stones before the harvest is ended. Nothing but the public works now in progress can prevent the union workhouses being crowded to excess; at present the inmates are comparatively but few. Wages vary from 8s to 10s per week. Much alarm is prevalent among the lower class on account of the high price of coals.—Sept. 27.

## SUSSEX.

At length the harvest is completed, and we proceed to give the account of the various crops, as far as they have come under our observation. The wheat is certainly *below an average*, and nearly the whole has been carried in such bad condition that very little will be fit to grind by itself till after the dry March winds, which we generally have at that

time of year. Barley also is a short crop, *much below an average*. A barley stack is quite a rare sight, as on many farms there is not one, the barns holding the whole. From what we learn of other counties, particularly Norfolk and Suffolk, Essex and Cambridgeshire (all great barley counties) we have been, compared with them, highly favoured as to weather. Little barley has been injured by the rain; indeed, we should say, on the whole, it has been benefited. We have only had showers, with cold brisk winds, so that little or no barley has been sprouted in the fields; whilst we hear from several Norfolk and Suffolk friends, who came to attend Mr. Ellman's sale at Glynde, and the Lewes sheep fair, that they have had incessant rains for the last three weeks, which have very much discoloured a great proportion of their barley. Oats are below an average. Peas in some places are very good; in others, not worth harvesting. Beans, generally, are very good; and tares the greatest crop perhaps ever known. At Mr. Ellman's sale on the 20th there was a numerous and respectable attendance of Southdown breeders from many different counties, and the ewes were sold and the rams let at very satisfactory prices; the ewes averaging nearly 50s, and the rams letting at from 11 to 25 guineas. His Grace the Duke of Richmond honoured Mr. Ellman by sending two ram lambs to compete for the pair of goblets given by Mr. Ellman at his sale, bred from the Glynde flock, and was the successful candidate; the judges pronouncing the two shown by his Grace to be the two best exhibited. At the great sheep fair at Lewes, on the 21st, about 46,000 sheep and lambs were penned. A few lots of ewes were sold at high prices, but a large proportion at about 27s, and many driven home unsold, to be brought to the next Lewes fair on the 3rd of October, which will be a large one.

#### NOTTINGHAMSHIRE.

I am almost weary of sending you my monotonous reports, having to sing the same dolorous song so many times over. Since my last report the weather has been very unsettled, with a west and north-west wind, accompanied with extreme cold rains, which have had a very severe effect upon vegetables generally. The appearance of the grass fields and other vegetables present a blue chilled appearance, more resembling the month of March than the present season of the year. The uncongeniality of the month has been a great retarder of the harvest, and has caused grain of every description to be got home in a hurried manner, and of course not in a first-rate condition. Wheat is generally secured in most parts of the county, so that now we have done thinking of an unsound harvest; the markets are becoming more steady, but not improved in quality; the samples come into market extremely coarse and light, and but few parcels are free from smut, more or less. Barley and oats are inferior in quantity and quality to last year: prices are advancing, and I think are likely to advance from the deficiency of the crop; I think I may safely say there is not so much straw by one-third, in proportion to last year, so that the quantity of corn must necessarily be far short to what it has been for some years past. Lentils are almost finished, and I should think that the farmer never looked to this crop with a more watchful eye; he has had nothing else to rely upon, the uncongeniality of the season proving so unfavourable to the clover eddishes, and other grasses. Food of every description for cattle is extremely scarce, and eddishes of every description are selling at amazing high prices. Hay is selling at prices from 6s 10d to 7s 10d per ton very freely, so that the farmer

would do well to take time by the fore-lock, and not let his servants cut too deep into his hay-stack at the commencement of the winter, for he may rest himself assured that if he lives to see another spring, that the price will be a most exorbitant one. It is generally considered that turnips that have withstood the early ravages of the fly, may now be considered safe, but this year we find it otherwise; many fields within my observation that appeared as fine plants as ever nature produced, have been attacked by the smother fly, and completely destroyed,—thus we see this year that turnips have had nothing but enemies to contend with—a host of them in rapid succession: what one has left the other has completely destroyed, so that, as I said before, it behoves the farmer to seize time by the fore-lock, and use every handful of food with the greatest economy possible. Cabbage has suffered the same fate with the turnip; fine fields that had the most imposing appearance you may now find a complete wreck, the smother fly has attacked almost every plant and every leaf, covering the whole in a complete body. There is a variance of opinions as to the cause of plants being attacked by this fly; whether it is from a superabundance of fly brought by some particular winds, as we find is the case at some periods of the year, or whether it is the cold uncongenial weather that brings on an unhealthy state of the plant, and creates the fly; I am rather of the latter opinion, for we invariably find that the smother fly always attacks the most unhealthy plants first. I should feel obliged by any of your numerous readers giving their opinion upon this subject. Our corn markets are becoming more settled than they have been of late, the holders of old wheat selling more freely, now the new is secured. Oats and beans meet with a good demand, at advanced prices. Barley finds purchasers at good prices, and I think I may safely say, the markets are much improved. There is a universal complaint of smut amongst the farmers. I saw in the *Mark Lane Express* a few weeks ago, various recipes for the cure of smut; now the same gentleman would oblige me by answering the following questions:—What is the cause of smut? What are the effects the various washes have which are used as a preventive? How they act upon the seed? and why the first recipe he produced acted more beneficially than the other?—I have found it prevail under every mode which he has adopted, and a farmer in our neighbourhood, a few years ago, had a field of wheat that stood till it was what is termed dead ripe, and in removing, lost a considerable quantity of its grain; the same field was fallow wheat—had some stunted ears in it, and was seeded down with white and red clover; the year following the same field, from the quantity of wheat that had shaken out of the preceding crop was sufficiently thick and healthy to remain a second year, and did so, and was taken off a good crop and entirely free from smut; and I myself had a field last year, that was white wheat, and smutted; the same field was seeded with red clover, and missed; this last spring I had sowed it with oats, and amongst the oats was a considerable quantity of wheat, that had shed out the preceding year, the oats that were sown being entirely free from wheat, so that the wheat which grew amongst the oats, must be of the preceding year's growth, upon the same land. Now, that wheat which grew amongst the oats was entirely free from smut, as were the former, which seeded itself. Well, last Michaelmas I sowed the same wheat that was taken off the field just mentioned, that was sown with oats this last spring, in a field adjoining, that was a summer fallow, the seed was well soluted

with wash, and afterwards quick lime applied, and now we have taken off a good crop of wheat. I really cannot give an opinion upon the subject, for we find it under every mode of treatment which has been adopted—no disparagement to the gentleman who gave us the recipes, rather—many thanks to him and to all who may disseminate any thing to the improvement of agriculture. The best method I have found, or rather the most effective one, when you have it, to get rid of it is this. I order the person who thrashes, to set the wheat on an end, the smutted ears are then very perceptible, and may be picked out with ease, then to open the sheaf, and examine the short ears; by this method you may bring your parcel to market very little inferior to that which is free from smut, allowing the person who thrashes 2d per bushel for the extra labour bestowed upon it. I forgot to remark that the corn fields I have mentioned that seeded themselves, of course never were washed, nor soluted with any thing, which appears to still place the question in obscurity.—S.P.G.—Sept. 21.

#### NORFOLK.

SIR.—Although harvest has been generally completed in this district these twelve days, we have delayed handing you our annual report of the crops, it being our wish to ascertain, as nearly as possible, both quantity and quality; also to inspect the deliveries now coming to market. The weather during the harvest was generally fine, and, upon the whole, every kind of grain (beans excepted) secured in good order. Wheat is rather short of an average crop, a great portion, however, will be of excellent quality; some too hastily carried is of a secondary description, the weights of those already delivered are from 61 to 64 lbs per bushel. Barley may be reckoned an average crop, the greater part of which, both common and Chevalier, is of fine malting quality, particularly those from off our best soils, the weight not quite so heavy as last season but much more tender; those grown on the poor and heavy lands are rather coarse, but well suited for distillation, being perfectly sound. There is still a great deal abroad on the coast and north of this place, which has received considerable injury from the continued wet and windy weather, it being lodged and much sprouted: some little quantity grown in this neighbourhood has been delivered, and weighs from 51 to 55 lbs per bushel as in quality. Beans not much grown in this district; the crop, we understand, is good, but are yet in the fields waiting more favourable weather. Peas are all secured in good condition, quantity abundant, and quality fine. Oats are by no means a good crop, the colour indifferent, and the weight not equal to the growth of last season. No stocks of old grain on hand, wheat excepted, of this article some quantity remains with our opulent farmers, who are not inclined to sell at present, expecting higher prices. We remain, Sir,

Your's very respectfully,  
WM. HANKS AND SON.

#### LIVERPOOL, SEPT. 1.

At the close of last season we thought it desirable, in lieu of waiting upon you with the usual statement of the monthly deliveries of Grain, &c., into this port, to give a return of the total quantities received during a series of years; this we have, in the table below, extended to the end of the month just past, and we also attach the price of each article of the free trade at the several periods, taking the value of Irish produce as the standard.

On reference to this table, a little increase will be observed in the general supplies for the last twelve months over those for the year immediately preceding, arising as respects Wheat, from the greater quantity

of English brought coastwise, but in making the comparison with the average of the three years 1832, 1833 and 1834, we find a deficiency of 133,000 quarters of Wheat and Flour, and 87,000 qrs of Oats and Oatmeal. As regards prices, there was, with little exception, during the years 1829, 1830, 1831, 1832, 1833, 1834, and 1835, a gradual depreciation in the value of almost all agricultural produce, especially Wheat, which, at the close of August, 1835, was selling as low as 5s 6d per 70lbs. The Corn trade, however, has since participated in that improvement which has pervaded most other branches of commerce, and Wheat may now be noted fully 25 per cent, and Oats 12 to 15 per cent higher than at the period just referred to. The present stocks of free Wheat do not materially vary in amount from those held on the 31st August last year, say about 140,000 quarters; there is now, however, a much lighter stock of Flour, and of Barley and Oats the market may be almost said to be bare. There are somewhat more than 40,000 loads of Oatmeal in granary, and there may remain of the recently-liberated Foreign Peas, about 9,000 quarters. Free Beans are scarce, but the stocks in bond may be considered available to the home market. The sales in Wheat have, throughout the season, been almost entirely restricted to our town and its vicinity; the low rates and superior quality of the English samples have at all times kept Irish out of Manchester and the surrounding district, nor has the Flour trade of the port been much more favourably situated. During the month there has been a pretty good demand for Wheat from our millers and dealers, but prices in the early part of it, influenced by fine weather for harvest, were reduced 3d to 4d per bushel, subsequently they have nearly recovered this depression, and are now much the same as on the 30th ultimo. The best English white is worth 7s 9d to 8s, red, 7s 4d to 7s 6d, Max and Scotch white, 7s to 7s 6d, red, 6s 10d to 7s 4d, and the best Irish red, 6s 9d to 7s; middling runs of the latter may be bought at 6s to 6s 6d per 70lbs. The home demand for Flour has kept pace with the supply, and there has seldom been a season with so little old left over, or so little out of condition as at this moment. Prime brands of English are worth 40s to 42s, and Irish, 37s to 41s per 280lbs. The Oat trade has been uniformly dull, with prices rather on the decline, and this in the face of not only one of the lightest Hay crops that has been experienced for many years, but probably one of the lightest stocks of Oats. The best old Scotch are held at 3s 4d to 3s 6d; choice mealing qualities of Irish 3s 1d, and fair provender 2s 11d to 3s per 45lbs. A few thousand quarters of Irish new have already appeared, and the quality good, and have been sold at 3s to 3s 3d; at this moment 3s 2d per 45lbs may be considered an extreme quotation. Old Oatmeal has met a fair retail sale at 24s to 26s per load of 240lbs, and a few parcels have also changed hands on speculation. Prices of new Oatmeal opened at 31s and have receded to 27s 6d per 240lbs. The transactions in Barley have been confined to the sale of some parcels of old (which has been kept over) at 4s to 4s 2d, a little Irish new Bere at 4s per 60lbs, and a small cargo of Foreign, for malting, at 36s per imp. quarter, duty paid. Duty has been paid on 4,800 qrs of Peas, and 1,150 quarters of Beans. At a reduction of 3s to 4s per quarter on previous rates, say at 34s 6d to 37s, there has been a considerable clearance of the former, there are few, if any, now offering under 38s to 40s per quarter; the best English are held at 42s to 44s per imperial quarter. Several cargoes of Beans have been taken on country account; a few fine have brought 43s, but the bulk of the sales have been at 35s to 37s per quarter. The remainder of a cargo of Indian Corn has been retailed at 38s to 40s per 480lbs. There has been a very large business in bonded articles, chiefly for exportation to the United States and British North America; the exports of Wheat have been to the extent of 9,300 quarters, and those of Oats to 3,300 quarters; upwards of 12,400 barrels of Flour have also been re-shipped, the latter chiefly on owners' account. The sales of Wheat and Oats have, however,

greatly exceeded in amount the quantities yet exported; of the latter, 8,000 to 10,000 quarters have changed hands at prices varying from 1s 10d to 2s 4d; but for the most part at 2s 3d per 45lbs. The demand for Wheat has run chiefly on the recent importations from the Lower Baltic Ports, which have found buyers at 4s 4d to 4s 6d; latterly a small cargo of very fine has brought 4s 8d; a parcel of inferior Danzig has been sold at 4s per 70lbs. The transactions in Flour have not exceeded a few thousand barrels at 24s to 25s for fresh Baltic and 23s to 25s for United States sour; the latter price was paid for a little Western Canal. The stocks in bond consist of

It is yet too early to form anything like a correct judgment upon the present crops; in the Southern counties of England a large proportion of the Wheat is stated to be secured, and, judging from the fine weather during harvest, it ought to be in good order; the generality of the samples, however, that have appeared in the London market do not bear out this expectation. In the midland counties, also, a great part of the Wheat is cut, and a considerable proportion of it housed, but in this district and further north there is little yet saved. Latterly the weather has been showery, and such, at least, as to protract harvest. The reports are very contradictory as to the yield per acre, but it is pretty generally agreed that the breadth of land under Wheat is much reduced, and that there is reason to apprehend that the crops will be found below an average.

NORTH DEVON.

The heavy rains which fell at intervals from the 17th until towards the end of the last month, impeded the wheat harvest, without doing any serious injury; this description of grain is now nearly secured, but little of it has yet appeared in the markets, and this is found unfit to grind by itself, being so extremely soft and out of condition; the quantity of straw proves  $\frac{1}{3}$  to  $\frac{1}{2}$  short of the produce of last year, therefore there is no doubt of the crop being considerably below an average, though the yielding is admitted to be good, with the exception of its having more smut (when the condition has improved), the quality will be equal to the growth of 1835. On the best lands, the cutting of barley, and oats, became general the beginning of this month, about which time the rain set in more heavily, and continued with little intermission until the 11th inst., since which the weather has settled fine, and the farmers have been enabled

to house a considerable quantity of corn in good order; in many fields where it was fully ripe a large portion of grain has been beaten out by the heavy rains, and in most situations the corn lying on the ground has been slightly stained, though we have not heard any complaint of its sprouting; on our cold heavy soils, and coarse Moorlands, it will require three or four weeks fine weather, to ripen a considerable breadth, both of barley, and oats; this portion there is no doubt, will be found light, and of inferior quality. The barley which has been cut and secured without rain, is high coloured, and rather coarse, but of sufficient body to weigh 53lbs per bushel, when fit for use; this grain, as well as wheat, and oats, will take some time, before it can be stored, or shipped in any considerable quantity; the barley which has been exposed to the late rain, and free from stain, has improved in appearance. It was thought at the time of our last report, that the turnips would generally be a good crop, since which, the black caterpillars have proved very destructive, and entirely cleared many fields from every appearance of vegetation; in the fields least injured, the turnips are left in patches, and the crop rendered equally deficient as in the last year; in some districts for ten or twelve miles, the potatoes have suffered fully as much, whilst in other parts they look healthy, and the only complaint is the failure in first growing, the late injury has been done by caterpillars and grubworms, which in some situations have cleared whole fields, whilst in others large portions are as completely cleared as if cut with a scythe, and when the insects reach the extremity of the field they in general begin again at a part distant from their first feeding; it however appears rather extraordinary that the early kinds of potatoes are not in the least injured, whilst those of the red apple kind are entirely consumed; many fields of hay were out during the late heavy rain, which are found so much injured as to be but of little value for fodder; there was a good supply of cattle at South Malton fair on the 31st ult, particularly of sheep, which met a free sale, as some agents were employed in purchasing for the Welch markets; bullocks were not so much in demand, though offered at declining prices, cows and calves being scarce were sold on good terms.—Sept. 15.

KENT.

We are on the eve of finishing harvest, after having it retarded by the frequent showers which have fallen of late, so much so, that there has not been a day this week fit to carry corn, of which there is yet some barley remaining which will be sadly discoloured, if not sprouted. The wheat was mostly carried previous to the change of weather, and of this crop, the opinion at present is, that it will not be an average one, owing in a great measure to the small breadth of land sowed with this grain, and the lightness of it on the poor soils. Barley is expected to be quite an average one, although in a great number of cases it will be very unproductive, but the unusual number of acres sown this season will make up the deficiency. Oats, of which we are not large growers, is certainly below the average. Peas, with few exceptions, are good; but of beans, the crop is various; some fields very good crops, others but very indifferent. Turnips, cole, and potatoes have improved very much of late, owing to the rains. In the cattle markets there has been more business done, owing to the keep being more plentiful, and the sale at present is good for both beast and sheep. In the corn markets we have been doing business on rather better terms than last month, and there seems a probability that good corn will command good prices for some time to come at least. The market for wool is at present very flat, the holders looking for higher prices, while the staplers are looking downwards.—Sept. 9.

## GLAMORGANSHIRE.

The weather for the last fortnight has been wet, and harvest operations are seriously retarded; the corn housed in that period is not in good condition. The bulk of the wheat crop on all the best soils had been previously secured in order, but on all the late soils, and in the hilly district, a great portion of wheat is still out. Some pieces of barley in the vale have been stacked, but none in the hills, and nearly the whole of this crop and the oats remain to be harvested. What has been cut down begins to be discoloured, and will soon sprout. The wheat crop is not equal to those of the last two or three years; the ear is well filled, but it will not weigh so heavy; it stood thin on the ground, and the bulk in the stack-yards is very deficient. The barley, even if well harvested, of which there is no prospect, will be a coarse sample, with a large proportion of thin grain. Oats are a better crop, and about an average, if they can be properly harvested. Beans and peas are very short in the stalk, and a light crop. Those modern locusts, the black caterpillars, continue to be most destructive to the turnips. This insect, which has not appeared to any extent for many years, until last summer, must now be added to the previous long list of enemies to this tender plant, and appears to be the most troublesome. The ravages of the fly, slug, wire-worm, grub, &c. take place only while the plant is young; but from the time the leaf appears, until the root arrives to maturity, it is a prey to the black caterpillar. At present they are more destructive than in any part of the summer. We know of no remedy at this advanced period; brushing them off checks their fatal operations on the plant, which they do not otherwise quit as long as any vegetation remains in it. When the turnip is small, it may be covered with quick lime, which is found beneficial. Ducks devour them greedily, and a well stocked rookery, which the farmers generally look upon as a great nuisance, might now be of great service in the neighbourhood. The mangels are small in size, and will be a defective crop. Potatoes have improved very considerably lately, and promise well. Hay is scarce, and now selling from 5*l* to 5*l* 10*s* a ton. The produce of the hay and pasture land throughout the summer having been extremely light, the stock of winter provender is far below the usual quantity. Grass and latter-maths still continue short, and stock will soon be required to be brought into the yard. The market for fat stock must consequently be scantily supplied for another year. The corn market is improving for old dry samples, which are likely to be in demand.—*Sept. 9.*

GENERAL AGRICULTURAL REPORT  
FOR SEPTEMBER.

As relates to the progress of the harvest during the month, the bulk, quality, and the harvested and unharvested state of the crops, both verbal and published, rumours have been exceedingly contradictory: whence we feel much difficulty, in endeavouring to explain what we conceive to be the plain and honest truth; as the frivolous west-end Cockney periodical scribes, who collect all their intelligence from taking a Sunday walk to White Conduit House, Kensington Gardens, St. James' and Hyde Parks, or, at the most remote distance, to Battersea Fields, will presume to know better than those justly entitled to the appellation of agricultural weekly and monthly periodicals, by incurring a heavy expense in endeavouring to obtain accurate accounts, written by practical agriculturists of unimpeachable character, and of dearly bought extensive practical experience. We consider, both the Scotch philosophy of measuring animals, and other farm produce, after the manner of the late shepherd, Hogg, measuring the quantity of salmon in the Scotch rivers, or the Irish exaggerated reports relative to a deficient crop, as of no utility whatever: the former having been completely refuted, by the Scotch beasts weigh-

ing, on the scales of the London butchers who purchased, from 80 to 150 lbs. each more than they were measured at: the Irish complaints being almost invariably closely followed by the arrival, in the London market, of great supplies of the very articles a scarcity of which had been complained of, as existing in the sister kingdom. Notwithstanding, however, that there is some exaggeration, even in the publications of Scotland, we believe, from the intelligence, in which we place the greatest degree of reliance, from all quarters, as well as from our communications with farmers, graziers, sheep and cattle salesmen, and other country gentlemen, that no fault can possibly be found with the bulk and quality of the present year's general corn and pulse crops: but there exists both in the north of England, and the northern parts of Scotland, apprehension, that a considerable breadth of barley, oats, and beans will be much damaged, if not wholly lost, on account of their ripening having been seriously checked by a long succession of rains; but everywhere south of Yorkshire, and to some distance north in that great county, the harvest, with the exception of there being still a few breadths of oats, beans, and barley, lying and standing even in our most southern districts, the harvest has reached an auspicious conclusion.

The hop harvest, the humidity and density of the atmosphere considered, has, since its commencement, proceeded with much less interruption than could possibly have been anticipated, and will be so good as to greatly deceive the nervous duty-mongers, though a considerable portion of those which have reached the Borough have been out of condition, and consequently have produced but low prices.

The early wheat seeding, which has now become general, is proceeding in Essex, Kent, Sussex, Berkshire, Buckinghamshire, and, indeed, some parts of Norfolk and Suffolk, as well as in the whole of our western and midland districts, under favourable auspices, whilst "gentle showers glad the plowman's heart, and make the earth mellow, for the reception of the seed." There are, at this time, said to be, in several parts of Berkshire and Wiltshire, well stocked fields of newly sown healthy looking wheat plants, several inches high, so entirely concealing the surface of the soil as to resemble rich pasture herbage. The pastures, too, are still fresh and luxuriant, and the sheep and cattle depastured in them, with live farm stock, in general, healthy and doing well. The latter crop of both meadow and seed hay, as far as it has been hitherto harvested, is said to have been pretty generally good. The growing tares, rape, turnips, and potatoes, are so far improved as to promise a full average growth, and the fruit crop, both in gardens, fields, and orchards, is described as unusually good.

As relates to the prices of farm produce, those of both fat and store stock, including milch cows and store pigs, have been somewhat, but not very, drooping: of poultry and dairy produce, as also straw and new hops, somewhat on the advance: of wool, hay, and horses, about stationary.

The best sign we can perceive of approaching agricultural prosperity, is the unusually limited number of changes of tenantry that are about to take place at the closely approaching Michaelmas. A great majority of farmers, however, seem to be still dissatisfied with both the recent Parliamentary as well as the Central Committees, and likewise with the new Tithe Commutation Act, and its *Commissioners*.

It seems to have excited a great degree of astonishment in the agricultural community, that nothing

was said in any of the speeches at the Northamptonshire Agricultural Society of the death of the late Rev. Henry Berry, a celebrated breeder of what is supposed, by some, to be the improved short-horned breed of beasts: but this is in perfect harmony with the French phrase, which asserts, "Quand un homme est mort, on ne lui pense pas plus."

Here follows a retrospect of the supplies and prices of live stock exhibited in Smithfield and Islington Markets, since that published in our last month's report:

Supply of preceding month. }	1,696	15,725	65	10
------------------------------	-------	--------	----	----

The above statements show, in the supplies of Smithfield, an increase of 788 beasts, a decrease of 7,210 sheep and lambs, 38 calves, and 475 pigs; in those of Islington a decrease of 317 beasts, 2,684 sheep and lambs, and 36 calves, and an increase of 80 pigs.

About 6,960 of the beasts which have formed the supplies of the above markets, came from Lincolnshire, Leicestershire, Northamptonshire, and our other northern grazing counties, up the St. Alban's road; about 4,870 up the other northern roads; about 1,260 from our western and midland districts; about 920 from Norfolk, Suffolk, Essex, and Cambridgeshire; about 440, by sea, from Scotland; about 120 from Kent, Sussex, and Surrey; and most of the remainder, with about 45 lusty Towns-end cows, from the marshes, &c. in the neighbourhood of London.

PRICES.

	Aug. 26.		Sep. 23.	
	s. d.	s. d.	s. d.	s. d.
Inferior Beef . . . . .	2 2	to 2 6	.. 2 0	to 2 4
Middling, do. . . . .	2 2	to 3 4	.. 2 6	to 3 0
Prime, do. . . . .	3 10	to 4 4	.. 3 6	to 4 0
Inferior Mutton . . . . .	2 6	to 2 10	.. 2 4	to 2 6
Middling, do. . . . .	3 0	to 3 6	.. 2 8	to 3 0
Prime, ditto, . . . . .	4 0	to 4 8	.. 3 10	to 4 4
Lamb . . . . .	4 0	to 5 2	.. 3 8	to 4 4
Veal . . . . .	3 10	to 4 8	.. 3 8	to 4 6
Pork . . . . .	3 8	to 4 8	.. 3 6	to 4 4

It will be seen, by the above statement, that all kinds of meat have experienced, during the past month a considerable decline in prices.

The following is a comparison of the supplies and prices of fat stock sold in Smithfield on Monday, September 21, 1835, and Monday, September 19, 1836:—

At per 8lbs, sinking the offal.

	Sep. 21, 1835.		Sep. 19, 1836.

SUPPLIES.

Sep. 21, 1835. Sep. 19, 1836.

Beasts . . . . .	3,463	3,200
Sheep and lambs . . . . .	29,870	28,500
Calves . . . . .	250	270
Pigs . . . . .	450	380

By the above, it appears that the prices of beef were from 2d to 6d, of mutton 2d to 4d, of veal 6d to 10d, and of pork 4d to 6d per 8 lbs. dearer; of lamb 2d to 4d per 8 lbs. cheaper, on Monday, Sept. 19, 1836, than on Monday, Sep. 21, 1835: whilst there were 263 beasts, 1,300 sheep and lambs, and 70 pigs less, 20 calves more, in the market, on the former, than the latter market day.

A full moiety of the beasts has been both in Smithfield and Islington markets this month, as well as its predecessor, composed of short-horns; the remainder, of about equal numbers of Herefords, Devons, and Welch runts, with, comparatively, but very few Scots, Norfolk home-breds, with still fewer Irish beasts, but of a considerably increased number of fat and lusty cows, steers, and heifers of various breeds.

The sheep supply this month has consisted of about equal numbers of old and new Leicesters, South Downs, Kents, and Kentish half-breds, with about the last month's number of horned and polled Norfolks, old Lincolns, horned Somersets, and horned and polled Scotch and Welch sheep, &c.

The number of lambs throughout the month has been but limited, and they are now considered to be nearly, or quite, out of season.

But little slaughtered meat has reached London this month from Scotland and the north of England. The number of live sheep and lambs from the former quarter has only amounted to 730.

A very considerable number of the beasts has not been more than half fat, especially in Smithfield. The general quality of the sheep, lambs, calves, and porkers has been, in the whole, good.

The foliage of both fruit and forest trees, shrubs, hedge rows, &c., has been during the greater part of the month assuming its autumnal complexion, and slowly quitting, with great apparent reluctance, its spring and summer quarters.

NEW MODE OF RAISING POTATOES.—In a field on Mendip, near Oakhill, is a fine crop of potatoes surpassing in quality and size any seen in that neighbourhood, the produce not of seed potatoes, but of the sprouts which the country people of Somerset call chisms. These were taken off the potatoes, before sending them to market and planted, and the result proves that the poor man need not diminish his stock of food, but may use all his potatoes and yet have abundance of seed.—*Bath Journal.*

## AGRICULTURAL INTELLIGENCE, FAIRS, &amp;c.

**WEST AUCKLAND MARKET, DURHAM.**—At the opening of this market, on Saturday, the 17th inst., under great disadvantages from the incessant heavy rain which fell nearly the whole of the day, the supply of grain was considerable, far exceeding any of the neighbouring markets, and beyond the expectation of the most sanguine, which at once stamps the situation of West Auckland as the most favourable in the district for a Saturday's corn market. The exact quantity of each description of grain could not be correctly ascertained, owing to the inclemency of the weather, and the omission of a proper arrangement, too generally the case at the commencement of any new undertaking. So far as it could be ascertained, we believe, there were between 500 and 600 bushels of old wheat, (no new) which sold from 7s 1½d to 7s 9d per bushel. 300 to 400 bushels of Oats were readily bought up by the Colliery agents and millers; new, 3s 3d per bushel; old, 3s 6d to 3s 9d. A small quantity of Chevalier Barley sold at 4s 3d per bushel. Had the weather been such as to have brought the farmers to have brought their new wheat to market, the millers (a numerous attendance from all parts) were prepared, and would have purchased very extensively.

**LEWES SHEEP FAIR.**—There were about 36,000 sheep and lambs penned, and there was a numerous attendance of buyers, especially from distant counties. The high prices demanded by the flock-masters in the early part of the day, caused the business to be extremely dull, and no great number of sales were effected; in the after part of the fair there was somewhat more briskness, when many of the sellers we understand, submitted to a diminution in price.—Upon the whole, however, considerable numbers were driven home unsold. The average prices may be quoted for ewes, 25s to 37s, and lambs 17s to 25s per head. A prime lot of sheep belonging to Messrs. Thomas and Charles Groome, of Lion's Farm, near Worthing, were greatly admired, and were sold, the ewes for 40s and the yearling ewes, at 33s per head.

**BARNSTAPLE FAIR.**—The number of cattle was greater than on any similar occasion for several years past; and those of good quality met a ready sale at remunerating prices, but the poorer sorts were at a discount. A more than ordinary proportion of the beasts driven to the fair, changed owners. There was a paucity in number of superior oxen. Fat cattle (of which the supply was also scanty) averaged from about 8s 6d to 9s per score; good three-year old steers from 12l to 12l each; dairy cows and calves at about 12l; and store cattle about 5s per score. The horse fair was abundantly supplied; of really valuable saddle-horses there were but few, but of cart-horses and colts there was a great quantity, and of good quality, whilst of common hacks and farm horses the number was almost incalculable; there appeared to be a good deal of business transacting, but we are informed the prices were very low, excepting for a few choice articles.

**WORCESTER GREAT FAIR.**—The supply of cattle was numerous, but of rather an inferior quality. The supply of sheep, in consequence of the shortness of keep, was large, being estimated at about 5,000; but taken generally they were not of a superior kind. Beef sold at 5½d to 6½d per lb; mutton 5d to 6d. The quantity of cheese pitched was small, and met a dull sale at high prices; best 65s to 76s; seconds, 45s to 55s; family, 34s to 40s.

**BRIDGNORTH FAIR** was very thickly supplied with live stock, except store sheep which were in great plenty, but with few purchasers; prime fat small sheep sold on the average at 6d per lb. Prime fat cows averaged 6d per lb; cows with calves sold well; there were but few buyers for store beasts. Good hack and wagon horses sold at high prices.

**ABINGDON FAIR** was supplied with about the customary number of horses, which went off with the usual

grumbling, both of the buyers and the sellers; the former complaining that too much money was asked, and the latter that trade was *mortal* bad. This is not much of a cow fair, but there were more cattle for sale than usual. Sheep were more abundant than ever known. The usual pens were taken a fortnight previously, and many were not brought into the town at all, from want of room. There were very few of the large dealers present, and not more than half the things were sold.

**BUXTON FAIR** was well attended and presented a show of cattle, horses, and sheep, superior to most of its predecessors. A considerable business was transacted at better prices than were asked at the last fair.

**ASHBORNE CHEESE FAIR.**—There was a very great quantity of cheese, and all sold. Prices from 55s to 65s per cwt; the average, from 60s to 63s.

**ARLECDON FAIR.**—The show was extremely meagre. There was no demand for lean stock, the usual purchasers of cattle of this description scarcely ever asking the price. Milk cows were in request, but there were very few in the fair; which altogether was a very poor one, whether with regard to the number of beasts shown, the dealers in attendance, or the business transacted.

**GREAT SALE OF CATTLE.**—On Friday se'night the Earl of Selkirk's drove of St. Faith's cattle, pursuant to advertisement, was exposed to public sale on the lands of How-well and Milton-Parks, near Kirkcudbright. As it is the largest annual sale in Galloway, a great number of highly respectable cattle dealers, graziers, farmers, and fleshers attended on the occasion, and the prices realized considerably exceeded the expectations that were previously formed. The best lot brought 17l; the second best, 16l; the lowest, 9l 9s; and the average price of the whole was 13l 6s per head. The cattle were in excellent condition; there was a very keen rivalry; and unless there is a material prospective improvement in the English markets since Barnet fair, the most experienced judges that were present at this sale are of opinion that the purchasers may think themselves fortunate if they realise the cost price, including the unavoidable expenses of driving and selling. It is worthy of remark that none of the fleshers were buyers, believing that they could not have been so with any reasonable prospect of advantage.

At Mr. John Ellman's annual sale of ewes, and letting and sale of rams, which took place at Glynede, on Tuesday last, there was a numerous and highly respectable attendance of buyers, and we understand that the average price at which the ewes were sold, may be quoted at 46s per head. For the premium (a silver tankard) offered by Mr. Ellman, for the best Ram Lamb there were eight lambs exhibited, and it appeared quite certain that the competition was between those shown by his Grace the Duke of Richmond, and Mr. John Putland, of Firlie. After a very long discussion between the Judges, on the merits of the two lambs, the prize was eventually awarded to his Grace.

At the Sheep Fair on Woodbury Hill, the sale was dull, in consequence of a scarcity of feed. A small proportion only of first-rate ewes was penned. Down ewes fetched from 19s to 27s; Lambs from 14s to 21s. Good fleshy wethers were in request, and sold tolerably well, maintaining the late prices; but it was altogether a dull trade. The wool business was flat, and prices showed rather a tendency to decline, owing to the great influx of foreign wool, the importation of the present year up to this time having exceeded that up to the same period last year by about 12,000,000 lbs. The average price at the fair was about 5 per cent. less than that at the Dorchester August Fair, the reduction being from 20d to 19d per lb. Many horses were offered for sale, chiefly of the cart kind, and very few found purchasers.

A new Sheep and Pig Fair has been established at

KINGTON, Herefordshire, held the day preceding the usual cattle fair. This alteration is considered as a great improvement, as considerable inconvenience was experienced from having all the fairs held on one day. The new fair was held for the first time on Saturday, Sept. 17. There were upwards of 3,000 sheep penned, consisting of Leicesters, Southdowns, and a large proportion of hill sheep. Good fat wethers averaged from 5½ to 6d per lb. Ewes for store, from the scarcity of keep, met with a dull sale. Other descriptions were disposed of at rather reduced prices. The depression may be accounted for owing to the unprecedented quantity of stock, and to there being but few dealers in attendance, who probably were not aware of the alteration which has taken place, or were deterred from attending in consequence of Sunday intervening. On Monday the cattle fair was held. There was a large supply of cattle, consisting chiefly of the Herefordshire breed, but the prices they fetched were lower than was expected.

**BACKWELL FAIR.**—There were but few fat beasts to be seen; the best steer and heifer beef fetched from 48s to 50s per cwt. There were a great many sucking colts, some of the best of which sold at prices varying from 8l to 11l each.

**THE MENZION SHOW AND SALE.**—The Menzion Show and Sale of Cheviot Tups belonging to Messrs. Aitchison, the celebrated breeders of that kind of stock, took place at Menzion in Tweedsmuir, on the 8th of September, when a splendid lot of 130 of their famed sheep were exhibited, a part of which were generally admitted by good judges to be of the first-rate description; indeed it was affirmed that several of the tups could not be surpassed by any, in either the South of Scotland or North of England. This will be pretty well proved by the prices given for them. There was a very respectable and numerous attendance, and the public sale went off in the most spirited manner. One-year-old sheep sold at from 2l 10s to 3l 17s, two-year olds, 3l 3s to 4l 14s, and some even higher. A considerable number of the three-year olds brought from 7l to 9l 15s, while four-year-olds went as high as 13l 10s, and second tup lambs fetched 4½s. After the sale, Messrs. Aitchison entertained a party of seventy gentlemen to a substantial dinner, and the afternoon was spent with the utmost conviviality.

The supply of sheep at Wherwell Fair far exceeded the demand, notwithstanding there was a numerous attendance of dealers. The few sales effected were at a reduction of 2s per head on the prices of Wilton Fair. The number of sheep penned exceeded those of the last ten years.

**SALE OF CHOICE STOCK.**—On Wednesday week, the park and grounds adjoining to Harley Hall, near Northallerton, the seat of John Charles Maynard, Esq. were thronged with gentlemen breeders and graziers, from most parts of England, Wales, &c. and also some foreigners, to witness the sale of prime stock belonging to that gentleman. The buyers were numerous and bid with great spirit. The result of that day's sale was, 24 cows sold for 1,099 guineas; 15 two-year old heifers, 577 gs.; 9 one-year do., 275 gs.; 6 heifer calves, 136 gs.; 5 bulls, 320 gs.; 8 bull calves, 403 gs.

**READING MICHAELMAS CHEESE FAIR** was very well attended, and nearly 700 tons of cheese were pitched in the Forbury, which owing to the smallness of the made in generality of the dairies this season, was considered a large quantity. Great doubts were at first entertained as to there being so much and we believe we can assert from authority, that there was about 100 tons less pitched this year than on the previous one. The value of the cheese alone, therefore, computing it at an average of 70l per ton, and supposing there to be only 600 tons, would amount to 42,000l. Best thick cheese from 60s to 70s; a few of the best dairies realized 72s; best North Wilts or loaf cheese from 75s to 80s; best thin from 60s to 65s. The sale being brisk, the prices on the whole were 2s per cwt higher on the second day than on the first, and nearly all the good cheese appeared to be cleared off before the conclusion of the fair.—The Cattle Market, for horses and horned cattle was considerable, but inferior

in quality, and met with a very dull sale. Several good horses were, however, disposed of at the "Shew" on the Tuesday. There was one fine drove of Herefordshire oxen which was disposed of at an early hour.

**EGREMONT CRAB FAIR.**—The show of cattle was limited, and the number of buyers also small. Good animals brought high prices, but very few sales were effected.

**NORTHAMPTON CHEESE FAIR** was rather thinly supplied with cheese—a consequence of the want of grass. What was brought was cleared off more rapidly than in any year within our remembrance. Some prime dairies fetched 72s. This fair is also celebrated for store ewes, of which there was a more than usual number: the greater part were sold, but from the want of grass, at low prices. There was a very large show of very fine tups, and considering the times the tuppeters had no great reason to find fault with the prices at which they were let. A large number of ordinary store cattle, of which a good number were sold, but the sellers complained heavily of the price. There was a great deal of cow beef, which bore evident testimony to the shortness of grass, so that the trade was very dull. Of mutton a great quantity, and the prices were the same as they have been of late.

The following has been recommended as a cheap and effectual expedient to prevent rats and mice from getting into corn ricks:—The rick should be built nearly perpendicular, and cut round about two feet high from the ground, slanting from the top towards the bottom about eighteen inches. The part that is cut is plastered over with mortar made of clay, or any other substance that will stick to the ends of the straw, leaving a rim at the top, of about two inches. The whole is then white washed. This plan is adopted by many farmers in Norfolk, and those who practice it, never have their corn injured by rats or mice.—*York Herald.*

**PRODIGIOUS CROP OF CHEVALIER BARLEY.**—Our readers are already well aware of the highly productive nature of this sort of barley, but we believe few, if any of them, could have anticipated such an extraordinary return as that which we are about to record, and which has just taken place in this immediate neighbourhood. On the 21st of March last, a small field, consisting of about three acres and a half, on the estate of Roselle, was sown with only five bushels of seed, which is understood to be much less than the supply calculated to insure a full crop, but the reason for giving such a small quantity was to secure a full crop of grass after the barley. This choice field is now nearly all ripe—the half of it was cut down yesterday (five months and fifteen days after being sown,) and is of excellent quality. A quantity of it has been left at this office, where any person may see it, and it will afterwards be placed in the agricultural and horticultural museum now forming. From one pickle of seed rises twenty-one straws, and from another the extraordinary number of thirty-five! We find the number of pickles on each head to be about twenty-eight or thirty—which gives the large return of nearly sixteen hundred pickles from the parent stem. Some of the heads from the under part to the top of the awns measure ten inches in length; the average length of the straw over the whole field is four feet and nine inches; and it is computed that the return of the grain will be at the rate of seven and a half or eight bolls per acre. But of this we will speak when the exact quantity has been ascertained by measurement.—Should the Chevalier turn out as well on all the breadths on which it is sown in this and other counties, the farmers may well join with Burns in boasting that—

"We'll mak' our maut, we'll brew our drink,  
We'll dance, we'll sing, and rejoice man," &c.

We may add, that this extraordinary crop was sown after potatoes, mangel wurzel, and carrot.—*Ayr Observer.*

## REVIEW OF THE CORN TRADE

DURING THE MONTH OF SEPTEMBER.

The fine weather which favoured agricultural proceedings during August, has the past month been succeeded by rain and cold, and the temperature morning and evening approaching the freezing point; indeed one or two nights, thin coatings of ice were even formed on stagnant waters. Though the bulk of the wheat crop had been secured in those counties principally dedicated to its cultivation, before the atmospherical change took place, yet in the more northern counties of England, as well as throughout Scotland and Ireland, the harvest has been materially impeded, and the result rendered more precarious at this advanced period of the season. About the middle of the month however, dry warm weather again appeared in Ireland, and Scotland, and the north of England, and the farmers exerting themselves to the utmost during the sunshine, were enabled to make rapid progress in housing their corn. Towards the close the weather became again unsettled, and though the quantity of wheat now outstanding is not to any material extent, yet the bulk of the barley and oats, are still subjected to all the vicissitudes of our climate. Many complaints have been made at the markets in different parts of the kingdom, that the farmers have not only been induced prematurely to cut their wheat, but have not allowed it to arrive at maturity in the sheaf, having carted it immediately, fearful of trusting the weather, and many samples therefore are coarse, tender and ill-conditioned, and the quality it is to be feared in instances irredeemably deteriorated, by so hasty and injudicious a proceeding. Accounts seem to concur in representing the yield for the bulk of straw, superior to last year, the ears being generally thickly set and well filled; but the growth is less, and the plant much thinner on the ground; and though the aggregate yield may approach a low average of former years, previous to the three last seasons, yet as compared with the produce of 1833-34-35 it is decidedly deficient, with a much greater prevalence to smut, roughness in the sample, and thickness in the skin. With the exception of Suffolk, where the farmers have been more fortunate than their neighbours in securing the barley, the bulk of this grain has had to endure all the changes of the weather, experienced during the past month, and the sample therefore is deteriorated in quality, and in many instances, being coarse, stained, and sprouted; and a greater disparity will exist in the quality than has been witnessed for several seasons. The growth is estimated at an average, and an extended breadth cultivated.

In Scotland the general backwardness of the season, and the check agricultural proceedings have sustained from the weather, has rendered

the result of the harvest extremely doubtful, especially in the more northern districts, where the grain has in places not yet ripened. Wheat is below an average produce, and inferior in quality, and the breadth of land sown much less than last season, though the stock of old wheat remaining on hand is still large. Barley is the best grain crop of the season, and an average in quantity and quality. Oats vary according to situation, and time of sowing, but on the whole are likely to turn out a moderate average.

In Ireland, the grains of most of the new samples of wheat, have been well filled and plump, but owing to the very continued rains, are soft and out of condition, and the crop generally will require kiln-drying. The produce will be below an average even for the quantity of land sown, which is considerably diminished from last year; though the consumption of the article is rapidly on the increase throughout the kingdom; yet on the other hand, many merchants, as well as farmers, are holders of old wheat, and are only wanting an advance in price to induce them to quit their stocks. Barley, the cultivation of which has been much extended, will, with the exception of the late sown, prove pretty equal, both in point of quality and quantity to the average of past years. The extent of ground sown with oats is equal, if not greater than former years, but the produce varies much in different districts; the early sown oats on dry and stiff soils had suffered much from the severe drought in May and June, and consequently will not yield a large produce. In the inland and hilly districts where sowing has not commenced so early, the crop in general is luxuriant, but much is still green, and at this late period the harvest must be hazardous. Potatoes in many places have partially failed, but not to such an extent as materially to affect the aggregate crop of the country.

The clemency of the weather at such a critical period of the season, had a material effect on the minds of the holders of old wheat, and at all the leading markets, prices advanced during the early part of September 4s to 5s per pr, and fine dry new samples 2s to 3s; as however, the weather improved, and the reports from the north of England, Ireland, and Scotland, came more favourable, millers bought but sparingly, and farmers and factors were obliged to submit to lower rates, leaving the currencies at the close of the month 1s to 2s higher, than at the termination of August.

The unfavourable accounts previously received from the United States of America, as to the failure of the wheat crop having been corroborated, and the high prices of wheat in the more southern departments of France, owing to the failure of the

crops, has caused bonded wheat to continue in request, and holders have demanded rather higher rates, but the extent of business has not at all been commensurate to the orders transmitted from America, or the shipments made from England; as, in the first place, the orders have been generally only received here in transit, having been forwarded to the Baltic, Elbe, &c., for shipment, and in the other, most of the exports have been made on owners' account. About 6,000 qrs have been reported for export to New York; 3,900 qrs to Boston, and a few hundred qrs to Baltimore, besides some shipments to New South Wales, Madeira, and the Mauritius. Danzig wheat has obtained 34s to 36s; Lower Baltic red, 30s to 32s. Archangel and Peterburg, 20s to 25s; and for fine 26s has been refused.

The prices of town-made flour have not participated in the fluctuations of wheat, but ships' qualities have advanced fully 2s per sack; but towards the close of the month, again receded 6d to 1s. Bonded flour has been much in request for shipment to the West Indies, Mauritius, &c., as the failure in the crops of wheat in the United States has rendered those ports which have been accustomed to be supplied with flour from America, dependent on the European markets for part of their future supplies; all the fresh arrivals of flour from Hamburg and the Baltic have found ready purchasers at improving rates, Danzig and Hamburg qualities bring worth 23s to 24s per barrel; and several thousand cwts have been shipped from London during the past month.

The alteration in the duties consist of an advance of 1s per qr on wheat; 3s on rye; and 5s 9d on peas; while on beans the duty has declined 1s 6d per qr.

The receipts of barley have been limited, and in the early part of the month, the demand being confined to grinding and distilling qualities, prices sustained no alteration. On the appearance of a few new malting samples, more animation pervaded the trade, but great disparity being found in the quality, Maltsters only selected the best descriptions at 37s to 38s. As the parcels offering improved, and the accounts were more unfavourable for the outstanding crops, fine Chevalier advanced in value, and 40s to 42s and 44s was realised; an extra prime parcel being reported to have fetched 45s and even 46s; but towards the end of September, the new samples increased in quantity, and though several continued to come to hand, coarse and discoloured, yet many of the Suffolk parcels were fine, prices in consequence receded 1s to 2s per qr for fine descriptions, and 2s to 3s for secondary and inferior malting, and 1s to 2s for distilling and grinding sorts. Old foreign barley in bond has obtained 20s per qr.

Fine tender old malt has met an animated demand owing to the inferior quality of the new barley for malting; and prices have advanced 5s

to 6s per qr; the currencies remaining firm at this improvement.

The supply of oats has been rather liberal for the season of the year, though less than the previous month, both from England and Ireland; but larger from Scotland. The demand at the beginning of the month was languid, and prices receded 6d to 1s per qr; but the protracted state of the harvest in Ireland and Scotland communicated more firmness to the trade; and as the arrivals were not large, a gradual advance has taken place on the article, English qualities being 1s 6d to 2s 6d per qr dearer than at the close of August; Scotch and Irish, 2s to 3s per qr; good Irish white 40 lbs oats being worth 25s to 26s, and fine Scotch potatoe noted at 30s to 31s, and even 32s. A great many new Limerick oats have been sold at 11s 3d to 11s 6d per barrel, for delivery free on board, in October, November, and December; and the general contract price, free on board, in Ireland, has been 11s 3d, 11s 6d, to 11s 9d per barrel. A few foreign oats have weekly paid the prevailing duty of 18s 10d per qr, and several small shipments of the bonded article have been made to the West Indies and the Mauritius, &c. Russian oats, free, are worth 24s, and good fresh foreign feed, 25s to 26s, and in bond, 14s to 15s.

Old beans as well as peas of all descriptions have sustained a material improvement in value, the former article having advanced fully 4s per qr, and white peas 6s to 7s, grey and maple 5s; the trade for both beans and peas ruling firm at the advance. New beans come to hand spotted and out of condition, and have not participated in the advance of old, unless extremely dry.

During the month of September the following quantities of Grain and Flour have arrived in the Port of London.

At Montreal prices of wheat remain steady at 5s 7½d to 5s 9d per 60lbs for Upper Canada quality, and as the report of the crops of wheat in Lower Canada are far from favourable, prices are not expected to recede; it appears the ears of wheat have been much injured by the fly, as well as the drought experienced during the spring, which has also checked the growth of summer grain. At Quebec the agricultural report commences, by stating, that for the last sixteen seasons the writer had never en-

tained such unfavourable forebodings as at present; these remarks however, more especially apply towards summer grain, wheat being the best of the grain crops, and on all low lands will be probably an average return. Flour was firm at 30s to 31s 6d, and superfine was enquired after at 32s to 32s 6d, and several purchases of fine appeared for forward delivery, 30s being refused for delivery on the 1st of October. Much of the flour from Upper Canada arrives out of condition; the accounts however, from Upper Canada are of a more favourable tendency; from Kingston the statement is made, that in that district, the wheat crop is generally very good, and "on the whole never better"; the other crops are represented as moderate, except Indian Corn, which is a general failure. From St. John, New Brunswick, we learn that the prospects of the farmers had much improved, and good average crops were anticipated. From St. Andrews it is reported vegetation was making rapid progress, and the crops had assumed a promising appearance.

At Hobart Town, Van Diemen's Land, prices had rather given way, owing to the reported large shipments which were being made to Sydney from Launceston, the Indies, England, &c., and wheat was noted at 6s 6d to 8s 6d per bushel. At Launceston the same causes had operated on the currencies, but the last advices from Sydney bringing the quotations still at 11s to 12s 6d, holders were enabled to realize 9s to 10s per bushel.

At Sydney, New South Wales, prices were noted at 9s to 12s 6d. A sale of about 1,000 qrs of wheat received from the East Indies, had been made, but as the quality was inferior, and not weighing, on an average, more than 56lbs per bushel, the prices realized were comparatively much lower, not exceeding 5s 10d to 7s per bushel. Indian corn maintained high rates, selling at 7s to 8s 6d per bushel.

The wheat harvest in France, may now be considered as terminated, but as thrashing has not yet become general, a decided opinion cannot be formed as to the actual deficiency of the crop; that it is inferior to the produce of the last season, not a doubt exists, and particularly in the more southern departments; the previous harvest was, however, superabundant, and the yield in many districts is expected to be one-fourth to one-third less, with an inferiority of quality; in some parts it is almost equal to the last season's growth, and in a few the farmer calculated of obtaining from the straw fully as much grain as he thrashed out in 1835, which will perhaps make an aggregate quantity, barely equivalent to a low average yield. Smut prevails to some extent, and even where liming the seed has been had recourse to. The barley harvest is fast drawing to a conclusion, and appears on the whole, to be deteriorated in quantity and quality by the continuance of the drought; oats from the same cause are also a deficient produce, and in Normandy and Picardy are also much endangered at present by being exposed to the rain.

Prices are firm, with a tendency to advance, particularly for the finer descriptions of new wheat, as the excellent condition of the grain renders it almost immediately fit for the millers' purposes, and the general quality of the old wheat remaining on hand is inferior, and much of it out of condition. The crop of wheat in the circle round Paris, from whence the metropolis draws the bulk of its supply, appears to have been more favoured than most other districts, and therefore the city will possess the greatest facility of being well provided with the staple commodity of life. At Bordeaux, Marseille, and neighbouring markets, prices of wheat are ranging

high, owing to the deficiency of the crops, and several parcels of foreign corn have been already received, which have been made free at Cherbourg, Brest, or other ports in that class; and the unequal operation of the French Corn Laws has given considerable dissatisfaction to the agriculturists, who seem determined to petition government either for the equitable administration of the existing code, by not allowing the cargo of wheat which has paid duty at any certain port to be re-exported, or the law in this particular to be repealed.

The crops in several of the Italian States turn out less productive than was expected; some below an average, and in others where superabundance was calculated upon, the yield on thrashing is little more than a full average; these facts are operating on the currencies, combined with the reports of the falling off in the produce in the South of France; in addition to which the accounts from Naples, received from Genoa, state that in Piedmont and Lombardy the crops had proved deficient; Barletta wheat in consequence was not to be shipped under 28s to 30s, and at Ancona the inequality of the harvest in many parts of Italy, and a demand having been experienced from Venice, had caused prices to range at 26s 6d per qr.

At St. Petersburg sales of Linseed deliverable in loco, and of the best quality, had been made at 44s per qr; inferior, for future delivery, 37s 6d. At Riga, small parcels of Wheat were finding occasional purchasers, at 27s 3d to 30s 6d. Barley, of about 48lbs, at 17s, and Oats, at 11s 10d to 12s 4d. Rye was realising 20s 6d; Crushing Linseed, of middling quality, was to be had at 40s 10d per qr; and Hempseed at 26s 5d, but the stocks of both reduced to a few thousand barrels; the crop of Sowing Linseed promised an abundant return, but as the harvest will be late, both quantity and quality will be likely rendered more liable to injury from the weather; if well secured, prices are expected to range moderately low, say equal to 46s 6d per qr.

At Konigsberg the trade was firm, in consequence of the advance in the London currencies, and though few additional orders had been received, yet those transmitted to Danzig for American account, and the different vessels which had been chartered at Copenhagen with a freight of 10s per quarter to New York, had communicated a fresh impetus to speculators, and if purchases had to be made, it was expected an advance of 10 to 15 florins per last would be demanded. New wheat was of fair quality, and average in quantity.

At Danzig the demand for wheat had rather improved, and those holders willing to quit, readily found speculative purchasers at the current rates, prices of fine mixed qualities varying from 25s to 26s 9d, according to colour and weight. About 1,000 qrs of Rye had been bought for shipment to America at 14s 6d per qr. High mixed was noted at 27s to 30s. White wheat, 30s to 35s. Flour of first quality, 19s, but none offering.

At the Mecklenberg ports purchases were being made for shipment to America, and the finer wheats were held at 27s to 28s per qr. The wheat crop is estimated below an average produce, and Barley will be only a moderate crop. At Rostock the farmers report the quality of the wheat as very fine, though the few samples which had appeared at market did not fully bear out their statements.

At Hamburg several parcels of wheat had been purchased for America, and prices were firm. Some new Marks had been received, and the quality and condition better than anticipated, and realised 30s to 30s 6d for the consumption. Rapeseed was dull at

31l to 31l 5s, and upwards of 10,000 qrs offering. At Rotterdam the wheat trade had been rendered very animated, owing to extensive orders for shipment to America; white Zealand wheat was selling at 29s 6d to 32s, weighing 60 to 61 lbs; red Rhine of 62 to 63 lbs, at 30s to 31s per qr, in bond. As the shipments of barley from the Baltic, as well as Riga had been limited, and the consumption of the distillery considerable, prices were expected to range high during the winter. The stock of Rape Oil having proved larger than calculated upon, Rapeseed, instead of advancing, had rather receded in value, and was selling at 34l to 35l per last. New Linseed was held at 54s to 56s. White cloverseed was good in quality, and sold at 40s to 45s. The red seed crop was favorably reported.

The advices from the United States of America continue to preserve an unfavorable tendency as regards the failure in the wheat crop, with the exception of the district of Illinois, Michigan, and greatest part of Ohio. At New York, new North Carolina wheat had arrived, the quality fair, and which realised 59s 7d, though it had been previously stated that 2 dollars, or about 73s 4d had been refused; one or two parcels of foreign had been sold at 60s 6d, and the market quite bare. Rye was in request at higher prices, foreign obtaining 36s 8d and 41s 3d. Flour had improved, and Western Canal was worth 36s; part of the crops in Ohio are represented as likely to yield one-third to one-fourth less than last season. From Niagara the accounts state that Wheat has proved short of a middling average. At Baltimore, the crops are stated not merely as being short of an average, but an actual failure, and where the expectations of the agriculturist had induced him to hope a favourable return for his labour, he has not reaped more than one-third or one-fourth of his anticipated produce, in addition to which the quality is represented as being much inferior to an average of former years, which is exemplified in prices varying from 45s 10d to 64s 6d per qr. New Rye was selling at 36s 8d to 41s 3d. New Oats were obtaining 11s 8d to 12s 10d, the crop of the latter article being generally favourably reported. Howard-Street Flour was selling at 36s to 37s 1d, and City Mills and Susquehanna qualities were realising as high as the latter price. At Philadelphia, the failure in the crop in various sections, are referred to as exceeding the previously formed anticipations, which it must be remarked, depend so mainly on the bias of the individual who has formed them, that little is to be elicited from the statement. Wheat, bonded, was worth 58s to 67s. Flour was obtaining 36s per barrel. Rye had proved very deficient, and would not, it was feared, in districts, pay for thrashing, and was noted at 40s 4d to 41s 10d per qr. From Petersburg, Alexandria, Cincinnati, &c., the reports of the crops partially varied, but, on the whole, were little less unfavourable.

**WOOL MARKETS.**  
**BRITISH.**

*No alteration in the currencies since our last.*

**WAKEFIELD WOOL MARKET, Sept. 23.**—There is no quotable difference in the value of either long or short wool this week, but the quantity of business done is rather below an average, and there is an absence of that briskness which characterised the wool trade a few weeks back. Probably the feverish state of the money market occasions consumers to act more cautiously, as we yet hear of no one reducing his consumption.

**CHELMSFORD WOOL FAIR.**—At a meeting of the Committee of the Chelmsford Agricultural Society, on Friday, on reading the several certificates delivered by the wool buyers of the 21st of June, it was unanimously resolved,—“That Messrs. William and Thomas Johns were duly entitled to the Cup given at the Wool Fair, they having purchased 196 packs, 1 dft 71 lb.” The return made by Messrs. Legg, was 135 packs, 0 qrs 39 lbs. From the best information the Committee could obtain, the amount sold on the same day was at least 9,000*l*. This quantity, we understand, was absolutely sold on the day of the Fair, exclusive of all sales made previously and subsequently.

**LIVERPOOL.**

**WEEK ENDING SEPTEMBER 26.**

**ENGLISH WOOLS.**—Prices here are nominal in price, and partake of the general depression of the market. Combing fleeces, 20d to 21d; Down ewes and wethers, 20d to 21d; ditto tegs, 22½d to 24d; super. skin, 19d to 20d; head ditto, 17d to 18d.

**SCOTCH WOOL.**—We have a large attendance of buyers at the sale of Foreign and Colonial Wools this week, but have not heard of many operations in Scotch Wool. A few transactions in Cheviot and Laid Highland at old rates are all that have come to our knowledge. The recent large purchases by consumers, joined to the present state of the money market, will we expect produce quietude in this market for a few weeks. We do not anticipate any ultimate decline in price.

	per stone of 24 lbs.			
Laid Highland Wool, from 12s 6d to 13s 6d	12s 6d	13s 6d

Washed do. do. ....	26s 0d	28s 0d		
White do. do. ....	32s 0d	36s 0d		
Import for the week .....	1262 bags.			
Previously this year .....	13937 do.			

**IRISH WOOL** has been in limited request. To make sales some reduction has in every instance been submitted to. The imports for the week amount to 68 bags. Irish fleeces, mixed lots, per lb. 17½d to 18½d; ditto wethers, 17d to 17½d; ditto hogs, 19d to 20d; ditto combing skin, 16d to 17d; ditto short skin, 14½d to 16½d. Import for the week, 67 bags; previously this year, 4,865.

**FOREIGN WOOLS.**—Several large lots of Australian and other wools were brought to the hammer to-day and yesterday, pursuant to advertisement. The attendance of country dealers yesterday was very large, although to-day it was much decreased. About 1,700 bags were sold yesterday, at the average prices of the last London sale, but from 2d to 3d per lb. below the prices obtained here by auction last month. In consequence of this change several holders withdrew their lots, and others would have followed the example if they had not previously advertised. Odessa, fine, 2s to 3s 6d; Portugal R., 1s 6d to 1s 7d, ditto, low marks, 1s 0½d to 1s 2½d; Spanish R, 2s 6d to 2s 9d; F S, 2s 2d to 2s 4d; German fleeces, 2s 2d to 2s 6d; assorted, 2s 6d to 2s 9d; lambs, 2s 6d to 3s 6d; New South Wales, 2s 4d to 3s; Russian wool, 8½d to 9½d; Buenos Ayres, 4d to 5½d; Mogadore and Barbary, 4½d to 6d;

washed Peruvian, 14d to 16d. Import for the week, 1,328 bags; previously this year, 32,027 bags.

**FOREIGN.**

SEPT. 26.

About 1,250 packages of German, Russian, Italian, and Turkish wools have formed the London supply, since this day's night. No public sales are appointed; and private contract trade is steady, at our last quoted prices.

**BONES.**

Since our last there have passed the SOUND or ELSINORE, the GREAT BELT, and the HOLSTEIN CANAL, ships loaded with Bones, bound for Hull, 3; Berwick, 3; Macduff, 1; Leith, 1; Arbroath, 1; St. Andrew, 1; other parts of England, 4.

**REVIEW OF THE HOP TRADE.**

SEPTEMBER 25.

About the middle of this month the new Hops began to reach the market: the first lots proved very inferior, it being the invariable practice, with the growers, to pick the mouldy and diseased Hops as early as they can; these have mostly been sold at low prices. Up to the present time we have received about 11,000 Pockets, some of good quality, but generally speaking low in colour, though quite equal to what could have been expected for the unfavourable season, the wind and constant wet having seriously injured the growth; and to this we have to add a great increase of blight—the fly and lice are found in great quantities in the body of the Hop, feeding on and impoverishing the article. The Hopping is fast drawing to a close, in fact many have already finished: the pickers have got over the ground rapidly, occasioned by the Hops coming so far short of the expectation when they commenced. The estimated Duty still falling, it is now quoted at 175*m*. on the market, but in the different districts at 160*m*.; prices vary much according to quality: the article is in great demand for consumption as well as speculation, many believing the growth will prove deficient of the quantity required for consumption even when you add the overplus produced last season:—

**WORCESTER.**—The supply of hops at our annual fair on Monday was not so numerous as on former occasions, which may be attributed to the lateness of the season. There were between 700 and 800 pockets in the fair, of which were sold 587 new, and 17 old. Prices from 4*l* 10s to 5*l* 15s, according to quality, which was, generally speaking, middling. On the previous market day little business was done; about 184 pockets were in the market, and new 18, old 3, sold. It is the opinion of many that our duty is much over rated, and that it will not exceed last year's, viz, 15,751*l*.

## TURF INTELLIGENCE.

Such of the readers of this publication as have been in the habit of perusing our ex-cogitations, are aware that, on the approach of the Doncaster Races for 1835, we foretold the success of Queen of Trumps in a manner more positive than many of our friends deemed consistent. The cunning priests of Delphi, and the soothsayers of old, aware of the danger of specific or absolute prognostication, took great care to render their oracular conjectures so equivocal, that, come what might, the interpretation of the specious augury was sufficiently flexible so as to appear applicable to the event. If, however, in our surmise of last year, to which we have above alluded, we unhesitatingly ventured to pronounce the triumph of the Cambrian Queen as certain, our prophetic reputation was placed in little danger; since, with a knowledge of the powers of this extraordinary filly, and a tolerably accurate estimate of her competitors, scarcely a doubt could be entertained as to the result, particularly as we knew her to be in the hands of a gentleman (Mr. Mostyn) whose honourable integrity raised him far above suspicion. Thus presciently successful, we have, for some previous weeks, given our opinion of the prominent candidates for the St. Leger, which came off on the 20th inst. at Doncaster, and predicted the success of Elis; but not in that unqualified manner in which we last year expressed our pre-conviction of Queen of Trumps: nor was this possible; because the approach of Elis to the Doncaster St. Leger was indirect, devious, uncertain, and suspicious.

On the next assemblage of the metropolitan book men, after the conclusion of Egham Races, that proposal was made by the agents of Lord Lichfield, (1,200*l.* at 10 to 1 against Elis), which, however extraordinary it might appear, was agreed to, and under such conditions Elis was sent to Doncaster; as we already observed.

If therefore we calmly consider the progress of Elis up to the bargain in question, we must arrive at the conclusion that he was an extraordinary animal, but that his chance of winning the St. Leger was much reduced, owing to his previous exertions, so unusual on all similar occasions. Consequently, in speaking prospectively of the success of Elis, however high our opinion might be of his racing capabilities, we did not lose sight of the injury likely to result from such extraordinary previous exertions, particularly on a three-year-old. Yet, on the other hand, when we duly considered his struggle with Bay Middleton, and the manner in which he had performed the various engagements to which he had been subjected, and that there was good reason to believe he had sustained no injury from the succession of struggles already noticed; we hesitated not to pronounce him

prospectively the victor, for the then ensuing St. Leger, with, however, that degree of qualification which, under the circumstances already detailed, appeared indispensably requisite.

As a tabular list of Doncaster Races accompanies these preliminary observations, it will only be necessary to notice in this place those particular and prominent events which seem to require or to admit of further illustration.

The first event of these celebrated races for the present year (the Fitzwilliam Stakes) was rendered remarkable by the dead heat which took place between Birdlime and General Chasse, upon which the owners of these nags agreed to divide the Stakes. Our readers will recollect, that Birdlime carried off the Cup at the late Liverpool Races, in defiance of the General, whose previous distinguished success, particularly on the Liverpool Course, had raised him so highly in the estimation of the book men of the north-west, that he had continued the decided favorite up to the moment of starting.

On Tuesday, the 20th, at half-past three o'clock, the following candidates for the St. Leger appeared on the Course; namely, Elis, Scroggins (late Brother to St. Giles) Bee's Wing, Traphall, Ebberston, Vulture, Snyders, Bombasine Colt, Carew, Locomotive, Redshank, Wedge, The Carpenter, The Bard, and Black Diamond. From the time that Elis's appearance for this Great Stake became certain, up to this moment, the odds had continued in the same course; the only apparent difference being the increased estimate of Scroggins and Elis, the marked decline of Wedge, the extinction of Gladiator: we will quote the odds at starting:—

6 to 4 agst	Scroggins (Brother to St. Giles).
7 — 2	— Elis
8 — 1	— Traphall
10 — 1	— Redshank
10 — 1	— Wedge
14 — 1	— Bee's Wing
20 — 1	— Vulture
20 — 1	— Black Diamond
30 — 1	— Snyders

After two false starts, they went well away, Wedge taking the lead for "the honour of Ould Ireland;" but unfortunately for his own immortality, and the glory of the Sister Kingdom, he was soon superseded in his advance by Carew; the field well together, Elis and Scroggins in the midst of the throng, Traphall and Snyders bringing up the rear. Shortly, the favorites, Scroggins and Elis, might be observed advancing to the front; and, at length, Elis singled himself out and took a decided and commanding lead, going at his ease however, while Scroggins and Bee's Wing were struggling hard behind him: the result was no longer doubtful; the superiority of Elis became pre-eminently conspicuous: he went home at the top of his rate, several lengths a-head of Scroggins and Bee's Wing,

who very severely disputed the honor of the second place, which was given in favor of the former by half a head; The Bard and Snyders going in about a length behind Bee's Wing and her successful competitor: the rest of the field pulled up of course as soon as they saw their chance completely extinguished. A superior field, in all probability, never came out for the Doncaster St. Leger; and, making due allowance for the supremacy of Elis, it was a most interesting, a most beautiful race, witnessed by admiring myriads: the assemblage was very numerous; while, like Corinthian capitals, rank, fashion, and beauty, gave an exquisite finish to the densely crowded and busy scene.

Notwithstanding the trembling suspicion which was excited, and for some time kept alive, by the adscititious or unusual movements of Elis, no doubt can be entertained that the race was honestly run. The amount of the Stakes, after the customary deductions, is 2075*l*. The Earl of Lichfield and his party have been great winners, beyond all question; those who backed the opinion of the Scotts have suffered; as well as many of the professed book men, who, with the extraordinary performances of Elis staring them in the face, and the knowledge of his being all right, blindly encountered their fate.

Elis is by Langar, out of Olympia by Sir Oliver, her dam Scotilla, by Auvil, out of Scota, by Eclipse, out of Harmony, by Herod, out of Rutilla.

The next event in point of importance, was the Cup; for which we had booked Queen of Trumps as the winner, and Touchstone the second in our estimation, as a matter of course; it will be seen by the list, that the Cambrian Queen did not appear at the starting-post for this glittering prize, and therefore little doubt can be entertained that she was amiss; her fore-legs were always suspicious, and on this account she became an uncertain animal to back (p. p. at least) notwithstanding her otherwise very superior powers of progressive motion. Bad fore legs must be a family failing: Velocipede, her sire, presents in form the beau ideal of a racer, and he proved himself one of the very first class; yet we never saw more crazy fore legs: his stock generally prove racers.

As Queen of Trumps was out of the question, Touchstone might be said to have it all his own way. General Chasse was fancied by some for the Doncaster Cup; but such persons made a most erroneous estimate of Touchstone, to say nothing of several other competitors who, on this occasion, proved themselves superior to him. The General made but a poor figure last year at Doncaster for the Cup, while his recent complete defeat can add no refreshing spirit to his withering laurels. General Chasse is a very good horse, and has proved himself a superior racer: he has done more work than usual, and for the most part performed it well; but he cannot last for ever: "he would make a race with a

donkey," and in consequence of this disposition, has been enabled to go through more than ordinary exertion. If we take a retrospective view of the performances of Touchstone and General Chasse, we must acknowledge both horses to be far above the ordinary class of racers; but, notwithstanding the General's frequent success in the north-west, he sinks in the comparison with his successful rival.

Bee's Wing, the only one amongst the stock of the justly celebrated Dr. Syntax entitled to distinguished notice, has proved that she inherits one of the leading and most valuable qualities of her renowned sire; namely, stoutness. It was unfortunate for her to meet such a field for the St. Leger, and particularly such a competitor as Elis. She may be regarded as equally unlucky by coming in contact with Touchstone for the Cup: however, that she was much underrated by the book men previous to Doncaster Races has become evident by her performances.

Wedge, whatever might have been his pretensions in his native country, has, as we always suspected he would, proved himself miserably deficient for the Great St. Leger. Yet, did he occupy the second position in the list of the odds for a very considerable period, nor was it till Elis came permanently into the market that he found his proper level, and sunk into comparative nothingness.

**TURKISH HORSES.**—"The Turkish horses are easily distinguished from others by their forms. They have good middle pieces, though rather round; high and thick crests, resembling in their immense arch that of the Godolphin Arabian. Their heads are rather coarse and badly put on; and their legs are short, flat, and bony. The favourite colours are the pie-balds and the strawberries, especially when the two near legs and one of the off ones are white. The Italians have the same predilection, saying, *Balzano a tre, è cavallo di Rè*. White muzzles and wall-eyes are also considered as great beauties. One horse was particularly pointed out to us as remarkable for his extraordinary colour, which was certainly most singular, being a perfectly bright crimson shade of chestnut, which, viewed under the influence of the sun rays, looked exactly like the finest carmine. I imagined it to be produced by the khennah, or some other dye, but was positively assured it was the horse's natural colour. The Dongolese horses are excellently adapted for the carriage, many being from sixteen to seventeen hands high, very showy, and with grand action. They are, however, remarkably long in the back, and rough in their movements when rode. Sadih Khan, a Persian who has long resided in England, had lately arrived at Constantinople from his own country, bringing with him, amongst other horses, one of the breed of Takkah in Khorassan, which, in common with all his race, was possessed of the curious distinction of having no mane. He was altogether a showy horse, with an English thorough-bred look about him. The horses in Turkey are all kept excessively fat, and are shod with bare shoes, with high projecting nail-heads, there being no groove."—*Temple's Travels*.

## THE PLATE.

The Bull "RUBY," which forms the subject of our Plate, is the property of Mr. R. Iveson, of Hedon, Yorkshire, and obtained the prize as the "best bull of any age, from any part of the kingdom," at the late Exhibition of the East Riding Agricultural Association. There were in all, ten competitors for the prize, and "Ruby" was declared by the Judges to be the best. "Ruby" was calved the 25th May, 1831,

by "Rolla," d. by M'Gregor," g. d. by Julius Caesar," g. g. d. by "Bacchus," g. g. g. d. by "Pilot," (495.)

"Rolla," by "Charles," (878,) d. "Fortuna," by "Pilot," (496,) g. d. "Modish," by "Remus," (477.)

"M'GREGOR" by "Rob Roy," (557,) d. by "Wellington," a son of "Old Brampton," g. d. by Mr. Collins' "Short Legs," a son of "Minor," g. g. d. by Mr. Dale's son of "Brown's White Bull."

## THE HIGHLAND AGRICULTURAL SOCIETY.

Since our last reports of the proceedings at two most important Agricultural meetings have come to hand. The meeting of the Highland Agricultural Society at Perth, and of the Liverpool Agricultural Society at Liverpool. We have always held up the Highland Agricultural Society as a model for all other societies, and we rejoice to be enabled to state, that nothing has occurred to alter in the slightest degree the good opinion we have ever entertained of the benefits which a perseverance in a similar course must produce to the cause of agriculture. The exhibition of stock at Perth far exceeded in quantity and quality that of any former meeting. The improvement in the quality of stock generally in Scotland, and the improving condition of the agriculturist were generally admitted. Considerable doubt has been thrown by many persons upon the correctness of a statement made by Mr. S. Lefevre in his pamphlet, as to the realization of better profits by the Scotch than the English farmers, of which evidence was given in detail before the Agricultural Committee. We find, however, the Noble Chairman, the Marquis of Breadalbane, making the following observations, not only uncontradicted but seemingly approved by the company present, consisting of 1,100 noblemen, gentlemen, and yeomen.

"That great source of wealth, the agriculture of the country, is prospering with us, I believe, more than has been acknowledged by our southern neighbours to be the case with them; and it has been stated in evidence before the Parliamentary Committee, that upon certain soils which in England return but small profits, or rather none at all, remunerating returns from similar soils are made in Scotland. (*Hear, hear.*) This effect, gentlemen, is in some measure to be ascribed to the proprietors; but

also in a greater degree to the intelligence, skill, and sound judgment of the tenantry." (*Cheers.*)

Too much cannot be said of the benefits derived from agricultural associations, in bringing landlords and tenants together, in causing them to associate upon such an equal and friendly footing as may enable the landlords to ascertain of their own personal knowledge, and not through the representation of others, the precise situation in which not only their own tenantry, but the tenantry generally are placed. The advantages resulting from such intercommunity did not pass unnoticed at the Perth meeting. The Marquis of Tweeddale observed—

"Connected as he was with many of the agricultural societies in the south, and having attended their meetings, he had every opportunity of being intimately acquainted with their sentiments and feelings. It was through the means of these agricultural societies that he had the pleasure of making acquaintance with the industrious tenantry of Scotland, the greatest pleasure he had enjoyed since his establishment in his native country."

Mr. Fox Maule, M. P., too, gave expression to similar sentiments. He said—

"I am one of those who admire meetings of this nature, because, as my friend Mr. Watson said, they bring the landlord and tenant into friendly competition, where the tenant as often proves victor over the landlord as the landlord over the tenant. I admire them for another reason, which my friend omitted to mention, that they bring them together again in the afternoon round the social board; where all are mixed and associated together without any further arrangement, except what is necessary to support the chair and the vice chair, and where landlord and tenant mix together, receiving freely the opinions of each other, giving and taking jokes, and all joining in the conviviality and harmony of the meeting." (*Cheers.*)

Mr. Oliphant, M. P. adverted to the knowledge

which he had himself acquired from attending such meetings.

"He had travelled," he said, "over great part of the continent, but he had never met with a society or with a meeting, which had for its objects the beneficent purposes of this society. There was no other country in the world where the Lord and his tenantry sat together, and talked freely with each other of the best and most economical mode of rearing the productions of the earth, and the breeding of stock. He stated that he had been a witness before the late Parliamentary Committee on Agriculture, and the attention which was there paid to Scotland would have made a Scotchman's heart dance within him. He and his friends were frequently asked how he came to know such and such things: and their general answer was—because we mix with men who have intelligence to communicate them to us." (*Cheers.*)

Several eminent agriculturists from England attended, amongst whom was Mr. Handley, M. P. for Lincolnshire, who, in returning thanks on behalf of the "strangers" present, made a speech replete with sound principle, and containing much valuable information, more especially upon the application of steam power to lusbandry. The Honourable Member observed—

"The noble Lord, your excellent and esteemed President, observed somewhat early in the evening, that your southern brethren were labouring under distress; but I observe he expressed that opinion with some degree of doubt. Permit me with sorrow and pain to tell you, there is no doubt about it. (*Hear.*) I speak feelingly—practically—on this subject. The causes I do not pretend to name; but, however fortunate you may have been when wheat was selling at 4s or 5s per bushel, we were not in the same boat with you, and suffered a considerable deficiency, though I am happy to say that is now in course of being ameliorated. It is, however, a wise dispensation, that out of evil good rises; and I believe that good has risen in this instance to the farmers of England. *They no longer look to Parliament for relief—they feel they have protecting laws which give them the highest prices in Europe for their produce, and they can expect no more;* and that in contending with that depression of prices which they have suffered—and which, considering the prospects of the country I fear they have still to look forward to—they must do as you do—they must pursue the course in which, for the last 50 years, aided as you have been—and gentlemen should never forget it—by a moral and religious peasantry (*cheers*) you have successfully contended with the rigours of your northern climate, and the sterility of your soil. (*Cheers.*) You have set an example to us of what may be done by skill, enterprise, and determination; and I trust the day is not far distant when we shall have such a society as the noble Lord alluded to; when we shall take a leaf out of your book, and I trust we will derive advantage from it. (*Cheers.*) I am aware I have detained you too long already (*cheers and cries of "no"*), but I confess I shall feel disappointed if, after the compliment which the Society did me the honour to pay me last Summer, in corresponding with me upon the application of steam to agriculture; and considering the interest which they showed on the subject at their next meeting—and the munificent manner in which they expressed the interest they felt—I shall be disappointed if, after all that, I left Perth without any allusion to the subject. When I look forward, as I must do, to the prices which we may in future expect to obtain for our produce, and feel that we must depend upon our own exertions alone, I

am impressed with the conviction that steam does not blaze for the manufacturer only, but that that mighty and almost superhuman aid may be applied to the pursuits of that class of gentlemen to whom I am now more immediately addressing myself."

Of Mr. Handley's devotion to the cause of agriculture, no man, we believe, who is acquainted with him can doubt. His practical knowledge is great, his labours in the Agricultural Committee have put him in possession of information which enables him to take a correct view of the situation and prospects of the British farmer; and what does he tell them, but what we have told them over and over again, that to their own exertions, including of course improvements in the science of agriculture, and not to the legislature, must they look for redress. Having made some further remarks upon Mr. Heathcote's steam-plough, upon which he stated Mr. Heathcote had expended 10,000*l.*, he observed, that Mr. Parkes, who superintended the engineering department of the machine, was present, and would enter more fully into the details. Mr. Parkes having been called upon by the Chairman, gave an interesting account of the history of Mr. Heathcote's invention. He said—

"Mr. H. and he had been more than three years occupied before they were aware that any individual, or any body, had turned their attention to the subject. They at length became acquainted with his friend, Mr. Handley, whom he might now call a steam apostle—(*Laughter*)—for he travelled into all places to advocate the cause.—With reference to the invention itself, he stated that the machine which gave impulse to the plough was locomotive, but not to the same extent as the plough itself. By a peculiar process the machine was made to advance only 11 yards, while the plough attached to it turned over a statute acre of ground. By this means a great economy of power was obtained. He also stated that from the anomalous nature of bog land—a mixture of peat and water—no expense was incurred in the articles of water or fuel, the ditches supplying the former and the peat the latter. The machine was thus enabled to feed itself as it went on; and in fact the workmen gave it the name of the Running Fire. He then stated that Mr. Heathcote and himself had been so absorbed in investigating the mechanical properties applicable to the machine, that they had not been able to devote much attention to the chemical properties of bog. But he might state one or two curious results to which their enquiries had led them. It was generally supposed that bogs could not be cultivated except by manure; and it was very easy to see, that in Ireland, where there were 2,500,000 acres of that anomalous substance, it was impossible to obtain manure to such an extent; but he had discovered that they could make the bog itself furnish a manure, which produced as beautiful grasses as were to be seen any where in Great Britain. This was done by converting the superficial coat of moss into coke; and they found that the carbonaceous matter contained in the moss was quite sufficient to produce those grasses.—As an instance, he mentioned that last June twelve-months, he ploughed a piece of bog, and laid on it the ashes of the peat-coke. From that land he had since taken five crops, which was a sufficient proof that the power of peat dust or coke was enough to produce the effects he had mentioned. He stated farther, that they had by means of steam, been able to convert the moss into a beautiful mould, but they had

not yet succeeded in causing it to ferment. He mentioned this in order to stimulate others to take up the subject. The system they pursued in moss cultivation was to begin ploughing without any draining. The plough completely turned up the sod, so that the heather, lying beneath, formed a drain of itself, and the new surface was rendered quite level. They left it in that state to the action of the elements for two years; or one with a hard winter might be sufficient. They found that this simple process was quite sufficient for pulverization."

The proceedings at the meeting of the Liverpool Society, of which a full report will be found in another part, will be to the full as satisfactory as those at Perth. The remarks upon the benefit of draining, contained in the REPORT of the Committee deserve particular attention. The speech of John Binns, Esq. of Lancaster, should be most carefully perused, containing as it does a mass of sound practical information, compressed in a very narrow compass.

## AGRICULTURAL MEETING AT PERTH.

GENERAL SHOW OF LIVE STOCK, IMPLEMENTS OF HUSBANDRY, ROOTS, SEEDS, &c.

*Under the patronage of the Highland and Agricultural Society of Scotland.*

This great Agricultural meeting and exhibition was held at Perth on Friday, Oct. 7.

Judging from the money collected at the entrances, the number of visitors to the exhibition must have fully exceeded 5,000.

The number of strangers in Perth exceeded all precedent. For some days previously the roads in every direction presented a constant succession of arrivals—landed proprietors and agriculturists were present from England and Ireland; while every district in Scotland and the Isles had its agricultural wealth and intelligence represented at this meeting. The following is an authentic account of the proceedings:—

The arrangements for this great meeting, the second which has been held under the auspices of the Society at Perth, were conducted by a Committee consisting of the Lord-Lieutenants, Vice-Lieutenants, Conveners, and Committees, especially named by each of the counties of Perth, Forfar, Fife, and Kinross, assisted by a deputation of the Directors of the Society and the Secretaries of the Local Associations connected with these counties.

The noblemen and gentlemen forming the committee were nearly all in attendance early on the morning of Thursday, and after partaking of an elegant *dejeuner a la fourchette*, given by the Lord Provost and Magistrates of the City of Perth, in the Assembly Rooms, entered upon the active and preparatory duties of the day.

Lord Kinnaird took the chair; there being present Lord Stormont, Preses of the Deputation of Directors, the Marquises of Tweeddale and Breadalbane, and the other noblemen and gentlemen members of the Committee. The various committees were named for conducting the duties of the meeting, and the following gentlemen were appointed as judges for determining the premiums for the different classes of Stock and other subjects of competition.

For the *Short-Horns*.—The Marquis of Tweeddale; Mr. Charge, Baron, Richmond, Yorkshire; and Mr. Heriot, Ladykirk, Berwickshire.

For the *West Highland Breed*.—Mr. Stewart of Auchadashnig, Island of Mull, Argyllshire, and Mr. M'Farlane, Strachurmore, Argyllshire, and Mr. Campbell of Jura.

For the *Ayrshire Breed*.—Mr. Bartlemore of Seaside, Ardrossan, and Mr. Wilson of Deanside, Renfrew.

For the *Polled Breed*.—Mr. Miller of Ballumbie; Mr. Proctor of Glamis; Mr. Crawford, of Balbozie.

For the *Fife Breed*.—Mr. Crawford, Balbozie; Mr. Forsyth, Balbirnie; Mr. John Proctor, Glamis.

For the *Best of any Breed*.—The same Judges as for the *Short-Horn*.

For *Horses*.—Mr. Cossar, Dunse, and Mr. Dick, Veterinary Surgeon, Edinburgh.

For *Black-faced and Cheviot Sheep*.—Mr. Graham of Lockerbie, Dumfries-shire, and Mr. Sellar, of Westfield, Sutherlandshire.

For *Leicester and Crosses with the Leicester*.—The same Judges as for the *Short-Horns*.

For *Swine*.—The same Judges as for the *Short-Horns*.

For *extra Stock*.—Mr. Hunt, Thornington, North Durham; Mr. M'Donald, Craighuie; Mr. Torrance of Kilsaintinian.

For *Implements, Roots, and Seeds, &c.* Mr. Robison, Secretary of the Royal Society, Edinburgh; Professor Low; Mr. Hunter of Thurston, East Lothian; Mr. Parkes, Engineer, Lancashire; Mr. Oliphant of Condie; Lord Douglas Gordon Halyburton, and Mr. Slight, Curator of the Highland Society's Models.

For *Sweepstakes*.—Mr. Watson, Keillor, and Mr. Thomson, North Mains of Strathallan.

At an early hour on the day of the Show, a large Committee of Gentlemen were in attendance, and so perfect were all the arrangements, that the whole of the animals were in the situations allotted to them, and the Judges ready to enter upon their duties at half-past nine o'clock. By the kindness of the Board of Ordnance, the handsome and spacious building formerly erected for prisoners of war was assigned for the Show. By the same obliging attention a splendid banquetting room, within the barraeks, calculated to contain above 1,000 persons, was fitted up for the Society's accommodation.

The Stock of all kinds brought forward in competition for the premiums amounted to 709, being 315 head more than were exhibited at the previous Meeting at Perth—and of a quality very far superior.

### CATTLE.

Of the *Short-Horned* breed, 39 animals were entered for competition, namely, 22 Bulls, 11 Cows, 3 Heifers, and 3 Steers, calved after January 1834. The increase in the number of this valuable breed, is the subject of just congratulation, not only on account of the intrinsic merit of this class of Stock, so much suited to the more fertile parts of the districts immediately connected with the Show, but as being calculated to improve in a remarkable manner the less improved of the native Stock. It is not here our purpose to recommend rash and inconsiderate crossing, but there are assuredly a few of the races of the lower parts of Scotland, into which an infusion of the blood of this highly cultivated breed will not be productive of important benefit. Amongst the Competitors of this class of Stock, we are pleased to record the names of the Duke of Buccleuch, the Earl of Hopetoun, Lord Kinnaird, Lord Gray, and others, all anxious to contribute their endeavours to the improvement of this part of the Stock of the country.

The premiums awarded were as follows:—

For the first class of Bulls, the first to Mr. George Reid, Ballancrieff, East Lothian; the second to Mr. Samuel Richmond, Chaplebank, Perthshire. For the class of Cows to Mr. Thomas Ritchie, Bowhouse, Clackmannanshire. For the Class of Heifers, to Mr. Barclay Allardice of Ury. For the class of Steers, calved after the 1st January 1834, in lots of two, to Mr. Charles Hunter, Argaitth, Perthshire. In this class of stock the heifers exhibited by the Duke of Buccleuch, were noticed as deserving great praise.

**WEST HIGHLAND BREED.**—It was to be anticipated that this, the most important of all the native breeds of Scotland from its being the staple produce of so large a part of the country, would attract peculiar attention. The number of animals entered for competition was 42, of which 8 were bulls, 14 cows, 4 oxen, calved after 1st January 1832, 2 oxen, calved after 1st January 1833, 9 heifers, calved after 1st January 1832, 4 heifers, calved

after 1st January 1834; amongst the competitors we noticed the names of some of the most distinguished breeders of Highland stock, and as a gratifying proof of the emulation excited, several of the lots travelled a distance of 250 miles to the place of exhibition.

The premiums awarded for the West Highland Stock were as under:—The first to the Marquis of Breadalbane; the second to Mr. Donald Stewart, Luskintyre, Island of Harris. The bull of Mr. James Stewart, Edra-leuchdach, near Callender, was noticed by the Judges in terms of commendation, and the honorary premium was awarded to the Marquis of Breadalbane as the breeder of the best bull in this class.

The Premium for Cows in this class was awarded to the Marquis of Breadalbane, and the ewe exhibited by Mr. James Stewart, was also noticed as possessing merit.

For the fat Oxen of this breed, calved after 1st January 1832, to Mr. John Wauchope, of Edmonstone, and those belonging to Mr. Charles Stewart of Chesthill, were commended by the Judges.

For the fat Oxen calved after 1st January 1833, to Mr. Alexander Stewart of Glenlyon House.

For Heifers calved after 1st January 1833, to the Marquis of Breadalbane, and for Heifers calved after 1st January 1834, the premium was also awarded to the same noble Lord.

For the five Oxen calved after 1st January 1834, bred by the exhibitor, to Mr. Charles Stewart, Chesthill.

**AYRSHIRE BREED.**—The number produced of this head being 30 in all, was much greater than we should have anticipated, evincing, however, the high favour in which its qualities for the dairy are held over Scotland. Amongst those who contributed in the largest numbers in this branch of stock, was the Earl of Mansfield. The premiums were awarded as under:—

For the best Bull to Sir John Muir Mackenzie, of Delvine, as also the Honorary Medal for being the breeder of the best bull. The Bulls exhibited by the Earl of Mansfield and Mr. Peter were commended by the Judges as deserving of merit.

For the best Cow to the Earl of Mansfield, and that exhibited by Mr. Lawrance, Drews, was commended by the Judges.

For Heifers calved after 1st January, 1834, to the Earl of Mansfield; and other two lots exhibited by his Lordship were commended by the Judges.

The Galloway, Polled Angus, and Polled Aberdeenshire breeds occupy an important place in this exhibition, though the numbers brought forward on the present occasion were comparatively small. The reasons which induced the Society to class those breeds together are detailed in a report published by the Society explanatory of the principles according to which they proposed to frame their offers of future premiums. The principal exhibitor in this class is Mr. Watson of Keilor, and it is a pleasure to us to record the high sense entertained by all breeders of the skill and judgment with which this gentleman has proceeded in his course of improvement. Whatever difference of opinion may exist as to the expediency of extending the Polled Angus as a breed, none can exist as to the merits of Mr. Watson as its great improver. In his hands this race seems to have arrived at all the perfection of form of which it is capable.

The premiums most justly awarded were, for the best Bull, calved after 1st January 1830, to Mr. Watson, besides an honorary premium for being the breeder of the best Bull in this class.

For the best and second best Cows, to Mr. Watson. For fat Oxen calved after 1st January 1832, to Mr. Watson.

**FIFE BREED.**—The number of animals entered of the Fife breed was sixteen, namely, six bulls, six cows, two fat oxen, and two steers calved after 1st January 1834. Much discussion has arisen regarding a resolution of the Society not to give premiums for the direct cultivation of the Fife breed, but to give premiums to the animals so named solely as they should be in themselves good. This was founded on two positions, first, that although admirable animals were constantly produced,

in Fifeshire, by the care and skill of particular breeders yet the general character of the Stock of the County is not such as to render it expedient to perpetuate it as a distinct breed, and, secondly, that the County of Fife was enabled of producing the finest Class of Stock, and therefore did not require protection for its peculiar breed. But, in the case of the present exhibition, a concession was justly made to the wishes of the gentlemen of the county of Fife, and a class of premiums was framed for this particular breed. The result thus far accords with the opinion expressed in the Society's Report that excellent animals may be raised by the breeders of this stock, as indeed of every other to which the necessary attention is given. The stock exhibited on the present occasion does the highest credit to the gentlemen who have brought it forward, and the premiums were awarded as follows:—

For the best Bull, calved after 1st January 1830, to Colonel Lindsay of Balcarras. An honorary premium was awarded to Mr. Thomson of Orkie, as the breeder of this bull. The bulls of Mr. Thomson, Orkie Mill, and Mr. David Wallace, were commended as possessing great merit.

For the best Cow of the same breed, to Mr. James McB. Fernie of Kilmux. The cows belonging to the Earl of Rothes, Mr. Hill of Lambro, Mr. Hutchison, Kirkaldy, and Colonel Lindsay of Balcarras, were recommended as possessing great merit.

For Oxen, calved after the 1st January 1832, to Lord Loughborough; and for those calved after 1st January 1832, to Mr. Fernie of Kilmux.

For fat Oxen, calved after 1st January 1833, to Mr. David Wallace of Balgrumo, Fifeshire; and for Steers, calved after 1st January, 1834, bred by the exhibitor, to Colonel Lindsay of Balcarras.

**ANY BREED.**—For the fat Ox of any breed, pure or cross, except the Short Horn, calved after 1st January 1832, the first premium was awarded to Mr. Andrew Dalgairns of Ingliston, for a cross between the Angus and Short Horn, and the second to Mr. O. Tyndal Bruce of Falkland.

The Judges also noticed in terms of commendation another ox exhibited in the same class by Mr. Bruce, and an ox exhibited by Mr. Fernie of Kilmux.

#### SHEEP.

The Sheep Stock brought forward was very numerous and important. The first in order was that of the Black-faced, heath-breed. Amongst the competitors we find the name of Mr. Robertson of Broomlee, who justly occupies so high a place as the improver of this race of sheep.

The premiums awarded in the Black-faced breed were:—For the best Tups to Mr. Alexander Denholm Beatlows, Lanarkshire.

For the best pen of five Ewes, not exceeding five years and seven months old, selected from a regular breeding stock of not fewer than 100, and the ewes having reared lambs to 1st July, to Mr. Thomas Robertson of Broomlee.

For the best pen of five Gimmers, under the same conditions, to Mr. Andrew Weir, West Linburn, Ayrshire.

For the best pen of five fat Wethers, under similar conditions, but not exceeding four years and seven months old, to Mr. James Miln of Woodhill, Forfarshire.

For the best pen of fat Wethers, under similar conditions, but not exceeding five years seven months old, to Mr. Thomas Robertson, Broomlee.

**LEICESTER BREED.**—It is with real pleasure we saw the numerous list of Competitors in this important class of Stock, and the valuable animals brought forward by breeders of distinction.

The following premiums were awarded:—For the best Tups not exceeding 45 months old, to Mr. Watson of Keillor.

For the best pen of three Ewes of any age, to Mr. Watson of Keillor.

For the best pen of three Wethers, not exceeding 32 months old, to the Earl of Mansfield.

For the best pen of Gimmers, to Mr. Watson of Keillor.

For the best pen of Wether Lambs, to Mr. Watson of Keillor.

For the best pen of Ewe Lambs, to Mr. Watson of Keillor.

**CHEVIOT BREED.**—We were somewhat surprised at the small comparative number of this class of stock. The premiums awarded were as under:—

For the best Tups to Mr. William Aitchison of Menzeon, Peebles-shire.

For the best Ewes, also to Mr. Aitchison.

**CROSS BREEDS.**—For Wethers of any cross, to Mr. John Gardner of North Kinkell, Perthshire.

#### HORSES.

Although the exhibition of this important Class of Stock was much less numerous than we anticipated from the district, there were some very fine animals amongst the Stallions—several Mares worthy of notice, but the Fillies were of very inferior description.

The premium for the best Draught Stallion was awarded to Mr. Alexander Keith of Netherthird, Aberdeenshire.

The Judges noticed the Stallion belonging to Mr. Wilson, Firthfield, Fifeshire, as being the second best.

For the best breeding Mare, for agricultural purposes, to Mr. Andrew Bannerman of Tullibardine, Perthshire; and for the second best to Mr. William Mackean of Lumloch, Lanarkshire.

For the best Filly for agricultural purposes, to Mr. Christopher Veitch of Park, Linlithgowshire.

#### SWINE.

Amongst the class of Swine a considerable number was produced; the premiums were awarded as follows:—

For the best Boar to Robert Graham, Esq. of Garvoek.

For the best Sow to Lord Lynedoch.

For the Sows belonging to Cottars who do not pay 1*l.* of Rent, to Mr. William Ancher of Tullibardine Cottage.

For the best Pigs, to the Earl of Mansfield.

#### WOOL.

The premiums advertised for the best samples of wool were awarded at the Wool Fair held at Perth on 12th July last. The successful competitors were for the best combing wool, to Captain Hunter of Auchterarder. For Cheviot or short wool to Mr. John Welsh, Glenefiek, Forfarshire. For Highland wool, to Mr. John Bennet, Methven Street, Perth.

#### EXTRA STOCK.

A great variety was produced under this head, many of them possessing much merit. A fine cow of the North Devon Breed, belonging to Lord Lynedoch, deserves to be especially noticed. This animal may be considered as nearly a perfect specimen of the pure North Devon breed. A three-year-old heifer, a cross between the short-horn and Ayrshire, the property of Mr. D. Ritchie, was remarked by the Judges to be very fine, as were two three-year-old Lewis heifers, the property of the Messrs. Stewart. We have to notice also a fine three-year-old heifer, the property of Mr. Charles Stewart, small but handsome; a short-horn quey calf, the property of Mr. Thomas G. Mackay; and an uncommonly fine Highland ox, the property of the same gentleman. The following are also referred to by the Judges in their report:—A cow, seven years old, a cross between the short-horn and Ayrshire, the property of Mr. Alexander Symons, Errol; a Guernsey Cow, belonging to Mr. Smythe of Methven; four two-year old heifers, belonging to the Earl of Mansfield; a short-horn bull calf, the property of Lord Rollo; two curious oxen, supposed to be of the old Scotch breed, the property of Mr. Fox Maule; three oxen of the Highland breed, belonging to Mr. Charles Stewart; four oxen, crosses between a short-horn and a country cow, the property of Mr. Dron; a very good ox of the Fife breed, belonging to Mr. Fernie of Kilnux; a bull of the polled Angus breed, the property of Sir James Montgomery; and lastly, a short-horn bull, the property of the Duke of Buccleuch.

Amongst the Class of Extra Sheep, we have to notice with the highest commendation, two splendid Rams of the Southdown breed, exhibited by Mr. Ellman of Beddingham, in Sussex. The Messrs. Ellman are known throughout England as the great improvers of this beautiful breed; and we feel gratified that such examples of it have been introduced directly into Scotland by themselves. Mr. Watson of Keillor is the chief supporter of the Southdowns in Scotland, and he produced some very fine specimens of them, derived, originally, we believe, from the stock of Mr. Ellman, but now reared and acclimated upon his own farm. The Judges remarked with approbation, three wethers, one a pure Leicester, and two crosses between the Cotswold and Leicester, the property of Lord Lynedoch; a tup of the Leicester breed, the property of Mr. Handley, M. P.; a year-old tup of the Leicester breed, the property of Mr. G. Weir; and lastly, two ewe lambs of the black-faced breed, the property of Miss Spence Yeaman of Murie.

Amongst the Extra Stock of Horses there was particularly observed by the Judges, a thorough-bred stallion, belonging to Lord Kinnaird, fitted for excellent hunters and roadsters; and a fine black filly, belonging to Mr. Bannerman of Tullibardine, was particularly admired.

#### SWEEPSTAKES.

Various Sweepstakes by the members of the Perthshire Farming Association afterwards took place, which excited much interest amongst the competitors:—1st, For the best one year old Filly, gained by Mr. William Thomson, Ledketty. 2nd, For the best two year old Filly, gained by Mr. Bannerman, Tullibardine. 3rd, For a three year old Filly, gained by Mr. George Ritchie at Rhynd. 4th, For the best breeding Mare for agricultural purposes, gained by Mr. William Cunningham, Goodlyburn. 5th, For the best two year old Colt, gained by Mr. Hunter of Auchterarder. 6th, For the best Leicester Tup, gained by Mr. Staines at Lynedoch. 7th, For the best pair of cross-bred Stots, gained by Mr. Hunter of Auchterarder. 8th, For the best Cow-calf of the pure short-horned breed, gained by Mr. Alexander Symons, Erroll.

#### IMPLEMENTS AND MACHINES.

In this class a working model of a very ingenious machine for making draining tiles, invented by the Marquis of Tweeddale, excited much attention. This machine moulds the clay into the form required, with facility, and seemed to the Judges well calculated to answer the purposes intended. An honorary medal was voted to the noble Marquis.—Premiums were voted to Mr. Jaek for a contrivance for securing an equal flow of water from dams and reservoirs. To Mr. Stewart Hepburn for a model of conical rollers for pulverizing soil. To Mr. Stirling of Glenbervie, for a moveable harper screen, for sorting gravel; and for a species of moveable wooden railway for removing turnips from wet land. The Judges farther called the attention of the Society to various useful implements. To an enlarged and improved road scraper, by Mr. John Melville. The improved straw and hay-cutting machine of James Slight and Co., Edinburgh, machine-makers to the Society, was shown in operation, and attracted much interest and attention. To various implements exhibited by Messrs. Drummond of Stirling. To lots of draining tiles of superior workmanship and materials, of Mr. Bogle of Ayr, and Mr. Stirling of Glenbervie; and to Mr. Crosshill's patent clod-crusher.

The reaping machine, by Mr. Smith, of Deanston, was again brought forward, and was tried in presence of members of the Society on Friday. Nothing can exceed the perseverance of this gentleman in the perfecting of this important instrument; and we trust that he will speedily be enabled to surmount the difficulties which may still present themselves. We should almost despair of success if it failed in the hands of Mr. Smith.

Mr. Beart of Godmanchester exhibited a patent machine for making drain tile, which has the merit of being extremely simple, both in construction and in

operation; and, among many others, the following may also be mentioned:—

A turnip and bone-dust sowing-machine, for one drill, by David Barty, Meiklcour.

A model of a compact family mangle, by John Ramsay, Kettins.

#### ROOTS AND SEEDS.

The first to be noticed of the subjects of competition under this head is the extensive collection produced by Messrs. Lawson and Son, Seedsmen of the Society. This collection, besides examples of plants suited to common cultivation, presented a number of rare objects, and particularly specimens of the cones of *Him-mayala Conifera*, transmitted to the Highland and Agricultural Society, by the Hon. Leslie Melville.—Some specimens of grain from Professor Fisher of St. Petersburg were also exhibited, and a great variety of roots and tubers. The Committee recommend that honourable notice be taken of the exertions of Messrs. Lawson and Son on this and on all former occasions. The next exhibition to be noticed is a collection by Messrs. Dickson and Turnbull of Perth. This, besides containing numerous examples of the potatoe and other useful plants, contained a very extensive collection of coniferous trees. The Committee recommend that an honorary premium be awarded to Messrs. Dickson and Turnbull.

Messrs. Drummond of Stirling, exhibited a collection of various vegetable productions, and amongst these a specimen of *Trifolium hybridum*, a plant which has been recently introduced to the notice of agriculturists, and is likely to admit of beneficial cultivation. The Committee recommend that an honorary premium be awarded to Messrs. Drummond.

Specimens of preserved potatoes were produced by Mr. Sharp; specimens of large turnips and other plants, by the Earl of Rothes, and some very fine specimens of Cabbage by Baillie Ross of Perth.—The Committee recommend that these contributions be acknowledged by a proper notice in the account of the proceedings of the show. An extensive collection of dried specimens and grass seeds was produced by Mr. Bishop, and an authenticated account of the produce of potatoes cultivated by him. Mr. Gorrie of Annat Crove, presented an extensive collection of vegetable productions, including 12 varieties of Barley, 58 varieties of wheat, 15 varieties of field peas, 19 varieties of oats, and 12 of field beans; several new and tall grasses from America; 20 specimens of aftermath from valuable varieties. The Committee recommend that thanks be given to Mr. Bishop, and that an honorary medal be given to Mr. Gorrie, with a warm expression of the Society's sense of his meritorious attention to bringing into notice varieties of useful plants.

#### BUTTER AND CHEESE.

Although no premiums were offered, various specimens of native cheese were produced, and particularly by Messrs. Dickie from Stewarton, Mr. Boreland from Hill House, Mr. James Dunlop, and Mr. James Lindsay from Fenwick, all in the county of Ayr. Lord Lynedoch also sent specimens of cheese made at Lynedoch, in the manner of Leicester, and which the Judges reported to be of excellent quality.

**THE TITHES ACT.**—Opinion of the Bishop of Exeter on the practical effects of this Act, delivered at the visitation at Exeter:—"My own opinion is, that in the first instance, it will work well; but, however equitable it may at first appear, it is likely, after a lapse of years, to leave the incumbents with little or no compensation, and that all the benefit would fall to the share of the landowner. For, in consequence of the improved and improving state of cultivation—and in this age of invention, where internal communication is and will be so much laid open—the value of land will be greatly increased, and the landowner has no right to shut out the clergy from their share in the advantage. In the

reign of Henry VIII. all Church property was valued, and there is not a living in the kingdom but was reduced as low as 20*l*. Wheat was then 10*s* per qr, and if a corn-rent had been the criterion of value, instead of there being livings worth 800*l* or a 1,000*l* a-year, they would have been estimated at forty quarters of wheat, which would have amounted to no more than 80*l*, and at a period of more modern date, not beyond the memory of many of those who hear me, in the year 1792, wheat was about the same price as at the present time, when the value of land was increased twofold, and so had the income of those holding benefices. If, therefore, the present act had been passed at that time, their income would have been only half what it now is. Now there is no reason why such causes may not operate in a similar manner at a future period, so that by fixing permanently the amount of tithes by this act, a great injury may be inflicted upon the clergy, who may hold benefices at a future period, for that which may appear equitable at the present moment, may be the means of reducing their income to one half the present amount.

**THE AGRICULTURISTS.**—The Conservatives and the Conservative Journals, being in the habit of setting themselves up as the only "friends" of the Agriculturists, we recommend the following leading article of that most leading Conservative Journal, *The Times*, to the attention of our Agricultural readers:—

"A very bulky volume of the evidence taken before the Select Committee of the Lords 'on the State of Agriculture' has been published. We know not who selected the witnesses; but, for the most part they are persons well known to be thick-and-thin supporters of the Corn Laws, advocates of high prices, and anti-Peel's-Bill theorists. We shall, probably, make some extracts in a day or two, and thus exhibit to the world what feeble and inconsistent arguments are adduced in order to bolster up an erroneous system. The cultivators of bad land, and the friends of an unsubstantial currency, are too much interested in high rents and high prices to be adopted as oracles. Reasonable rents, under ordinary circumstances, insure to the farmer reasonable profits; and the merchant should feel that a well-conducted enterprise, founded on the calculation of moderate prices, is a more certain as well as a more reputable mode of acquiring wealth than any of those gigantic gambling speculations, when, in order to obtain immense returns, all is risked, and frequently all is lost, *not* excepting honour."

One of the most important branches of the commerce of Paris is the butcher's trade, 72,000 bullocks, 16,000 cows, 72,000 calves, and 360,000 sheep, being required for the yearly supply of the inhabitants of the capital. The net price of the above amounts to 42,584,000*fr.*, and to 48,109,200*fr.* including all expences and duties, which are paid before the meat is sold to the consumer. The following is a summary of the receipts of the butchers, which may be compared with the expenditure:—Meat 41,515,200*fr.*, skins and hides, 4,860,000*fr.*, tallow, 4,023,200*fr.*, offal, 1,304,000*fr.*, tongues, 176,000*fr.*, feet, 165,440*fr.*; sum total 52,133,840*fr.* Deducting from the above sum the cost, or 48,109,200*fr.*, it will appear that the profits amount to 4,024,640*fr.* which, divided among the 500 butchers of the city of Paris, will leave for each a yearly profit of 8,049*fr.* 33 *c.*—*Galignani.*

## THE SUTHERLAND OBELISK IN SHROPSHIRE.

We noticed some time ago the determination of the Tenantry of the Duke of Sutherland's Shropshire estates to erect an Obelisk on Lilleshall Hill, in this county, in token of their respect and gratitude to the memory of their revered landlord, the late Duke, and a subscription was set on foot, and upwards of 800*l.* was immediately subscribed by the tenantry alone for this laudable purpose. This Memorial was erected by Mr. Smith, after a design by Mr. Hamilton, with stone of an excellent and durable nature from the Duke of Sutherland's Quarry, at Red Lake, which his Grace kindly condescended to give for the occasion. The base of the Obelisk is shaped in the form of steps, with large corner solid square stones, upon which are placed recumbent—Wolves (the crest of the Noble Family.) The Obelisk is of the form of the pyramid of Heliopolis, and the whole erection is of the height of 70 feet, forming a conspicuous feature in the county. Upon an entablature, on the base of the column, is the following just eulogium:—

“ To the Memory  
of

George Granville Leveson Gower, K. G.  
First Duke of Sutherland,  
The most Just and Generous of Landlords,  
This Monument is erected

By the Occupiers of his Grace's Shropshire Farms, As a public testimony that he went down to his Grace with the Blessings of his Tenants, and left behind him upon his Estates the best Inheritance which a Gentleman of England can bequeath to his Son, men ready to stand by his HOUSE, Heart and Hand.”

Under the active and unremitting attention of Richard Mountford, Esq., the Chairman, and the other Members of the Committee of Subscribers, consisting of some of his Grace's principal Tenantry, this MEMORIAL was erected and completely finished at an expence within the amount of the subscriptions; and the Committee determined to apply the surplus of the subscriptions to present Mr. FISHER with a Silver Cup, in token of their estimation of his services as their Honorary Secretary. This Cup was designed by Messrs. Collis and Co. of Birmingham, (successors to Sir Edward Thomason,) and is emblematical on all sides of the Obelisk, containing on one side the above monumental eulogium, and on the obverse, the following inscription:—

“ This Cup is presented to Robert Fisher, Esquire, by the Committee who had the superintendance of the erection of the Sutherland Monument on Lilleshall Hill, as a testimony of their esteem, for the very kind, valuable, and gratuitous assistance rendered them by that gentleman, from the origin to the completion of the structure.

RICHD. MOUNTFORD, Chairman.

July 16th, 1836.

Mr. MOUNTFORD, (the Chairman) the Committee, and a party of friends, dined with Mr. Fisher on Friday last, by his request, to afford him an opportunity of expressing his obligation for this handsome Present, when the Chairman introduced the subject in a neat speech, expressive of the boundless virtues, munificence, and liberality of their late landlord, his Grace the late Duke of Sutherland, and called the attention of the company to the high feeling which such kindness had produced in the hearts of his Grace's Tenantry, who, in Shropshire, as well as in Sutherlandshire and Staffordshire, had vied with each other in erecting Lasting Memorials to the memory of their munificent Patron and best of Land-

lords; and the Chairman observed that it was matter of just pride to his Grace's Shropshire Tenantry that they had been enabled not only to effect this purpose without the aid of any other subscription, but also to exhibit their sense of their Honorary Secretary's able assistance, by presenting him with that Cup.

Mr. FISHER then expressed that he had felt so deep and lively an interest in the erection of the Sutherland Memorial, that no other stimulus had been wanting, and he must therefore attribute the origin of this handsome and unmerited gift to the personal friendship and kindness of the Chairman and other friends on the Committee, and not to any deserts of his own. On this very interesting subject he also observed that the gratitude he bore to the late Duke in his professional character, and the high respect and esteem in which his Grace's Memory was held by all who knew him, afforded sufficient inducements for much more arduous exertions than had been required from him, on this occasion, without reference to any idea of remuneration, which never entered his mind. Mr. Fisher then repeated his grateful thanks to the Chairman and other Members of the Committee, and drank their healths out of the Sutherland Cup.

Amongst other appropriate toasts:—

The memory of the late Duke of Sutherland, and the healths of the present Duke—of the Duchess Countess—of the Marquess of Stafford—of the Duchess of Sutherland—and of the Junior and other Branches of the Family,—and of James Loch, Esq., M.P. and William Lewis, Esq., his Grace's Auditor and Agent,—were severally drank out of the Cup, and the Company agreed that THE CUP gave a zest to the wine which the glass did not afford.

The health of the Members of the Committee, and also, particularly of the Rev. John Blunt, Vicar of Lilleshall, and Mr. Richard Duncalfe, who had been very active in settling and arranging the plans and inspecting the execution of the work, were severally drank with much glee; and the party separated at a late hour in mutual good harmony and satisfaction after some excellent songs, by Mr. Phillips and other Gentlemen of the party.—*Shrewsbury Chronicle*, Oct. 1.

NATIONAL EDUCATION BOARD FOR IRELAND.—AGRICULTURE.—During the last week, Mr. Carlisle, one of the Commissioners for education in Ireland, and who was also one of the chief commissioners of poor laws, for this country, has been on a visit to this city and its neighbourhood, and has been minutely inspecting most of the national schools in and about Limerick. In every instance, we understand, he found the establishments conducted in the most satisfactory manner, particularly the school under the superintendance of Lady Clare, at Kiskeaquirk, and that at Mountshannon, under the care of Lady Isabella Fitzgibbon. We have heard that the object of the commissioner's visit is to ascertain, by personal inspection, whether any of those charges brought against the schools have any foundation. Another object which Mr. Carlisle has in view is, to inquire into the practicability of establishing district model schools, in such situations as may be best suited for the purpose. These model schools are of three classes, one for infants, another for girls, and a third for boys. To this last it is intended to attach a small farm, where both master and scholar will be practically instructed in the most approved modes of agriculture, including the most

economical and best system of managing land. In this establishment masters will be thus trained, so as to blend with the acquirement of letters a sufficiently popular knowledge of that important art, on the successful acquirement of which may be made to depend the happiness and comfort of the great majority of the people. We understand Mr. Carlisle attended the only public meeting which took place during his visit, namely, the Breeders and Graziers' Society for the counties of Limerick, Clare, and Tipperary, which took place on Saturday, at Quinlivan's Hotel. At the meeting, which was composed of gentlemen from the surrounding counties, Mr. Carlisle shortly explained the views of the commissioners of education, particularly with reference to the attention intended to be devoted to agriculture, the announcement of which was received with the most unanimous approbation. The immediate introduction of this treasure is, we believe, only delayed till a communication can be had with the Chancellor of the Exchequer, on his return from London. In the meantime Mr. Carlisle has gone to the county of Clare, and will subsequently visit the county of Tipperary.—*Limerick Chronicle*.

### CURE FOR THE TAINT OR DECAY OF THE POTATOE.

(FROM THE DUMFRIES TIMES.)

The potatoe, hitherto the most healthy and vigorous growing plant under cultivation, has of late become the most precarious and uncertain; and the failure of this important crop has, for some years past, engrossed very general attention, and become the subject of much speculative discussion. The uncertainty of success in cultivating the potatoe, in consequence of the frequent failures, if no preventive can be found, must tend materially to diminish the quantity grown; and the want of so indispensable an article of food, taking the increased state of our population into view, cannot fail to be matter of serious consideration. Even famine may be the consequence at no distant day, and what can be done to prevent so awful a calamity, is of serious importance. The consideration of this subject has of late been urged on my mind, and doubtless on many others. I have written my remarks in the form of a treatise on the potatoe, touching shortly on its history and introduction into this country; its cultivation, nature, and botanical properties; its liability to decay, and its natural restoratives; its diseases, and the remedies and preventives of such; the method of obtaining and preserving seed, and rearing new kinds. From research into the nature of the potatoe and observation of its habits, I consider I am so far master of the cause and nature of the present disease, which has become so general all over the three kingdoms, as to presume, though it is rather a bold presumption, that I can in future completely prevent its ravages, and restore the cultivation of it to its wonted security, and insure a successful continuation of this most useful root. To obtain an object so desirable I have noted down a few simple rules drawn from nature, and which being easy and practicable I would recommend to be carefully observed. Much depends upon taking up at a certain time and properly securing the seed roots; and, as my observations on the nature of the disease cannot be before the public for some time, I hope, through the medium of the public papers, to give a short abridged extract from my work for the information of the

growers, and I would urge a very simple operation on their punctual observance, the attending to which will be of most material consequence—this is the proper securing the seed roots, as the season for doing so is now at hand. I will therefore say, let every cultivator take up just now such a quantity of seed as they intend to use in the ensuing Spring, from the greenest and latest planted portion of their crop, and have them properly secured. Potatoes intended for seed should never be fully ripened, but taken up when the skin will easily rub off in handling them, or as near that state as they possibly can be got—at all events before the stalks are decayed.

The operation of securing them is quite simple: prepare a pit in a dry situation, free from any possibility of retaining bottom water; sink it a foot deep, or as near so as the soil will admit of; the width may be three or four feet; the length depends on the quantity to be secured; then along the bottom spread not above five inches deep of the potatoes, then throw over them a stratum of well broken mould, and allow it to sink in among the potatoes; again lay on another five inches of potatoes, and more earth as formerly; and with a third cover of potatoes, finish with a gentle round, not a ridged top as is usual; then cover six or eight inches of loose mould over the whole, still allowing as much as possible to sink among the potatoes, until every crevice is filled, and the operation is finished. Use no straw on the top of the pit, as my object in keeping the pit flat, is that the winter rains may sink through the earth to keep the potatoes callier and fresh; but again, I say, take due care to have loose earth mixed among them, and by no means a thicker mass than fifteen inches, if less so much the better. Six or eight inches of closs covered on the top, rounded a little, will protect them from frost, and exclude the air. When bedded in earth, a very thin cover will preserve them.

The taking up of seed potatoes in a green state, and exposing them in the open air for a week or more before pitting them, to make them green or watery, is no new or rash theory, but has been long in general use by gardeners and extensive growers of early kinds for market, to preserve in a vigorous state these favourite kinds. I have not recommended the exposing them; it may either be done or not. I am trying it with some of my own. The reason why I recommend the early raising for the late kinds is this—they have of late in a great measure given up bearing seed-plums, as they are generally termed, and are in consequence become more early in their nature. When fully ripened, they lose their vegetable sap, and become so very dry and mealy, that the cutting them in spring, and exposing them for hours in a cart at the field to the dry air and hot sun, or covering them into hot and dry mould, often destroys, or renders their vegetation precarious. From this cause alone can an explanation be drawn, of the mysterious and unaccountable attacks of the disease, in taking a portion of one day's planting in the same field and same seed, while the remainder succeeds. The fact is this, the whole must be in a precarious state, but the part over-dried, or those planted at the hottest period of the day, only fail, the other, at a venture, holds out. Thus they will fail and grow alternately, and have done so in such a whimsical manner, as to set description almost at defiance. The aggravation of the failure of the present season, was owing to its being a very dry one at the time of planting, and goes far to prove the last supposition; but I have watched the disease since 1832, and found it uniform in this mode of attack. The kinds of potatoes now in general use, are all old and worn out; this I have proved

in my work, from reference to a number of undoubted evidences. New ones must be raised; but the old must be preserved, which is possible, until superseded by new and more vigorous. The operations to be observed at the planting season, are equally plain as those described, and no ingredient is required, but the ordinary elements of air, earth, and water, and with these I am confident I can anticipate the arch-destroyer, and frustrate its operations. I have little faith in the application of hot lime, as recommended; nor will planting the potatoes whole, be a permanent preventive. They have this season failed both in this country and in Ireland, when so planted, which still gives the disease a more formidable appearance, though, it is to be hoped, the evil is not insurmountable.

Castle-Douglas, 31st Sep., 1836.

## LETTERS ON AGRICULTURAL DISTRESS.

ADDRESSED TO THE FARMERS OF ENGLAND.

No. 1.

(To the Editor of the York Herald.)

SIR:—Allow me through the medium of your widely circulated journal, to offer a few remarks and observations, addressed to the farmers of this country, on the above important subject of agricultural distress, the existence of which, I believe, will be admitted by every sect and party.

### FARMERS OF ENGLAND!

I trust you will pardon the liberty I have taken, in thus presuming to come before you, to address you, on the important subject of agricultural distress, the existence of which I believe, will be admitted by every sect and party.

Another session of Parliament has drawn to a close, during several months of which a committee has been sitting to investigate this subject, which has terminated its labours, without coming to any conclusion as to any plan or measures, to be adopted to alleviate this distress! and contenting itself merely with presenting to the House a copy of the evidence and examination of the persons taken before it. This is another precious specimen of the way in which the time of the people's representatives is consumed—but let that pass.

Mr. S. Lefevre, the chairman of that committee, had drawn up a report, in which the whole state of the case was fairly laid down, but on the motion of the Tory, Sir James Graham, seconded by the Tory, the Marquis of Chandos, that great pretended friend of, and stickler for, the rights and interests of the farmer,—this report (though it has since come before the public) was suppressed, and not suffered to be presented.

Farmers of England! what think you was the reason of this? Mr. S. Lefevre, the chairman of the committee, who furnished the report, shall tell you in his own words, which I copy from his speech:—"He admitted that his report did not meet the views of the committee, but if the committee had allowed it, they could have shown that every paragraph had been established by the evidence." He further observed—"As to the interests of the farmer, I can assure the House that no one has a greater interest in maintaining them than I have; and the great evil has been, that the farmers never were told what was the true state of the case. They had too great a dependence upon

*Corn Laws.* Therefore I said, that they ought, in the first instance, to look to their landlords, and that when they had fairly and properly reduced their rents, the farmers must rely on the other sources possessed in common by all agriculturists, by which many are enjoying a state of comparative prosperity."

Farmers of England! this was the reason then, this was the secret, why a report, containing such sentiments and opinions, so inimical to the flagrant and unjust monopoly of the domineering and grasping landlords, should be annulled and rejected by those self-same tax makers, and consumers of the produce and profits of your industry.

By this time, and from this state of the case, you must be well aware how worse than vain it must be to expect relief from Parliament. The judges in this case, namely, the over-fed landlords and huge monopolisers, sit in judgment on their own interests. Do you suppose they will do any thing to injure those interests and privileges (even though they have obtained them at your expense,) by proposing, much less by passing any liberal plans or measures for your relief, which must necessarily reduce their extravagant incomes? Or can you for a moment expect them to voluntarily come forward and reduce their rents? If so, you must be utterly blind, and ignorant indeed—No, no. "Trust not for freedom to the Frank." Put not your confidence for redress and relief in the landlords. Be assured they will do nothing liberal unless compelled, but on the contrary exact, and take what they can get, even to the uttermost farthing.

But to this part of the subject I will return again, for the present I proceed to briefly consider what relief, were it ever so wishful and disposed, it is in the power of the Government to grant you.

There are only two measures of much importance for this purpose of affording you relief, which I have seen brought forward in Parliament. The one is the repeal of the malt tax.

Now before going any further into this question, I must remind you, that we have such a thing as a national debt, and moreover, that as we cannot pay off this debt, we are obliged to keep up the national credit by paying annually the interest of this debt.

Now to raise this interest, and carry on the affairs of Government, taxes are imposed (and here you have the origin and cause of taxation) upon almost every thing we can see, feel, or have any idea of, and amongst the rest, upon malt.

I have not confined myself to figures or numbers in my calculation; this is quite immaterial to the argument; I wish merely to establish this principle in as few words as possible, namely, that the amount of revenue derived from taxation, must be equal to, or above the amount of the interest of the debt.

This being the case, and an admitted fact, you will see at a glance that it is quite impracticable, nay completely impossible for any ministry to reduce taxation before having previously saved the amount, by the reduction of pensions, salaries, and places, or some other plans of economy or reform in the public expenditure. All other species of reducing taxation is a juggle, a kind of legerdemain, which has long been played off by our "hereditary Legislators," for the amusement and deception of the people. It is, in other words, the taking out of one pocket and putting it into another; or, the reducing one tax and adding the reduction to another.

Now suppose the amount of the malt tax to equal

four millions, and that it was repealed; of course there would be a deficit of four millions in the interest of the debt, which could not be raised but by one of the three following means, namely, 1st, To save the money by retrenchment and economy. 2nd, To lay four millions upon some existing tax or taxes. Or, 3dly, By the imposition of a property tax.

With regard to the first plan, ministers either have not the power or the will to save the sum by reducing the pension list, the salaries of their officers and public functionaries, the expenses of the court, the immense revenues and sees of the bishops, or by any other system of reform and retrenchment.

With respect to the second plan, were it practicable, it would be but a repetition of the old juggle, of shifting the saddle from one side to the other, so that, what you gained one way, you would lose the other, and thus be left in the same position; but putting this apart, there are no taxes on which the deficit occasioned by a repeal of the malt tax, could be laid, which are not already sufficiently onerous, and almost with difficulty levied and obtained; so that this plan will not answer.

It is not my intention to enter into any lengthened observations on the third plan of raising the deficit, namely, by the imposition of a property tax; but I cannot help remarking that I consider there is no necessity for it, in the present state and prospects of the country, and that in no case can it be justified, save in a time of war, or a state of great public pressure of affairs, much less, therefore, in a time of profound peace; and finally, that it would be manifestly and evidently unjust and indefensible in a time like the present, when the commerce and manufactures of the country are in a most flourishing condition, and every class, and interest, *save yours*, in a state of the most unexampled prosperity.

I do not require to be told, for I know full well, that it is true, that you, and all those persons forming what is called the middle class or masses of society, pay a far greater ratio of taxes, and bear far heavier state burdens than your landlords and peers; and that they enjoy many exemptions, and privileges, and immunities, which you are debarred of, and this from their having had the *laws of their own making*; I also freely admit, that this is highly unjust and improper, and that the greater the property, the greater ought to be the rate of taxation it should pay for its protection; and that, therefore, your landlords, peers, bishops, parsons, and gentry, alias, the upper ranks of society, should contribute a far greater share of taxes to the maintenance of the state, than they do at present; yet admitting all this, you will perceive that it is quite different and distinct from a property tax, which I repeat and maintain ought not to be, and cannot justly be laid on the nation in its present flourishing state, and that for your sole benefit.

Now, setting aside entirely the question, whether a repeal of the malt tax would be of any benefit to you or not, you must perceive from what is here advanced, that it is inexpedient, if not impossible for the government to repeal it.

But there is another plan of relief which has been much lauded, and boasted of by the friends and partisans of Mr. E. S. Cayley, and which that gentleman brought forward in the House of Commons, on the first of June, 1835, and was defeated; and here I allude to the currency question.

Now, as this gentleman considers himself, and no doubt wishes to be considered, a friend to agri-

culture, and consequently a friend to your interests, and moreover gives a consistent vote on all questions, having for their object the reformation of abuses, and the improvement of the country, I shall not for these reasons say anything ungenerous of him in this place, or anything calculated to injure him in your estimation.

One thing, however, I must remark, (and it is charitable so to think) that he is certainly a very mistaken man in his ideas on the currency question.

I shall not impugn his motives in seeking to depreciate the present standard of value, by the substitution of a silver standard, or of a silver and gold standard conjoined; it shall be sufficient for me to state the result and consequences of such a measure, as they were proved and pointed out in the debate on the question, and to which I refer you, Farmers of England, for further information.

In this debate it was distinctly proved that there was no connection between the state of the currency and the fall in the price of wheat, as it had happened almost invariably that as the quantity of circulating medium had increased in the country, the price of wheat instead of rising, had fallen. It was also proved that the effect of depreciating the standard would very little, if at all, benefit you, but on the contrary, injure and lower the prices of labour of your servants—that the public creditor would be robbed of his just claims which would be received by the public debtor—and that it would bring about another panic and general bankruptcy in the country. It was remarked by Sir Robert Peel, that “all that the agriculturist could gain” (by depreciating the standard) “would be, in what he could save in defrauding the public creditor, and from pinching his impoverished labourer.”

Farmers of England! after these statements, I flatter myself I need not say any more to point out to you how fallacious would be your hopes of obtaining relief from such a measure; but even admitting that you could receive from it all the relief you stand in need of; poor, and distressed, and suffering under the pressure of difficulties as you may be, and no doubt are, whatever may be Mr. Cayley's opinion of you, I shall not, I cannot, for a moment, think that you would ever be so base, pitiful, not to say dishonest, as to wish even to benefit yourselves by the robbery of any other classes of the community, or at the expense of the public faith, and the ruin of the national credit.

The exactions of your rack-renting landlords, the plunderings of your tithe-grasping parsons, the operations and pressure of bad laws and taxes, joined with the natural and unavoidable fluctuations of crops and seasons, have rendered, and may render you for some time yet, in depressed circumstances, yet remember, though these causes may keep you *poor*, neither they, nor any other power on earth, can make you dishonest. No! Farmers of England! Descendants of those noble yeomen whose indomitable courage gained the glorious victories of Cressy and Agincourt! and carried the fame of their country over the civilized globe—you would indeed disgrace your brave ancestors by accepting of relief at the expense of honour! Trust not then for that relief by any depreciation of the standard of value of the realm.

It is, no doubt, true that you suffered great inconvenience and distress, along with the other classes of society, from the withdrawal of the one pound notes from circulation; but you must by this time be well aware that this was a measure of

sound and strict justice, to prevent the recurrence of those panics which had before afflicted the country, from the circulation of a fictitious medium in quantities so very much beyond the real capital at stake, and to place upon a firm and substantial basis, the monetary transactions and fiscal of the nation!

After these statements, it is quite unnecessary for me again to repeat that it is in vain for you to expect relief from the legislature. In fact, Lord John Russell expressly declared this in the House of Commons, on the 21st of July last, in the following words taken from his speech:—

“He admitted, as he must do, that distress had prevailed for some years among the occupiers of the land, a distress which he had always lamented, and which he hoped was now diminishing—it was not to be relieved by a change in the currency—that it was not to be relieved by the repeal of the malt tax—that it was not to be relieved by any specific measure the parliament could apply to the evil.”

Such being the case, (if you, Mr. Editor, will be kind enough to grant me the space of your valuable columns) I shall proceed in my next letter, to consider the means remaining of obtaining relief to agricultural distress, till which time

I am your obedient servant,  
*Malton, Oct, 1836.* AGRICOLA.

#### FROM A CORRESPONDENT IN SUFFOLK.

At Oakley Park, on Wednesday the 5th of Oct., Major General Sir Edward and Lady Kerrison, gave their annual dinner and entertainment to their Cottage Garden Tenants, altogether about 200. The schools belonging to the parishes in which their estate is situated also assembled to partake of their hospitality. The gentlemen, clergy and occupiers of land in the several surrounding parishes were also invited to a luncheon, and to witness the assemblage of so numerous a portion of the peasantry of the country, and see their own labourers receive the prizes which were awarded them. The gardens were visited by competent judges, and most satisfactory results reported of the immense produce grown on the land, and appearance of improved condition of the poor cottager, so as to render him comfortable and happy, and tend to his becoming a more useful member of society. The system adopted here, may be said in all points, and particularly the quantity of land, quality, &c. to surpass in intrinsic worth, others of the kind, and must certainly be more valuable to all parties than might, without consideration, be conceived, as nothing could show more satisfactorily the productiveness of the soil in that neighbourhood when carefully cultivated.

The day proved very propitious, which enabled the cottagers and a large congregation to assemble at Hoxne Church at half-past twelve o'clock. After the usual service of prayers an appropriate sermon was preached by the Rev. Lord Bayning, which rivetted the attention of all present, and could not fail to raise in the heart of many a hoary headed cottager a glow of love and adoration to him who alone stands supremely good, the great Governor of the Universe. It must not be omitted that the sweet tone of a new organ which was presented by Sir Edward Kerrison, Bart., to the Church, and then played for the first time, and aided by a hymn prepared for the occasion, excited much admiration,

while the skill of the organist, assisted by the young voices of the children joining in hymns and chants, added much to the religious solemnity of the occasion. After service a general meeting took place at the East Lodge, about half a mile from Oakley Park, whence they proceeded to partake of an excellent dinner prepared for them, headed by a band of music playing appropriate airs, and so numerous were the persons, that men, women, and children, formed a line in continuity nearly to the Mansion. The appearance of the train in passing the Serpentine River and walks in the Grove on their approach to the house, was so strikingly affecting, that it would be difficult to give a perfect description of it. After their arrival, grace was said by the Rev. Lord Bayning, they all sat down to regale themselves in the most orderly manner, and excited the admiration of the numerous party which had arrived to join in the pleasure and interesting scene of the day.

Too much cannot be said in favour of the scheme so warmly supported by that kind hearted liberal landlord and friend to the working classes, both in money and personal attention.

#### THE TITHE BILL.

TO THE EDITOR OF THE HEREFORD TIMES.

SIR,—Having given to your readers, rather amply, my opinion of the Tithe Commutation Bill, during its passage through the House of Commons, and that, if passed into a law, it would prove highly injurious to the agricultural interest; and ruinous, if the compulsory clause should ever be enforced, to the Established Church—I have waited till the present time, though my opinions remain unchanged, under the hope of reading in your paper those of others upon it.

Some very important, and in my view, very absurd and imperious clauses, have been subsequently added to the Bill. By one of these, every clergyman who has not enforced his claim of tithes to the amount of four-fifths of their value, and I am happy to say, that there are many who, (from the best motives, and from feeling the iniquity of the Tithe Laws, which take away the tenth produce of the soil, without making any allowance for the increased expense of culture, through taxation and other causes) have not done so, will, with their successors, for ever be robbed of a portion; and, in cases within my own knowledge, of a very considerable portion of their just dues; and I do not doubt, but that a good many of those pious and conscientious persons who have so warmly defended the rights of the Church, will be found quite as willing as others to rob it, under the circumstances above-mentioned. No clergyman, with any regard to justice, can, in my opinion, permit his tithes to be commuted upon such iniquitous terms; and I hope that the conscientious and excellent men above-mentioned, who, from the best motives, have not fully enforced their claims, will feel that, though they have had a right to relinquish a portion of their own temporary just claims, they have no right to give away the property of their successors.

By another clause, the clergy are given the power to demand a higher payment for all ground which shall hereafter be employed as hop ground, orchard, or market garden. Now, the hop-grower who purchases his poles, as hop growers generally do, already pays a heavy tax to the Church, in the price of tithe poles; and much of the ground now growing hops in Here-

fordshire is of very little value to the tithe-owner, under any other mode of culture; and such generally yields but little profit to the farmer.

The produce of an orchard, during many years after being planted, is wholly insufficient to repay the expenses of protecting the trees. At what period of the growth of such trees is the clergyman to make his demand for a larger payment? During the progressive decay of an orchard, and when, comparatively, few of the trees remain, and those but little productive, is the ground still to pay, as an orchard, to the clergyman of the parish?

Most of the ground round towns is now employed as a pasture for riding horses; from such nothing whatever is due to the tithe-owner, and from such ground the owner obtains, on this account, a very high rent. The chief object of the Tithe Commutation Bill was to enable every occupier of the soil to cultivate it to the greatest advantage to himself and to the public, and to put an end to the ruinous influence of quarrels between the clergy and their parishioners. Under a just and proper mode of commutation, all ground would be made to pay according to its intrinsic value to the title-owner, and most of the soil now employed as a pasture, near towns, for riding-horses, might be cultivated as market-garden ground, with much advantage to the inhabitants of such towns, and might find employment, as the market gardens round London do, to numerous women, and feeble old men. A tax upon hop grounds and market gardens must necessarily fall wholly upon the consumers of beer and potatoes, and other vegetables, and, of course, chiefly upon the labouring classes of society; and those classes are now sufficiently enlightened to know this, and to know for whose benefit they are made to pay a higher price for the common necessaries of life.

The Bill ought, I conceive, to have defined what a market garden is. Does ground cease to be a garden when it is partially tilled by means of a plough? The market gardeners, with many of whom my office of president of the Horticultural Society of London has caused me to be acquainted, have latterly complained to me, that they sustain very great injury by the circumstance of a very large portion of the produce of the gardens of the nobility and other affluent classes being sold in the market, as is well known. Is it equitable, that the ground of the poor laborious market gardener should be subject to a heavy tax, from the operation of which the future gardens of the higher and more opulent classes of society will be wholly exempted?

I ask the clergy what will be the effect of their being placed to act as spies respecting the culture of the soil in their parishes, and of their enforcing the conditions of the clauses above-mentioned? and I will tell them that it will cause the churches to be deserted, or, perhaps, what is still worse, occupied solely by a couple of hired old women, as has already occurred in too many cases; and they will be deprived of all power of annoying those by whom they will be insulted.

It will, perhaps, be said that the landowner only, and not the farmer, will have to pay the clergy; but it will be found, that the landlord will not indemnify the farmer from the extortions of the clergy; and I will confidently tell the farmer, that whenever the clergyman extorts more than his due, he (the farmer) will be, to a large extent, the sufferer, in almost all cases; and if he, so far approves the conduct of the clergyman, that he, with proper feelings, take the holy sacrament from his hands, and can attend, with proper feelings, the church, he ought not to complain, if he, in part, supports the clergyman of his parish. But

the landowners and the farmers will be led by their interests, aye, and by their moral and religious feelings, also, to join in causing the legislature to award to the clergy their just dues only; for it is but too well known, that the public dissatisfaction with the clergy, arising (I am happy to admit) from the misconduct of a comparatively few, has caused the enormous secession from the Established Church, and the decay of the established religion of the country.

I may be asked why Lord John Russell and his party did not cause a better bill to be passed. I have put the question to many of his party, and the answer which I have always received, has been, that they could not. The landowners and farmers appeared whilst the clauses of the Bill were discussing, to look on with supine indifference. I had frequent communications with Sir Robert Price, who, I can confidently say, did his duty in opposing the injurious clauses of the bill; but of what value could his exertions prove, when his opponents could tell him, that amongst all his constituents, he could not name two, who had expressed any degree of disapprobation of the bill?

The claims of the Church upon my property are small, and the position of my titheable property, and other circumstances, give me the power to resist oppression: and, if I chose, to oppress. I would, however, gladly commute, upon equitable and beneficial terms, to the Church—but I am wholly at a loss how to commute under the conditions of the bill. Others with whom I have conversed, have expressed the same feelings, and have agreed with me in thinking, that without enforcing the compulsory clause, the bill will ever remain, to a very great extent, a dead letter; and if our legislators would proceed to enforce the compulsory clause, they will, in my opinion, prove themselves much better qualified to sit in an infant school, or in a cell in bedlam, than in either House of Parliament.

I propose, in your next week's paper, to address a few remarks to my countrymen, upon the iniquitous operation of the Corn Rent, if adopted, by the possessors and cultivators of Herefordshire.

I remain, Sir, your obedient servant,

T. A. KNIGHT.

### LANCASTER AGRICULTURAL SOCIETY.

On Monday, October 10, the Lancaster Agricultural Society held its annual meeting, and we are happy to say it proved in all respects one of the most satisfactory that has occurred for some years.

With regard to the show of cattle, we have the authority of some of the most experienced practical men in the district for saying that it was highly creditable to the society and far superior to any that has preceded it for some time. We heard it observed that there was nothing shown that could fairly be called indifferent, and that the many who, of course, could not get prizes, well deserved them. It was really gratifying to see so much good servicable stock exhibited, bearing, as it did, sure testimony to the efficiency of the society, and of the improvement of our local agriculture in one of its most important branches. Both in quantity and quality the stock shown was such as we have not been in the habit of witnessing; and in respect to horses, the exhibition afforded the highest satisfaction.

About four o'clock, a large party assembled at dinner, at Pritt's, King's Arms. The President, John Bolden, Esq., of Hylning, presided, and he was supported by J. Wilson Patten, Esq., M.P. for the

Northern Division, T. Greene, Esq., M.P. for the borough of Lancaster, E. Hornby, Esq., J. Bond, Esq., R. Atkinson, Esq., Rev. J. S. Bolden, J. C. Satterthwaite, Esq., T. H. Bateman, Esq., J. Bolden, Esq., &c. &c. The Vice-Chair was occupied by R. Hinde, Esq., who was supported by T. Thompson, Esq., S. E. Bolden, Esq., T. Redmayne, Esq., J. M. Arthington, Esq., E. Bond, Esq., H. R. Ford, Esq., J. Ford, Esq., F. Simpson, Esq., &c. &c.

The customary toasts having been drank,

The CHAIRMAN, in rising to propose the usual toast of success and perpetuity to the Society, expressed himself happy to see such a meeting as that before him, and explained that, owing to the unfavourable state of the weather and consequent backwardness of the season, it was considered desirable to put off the annual meeting till the present period. He hoped the arrangement had not proved inconvenient to any member of the Society, and he was happy to find by the full attendance of that day, that in other respects they had no reason to regret the postponement. With regard to the exhibition of that day, he was precluded from saying anything of the stock, as he himself was a competitor, but he might go so far as to say, that the show of horses and sheep was such as reflected no discredit upon the agriculture of the district, and though his friend Mr. Hornby had walked over with his pig, he would say, a finer specimen could not be shown. On the subject of agriculture generally, *he had last year cautioned the farmers not to be deluded with the notion that it was in the power of Parliament to afford any relief; and it gave him great satisfaction to see that Lord Stanley not only took the same view, but explained it in much better language than he was master of at the Liverpool meeting. His lordship also pursued the same line of argument in Parliament, and was ably supported by his hon. friends on his right and on his left, and with still higher effect by Sir Robert Peel. He thought the result of the enquiry that had taken place must convince all how chimerical was the idea of obtaining relief by legislative enactment, and that, for the best of all reasons—Parliament had not the power to grant it. They all knew that the most absurd notions were entertained on the subject, many believing that Parliament could regulate prices and profit, and rent into the bargain. He need not say that Parliament could have nothing to do with rents,—(hear,) and in regard to prices, it was astonishing to hear what strange notions some farmers entertained. Any person who had paid any attention to political economy must know that prices were wholly governed by supply and demand. Then, with regard to the more important question of profit, it was clear that Parliament could have nothing to do with that: since it depended entirely on the skill, prudence, and industry of the farmer. There had arisen, however, an engine much more powerful than Parliament in its influence on agriculture. He meant the power of steam, which was bringing the produce of the most distant places into one general market: and, under all these circumstances, he hoped the farmers would see that the parliamentary panacea for agricultural distress was all delusion. (Hear.) It would be observed, he spoke strongly on the matter, but, occupying the situation he did, he felt it his duty to make very particular enquiries into the opinions of farmers far and near, and he regretted to say, the most strange and absurd notions prevailed. He was sorry thus to see John Bull propagating the delusion, for he was sure no class would suffer more deeply from it than the farmers themselves. He trusted, however, from the favourable meeting of that day, and from what he knew of the feeling of the country, that the*

delusion was passing away; and he thought, upon the whole, they were justified in looking forward to better times and better circumstances. (Hear.) They all felt the unfortunate season just passed over in some degree, but he believed there was one description of crop that had suffered more than all the others, and that was turnips. All who heard him must be aware of the advantage of the turnip to the land, and that, in fact, turnip culture was the main stay of successful farming—that was, upon lands favourable to its cultivation. There was one subject that came nearer home, on which he would say a few words, which, he trusted, would be taken in good part. They were all aware of the benefit that accrued in general from ploughing matches. At the last meeting, there was one held on the northern edge of this town, and though the land staked out was unfavourable, he believed the judges considered the workmanship to be good; but it was a source of observation and regret, that on that occasion there was not one competitor south of the Lune. What was the reason he did not know. He believed the iron plough with two horses had not yet been introduced, and that they ploughed with two, three, four, or six horses, and sometimes with two drivers. It might be requisite in some soils, but generally speaking, if farmers had a spark of worldly wisdom left, they would not let such things be done on their land. He knew that in the south, they were proud, and justly proud of their horses, but he could wish to see them employ their excellent breed more economically. He would not detain the meeting longer, but propose, Success to the Lancaster Agricultural Society, with three times three.

The toast was drank with due honours.

Mr. WILSON PATTEN rose to propose the health of the President. The Lancaster Agricultural Society, he observed, was very fortunate in having its interests so efficiently guarded, and also in having the opportunity of receiving the advice that had that day been given from the chair. In that advice and the opinions declared by his hon. friend the President, he fully concurred. He had expressed elsewhere, his belief, that it was *not to Parliament but themselves, the agriculturists must look for relief*. He desired that things should be left to take their own course. For reduction of taxation he had always voted, not because he thought it could afford any great relief to the farmer, but because relief in any degree was what he sought. He believed, however, that it was following the advice of practical men like his friend the President, that the surest remedy was to be found, and to show their estimation of such advice, he proposed that they drink the President's health with three times three.—(Applause.)

The toast was cordially drank, amid the prescribed number of cheers.

The PRESIDENT said, he was most happy to be able to meet the Society to return his thanks, for the weather not content with attacking agriculture in general, had assailed their unfortunate President and laid him up in a fit of rheumatism, which rendered it doubtful whether he could attend the meeting. In alluding to the subject of turnips, he forgot one point, and that was to express a hope that some turnip growers present would be so kind as to give some account of the black caterpillar. There was also the disease that had attacked the potato, which was becoming worse and worse, and excited a good deal of alarm in the minds of many, for after all the experiments that had been resorted to, they were all as much in the dark as ever.

The PRESIDENT proposed the health of Mr. Wilson

Patten and Lord Stanley, with three times three.—*(Applause.)*

The toast was drunk with loud cheers.

Mr. WILSON PATTEN returned thanks. He could answer as well for his noble colleague as himself, that they were both resolved to support the interests of agriculture. He hoped he should ever be found in his place, ready to give his advice, and what was more important, his vote in favour of their interests. In whatever situation he should be placed, he should do his best to promote agriculture in general, and this Society in particular.—*(Applause.)*

The PRESIDENT begged to propose the health of Mr. Greene, in conjunction with his hon. colleague, Mr. Stewart.

Mr. GREENE begged to return his best thanks for himself and his hon. colleague, who, he was sure, would feel highly gratified, like himself, at having his health drunk by such a company as was then assembled. If he (Mr. Greene) had anything to regret, it was that there was not a larger attendance of farmers; because, nothing could be more beneficial to both farmer and landlord, than that all should be occasionally brought together and join in social intercourse. By staying away, they deprived themselves of the benefit of hearing the observations that had fallen from their worthy President that day, and which he was sure could not be heard without benefitting the hearer. He the more particularly dwelt on the subject, because he had lately attended the meeting at Burton, where so many farmers were assembled. It was to him most gratifying to witness all classes so meeting together, and bringing to bear their collective information; and if means could be devised for bringing the working farmers of the district more together, he was sure the Society would be greatly benefitted. With respect to his hon. colleague, he was most friendly to agriculture. All his early associations connected him with the soil, and though his present occupations led him to other pursuits, he knew he took a great interest in agricultural affairs, and in the welfare of this Society in particular.—*(Applause.)*

The PRESIDENT.—Mr. Ellison, can you tell what is most likely to check the depredations of the caterpillar on the turnips?

Mr. ELLISON.—I really cannot.

The PRESIDENT.—The question to consider was, how it was to be destroyed. He believed it was not so destructive as was represented, for he knew when they had eaten off the leaf the turnip had recovered, though it certainly did not arrive at the perfection it otherwise would.

Mr. THOMAS JACKSON.—I believe you are quite right Sir.

Mr. ELLISON begged to differ both from the President and his friend Mr. Jackson. He thought both wrong; for he had seen a field of five acres completely destroyed. In his own case also, where he was last year obliged to substitute turnips for the trifolium incarnatum, the crop was covered with black caterpillars. He ordered his men to cut birch boughs, and with these they whipped off quantities, and other men were employed the while in treading the insects down. By that means he got about half a crop. His brother had tried salt but it would not do. One night all Sedgewick rose and whipped off the caterpillars, but next day they were there again. At Merley Moss, the case he first alluded to, the leaves were entirely eaten off, but with his brother's they were only perforated. His white turnips were not attacked, the injury they received being chiefly occasioned by the weather.

The CHAIRMAN stated that in returning from Ken-

dal to his own house in August last, and when it was pouring with rain, he was surprised to see some people taking casks of water into a turnip field at Levens, and asking for an explanation, he was told that they were "poisoning the turnips." He believed it was a preparation of arsenic they were using, and he wished to know if it had been successful.

Mr. ELLISON.—He believed it did no good. The crops were worse than any other. With respect to potatoes, he thought he had last year got a pure seed, from which he might transplant without fear. It was procured from a district where the disease was not known. He cut the seed as usual, but got only half a crop. He then resolved to plant whole and gave orders to that effect, but he found only a portion had been left whole, the Hind having declared it to be complete waste. The result was that in the rows that were planted with cut seed, they were obliged to break the ground and sow Swedish turnips, but where the rows were planted whole the crop was quite good. He believed the fact to be that there was an insect which perforated the cut part of the potato and devoured all its juice, but which was repelled by the nauseous rind of the whole potato. He was also of opinion that by planting upon manure in the spring of the year animalculæ were brought to life and that these afterwards preyed upon the vegetation. There was another advantage in planting whole—they might plant them eighteen inches apart.

The PRESIDENT.—What was the produce?—that was, the difference between the produce of a potatoe planted whole and a potatoe cut into four or five sets?

Mr. ELLISON.—He was disposed to think that the produce was equal on a thriving potatoe soil.

Mr. WILSON PATTEN asked Mr. Ellison if he had ever tried one against the other?

Mr. ELLISON said he had. He had found years ago, and every farmer would bear him out in it, that the produce was greater where room was given than when planted full.

Mr. HORNBY observed that on a small scale he could confirm Mr. Ellison's statement. He had planted some Flat Reds and Red Kidnies, part of each whole, and part cut. In the latter case, both came up very badly indeed, whilst the rows set whole looked as flourishing as plants could, and he had no doubt they would turn out very good.

Mr. THOMAS JACKSON confirmed these statements. He had planted a quantity of the small pig potatoe whole, but finding his seed run short a few rows were planted cut. The whole sets came up as fine a crop as he ever saw, but the cut ones did not produce half a crop.

The PRESIDENT observed that what they had heard upon this important subject shewed how much his Hon. Friend Mr. Greene was in the right when he alluded to the advantage which farmers would experience by attending such meetings. He hoped however what had transpired would go abroad in another way.

Mr. WILSON PATTEN in allusion to what had just fallen from the chair, begged to propose the health of the worthy gentleman who had presided over the recent meeting of a neighbouring society, where of a company comprising nearly 100 persons, the chief part were farmers. It was indeed, an incalculable advantage to farmers to be present at these meetings, and bear what was said.

The PRESIDENT said he had heard much of the powers of steam, and he would mention that a few weeks ago he heard some of the engineers on the Darlington railway say the time would come when they would not have farms advertised in the usual

way, but that steam farms of large extent would be put up for letting. Whether it was to be so or not he could not tell, but he was assured that however the tillers of the soil were destined to cultivate their land they would do it in a spirit worthy the character of a British farmer. He begged to give the farmers of England, with three times three.

The toast was drank with due honours.

The premiums were then read by the Secretary.

Premium the first, a silver cup or five sovereigns, to the occupier of a farm of not less than forty acres who shall have made the greatest improvement in cultivation, &c.—Mr. Luke Ellison, of Sedgwick. There were four competitors.

A silver cup or three sovereigns, for the best crop of turnips—to Mr. John Scott, of Sedgwick. There were five competitors for this prize.

A silver cup or five sovereigns, for the best general Stock of Store Cattle—to Mr. Ellison, Sizergh.

The reading of the premiums was then resumed.

For the best Bull, a piece of plate or five sovereigns—Mr. Wm. Ellison.

For the best Cow, in milk or calf, or best three year Heifer, a piece of plate or three sovereigns—Mr. Bolden.

For the best two year old Heifer, a piece of plate or three sovereigns—Mr. Thos. Jackson.

For the best Ram, three sovereigns—Mr. Thos. Jackson.

For the best three shearing Gimmers, three sovereigns—Mr. Jno. Bland.

The Secretary then read the Sweepstakes:—

Long-horned Cow—Mr. Wilson Patten and Mr. T. R. W. France—won by the former.

Short-horned Cow—Mr. Bolden and Mr. Pritt—won by the former.

Cow of any breed—Mr. Wilson Patten, Mr. Greene, Mr. Atkinson, Mr. Bolden, and Mr. Pritt—won by Mr. Bolden.

Short-horned heifer—Mr. Pritt, and Mr. Bolden—won by the latter.

Brood Mare—Mr. Wilson Patten, Mr. P. Hesketh Fleetwood, and Mr. H. R. Ford—won by the latter.

Colt or Filly—Mr. Wilson Patten, Mr. P. Hesketh Fleetwood, and Mr. E. G. Hornby—won by the latter.

Colt or Filly (two years old)—Mr. Wilson Patten, Mr. Greene, Mr. F. Rawsthorne, Mr. Jno. Bateson, and Mr. W. Cottam—won by Mr. Rawsthorne.

Colt or Filly (one year old)—Mr. E. Hornby, and Mr. Aldren—won by the former.

Ram—Mr. Wilson France, Mr. Pritt, Mr. Bland, and Mr. Jno. Bateson,—won by the last named.

Ram (one shear)—Mr. Wilson France—no competitor.

Fat Ewe—Mr. Robt. Winder. No competitor.

Ewe—Mr. Wilson France, Mr. Ford, and Mr. R. Winder—won by Mr. Winder.

Ewe (one shear)—Mr. Bland, and Mr. Wilson France—won by the former.

Ewe Lamb—Mr. Wilson France, Mr. Pritt, Mr. Bland, and Mr. Winder—won by Mr. Bland.

Sow—Mr. P. Hesketh Fleetwood, Mr. Hornby, and Mr. Bolden—won by Mr. Hornby.

Turnip—Mr. W. Ellison.

The President proposed the health of the Judges of Stock—Mr. Scotson, of Toxteth-park; Mr. Dodds, of Standish, and Mr. Almond, of the same place.

The President took the opportunity of saying, that in consequence of the excellent show of young horses that day, it had occurred to him whether it would not be desirable to establish premiums for colts and fillies. If any gentleman objected, or the

funds would not admit of the additional premiums, it could be taken into consideration at the next meeting. It had suggested itself to him in consequence of the show that day, which did the district great credit.

The health of the judges of Stock was drank, with three times three.

Mr. Dodds returned thanks. With regard to the show, the stock was for the greater part above mediocrity. The sheep were not what he admired. He considered the fleeces too light, and it was a question whether the breeding a fine quality did not weaken the constitution of the animal, as well as produce a diminished quantity. With respect to the horses, there were some colts shown of which he should be glad to see more in the county. Altogether, it was a very fair show. Mr. Dodds then made some practical observations on the breeding of horned cattle, and then alluded to the subject of potatoes. He said, he could bear out Mr. Ellison and Mr. Jackson, in what they had stated, both with regard to cutting the seed and planting thick. He would advise farmers to give up thick planting. There was a case that had fallen under his observation, that could not be so easily accounted for. He had procured a lot of seed, and divided it amongst three of his friends. In two of the three lots the produce was ample, whilst the third proved a total failure.

Mr. Ellison thought this latter case might be accounted for, Mr. Dodds had not told the meeting whether all the lots had been planted at the same time of the day. He recollected once planting on warm manure in the morning, and resuming the work in the afternoon after the manure had been cooled by a heavy thunder shower; with the seed planted in the afternoon he was successful, but that planted in the morning was widely different. His conviction was, that the warmth of the manure gave existence to the animalculæ in it, and which in time fed on the plants.

Mr. Dodds said, he had heard Mr. Ellison maintain his doctrine of animalculæ before; but he remembered that when he was a boy, they planted potatoes in any way; and horse dung was generally used. Therefore, Mr. Ellison's doctrine amounted to nothing. At Wigan they tried all sorts of dung.

Mr. Ellison—But were they all planted whole?

Mr. Dodds—That did not matter.

Mr. Ellison said, it was true that in their younger days they planted as they pleased, but at that time the land was not so well drained, and the winters were more severe. He believed that it was owing to the open winters of late years that the animalculæ increased: the frost of winter being necessary to destroy the insects.

The health of the Judges of the Crops—Mr. Wm. Smith, of the Hole of Ellet; Mr. John Bateson, of Bolton-Sand-side, and Mr. Thomas Corbishley, of Thurnham, was then drank with three times three.

The President, in proposing the health of Richard Atkinson, Esq., of Ellet Grange, said the Society had long experienced great pleasure from the manner in which that gentleman had filled the office of Vice-President, and hoped he would live many happy years to repeat his kind offices.

Mr. Atkinson returned thanks.

Mr. Ellison proposed the health of Mr. Samuel Hinde, and the toast was drank with honours.

The President, in proposing the health of the Secretary, said no eulogium of his could do justice to the merits of Mr. Binns. He begged to give the health of their most excellent Secretary and Treasurer, and their sincere thanks to him for his ser-

vices during the long period that he had executed the duties of the office.

Mr. BINNS returned thanks. He had only to say for himself that he felt highly gratified to have been selected as the Secretary of the society for so many years. He considered agriculture of so great importance, that it was impossible for any man to do too much in its behalf, and if he had given his mite of assistance, he had only done his duty. With reference to what had been said by Mr. Greene, it was, indeed, much to be lamented, that farmers hung back from these meetings, for it was clear to him that it was the interest of all to support such societies as this. They ought to be encouraged not only by the farmer, but by every other class, since it was by improved cultivation the same area of soil could be made to produce a larger proportion of food, and the public would be able to purchase at a cheaper rate. To the manufacturer, in particular, with whom wages was so material an item of expenditure, he thought the promotion of agricultural improvement was a matter of great importance. With that impression, he wondered that more of the manufacturers in the district did not join the society. He would take the opportunity of suggesting the expediency of having a small library attached to the society. About 20/ would be quite enough to purchase one that would answer every purpose. He begged to return thanks to the meeting for drinking his health.

Mr. ELLISON, in reference to what Mr. Binns had said on the subject of grasses, wished to say a few words. He had been in shops in different places, and he generally found that what was sold for rye-grass seeds, was mixed up with common couch-grass. With that seed the farmer sowed his land, and however clean the land may have been, he would undo all by sowing this seed. He ought to sow only the pure rye-grass seeds raised from his own seeds. He was confident that half the dirty land was owing to the farmer purchasing these seeds. It was said the farmer ought to be a chemist. He did not think that, but he was sure he ought to be a botanist, and then he would keep his seeds more pure.

Mr. WILSON PATTEN proposed the health of Mr. Bond, and prosperity to the town of Lancaster, with three times three.

Mr. BOND returned thanks.

The PRESIDENT then alluded to the subjects for discussion, and said he should be glad to hear the opinion of any gentleman.

The first subject was on the increase of grain, stock, and manure, by cultivating green crops, and by stall feeding, and on the merits and comparison of different green crops.

The PRESIDENT having called upon some of the company for their remarks upon the first subject fixed for discussion, Mr. Binns stated that he had waited for Mr. Ellison or some other gentleman to express their opinion, but as the subject appeared likely to be lost sight of he wished to say a few words on the subject, believing at the same time that much benefit might arise from having subjects for discussion fixed beforehand, and noted in the lists, that the members might be prepared to give their sentiments fully. It was well known that clover, tares, turnips, and other green crops, if well managed were fertilizers of the land, in part it is supposed from their receiving a considerable portion of their nourishment from the atmosphere. It is also well known that the crops will fail if the same species of plant is sown on the same land year after year; that the land to be well managed must have change is admitted; the operations of nature and the course of this is not so easily ascertained or admitted; one

writer attributes it to the plants deriving each its peculiar sustenance from the soil, therefore if the same plant be sown frequently it exhausts that peculiar quality in the soil on which it feeds. Another attributes it to an excrementitious matter in the soil, which is left by plants which are injurious to plants of the same nature, but may be advantageous to plants of another genus. But it is certain that by an alternation grain and green crops, such as clover, turnips, mangel wurtzel, &c., the land is improved, and if the clover be mown and given to cattle in stalls or sheds, two acres will keep as much as three in the usual method, and the manure will be preserved and be of far greater value to the farmer than if exposed and dried in the sun and wind upon the field; and he may thus increase the fertility of his farm to almost any extent, and he will thereby increase not only his stock of cattle, but his grain and all other produce by cultivating green crops and by stall feeding.

Mr. JACKSON said the plan might do very well for a small arable farm of forty acres, but where there was a quantity of meadow and pasture it would not answer.

The PRESIDENT said that was the way an English farmer ought to come forward and state his objection. Now in opposition to Mr. Jackson's views he could show a farm just beyond Greta Bridge, where there were 20 or 30 heads of young horses all collected in the farm yard. The plan was found to answer in an extraordinary manner.

Mr. JACKSON.—But all have not that convenience.

The PRESIDENT.—True, but this shows the value of discussion.

Mr. ELLISON would venture to say that there was more accommodation of the sort required to be found in the farms of Westmorland and the north of Lancashire than in the whole world again. He had been on the Duke of Cleveland's estates in the north, and there was not one on which they could drive a cart into a barn and unload 40 or 50 loads of grain; and they had loose sheds for cattle. But here it was said the landlord did not do his tenant justice if he did not build this, that or the other. He was sure no stigma could attach to the landlords of Westmorland and Lancashire for not building conveniences to house grain.

Mr. ELLISON proposed the health of Mr. Jackson, of Borwick Hall, in a highly complimentary manner, and took occasion to say that he found all those farmers the most ready with their rent, who adopted the improved system of husbandry.

Mr. JACKSON returned thanks.

Before the meeting broke up, a number of Sweepstakes for the next meeting were entered into

**RUSSIAN AGRICULTURAL SCHOOL.**—The directing Senate of Russia, in consequence of an order from the Emperor has founded an agricultural school on one of the estates of the crown, and in the government of Mohiloff. This school is divided into two sections; in the first, the pupils are to study three years, in order to be capable of executing or advancing any plan proposed for the improvement of rural economy. The second is destined to the education of practical farmers, who by means of their extensive knowledge, may be able to direct the farming of great estates, and to introduce the improvements of which they themselves form the plan. The school is to be furnished with a collection of agricultural tools, both Russian and foreign, and either of the proper size or as models. The pupils will all be taught to make the various tools and machines which are used in the establishment, or which are required for sale.

PENRITH BRANCH OF THE EAST  
CUMBERLAND AGRICULTURAL  
SOCIETY.

The third annual meeting of this Society was held on Wednesday Sept. 28, at Penrith, and we rejoice to record that in every respect it was most cheering for the subscribers, and highly interesting to strangers, many of whom attended from a very considerable distance. The heavy and long-continued rain made the ground very uncomfortable, and the stock did not appear so well as they would have done had the day been more favourable. The quantity shown far exceeded that of the two previous years, being fully one-third more than last year, a convincing proof of the increasing interest taken in the success of this Society. Among other noble animals, a fine bull belonging to Mr. Denton, four years and a half old, attracted every person's observation: it was certainly one of the finest, as regards bulk, on the ground. A bull, purchased by Mr. Sober Watkin, of Plumpton, for ninety-five guineas, very naturally attracted the sight of many of the breeders present. The sheep were very first-rate, and so numerous that the task of selecting the best, must have been one of great difficulty to the Judges. The mares and foals were declared to be superior in every respect to those shown there on any former occasion, and the swine were good and great. If there was a falling off at all, it was in the quality of some of the inferior cattle, which did not come so near the winning mark as on some former occasions. We subjoin, in the course of this article, a list of the premiums awarded, with the names of the fortunate competitors.

A very sumptuous dinner was served at the George inn, to a most respectable party, 203 in number, including the principal gentry and yeomanry of the county.

After the cloth had been drawn, Wm. Crackanthorpe, Esq., of Newbiggin Hall, the Chairman, proposed the health of his Majesty with three times three.—The next toast was the Queen: then the Princess Victoria and the rest of the Royal Family: and then the Army and Navy.

The CHAIRMAN then said—Mr. Vice-President and Gentlemen, the next toast I shall propose to you is the health of the Lord Lieutenant of the County, as the liberal and munificent patron of this society, and the constant supporter of agriculture in general. (*Drank very cordially with three times three and one cheer more.*)

Colonel LOWTHER returned thanks.

The CHAIRMAN then, after some prefatory observations, said—I believe, Gentlemen, that I may congratulate myself that it has fallen to my lot to be called to this chair at a moment somewhat more favourable to the interests of agriculture than either of my predecessors. A great change has taken place in the prices of all sorts of agricultural produce. Wheat, I believe, at this moment bears an average of 50s, wool is in great demand, and I believe I may add that stock offers a fair remunerating price, both to the breeder and to the grazier. (*Hear, hear.*) And, Gentlemen, we must not forget that all these material changes for the better have taken place without resorting to any legislative enactment; not, indeed, that I believe the agricultural interest is so perfect, that no change is required, but we do not require any material change; for during the last Session, the House of Commons appointed an agricultural committee, formed of county members and the

most intelligent individuals in the House, and those gentlemen, best versed in the subject, were not able to come to a conclusion as to the cause of the distress that overhung this important interest so long, and therefore, of course, were not able to propose any remedy. Mountains appeared in parturition, but not even a mouse has been produced. (*Laughter and applause.*) As to the low price of wheat, in former years, for I think it was once as low as 36s per quarter, I think it may be fairly attributed in some measure to the abundant harvests with which it pleased providence to bless these islands—and what being the natural standard of all agricultural value, it follows therefore that all productions depreciated in the same proportion. There is, however, an elasticity about a great nation, that enables it to recover from the loudest shocks, and I believe the greater proportion of the wonderful and marvellous increase of the commerce and manufactures of this country is to be ascribed to the low prices of corn and other articles of agricultural produce. But it is impossible that such an interest can long languish, while commerce and manufacturers prosper, and I rejoice to say, that after a too-lengthened period, we are now witnessing the revival of this interest: the revival of agriculture has taken place; thus I think we may congratulate ourselves that by such healthy means, rather than by any more than doubtful experiments, I now refer more especially to any projected alteration of the currency, a new order of things have arisen, and that question I believe is now set at rest for ever. But, Gentlemen, I do not mean to say that there are not grievances which may not form a good subject of complaint on the part of our Representatives in the great council of the nation, their strongest and most serious attention. I think, for instance, that increased facilities may be given to the disposal of our produce; I think also that a part of the duty on malt may be repealed or taken off, for I have not to learn that it forms such a large amount of the income of the country, that it would be useless to dispense with the entirety. With respect to Tithes, I would remark that this subject has already engaged the attention of the legislature, and an Act which was passed on the subject during the last session of Parliament, has deprived us of the able services of our late Representative, Mr. Blamire, who has been called upon to carry that Act into force as a Commissioner. I hope, Gentlemen, it will not be considered impertinent in me if I express my regret at his absence this day, not in the character of a politician, for with that we have nothing to do here, but in the character of an agriculturist, for I am sure that no man has it more at heart. I trust that by this commutation of tithes a great scope is given to agricultural skill and industry, and that when a rent has been once permanently fixed, every man may cultivate his land according to his own way, and I trust this measure will be soon followed by a bill for the abolition of tithes. With regard to the poor-rates, which press heavily upon the land, I believe that I may say they have been reduced to a considerable extent by the new Bill, and that not less than two millions will be saved between the totals of 1831 and 1836, upon the general poor-rates of the country. In this district, we happily have been almost exempt from the almost intolerable burden, which oppressed the southern counties; here there still exists among the peasants, I believe, a bold feeling of honest independence; we know nothing here, happily, of

whole parishes becoming pauperized. As, however, the Act of the Legislature is for the purpose of rendering the deserving poor more comfortable and better attended to, while it is calculated to deter the idle and the profligate, and to raise the general standard of the moral feeling of the people, I trust it will become beneficial even in this county, though we cannot expect to derive from it the same benefit as they have done in the southern counties. The Highway-rate also presses heavily upon the farmers, but I trust that all these grievances will in time disappear, while the landlord and tenant, by a fair adaptation of the rents to the circumstances of the times, and an attention on the part of the farmers to those improvements which science is daily discovering, and which skill directs to practical purposes. I hope I may be allowed to say there is no occasion to despair, but on the contrary every encouragement to go on, and I therefore think Societies of this nature are particularly useful. They bring under the eye of the farmer the discoveries of others, and to the theorist gives the experience of the knowledge of the practical farmer, a knowledge which I am sorry to say the farmer does not attend to so much as the manufacturer, who solicits knowledge of every discovery, conscious that if they neglect any improvement, then skill is of no value. Let the farmer then, I say, follow the example of the manufacturer; *let the landlord accommodate his rents to the circumstances of the times*, let both petition the legislature for the removal of all real and acknowledged abuses, and then I am sure the sentiment of my toast will be fully borne out, namely, we shall have prosperity to the Penrith Agricultural Society. (*Loud Applause.*) The Chairman then read over the list of premiums, commenting, upon each as he proceeded. After he had gone through with the stock, he proceeded to remark that premiums had been offered to the most deserving servants in husbandry, and before declaring the awards under that head, he gave as a sentiment, "May the good tone of moral feeling among the labouring population of this county, continue to exist in as good a state as it has hitherto done."—He concluded his remarks on the premiums by proposing the health of the Judges who had that day made the awards.

The following are the awards.

#### FARMS.

1. To the tenant and occupier of any farm, whether or not dependent upon farming exclusively for a livelihood, the farm being not less in quantity than 100 statute acres, who shall have the same properly subdivided with fences, suitable to the soil and situation, in the neatest and most exact order, water-courses, water-banks, roads, gates, stiles, farm yards, &c. included; judicious draining, the arable land under the most approved course of cropping, and also the grass land in the neatest and best condition, &c. Soil and situation to be considered. 8*l*. Awarded to Mr. J. Robinson, of Plumpton.—Farm of 130 acres—51 acres grass land; part of this has laid one year, and the other part more than one year—this latter portion is not in good condition—the former is in excellent condition; 10 acres meadow; 25 acres turnips—an excellent crop considering the season, and well cleaned; 10 acres of seeds upon wheat stubble—very good; 10 acres of ditto upon barley stubble—also very good; 24 acres of oats upon land that was ploughed out in the spring, the land they grow upon is in poor condition; fences, gates, and stiles—the greater part very good, the remainder only indifferent. Report: we consider

from the excellence of his crop of turnips, and the goodness of his seeds, together with the general good order of his farm, that he is entitled to the premium, class 1.

Mr. John Mounsey, Askham, Westmoreland.—Farm of 160 acres, viz., 105 acres of grazing land, in very good order; 25 acres of meadow land, also in excellent order; 10 acres of wood land; 20 acres under the plough—not in the best style; gates, stiles, and fences—very good. Report: we consider the land in tillage—only 20 acres—far too small in proportion to the extent of the farm, and on this account we cannot award to him the premium.

2. To the tenant and occupier of any farm, not being less in quantity than 40 statute acres, nor more than 100 acres, who shall have the same in the neatest and most exact order, as in premium 1, 4*l*. Awarded to Mr. Thomas Stagg. From the general good order of his farm, we think him entitled to the premium, although there is no other competitor.

3. To the tenant and occupier of any farm, who shall produce the best crop of turnips, according to the nature and quality of the land, thoroughly cleared from weeds, and equally thinned; the number of acres to be in proportion to the quantity of arable land in such farm, 3*l*. Awarded to Mr. John Watson, of Longwithby.

4. To the person who shall produce to the Inspectors, at the September survey, the best general stock of store cattle, including horses, cows, sheep, pigs, &c., according to the extent and quality of the farm, the same being not less than 50 statute acres. The whole of the stock on such farm to be exhibited, 5*l*. Awarded to Mr. Sober Watkin. From the excellence of his stock, although no other competitor, we awarded the premium.

5. To the person who shall produce the best crop of turnips, raised from bone manure, 2*l*. (This premium is given by Mr. M. Robinson, of Stockbridge Mill, and Mr. Mitchell, of Bolton Mill, bone dust manufacturers.) Awarded to Mr. Henry Richardson, of White Stoe.

#### CATTLE.

6. For the best short-horned bull, being an approved stock getter, engaged to serve cows within the limits of this Society, during the succeeding season, for the use of the same, at 10*s*. each, 10*l*. Mr. Joseph Dixon, of Broadwath, for his bull, Reformer. Second best, Mr. David Bird, Catterlen Hall.

7. For the best short-horned bull, under 2 years old, to be kept as in premium 6, 4*l*. The committee have limited the number of cows to be served by this bull to 25. Mr. Watkin, Plumpton.

10. For the best short-horned cow or heifer, in calf or milk, 5*l*. Mr. George Hutchinson, Woodside.

11. For the best two year old short-horned heifer, 3*l*. Mr. Watkin Plumpton.

14. For the best two year old Galloway heifer, 2*l*. Mr. Gilkinson, Beaumont.

#### HORSES.

14. For the best brood mare, for the general purposes of agriculture, 4*l*. Mr. Simpson, Plumpton.

15. For the best Cleveland or coaching brood mare, 4*l*. Sir George Musgrave, Edenhall.

Mr. John Nichol, of Stainton, whose horse "Victory," obtained the premiums at Penrith, in 1835 and 1836, offered the following premiums:—

For the best foal got by Victory, 10*s*. Thomas Scott, Esq., Plumpton.

For the best two year old colt or filly, got by Victory, 1*l*. Mr. Rippon, Acorn Bank.

## SHEEP.

16. For the best black-faced ram, engaged to be kept during the succeeding season, within the limits of this Society, 2*l*. Mr. John Hodgson, Newbiggin.

17. For the second best black-faced ram, 1*l*. Mr. John Spedding.

18. For the best Herdwick ram, to be kept as in premium 16, 2*l*. Mr. John Robison, Blaze.

19. For the second best Herdwick Ram, 1*l*. Mr. John Mounsey, Settra Park.

20. For the best Leicester ram, to be kept as in premium 16, 4*l*. Mr. Fair, Frenchfield.

21. For the second best Leicester ram, 2*l*. Mr. Fair, Frenchfield.

22. For the best pen of five Leicester ewes, which have reared lambs this season, 2*l*. Mr. Watkin Plumpton.

23. For the best pen of five Leicester Gimmer Shearings, 2*l*. Mr. W. H. Parkin, Skirsgill.

24. For the best pen of 10 black-faced ewes, having reared lambs this season, upon the hills or heath, selected from one stock, bred in the district, and brought down from the hills or mountains where bred, not being grazed on good land, 3*l*. Mr. Matthew Atkinson, Templesowerby.

25. For the best pen of 10 Herdwick ewes, bred as in premium 24, 3*l*. Mr. Ellwood, Thorpe.

25. For the best pen of five black-faced gimmer shearings, bred as in premium 24, 2*l*. Mr. Atkinson, Templesowerby.

25. For the best pen of five Herdwick gimmer shearings, bred as in premium 24, 2*l*. Mr. John Robison, Blaze.

## PIGS.

26. For the best boar of the most approved breed, under 3 years old, engaged to be kept within the limits of this Society, during the succeeding season, for the use of the same, 3*l*. Mr. Tinkler, Julian Bower.

27. For the best breeding sow, which has had pigs within four months, of the most approved breed, 2*l*. Mr. Watkin, Plumpton.

28. For the second best breeding sow, as in premium 27, 1*l*. Mr. Stagg, Grange.

## REWARDS.

29. To the farmer's man-servant, who has lived the greatest number of years in one situation, to the perfect satisfaction of his employer, not being less than 10 years, 2*l*. Joseph Grindale, Hartsop, Patterdale, has lived with William Atkinson, of Hartsop, for 31 years and four months.

31. To the labourer in husbandry who has brought up the greatest number of legitimate children, without parochial relief, 3*l*. Thomas Favcett, labourer, Brockle Moor, widower, who has brought up 13 legitimate children, without ever receiving parochial relief.

## HUSBANDRY IMPLEMENTS.

32. To such improved implements of Husbandry as may be brought before the committee, that a discretionary power be left to the Judges to reward the inventors or exhibitors to the amount of 5*l*., if judged deserving:—

Bone drill—Mr. William Pollock, Dacre, 1*l*.

Turnip drill—Mr. Fair, Frenchfield, 10*s*.

Grass sowing machine—Mr. Fair, Frenchfield, 2*l*.

Single and double mould board iron plough—Mr. Fair, Frenchfield, 10*s*.

Single and double mould board iron plough.—Mr. Mounsey, Askham, 10*s*.

## SOCIETY'S SWEEPSTAKES.

1. Best fat cow or heifer of any breed, 1*l*. Mr. W. H. Parkin, Skirsgill.

2. Best fat bullock of any breed, 1*l*. Mr. W. H. Parkin.

7. Best Draught mare, 10*s*. Mr. John Cooper, Penrith.

8. Best fat pig, not exceeding 18 months old, 10*s*. Mr. George Wright, Eamont Bridge.

## PRIVATE SWEEPSTAKES.

A Best three year old hackney horse, 20*s*. each. Mr. Cooper, Carleton Hall.

B A pair of the best three year old grazing bullocks, 20*s*. each. Mr. W. H. Parkin, Skirsgill.

C Best breeding sow according to shapes and quality, 10*s*. Mr. Watkin, Plumpton.

D Best short-horned bull under two years old, 10*s*. Mr. Watkin, Plumpton.

E Best three old heifers, 20*s*. Mr. Watkin, Plumpton.

F Best fat cow or heifer of any breed or age, 1*l*. Mr. Watkin, Plumpton.

G Best two year old heifer, 10*s*. Mr. Watkin, Plumpton.

H Best one year old heifer, 10*s*. Mr. Benn, Lowther.

I Best heifer calf, 10*s*. Mr. Watkin, Plumpton.

J Best three one year old bullocks, 10*s*. Mr. David Hill, Edenhall.

K Best lot of five cows. Mr. Watkin, Plumpton.

Q Best fat ewe, 10*s*. Mr. W. H. Parkin, Skirsgill.

R Best Leicester tup lamb, 5*s*. Mr. Watkin, Plumpton.

S Best Leicester ewe lamb, 5*s*. Mr. Watkin, Plumpton.

Y Best shaped fat sow according to breeding and quality, 10*s*. each. Mr. Watkin, Plumpton.

Z Best heifer calf, 20*s*. each. Mr. Benn, Lowther.

A A Best three year old (or under) short-horned bull, 20*s*. Mr. Watkin, Plumpton.

B B Best boar, 10*s*. Mr. Tinkler, Julian Bower.

C C Best pen of five tup lambs. Mr. Watkin, Plumpton.

D D Best pen of five gimmer lambs, 10*s*. Mr. Watkin, Plumpton.

E E Best coaching colt foal, 10*s*. Mr. William Brown, Red Hills.

F F Best ten two year old heifers in the hands of the breeders, 20*s*. Mr. Fair, Frenchfield.

G G Best ten two year old bullocks in the hands of the breeders, 20*s*. Mr. Fair, Frenchfield.

H H Best ten dairy cows in full milk, 20*s*. Mr. Fair.

I I Best pure bred Leicester lambs, 20*s*. Mr. Fair.

L L Best three year old coaching colt, 10*s*. Mr. Rippon, Acorn Bank.

M M Best colt or filly foal of any breed, 10*s*. Mr. Cowper, Carleton Hall.

N N Best two year old coaching filly, 10*s*. Mr. John Peat, Mount Pleasant.

P P Best lot of three two year old short-horned bullocks, 10*s*. Mr. Fair, Frenchfield.

Q Q Best black-faced ram, 10*s*. Mr. John Hodgson, Newbiggin.

S S Best two year old gelding of the coaching breed, 10*s*. Mr. John Pears, Plumpton.

T T Best yearling of the coaching breed, 10*s*. Mr. Pears, Plumpton.

Mr. William Brown's premium for the best colt or filly foal got by Lottery. Nos. 6 and 7 were best, but as they belonged to Mr. Brown, he transferred it to Mr. Stephenson, of Pallet Hill.

Mr. GREY, of Corbridge,—one of the Judges whose health was drunk, and steward to the Greenwich Hospital estates, returned thanks.

The CHAIRMAN then proposed the health of the three Judges of the farms, Mr. John Graham, Mr. Unthank, and Mr. Pearson. (*Drank with three times three, and no cheer more.*)

Mr. GRAHAM returned thanks.

The CHAIRMAN next proposed the healths of the successful candidates, coupling with that toast the names of those who appear most frequently on the list, viz. Mr. Watkins, of Plumpton; and Mr. Fair, of Frenchfield. (*Drank with all the honours.*)

Mr. WATKIN said, I am extremely obliged to you for the compliment you have paid me, and have only to say, that I hope I may be placed in the same enviable situation next year. (*Applause.*)

Mr. HASELL, of Dalemain, the Vice-Chairman, then rose, and was received with continuous marks of applause. He said, I am exceedingly obliged to you for the handsome way in which you have greeted me, and I hope I have good taste enough, I am sure I have good feeling, to appreciate it properly. I am afraid I must begin in a very bold manner, by calling our worthy Chairman a little to order: he has jumped over one of my toasts, and given the other in such an able manner that he has quite confounded me. (*Laughter.*) But I beg to remind you, that as you have already drank the successful candidates most heartily and most deservedly, I beg leave, I say, to remind you of this plain fact, that if there were not also unsuccessful candidates, there could not be successful ones. (*Hear, hear.*) And the toast I am about to give is the unsuccessful candidates; and notwithstanding what Mr. Watkin has said, I hope the unsuccessful candidates next year, if they do not come up to him, may run him very hard. (*Laughter.*) And I would give you a good old English saying, a good old Cumberland wish, "Better luck to them next time." (*Three times three.*)

The VICE-CHAIRMAN then said, I beg leave to propose a toast, Mr. Chairman, which I have no doubt you will at once see the propriety of, and acknowledge it as it deserves. I hope the company will take the opportunity of returning their best thanks to the managers of this Society, especially the Committee of Management, whose healths I propose, coupled with the name of Mr. John Crosby, without whose efforts the business of this Society could not be managed in the satisfactory way in which it has been done. (*Drank with three times three.*)

Mr. CROSBY said, permit me, on behalf of the Committee and myself, to acknowledge the handsome manner in which our labours have been noticed. I am very sure that the Committee will be highly gratified at the success of our labours to-day. In the performance of our duty, we have received the most effective service from our worthy Treasurer, Mr. Fair, and our active Secretary, Mr. James Brown, and I am sure more merit is due to them than to us.

The CHAIRMAN—It is, I say, totally unnecessary for me, after what you have heard from the worthy Chairman of the Committee, to offer any thing in the shape of an eulogium upon Mr. Fair and Mr. Brown. In a Society of this kind, so much depends upon its machinery that without good officers we could not work, and I am glad to bear my testimony to that already afforded to the Treasurer and Secretary.

Mr. FAIR returned thanks for both, in an appropriate speech.

Mr. FERGUSON, Esq., of Harker, then proposed

the health of the Chairman, in a very neat speech. (*Drank with all the honours.*)

The CHAIRMAN said, I return you my thanks for the courteous manner in which he has proposed my health, and to you for so cordially acknowledging it. As I said before, I feel that I unworthily fill the office, because I have no pretensions to the character of a practical agriculturist, and feel that I am totally ignorant of the subject, and not prepared to take an active part in the proceedings of this day; but I think the keeping up of those institutions is the best means of keeping up agriculture, by bringing forward all the improvements in the science, for such I will call it—but not less in drawing together and cementing in a strong bond of union, the proprietor, the farmer, and the tradesmen of the various agricultural towns in which they are formed, for it is more important that as we all derive our existence from one soil, we should unite and keep together closely. Permit me to apologize now for a lapse of duty: I should ere this have given the health of our absent Vice-President, Sir George Musgrave. It was his intention to have attended this day, and no one would have rejoiced more than myself in beholding him among us, a resident agricultural gentleman, and I am sure that there is no one will do more to fulfil his duties towards this Society. I give you, therefore, his health, with an expression of deep regret at the cause of his absence. I would give it, I assure you, with three times three, with great pleasure, but on the present occasion I think it is better to give it without that accompaniment.

The VICE-CHAIRMAN then proposed the health of the Members for the county, Mr. James, who is present, and Sir James Graham, who would have been here, but for the death of his mother. (*Three times three.*)

W. JAMES, Esq., M. P., said, I beg you to accept my grateful acknowledgments for the honour you have just been pleased to confer upon the Members for the county by drinking the last toast, and particularly do I thank you for the compliment of giving me three cheers when I was standing up to address you. I take great shame to myself that this is my first attendance at a meeting of the Penrith Agricultural Society, but I am glad to say that I have been this day made a member, and have become a subscriber, and shall do my utmost in future to further your objects and ends, and although I am most unworthy to fill so conspicuous and useful a place as your late member, yet I trust to be able some day to show a fine animal of my own. (*Laughter.*) And if I only get a little of the good luck of the gentleman—Mr. Watkin, I believe, is his name—I shall be quite satisfied. (*Laughter.*) I concur with Mr. Hasell, that it is the duty of a representative, through the medium of a meeting like this, to carry to the great council of the nation your views and wishes, and I shall endeavour to do so. But I shall do more: I shall have an opportunity of making the personal acquaintance, and gaining the friendship, I hope, of those members with whom I may meet, and with my constituents, with whom I have formed a most important connexion. I can assure you that no man regrets more deeply than I do the depression which has taken place in the agricultural interest for so many years, but I join with Mr. Crackanthorpe in congratulating you upon its improved condition, and I shall be always most happy to do any thing to promote the just interests of the agriculturists. And before I sit down I beg

to propose to you a toast, which I am sure will deeply affect your wishes and interests, it is the health of a gentleman, than whom none is more respected and beloved in this county; it is the health of Mr. Hasell, with three times three, and long life to him.

Mr. HASELL returned thanks.

Mr. WILLIAMSON, being called upon, then sang an excellent original song, 17 verses in length, the hits of which were good, the only fault being that it bordered rather too much on politics for such a meeting.

The CHAIRMAN—I will now take the liberty of proposing the health of the Members for Westmorland, one of whom I am happy to have on my left hand. I believe there is no man in the county who is a better judge of some kinds of stock than Col. Lowther. (*Loud cheers.*) I speak particularly of horses, he having been in that department of the military service which has made him familiar with the cavalry horse. Nor is his agricultural knowledge confined to that particular class, for he has a good notion of a good hunter. Therefore I give you a toast which I am sure you will receive with great cordiality, the Members for Westmorland. (*Drank with three times three, and one cheer more.*)

Colonel LOWTHER, M.P., said, allow me, Gentlemen, to return you my best thanks, and I will not detain you long by any remarks at this hour of the evening, but I wish to set the Chairman right in one particular: he considers that I am only half a farmer. I wish I could see the prospects of the farmer in the same favorable light he does, but I think he colours them rather too high. I do not speak at random here, for I have been a practical farmer for 15 years in the midland counties; I am very fond of it, and have taken great pains in every kind of stock, and I may now tell you that I am a member of one of the largest agricultural societies in the kingdom, where there is a greater number of cattle assembled at the show than at any other in England, I speak of the county of Rutland show, and if an animal succeeds there, it is almost sure of obtaining a prize at Smithfield, and last year I had the pleasure of winning two prizes, the last of which was one for ten of the best Leicester ewes. (*Cheers.*) Be assured, Gentlemen, that if there were any thing I could do for you—and you know every little helps, and thus the snow-ball is converted into a mountain—you have only to name it, to ensure compliance from me. (*Loud applause.*)

The VICE-CHAIRMAN: After the very flattering manner in which my humble exertions have been received on this occasion, I cannot avoid recommending a friend to fill the office of Vice-chairman next year, and I have great pleasure in proposing to you a gentleman of high respectability, who would have been in this company, but that he is a practical farmer, and would have come here with a long speech about black-faced sheep, of which breed he is so intent on improving, that instead of being here, I fear he is lost in the midst of Helvellyn. (*Laughter.*) Secondly, he is a Member of Parliament, and thirdly, I beg leave to say, that he is a King. So that we have two Kings: one is King William the Fourth, and the other is the King of Patterdale—Mr. William Marshall. (*Cheers.*) I hope you will drink his health, and next year I hope we shall receive some valuable information from him about black-faced sheep.—*Three times three.*

The CHAIRMAN, in a very complimentary speech,

proposed the health of Mr. Marshall's colleague in parliament, Mr. Howard.

P. H. HOWARD, Esq., M.P., said, I wish, Gentlemen, that we had been favoured with the presence of my twin-brother in the representation of Carlisle, but he being absent it devolves upon me to return thanks for the honour I deeply feel. Although there have not been many competitors here this day from the immediate vicinity of Carlisle, yet it is some pride for me to reflect that the first prize has been borne away by my friend and neighbour, Mr. Joseph Dixon, and I am sure the city which I have the honour to represent, will shine by the reflected lustre from his fame. Allow me now to take this opportunity, Gentlemen, of suggesting, that by a Railway communication between this town and Carlisle, the agricultural interest would be materially benefitted in both towns. I trust that this will be a point not to be lost sight of, but that you may at no distant day send your stock by railroad and the canal to the Lancashire markets, and gladden the sight of a Liverpool alderman with the contemplation of these splendid specimens of stock shown to-day. We know that in Lancashire they have been rather accustomed to look with favour upon the lean kind of the Sister Isle; but once send your stock there, and the market is your own. My friend Mr. Williamson has just reminded me, that there is one premium neglected in this Society, which might prove very useful to the district. We have two premiums for nearly every kind, but none for that very excellent breed, the South Downs. Now if we had confined ourselves to the Cumberland breed, there might be some consistency in adhering to them; but when we have admitted the Leicestershire into the prize list, why not go a little further, and admit that kind of stock, which combines good mutton and excellent fleece—I mean the South Down sheep. My father, I recollect, at one time rented a large district of Skiddaw; he had upon that district large quantities of sheep, and I have it from my friend Mr. Thompson, of Bridekirk, that the South Down breed was introduced there, and the effects still continue, the weight is increased, and the quality is altogether superior to the native breed. He concluded by again thanking them.

The CHAIRMAN next proposed the healths of the Carlisle Gentlemen present, in eulogistic terms.

The VICE-CHAIRMAN, in a very appropriate speech, proposed "prosperity to the West Cumberland Agricultural Society," connecting with it the name of Mr. Browne, of Tallentire Hall.

W. BROWNE, Esq., said, I have to return you thanks, Gentlemen, on behalf of the West Cumberland Agricultural Society, for the honour you have been pleased to confer upon that body, and not less so for the honour you have conferred upon me as one of its members. We certainly cannot, I am sorry to say, enter into competition with you. I come here to learn, not to compete, but I hope we shall improve in time. In my exertions to establish the West Cumberland Agricultural Society, it was my wish to unite this great county together, the same as the kingdom of Scotland has been united in the Highland Society, that we might meet and compete together. I very much fear, however, that this feeling must be, as regards our side of the county, in abeyance at present, for I am sorry to say, after what I have seen this day, that we are not able to compete with you. We labour under great disadvantages; my neighbours, good men, have a very great anxiety

for following exactly the steps of their forefathers, and therefore we are obliged to comply with their wishes, by offering premiums for that venerable, but almost exploded breed of animals, the Cumberland long-horned. (*Laughter.*) I was congratulating myself at the latter end of last year, when some friends told me that there was only one of that breed shown, and I hoped I might say, in the language of Marmion, "Last of his race, by hutchers bled,—his like will ne'er be seen again." This, however, was a fallacious hope; for no sooner did the Spring meeting take place than we had five or six of these long-horned animals produced, and a sufficiency of cows to keep up the breed for my lifetime. I should wish, however, while on the subject of the West Cumberland Society, to say something in its favour; and though we cannot boast of the purity of blood you have displayed, we, I think, can compete with any part of England for variety of stock. (*Laughter.*) It has been said that nature delights in variety, but my West Cumberland neighbours beat nature hollow; for I do not believe there is a cross or a re-cross which we have not tried, and if the gentleman who has gained so many prizes to-day, wishes, like Alexander, for another world to conquer, I would wish him to come into West Cumberland and try his hand there: he will there find a great variety of animals, so much so, indeed, that it would puzzle the united skill of all the worthy judges present, to say from what stock they were originally derived. (*Cheers and Laughter.*) I do not know, Gentlemen, that we have any thing more than what I have mentioned to induce you to come amongst us. You can show us some of the best stock in England: I will not promise you a similar sight, but we can show you some of the worst. (*Laughter.*) I can only say, in conclusion, that I have one sincere wish, reserving to myself and my neighbours in the West their full share of it—may this Society go on and prosper, and may we go on and improve.

The CHAIRMAN next gave "Success to the Lancaster Agricultural Society," connecting with the name of Mr. Binns.

Mr. BINNS returned thanks in a very interesting practical speech.

Mr. BROWNE then recommended the notice of the meeting a new reaping-scythe, which he had introduced upon his farm, from Edinburgh, by which a man could easily reap an acre and a half or two acres per day. He obtained it from Drummond's museum at Edinburgh, the cost being only 13s.

The CHAIRMAN next gave the health of Mr. Howard, of Grey-stoke.

H. HOWARD, Esq., in returning thanks, urged upon the meeting the necessity of considering and furthering plans for the extension of railways to Penrith.

The health of Mr. Gill, and success to the Brampton Agricultural Society, and various other toasts followed.

The party broke up at about nine o'clock.

EXTRAORDINARY PRODUCTION OF WHEAT.—On two allotments of land, occupied by labourers at Eye, the property of Sir E. Kerrison, Bart., situated near the road leading from Eye to Brome, one piece, 23 rods, produced 9 bushels of wheat, which is equal to upwards of 15 eombs per acre; the other measuring 25 rods producing 11 bushels, which amounts to 17½ eombs per acre. The above shows the result of good farming.

## COUNTY OF BUCKINGHAM AGRICULTURAL DINNER.

On Saturday, Sept. 24th, the annual dinner of the farmers of the county of Bucks, took place at the George Hotel, Aylesbury. Upwards of 100 wealthy and influential holders of the soil attended. There were also present the Marquis of Chandos, W. Praed, Esq., M.P., Sir Thomas Freemantle, M.P., Captain Willocks, the Rev. Messrs. Young, Earl, Roth, Shepherd, &c.

On the proposal of "The health of the Marquis of Chandos," his lordship said that he was highly gratified by this expression of esteem and regard, and he felt great difficulty how best to express himself for repeated marks of kindness both upon public and private occasions. At a market table like the present, attended as it was by so large a portion of the farmers of the county, it would not be inopportune on his part to state a few opinions in respect to matters that concerned them all, identified as those opinions were with the agricultural interests of the country. (*Hear.*) Previous to the meeting of Parliament, the feeling of the country was decidedly in accordance with the fact that agricultural distress existed to an alarming extent, and the assembling of Parliament was looked to with great anxiety, in the hope that some measure would be devised by which that distress could be alleviated. (*Hear, hear.*) He had been exceedingly anxious that a select committee should be appointed to look into this state of distress, for the purpose of ascertaining if it were possible to afford any relief, and it was with sincere satisfaction he found that his intentions were anticipated by the Government, as was proved by the reference made to that distress in the speech from the throne. The Government, acting upon the recommendation of His Majesty's gracious speech, appointed a select committee themselves. The appointment of this committee took place a few days after the meeting of Parliament; but as it was an appointment made at the desire of Lord John Russell, of course he (the Marquis of Chandos) was not responsible for its acts. But the committee having been nominated by the noble lord, it devolved upon him (the Marquis of Chandos) to look to the names of those who composed it; and, upon seeing them, he at once declared to some honourable friends of his, that the committee was one in which he had no confidence, and one which, he believed, would be unsatisfactory to the farmers of England (*hear, hear.*); and his opinion upon this point rested upon the fact, that 19 of the members of the committee were taken from the ministerial side of the house, while only 14 were taken from that side of the house at which he (the Marquis of Chandos) had the honour to sit. The proposition to add Lord Darlington's name to the list was therefore made by him, but it was rejected by a majority of seven. This decision clearly proved to him that no friend of his would be allowed to be on the committee. (*Hear.*) Subsequently Mr. Woodhouse was appointed in lieu of Lord Stanley, who declined to act. Of the chairman of the committee, although politically opposed to him, he was bound to speak in terms of the highest respect; for nothing could be more manly or straightforward than his general conduct. A report was submitted to the committee, but he could not state its contents to the meeting, for it was not competent for a member of Parliament to advert to the contents of a report which had not received the sanction of the committee to which it had been submitted. He might be allowed, however, to say, that if this report had been assented to by the committee, in his judgment it would have

been most unsatisfactory, and would be calculated to ruin the best interests of the farmers of the country. (*Hear, hear.*) No report was made, but a pamphlet on the subject had been lately put forth by his hon. friend, Mr. Shaw Lefevre; and, although he did not agree in the conclusions come to, he admitted the fair and candid spirit in which he had given his pamphlet to the public. (*Hear, hear.*) Mr. S. Lefevre says—"I proceed, therefore, to explain my views on this interesting subject, leaving you to draw your own conclusions from the absence of any recommendation, which I attribute not to any want of consideration on the part of the committee for the interests of the farmer, but entirely to the impossibility of advancing any proposition which would meet with the concurrence of a majority of its members." Mr. S. Lefevre here states, in so many words, what he (the Marquis of Chandos) had frequently stated, namely, that he could not get more than four or five persons belonging to the committee to concur in any one specific mode of relief. He had advocated the repeal of the malt duty, but was defeated upon it. He then proposed, in his place in the House of Commons, that in any reduction of taxation which it was intended should take place, that the farmers should be considered in common with the rest of his Majesty's subjects. But upon this question also, he was beaten. Before the committee a good case was made in favour of a repeal of the malt duty, and he then consulted some friends as to the propriety of his again bringing the subject before the house; but they dissuaded him in consequence of the large majority that voted against him on the other question. Mr. S. Lefevre next says—"that there is evidently no want of sympathy on the part of the landowners for the condition of their tenantry." In this statement he perfectly concurred, and he felt grateful to Mr. S. Lefevre for having stated this important fact. Mr. Lefevre in another paragraph, makes a positive acknowledgement that the repeal of the malt tax would be advantageous to the farmer; but the way in which this reduction was proposed to be accomplished would be fatal to the best interest of the farmer. (*Hear.*) Now, in respect to this point, he differed in toto from his honourable friend, and denied that the malt duty was mixed up or interwoven with the existing corn laws. Of course the farmers never could have complained that that which was a protection of their interests could be one of the causes of their distress, (*hear*) and he was only astonished how such a question as the alteration of the existing poor-laws could form a topic of enquiry, where the complaint was agricultural distress. Mr. S. Lefevre, in writing upon this subject, proceeds to say,—“On these grounds I venture to recommend that the present scale of duties on the import of foreign corn be reduced, and one half of the malt duty remitted at the same time.” He opposed any such alteration of the malt duty. He was not to be blinded as to the end intended by this proposed step, for he would accept nothing that in his mind would have the effect of compromising the interests of the farmer. (*Applause.*) There were many who were anxious to repeal the corn laws for the sake of yielding to popular clamour; but where, he would ask, would be the farmer's protection if they accepted the reduction of one-half the duty on malt, with the proposed alteration of the existing corn laws? (*Hear.*) The evidence upon which the proposition of Mr. Shaw Lefevre was based, did not come from a farmer, or from any person connected immediately with the agricultural interests of the country, but from a gentleman, certainly of great respectability, but who was, in fact, a corn-factor, and who admitted that

any alteration in the existing corn laws would tend to benefit his own personal and private interests. (*Hear, hear.*) He knew not what were the opinions of Mr. Shaw Lefevre's constituents in Hampshire, but of this he was confident, that if any of the farmers of Hampshire, or of Buckinghamshire, expected to be benefited by a repeal of the corn laws, they would find themselves miserably disappointed. (*Hear.*) Mr. Shaw Lefevre, in another part of his pamphlet, mentioned:—"To some of my agricultural constituents I fear it may give dissatisfaction, because it does not point out a specific remedy for existing distress. To others it may cause alarm, because it proposes an alteration in those laws which have long been considered the key-stone of agricultural prosperity." On referring to the evidence which was given before the committee, it would be seen that it was there clearly proved that distress existed amongst the agriculturists of the country, and that that distress particularly bore upon heavy soils. It was objected to him (Lord Chandos) that he did not bring forward any specific motion during the last session in reference to the matter before the committee, but he had submitted a specific motion to the House of Commons to the effect, that in any reduction which should be made of the taxation of the country, a proportionate relief should be afforded to the farmer, in common with the rest of his Majesty's subjects. And here again he was defeated in his efforts to relieve the burdens of the farmer. (*Hear, hear.*) He would proceed to another part of the subject. They would remember that when the Reform Bill was before the legislature he had the honour of introducing a clause by which every 50*l* renter was enabled to give his vote at elections for knights of the shire. It was his pride that he had introduced this provision; and although it had been opposed by the Government of the day, yet, from the strong agricultural feeling which prevailed in the house, he was enabled to carry the clause triumphantly through it. If he gloried in anything, it was in having his name attached to the clause which appeared to have given so much offence; and he would ask them, would they sanction any alteration in it? ("No, no.") He had no wish to beard the Government. Had he wished to be turbulent or inclined to agitate, he could have got together a meeting equal in numbers, and much greater in point of influence and character than that collected at Birmingham, but that was not his object; his purpose was, by peaceable, constitutional, and tranquil means, to effect those objects which would be most beneficial to the country. (*Loud cheers.*)

FRENCH AGRICULTURE.—The thin weed choked crops, and starveling cattle and poultry of the French farmers, look wretched to English eyes; and the filth about the farm houses and cottages, and the neglected appearance of every thing, are not agreeable, certainly. But the country people are happy and contented, and polite to strangers and one another. They do not bow servilely to your coat or your estate, as in England, but exchange a salute with the frankness of good fellowship. It is quite a pleasure to receive and return the common greetings of "bon jours," or "beau temps," with the peasants. The want of capital, and the nigardly husbandry, which spares all the indispensable outlay to accumulate a pile of money to buy another acre of ground, tell little for the political economy of divided lands and small holdings; but the independence and happiness of individuals under this system are not to be overlooked in the estimate. The ever-boiling soup-kettle is replenished at little expense with herbs and vegetables, and the smallest medium of meat serves to flavour the mess.

## IMPORTANT TO FARMERS.

TO EDMOND WODHOUSE, ESQ. M. P.

Sir,—As a Member of the Central Agricultural Society, also of the Parliamentary Committee for Agricultural Enquiry, and the Member for this county, I and other Norfolk agriculturists have been anxiously waiting to learn from you the result of the enquiries of that Committee. The farmers have expressed their utmost degree of patience during the long and deliberate examination and enquiry respecting their "almost intolerable distress," as set forth in the petition of that society, not doubting but that the members thereof would produce evidence to support and establish their assertions, that the distress arose "mainly from parliamentary measures, and not from causes which are beyond the controul of Parliament," they being fully confident that "speedy and effectual redress" would be granted as one of the first and most important acts of Parliament, in compliance with the request and desires of the Central Society.

Your letter to the Editor of the Norwich Mercury, in the month of January last, inclosing a copy of the petition of the Central Society intended to be presented to the Lords and Commons, raised the hopes of the farmers to the highest pitch of expectation, being fully assured the Society was prepared to establish the fact of the distress, and the means of removing it, as set forth in that petition, consequently that on the meeting of Parliament they would be relieved from their intolerable burden. In this they were disappointed, but still finding a Committee of Enquiry was granted, their hopes and expectations were kept alive, waiting patiently, but anxiously, the result of that enquiry, presuming that during the sessions they should obtain their promised relief. However the sessions is closed, the Committee have finished their labours, the Central Society is vanished, and its members are dispersed, without leaving a wreck behind, or a gleam of hope, for the poor credulous and deluded farmers. It was a high and mighty conception on the part of the Society, but alas! it has proved a complete abortion.

We had expected that something in the shape of a report, or some information relative to the labours and proceedings of the Committee, would ere this time have been given to the farmers. If it has been discovered that Parliament can give no relief, it would have been only candour and honesty in them to have said so. Your constituents in the absence of all other information, may naturally claim from you an explanation of what has been the result of the enquiry of the Committee, of which you were, I presume, an active and intelligent member. I, a humble individual, and one of your constituents, shall feel highly gratified if you will favour the farmers and myself with your opinion as to the result of the enquiry, as it is not possible, or probable, the evidence given thereon will ever come to the hands of or be read by an hundredth part of your constituents, though I presume many of them would be perfectly satisfied with your opinion thereon, in preference to perusing it. However, in case you deem it unnecessary to give us a public explanation on this subject, may I request the favour of you to procure a copy of the Parliamentary evidence, published and laid before the House, for the use of myself and neighbours, in order that we may form our own opinion on this important, and I had almost said vital, subject.

From what I learn by the Norwich papers, I am not disappointed at the termination of this enquiry.

If you refer to my letter addressed to you, dated 26th January last, inserted in the Norwich Mercury, you will observe my opinion was, that Parliament could give no relief to the distressed and oppressed farmers, and that their relief could only come from landlords, tithe-owners, and a reduction of parish rates, or a considerable advance in the price of corn. I am the more confirmed in that opinion from the little information I can obtain of the result of the labours of the Committee, and I conclude from their silence, all hope of relief is vanished. I have seen in Bell's Weekly Paper, the examination of one or two witnesses, which appeared to me to relate chiefly to an enquiry how far it would benefit the farmer to be allowed to malt barley for the use of his horses and cattle; but there was not a question asked if rents and tithes were at a fair and just rate, or whether they were high or low. Unless the whole evidence is laid before the public, it is impossible to come to a just conclusion thereon. However if it is concealed, which appears to be the wish of the defunct Society, we shall conclude it is not proper to meet the eye of the suffering farmer.

If you wish to obtain a correct knowledge of the true state and condition of the farmers of this county, you may come at it very readily by spending one hour or two any market day on Norwich Cattle Hill, or at the Corn Market, with half a dozen of the intelligent tenants of your noble relative, or some other opulent Conservative. There you will obtain practical knowledge instead of theory; there you will get the necessary information to draw proper conclusions, and learn how they and their fellow sufferers may be relieved. If you wish for their good opinion and support at a future election, do not scruple to let it be publicly and openly published to the world. Let it be declared in the face of the landlords and tithe-owners, that the desired assistance and relief to the distressed and oppressed farmers must come from them and them only. The present prospect of the farmers is very little, if any, improved since January last, and if the distress was at that time "severe and almost intolerable," I conceive they now require that relief at the hands of the landlords and tithe-owners which they have sought in vain from the Central Society and Parliament. If you were induced, from the information of the Central Society, to believe that Parliament could grant relief to the distressed agriculturists, I trust you are now convinced it is not so, that your own good sense will admit you were in error, and I hope you will be honest enough to acknowledge it, or otherwise by your reply shew us that we are not right in our opinions upon this interesting enquiry. In case you remain silent on this subject, it will be an implied assent to the construction I have imputed to the Central Society and its Members, that their professions and proceedings are mere humbug and delusion.

I have the honour to remain, Sir,

Your most obedient humble servant,

THOMAS CLOWES.

Caister, 23rd August, 1836.

A NEW ARTICLE OF EXPORT.—Driving coals to Newcastle, and salt to Dysart, used to be thought absurd; but what would have been said of the driving of hay to America. This, in consequence of the failure of the crop there, is actually the case. There are at present, in the two export sheds here, 2500 stones of that commodity, ready to be shipped on board the Amity of Aberdeen, which is just about to be laid on for Miramichi. It is expected that she will take 10,000 stones. A larger vessel than the Amity is also to be dispatched from the Clyde to America with this novel article of export.—*Dundee Advertiser.*

## ON PRESERVING MANGEL WURZEL DURING THE WINTER.

TO THE EDITORS OF THE IRISH FARMER'S AND GARDENER'S MAGAZINE.

GENTLEMEN,—I beg leave through the medium of your Magazine, to request the advice and opinion of some of your correspondents as to the best mode of preserving mangel wurzel during the winter, a considerable quantity of mine having rotted in the pits in the last and preceding season, notwithstanding the roots were taken up carefully, the leaves stripped off, the crown paired with a knife, and, when piled up in the same form as potatoes are when pitted, covered with clean, dry straw, and then with earth.

I should particularly wish to ascertain whether the *experience* of any of your contributors would warrant the farmer, in leaving this crop to stand out, like turnips, during the winter and spring, a practice which I am almost inclined to hazard this year from the loss I sustained in the two last years, as also from the encouragement to make the trial, in having observed the cull plants left in a seed-bed, and which had stood in the ground all through last season were, even to the month of May last, as sound and firm as could be desired.

Your publishing this enquiry in the October number, so as to obtain the desired information in the following one, (November, being the usual time, I believe, for raising the crop,) would be highly beneficial to the Agricultural world in general, and in particular to your obedient servant,  
September 8th, 1836. M. W.

### ANSWER.

The cause of M. W.'s failure in preserving his mangel wurzel must be attributed to paring the crowns of the roots after the leaves were stripped off, or not putting earth (when covering the pit) next the roots, instead of straw, or not having mixed the roots plentifully with dry earth when piling them. Another circumstance might have caused M. W.'s roots to have rotted. If when he was taking them up he stripped the leaves off completely at once—particularly if they had been taken up early in November—the leaves are so fresh and full of sap at this period. In fact they have not done growing then. There is, consequently, a strong circulation of the natural fluids all through the plant. Taking the leaves off suddenly gives such a check to the ascending and descending sap, that the whole organized system is destroyed—and the roots by not having the organizable matter from the leaves regularly and gradually condensed become in an unsound state. We would not recommend mangel wurzel being left out all the winter, under any circumstances. They may do well of a mild winter and in a sheltered situation—but if there comes severe frost it will assuredly kill them. We had last winter some plants on a headland that were transplanted very late in the preceding summer. They were so small when the others were taking up that we did not think it worth while taking them. They continued safe all through the winter (notwithstanding the frost being pretty severe), and in April they attained a very good size. The roots weighed from 5 to 8lbs each. This proves that it is not prudent to take up the roots too early in any case. In 1830 a gentleman, (a friend of our's) in the neighbourhood of Dublin, had about three acres of very excellent mangel wurzel. They were allowed to stand out

all the winter. In January the frost came very severe, and the consequence was that all that had been over the ground of the roots appeared as if they had been boiled. The first fine day that came they were taken up and piled together, and covered with straw. In about a fortnight after they were piled the whole became a solid mass of putrid matter, and the stench arising from them became troublesome to a considerable distance from where they were. Thus nearly 200l worth of mangel wurzel was lost for the sake of experiment. Any experiment tried in such a case should be on a very small scale; and it should be proved sufficiently often before it be adopted on an extensive one. But as it is as easy to take mangel wurzel up at one time as another, and as if they are treated properly they are sure to be safe in pits—it is therefore better be "sure than sorry," and always to take them up the last week in November, or the first week in December. If the weather threatens to be severe they may be taken up earlier, and if it promises to be mild they may continue longer in the ground. A great quantity of them can be taken up in a short time when there is a fine day; and light frosts will do them no harm.

We have seen mangel wurzel piled up into a very large rick. It was built up in benches of about six feet wide each—putting a layer of straw at bottom, then a layer of roots *three deep*, and laying them flat and close the length and breadth of the bench; and so on, layers of roots and straw alternately until the rick was finished. It was then covered over with straw, and thatched neatly. The roots kept well by this method, but there was or appeared a dryness in the roots, which we did not like, and we are convinced they decreased considerably in weight.

From experience—the most successful we could desire—we recommend the following mode of preserving mangel wurzel during winter, with the greatest confidence.

About the first week in November, some of the leaves should be stripped off, taking only a few of the under ones off first. When they are all gone over in this manner, they should be commenced with again, and all taken off except a few in the centre. In going over them the third time the leaves may be completely stripped off, and then, if the weather be dry, they may be dug up. The footstalks of the leaves that remain should be paired off, and particularly the putrid leaves that are always found on them should be carefully cleaned off. But the crown or solid part of the root should on no account be touched. When any part of the root is wounded there forms a concretion on the wounded part—and when the root is stimulated by efforts of growth, &c., decomposition commences from the concretion formed on the wound, and rapidly spreads through the whole root—and when one root becomes rotten every other root that touches it becomes infected; and thus eventually—if not prevented—the whole are destroyed. When the roots are perfectly clean of leaves, &c. they should be pitted in a shallow pit made in a dry situation. The roots should be regularly piled up and made in the form of a potatoe pit—but much higher. They should be regularly and carefully mixed with dry earth all through, and the roots should be laid with their tops downwards, so that they would be fully half erect—for if they are laid in the same position as they grew, it will give them such facility in producing young roots and buds, that there will be so great a quan-

tity of fresh and soft vegetable matter produced as will be apt to cause a strong fermentation in the pit, and consequently endanger the roots. But even without this apprehension—the less they grow the better and the more nutritive the roots will be. When the pit is built it should be covered with the same kind of dry earth (particularly next the roots), about six inches deep, as was mixed through the roots, and then the pit should be well and carefully thatched over.

We are inclined to think that mangel wurzel cannot be preserved by any other mode safer than by this, and we feel confident that if "M. W." manages his roots so, he will in future sustain no loss by them.

### THE BANK OF ENGLAND — THE MONEY MARKET — AND THE CORN TRADE.

Next to the weather, and the relative produce of the several crops, so far as it has been ascertained, comes the monetary system in point of importance, as bearing on the forthcoming corn season. For this reason I have to-day devoted, and may possibly from time to time devote a little space to the "Money Market." It will be seen that the Bank of England, by her improper intercourse and connection with the state, has placed herself in the humiliating position of mere defence against two very powerful agents. The first, the Joint Stock Banks of England; the second, the monetary system of America, as growing up under her present Governmental policy. This is a subject that cannot be exhausted in a single letter, and I purpose to do no more at present than merely open the question—reserving to myself its discussion at such periods as my leisure permits. Those who have not given much attention to the matter may be informed that the system of banking by paper money commenced first in the world by the establishment of the Bank of England, in the year 1694; that this Bank was proposed to the merchants of London by a Mr. Paterson, an enterprising Scotchman, on a capital of 1,200,000l in 12,000 Shares, of 100l each; that it was originally conceived and set on foot for the benefit of *commerce*, but it was soon discovered by the powers of the day to be an admirable engine for political purposes; that it got a Charter, which in fact prevented any other Joint Stock Bank being established in England; that it was allowed by the Government from time to time to renew this Charter, and increase its capital, until it at last amounted to fourteen millions; that of this fourteen millions the whole of it is, and has been, lent to the Government according as it accumulated; that this Bank gradually extended its note issues through the medium of "Agents" in the principal Towns of England, until its circulation amounted to the enormous sum of 20 millions sterling; that these Agents, one by one withdrew from the mother Bank, and set up for themselves as Bankers, on their own account, with out any capital, issuing their own notes to an amazing amount, and getting possession of property of every kind; that some of the less prudent carried it with a high hand as regards personal expences,—some of them paying away many thousands in contested Elections; that prices of all our manufactured articles at several periods rose to a very high pitch, and consequently, foreigners who sold us their commodities, could not, in justice to themselves, take our commodities in exchange, but required bullion, with which

they could go to other markets and purchase 20 or 30 per cent. cheaper than in ours; that in these cases the demands set in on England for gold, and the Bank of England never having its capital available, it being always locked up in the hands of government—being itself the chief depository of the gold of the public, it was quite natural that to it all the applications for gold would be made, and its dependence on mere credit for the sustenance of a liability, ranging from twenty to five and thirty millions sterling, therefore brought it many times to a state of Bankruptcy, and upon every such occasion it pulled down by its utter helplessness, hundreds of the little Bankers, and hundreds of thousands of the merchants. The writers of the day called upon the government for a dissolution of connection with the Bank, but, it would appear, without effect, as the uncommercial and injurious union continues to this day. That somewhere about the year 1824-5, a terrible convulsion occurred in England, by the sudden contracting of the issues of this Bank, that this contraction was the necessary and inevitable consequence of a previous over issue of the mother Bank and the private Banks—that when from the simple stupid management of the Bank of England, the foreign exchanges set in against this country in these ever-to-be-remembered years, it suddenly drew in its accommodation to the private Bankers, and that as many as 240 of these stopped payment within the short space of six months at one period, and seventy at another,—that though this calamity was terrible to a degree incalculable, yet it was a source of great profit to the Bank of England, because her notes were then for ever established as current coin in the minds of the people of England,—that while these revulsions were going on, the Ministry of the day becoming alarmed at the consequences which might ensue in permitting the manufacturing portion of the community to depend longer on the capricious accommodation of the Bank of England on the one hand, or the unsafe, and indeed dangerous nature of the accommodation offered by the private Banks on the other, consented to bring in a Bill, permitting Banks of more partners than six to be established in England, within 65 miles of London. The Scotch had from an early date the full benefit of unrestrained and unlimited Joint Stock Banking, and a calamity of such a nature as that I have glanced at, never happened in that country, though at the time I write, there are in that country, with its population of two millions and a half, five-and-thirty Joint Stock Banks, some with ten, some with twenty, and some with forty branches. Well, at this time of commercial convulsion, it was deemed advisable to allow the Scotch system a trial in England, and the consequence was the establishment of several wealthy and influential Joint Stock Banks. For the first three or four years, the public hardly understood the system, and tendered little of their confidence to the new money masters, but at length the system worked its way, and one Joint Stock Bank sprung up after the other, in quick succession, until there is not, at the present day, a county or district in England without its local Bank, based on a considerable Joint Subscribed capital, and on an extended local proprietary.—Here then is a new power springing up under the very nose of the Bank of England, greater than the Bank itself—and unknown to the previous commercial constitution—to meet this new order of things, the Bank had to bestir herself and look about for business; she accordingly established Branches in several parts of England, but the movement was late; already had large proprietary Banks been established, commanding an extensive note issue, aided

by the local Shareholders in each district; the notes of the Bank of England were met in every quarter, and turned in against her in the Exchanges. In this state of things, the Bank holding a rod of 14 millions of debt over the Government, I will not say obtained through the medium of Mr. Clay, a Committee to investigate the most private movements and management of the Joint Stock Banks. This was a blow levelled at the Joint Stock system, but how was it met? why, by the Banks throwing open their books—from which it appeared that there was established in England and Wales, since the year 1826, 86 Joint Stock Banks with Branches—based on a paid up capital of eight millions and upwards, subscribed by twenty-four thousand proprietors,—that the total issue of these Joint Stock Banks amounted to three millions, and their deposits to about four millions. The capital paid up by these twenty-four thousand proprietors amounts to eight millions against a liability of seven millions. The capital of the Bank of England is fourteen millions, against a liability of thirty millions. The private properties of these twenty-four thousand proprietors, being from amongst the leading members of the commercial and manufacturing community of England, cannot be worth less than one hundred and twenty millions—every shilling of which is a security to the public, for the liabilities of these Banks. The Bank of England has a Charter, which protects her partners from all liability, and prevents her paying anything more than may be found in her coffers; of the contents of these coffers, we have reported to us twenty-nine million of “securities,” but whether these securities consist of I. O. U's. of Mr. Chancellor of the Exchequer, or Mr. any body else, no man can tell. But, here we are now, to witness the battle of these two principles between the Joint Stock Banks and the Bank of England—the Bank has thrown out, and continues to throw out the best, in fact the *very* best bills, when bearing the endorsements of Joint Stock Banks—the very circumstance which would make the bill undoubted in the eyes of most men, is in the eyes of the Directors in the Bank parlour sufficient to cause their rejection; the Joint Stock Banks have no notion of giving up, or what would be the same thing, succumbing to the Bank, by issuing her paper and suppressing their own—consequently the war is raging and will rage. On the other hand, small notes have been just abolished in America, and several millions of gold and silver are required by that rising State, to supply the place of 5 dollar notes, equal to our one pound notes, which had been in circulation, and which are suppressed. Several loans have been contracted by the American agents here, to supply the States with the required quantity of the precious metals; the metals are consequently going out, and the Bank is every hour increasing her caution, and decreasing her discounts, thinking that she can by these means save her credit—but her credit will be saved not by these means, but by the general confidence of the country, in the present prosperous state of its trade and commerce.—The Bank may let out all her gold, and all her silver too, and the credit of the country will be yet sustained. However, our business at present is to guess at the effect this state of things may have on prices. I need not say that it is a most dangerous thing to hazard an opinion at this early period—so far as the “Money Market” is concerned, its present state is quite against a high range of prices; and, from all appearances, little improvement may be expected until Christmas passes, and the proceedings which Parliament may think proper to adopt become discernible—in the meantime, it may be no harm to look back at

the rates of Corn for a few years past, that we may keep in mind what has been doing—I have taken the five weeks of September in the following years, to guide us as to the opening prices, and shall only remark to-day that we have a full average crop of *well-secured* wheat in England—a tolerable one of barley—a middling one of Oats—and a miserable one of Beans, Peas, &c. In Ireland and Scotland there is much yet to be secured; but the past three weeks, with the exception of two days, have been very favourable, and though there may be a proportion of early gathering in bad condition, and even damaged, yet such will do for distillation as well, or nearly as well as better saved corn. In addition to this, it must be kept in view, that there is really a *surplus* of old wheat in England, the accumulation of two years; and that the Irish millers hold pretty fairly of last year's cheap wheat. On the other hand, there will be a good demand for Flour the ensuing season, though it may possibly be at low prices—but altogether, the prudent Irish miller has before him a fair prospect of a remunerating season for his capital and skill. Although an interference in favour of low prices may be gathered from reasoning, yet I would remark that there is no great reason to suppose that prices will go to the low extreme of last season.

The accounts from America, from every part of the States, acquaint us that the wheat crop will be but the third part of an average. It is calculated that the Americans will require two million of quarters of wheat to supply the deficiencies. There is no doubt but this demand will keep Wheat from falling to an extreme low average. It would pay the Irish exporter just now to ship wheat to New York, if he can have it dried and free on board at 20s per barrel. The price in the interior Irish markets is about 22s, and in the seaport markets, about 23s per barrel. A few heavy markets may push it down to 20s, but at that I dare say it would be safe to lay in.—*Mooney's Circular, Sept. 30.*

## TO THOMAS BENTLEY, ESQ.

HERMITAGE, ROCHESTER.

MY DEAR SIR,—I quite agree with you that the present Act of Parliament, for the settlement of Tithe, is not so satisfactory to the tithe-payer as he had a right to expect. But I differ from you in the utility of putting off the attempt to settle the question amicably under its provisions, with the hope that the legislature will rescind the act just passed. I have always maintained that it is impossible to settle this question permanently, except by the sale of all tithe, and to this it must come at last; but as that is a question involving so many others, I think no government could carry such a measure immediately. The people must previously be more alive to its necessity, and more agreed as to the details of the measure, than, as it appears to me, they now are. I hope, therefore, that both the tithe-payer and tithe-receiver will take advantage of the time allowed by the act, and endeavour to make an amicable arrangement, which shall as near as possible approximate a fair adjustment of this vexatious and difficult question.

I intend to make an attempt in my own parish to establish the following plan, which appears to me to meet many of the objections urged by both parties, and as it is possible the same ideas may not have struck my neighbours, I address this letter to you through the public press, in the hope that my plan may be of use in settling the question, as far as it

can be settled, under the present Act of Parliament.

The first step I propose to take, is to call a meeting of the tithe-payers and receivers under the provisions of the Act of Parliament. Next, such meeting is to choose and appoint a committee of management of not less three, or more than five.

II. To appoint one surveyor for the tithe-payers, and the tithe receivers also to appoint another. These surveyors to have power to call in a third if they do not agree.

III. Such surveyors are then to value all the land of the parish after the following manner; that is to say, they are to give answers to the following table of questions, taking each farm or holding separate.

How much tithe per acre ought the land to pay per annum

If Arable?
„ Meadow
„ Marsh
„ Wood
„ Hop Ground, 2 years, 3 years, and upwards
„ Orchard or Garden.

Supposing the parish to be a Rectory, the answers will be simple; supposing it to be a Vicarage, all that will be required is to fix how much the arable land should pay for great tithe, how much for small. The remainder come under one or other heads without difficulty.

IV. When this valuation is completed, the surveyors are to give to the committee their answers to the table of questions, and

V. The committee will then turn the sum per acre of each kind of cultivation into so many bushels or parts of bushels (fractions below half a gallon and a farthing to be omitted) of wheat, at the average price as fixed by the act, and when this is done, the committee will call a meeting of the tithe-payers and receivers and declare "that each occupier's tithe is to be so many bushels or parts of bushels of wheat per acre," and this document shall be copied and a copy placed in the parish Record Chest.

So far as to fixing what the *measure* of tithe should be. Next as regards the payment to the tithe-receiver.

1. On or before the first of June and first of December in each year, the tithe-payers are to send to the tithe-receivers a statement of the number of acres under the various heads, which he has in occupation, with his calculation of the number of bushels, &c. of wheat the tithe amounts to.

2. The tithe-receivers shall then make out an account according to the average price of wheat, of the six weeks preceding the first of June and first of December, and send it to each tithe-payer in the following week with a notice of the time and place of payment.

3. Such payment to be made as so fixed under the penalties of non-payment as fixed by the act.

4. Any disputes that may arise to be settled by the tithe commissioners.

5. This valuation not to be re-opened or altered for ten years; nor at that time unless by consent of two-thirds of the tithe-payers.

You will now perceive that my object is to establish a fixed *measure* of tithe of every description of agricultural produce, according to the value of the soil it grows upon; and that the value in money of such fixed measure is to be regulated by the value of wheat, according to the averages of certain periods, which I consider preferable to taking the average of wheat, barley, and oats. You may perhaps think this complicated at first, but I am sanguine enough to hope that it will not prove so; on the contrary, that it may smooth many of the difficulties which

beset the question. I consider it promises to be fair for all parties, as it will allow of any kind of cultivation the farmer may choose, whilst the tithe-receiver will also benefit or lose, in the same proportion as the cultivator, and both will be on a par, let the price of wheat be high or low.

That I may not be obscure, and that others may clearly understand the process by which I would commute the valuation into a corn tithe, and that again into money, I will suppose a case with the various prices, &c., taken at random.

The surveyors being appointed, proceed to their duty, and commence with Farm A, in the parish of B, occupied by C as tenant. Parish B a Rectory.

We, Richard Stokes and John Davis, being appointed by the tithe-payers and tithe-receivers of the Rectory of B, proceed to value the tithes on the Farm A, in the occupation of C, according to the table furnished us; and we find that the following would be a true and just value of the tithe of such Farm, as stated below:—

Arable Land	per Acre	s.	d.
Meadow	.....	2	6
Marsh	.....	3	0
Wood	.....	2	6
Hop Ground, 2 years	.....	5	0
3 years and upwards	.....	14	0
Orchard and Garden	.....	5	0

(Signed) RICHARD STOKES, } Surveyors.  
JOHN DAVIS, }

This return having been sent to the committee of management, it will be the business of the committee to turn that valuation into wheat, according to the average price of wheat for the time stated by the act, viz.: 7 years, and then to send it to the occupier of the farm.

Assuming, merely by way of illustration, that the average price of wheat per bushel is 6s. The fixed measure of tithe for Farm A will be as follows:—

Arable	per Acre	B.	G.
Meadow	.....	1	2½
Marsh	.....	0	3½
Wood	.....	0	4
Wood	.....	0	3½
Hop Ground, 2 years	.....	0	7½
3 years, and upwards	.....	2	2½
Orchard or Gardens	.....	0	7½

The next stage respects the payment in money to the tithe-receiver. For this purpose the occupier of the Farm A shall send to the tithe-receiver on or before the first day of June, and the first day of December, a statement of the cultivation of his Farm, after the following manner:—

Farm A. Parish B. Occupier C.

The following I declare to be a true and just statement of the number of Acres occupied by me, and of the different manner in which they are cultivated, with my calculation, according to the scale laid down, of the measure of tithe I have to pay.

ACRES.		q.	B.	G.	
100	Arable	16	3	2	
20	Meadow	1	0	6	
20	Marsh	1	2	0	
45	Wood	2	3	5½	
8	Hop Ground, 3 years	4	0	0	
3	Orchard and Garden	0	2	6½	
196		Total	25	4	4
		or half	12	6	2

This, then, is the permanent measure of the tithe of Farm A, for the half year, ending first of June, or first of December, (as it may be.)

Upon receiving this statement, the tithe-receiver is to make a calculation from the average price of wheat at Mark Lane, for the last six weeks preceding the first of June and December, (which I will call 47s per quarter), and send it to the occupier C, with a notice of where the money is to be paid. The money tithe therefore of Farm A, for the whole year, will be as follows:—

	£	s.	d.
25 Quarters, at 47s. . . . .	58	15	0
1 Bushels, at 5s. 10d. . . . .	1	3	4
4 Gallons, at 3 $\frac{3}{4}$ d. . . . .	0	2	11
Total	60	1	3

One half 30 0 7 $\frac{1}{2}$

being the tithe payable to the tithe-receiver, for the half-year ending June or December, (as it may be.)

Tables might easily be constructed, showing what the price would be at per gallon, bushel, and quarter, at any sum; as also the number of bushels, or parts of bushels per acre; thus enabling the tithe-payer at once to calculate the measure of tithe he has to pay, and the tithe-receiver the amount of such measure in money.

It cannot fail I think to strike you, that the object I aim at, is to do justice as far as possible to tithe-payer and tithe-receiver, that the former should be able to cultivate his land as he pleases, without paying more tithe than is just; and the latter should not lose by the change, from a lower to a higher scale of cultivation. I am not vain enough to suppose this plan faultless, but it has this one advantage, I think, over any I have yet heard of, it will be perfectly fair to both parties when once the Surveyor's valuation is made; and is so far better than that proposed by the Act, that it does not give a premium to the bad farmer, by taking the value of the tithe *paid* in the last seven years, as the standard; neither does it take from the lenient tithe-receiver what his just proportion ought to be.

Hoping that the ideas here thrown out may be of use in smoothing the rough points of this difficult question,

I remain, my dear Sir, with much esteem,  
Yours very faithfully,  
J. M. TYLDEN.

Milsted, 30th September, 1836.

**NORWAY AND ENGLISH MOWING.**—I amused myself yesterday evening by walking over my landlord's (an innkeeper's) farm. I suppose there may be about a hundred acres cleared of bushes, of which two-thirds at least are under grass, natural, not sown, and preserved for hay, which the people are now busy in making. As the land is dry, and has not been top-dressed, the quantity is very small in proportion to the extent; the natural grasses not attaining any length under such circumstances. The cutting is excellent. The ground is shaven as close as a gentleman's lawn or bowling-green. They use a shorter scythe-blade than we do. If one considers the length of our common scythe-blade, it will be evident that the heel of it only can cut close to the ground. The point and one-third of the blade are sticking up the air, and what is cut by that part is cut too high. Look at one of our mowers at work. It is evident that he cannot, without great exertion and fatigue, keep his scythe close to the ground for its whole length. The point is in the middle of the stems of grass, and is working to waste, especially at the end of his sweep; and if the point were prolonged in the direction in which the blade stands, it would be flourishing over his head. The short blade saves the ridiculous sweep or semicircle of our mowers, one-half of which is working to waste either of time or of grass. *Laing's Residence in Norway.*

**THE AGRICULTURAL COMMITTEES.**

TO THE EDITOR OF THE YORK CHRONICLE.

SIR,—The session of Parliament is closed, and so far as regards the farmer, nothing is effected. The agricultural committees of which our Whig ministers made such a boast, have ended in nothing. A mass of incongruous evidence is collected,—scarcely two witnesses have agreed upon one point, and no report that was hit upon by any one member of the committee could be agreed upon. All they could unanimously assent to was—silence! It suited ministers, who dared not fly in the face of the free traders; it agreed with the views of the advocates of a fluctuating duty, who would rather hide facts from the country than avow anything which may tend to render them unpopular: Mr. Hume, and those who would wish to see not a sheaf of corn grown in the country, are pleased; the farm monopolist is allowed to grasp his thousands of acres unmolested: and the advocates and enemies of an alteration of the currency, prefer that the evidence should go without note or comment, than suffer a defeat in the committee; all quite sure that, if any thing can completely baffle and mystify the farmers into quietness, it is the ignorant, subtle, and irreconcilable evidence given by so many bailiffs, &c., &c., that will effect the object.

But although they have consented to the decision of the committees, as being most favourable to their views, all are not satisfied as to the course they shall pursue in future—each party is plotting its own scheme to introduce “early next session,”—each will occupy considerable discussion, and the time will thus be consumed away in angry debate, until the near approach of shooting on the moors warns them they must use dispatch, and as usual hurry over the business of the session; when the probability is, that the result will be a parliamentary resolution, declaring that it will not interfere with the agricultural interest. A defeat so signal must weaken the influence of the farmers in the House,—divide them more and more out of it, when the opportunity of effecting a repeal of the corn laws will offer, and agriculture will slowly and gradually fall away, until our verdant fields, our playful flocks, our noble herds, shall disappear, and we shall become a nation of manufactories, steamers, gin shops, prisons, and workhouses; and share the fate of luxurious and artificial states of society.

But some may comfort themselves by thinking that the landowners will never submit to this;—no not so long as they have power,—not so long as they have great interests at stake in agriculture; but the former our democratic principles are rapidly sweeping away, and the latter the extensive embarkation of capital in railroads and joint stockeries, is rapidly lessening.

We may expect Mr. Cayle; making his motion on the currency,—the Marquis of Chandos on the malt tax,—Sir R. Peel on the county-rate,—and Mr. Spring Rice will point to the poor law act, and Lord J. Russell to the tithe act, as all the relief the agriculturists can receive or expect. The farmers will be told that as no two can agree as to the cause of their distress, the remedy is out of legislative reach. Things may go on a little longer—this will probably be the result if the former is not;—so long as the extraordinary prosperity of our manufactures cause a superfluous consumption, the farmer *may live*, but let once the slightest flag take place, and ruin must be the inevitable consequence. In either this case or the former, the prospect of the farmer is dreary in the extreme.

We may however be told, and shall be told, both

in and out of the senate, that the committee's not reporting is a proof that there is no distress. From the evidence, however, it appears that there are hundreds of acres of land, especially in Buckinghamshire, which *cannot be let at any rent whatever*; that the capital of the farmers is nearly all exhausted, and that a knowledge of this renders it difficult for the farmer to obtain credit. These facts cannot be controverted, but there are other certain signs of distress existing, which are too apparent. When the farmer thrives, he is a satisfied man, now he is the very reverse, he is clamorous for a reduction of rent,—he is anxious to reduce wages, he is grasping to obtain all the land he can in hopes of increasing as much as possible his means of obtaining a livelihood, and *that he may have a better chance of borrowing money*, he is pushing his corn to market early in the season, to pay his rent and wages, let the price be as it may; and, lastly he has become a warm politician,—no surer sign that his distress is urging him out of his sphere.

If therefore the farmers would have any measure adopted, they must agree upon some one; direct all their energies to that, and obtain it before they ask for more;—if it be less it may avert much future disappointment and distress;—the whole vacation is before them, and let all be in preparation that petitions may pour into the House at its opening, in such a manner as will overwhelm the opponents of British agriculture. W. E. N.

**HINTS TO AGRICULTURISTS.**—The harvest work in this district, and I believe all over Norway, is well done; and parts of their management might be adopted with advantage in our late districts, where so much grain is lost or damaged almost every autumn by wind or rain. For every ten sheaves a pole of light strong wood, about the thickness of the handle of a garden-rake, and about nine feet in length, is fixed in the ground by an iron-shod borer: it costs here almost nothing. A man sets two sheaves on the ground, against the stem, and impales all the rest upon the pole, one above the other, with the heads hanging downwards. The pole enters before the band of each sheaf, and comes out at the bottom; the sheaf is put on with a pitchfork, and a whole field is picketed in this way with the greatest ease and as fast as cut. The crop is in perfect safety as soon as it is on the poles; no rain or damp can heat or make it grow. Only a single sheaf is exposed to the wet. It hangs with its head downwards, is open on all sides to the air and wind, and thus dries as fast as the rain wets it. Gales of wind cannot shake it, making the heads of the sheaves dash against one another, which often happens to corn standing in stooks; there is also not half of the handling and pitching about of the sheaves as in our harvest work; in which each sheaf is first dragged to the stook, and afterwards thrown into the cart. Here a sledge or car, on low wheels, comes along, the pole, which is lifted with all its sheaves, and laid into it at once; and each pole, when in the barn, is a tally for a thrave of ten sheaves. The crop is all necessarily brought at once into large barns, on account of the deep snow in winter. The straw must be well withered and quite dry when housed, which without this plan could seldom be effected. The sheaves are somewhat less than ours. Shearers here make good work, cut low, and all back-handed; that is, they grasp the corn with the back of the left hand towards the hook, not the palm, as with us; thus only the stalks contained in the hand can be cut over at one stroke. With us much more, almost an armful, is pressed against the edge of the hook, and cut over, the greater part of which is strewed about the field, and lost in carrying to the band; for it is only what the grasp can manage that come safely to the sheaf.—*Laing's Residence in Norway.*

**GREAT SALE OF MR. MAYNARD'S SHORT-HORNED STOCK, &c., WITH THE NAMES OF THE PURCHASERS.**

The extensive sale of improved short horned cattle, the property of J. C. Maynard, Esq., of Hartley Hall, near Northallerton; commenced on Wednesday week, at that place; Mr. Wetherell, auctioneer. This sale had been looked forward to with much interest by the breeders and agriculturists, and it was attended by a most numerous and respectable company from all parts of the kingdom, and even from foreign parts. So great was the influx of visitors, that for the two nights preceding the sale, beds could scarcely be procured in the neighbourhood sufficient to accommodate the many gentlemen who were drawn together, and the sale presented a most animated and interesting spectacle. The following list will show the value in which the several lots were held. The sale of the sheep also was at prices proportionately high:—

ON THE COW CABBAGE.

TO THE EDITORS OF THE IRISH FARMER'S AND GAR-  
DENER'S MAGAZINE.

An article on the Cæsarian Waterloo Cow-Cab-  
bage from the writer of these lines, having been in-  
serted in your number (35) for September, he has  
to thank the conductors of *The Irish Farmer's and  
Gardener's Magazine* for the additional extracts ap-  
pended thereto, as giving further support to the  
object of the writer from its publication, viz : *that  
Mr. Fullard's Cæsarian Waterloo Cow-Cabbage and the  
Jersey Kale are identically the same.* It is particu-  
larly desirable that the readers of this magazine  
should bear in mind that the article is not pre-  
tended by its author to be based on his experience,  
but is only a reasonable deduction from what had  
been previously published: it has ever been his  
practice, and shall so continue to be, to offer  
nothing as fact of which he has not had positive  
experience.

When it is considered that Mr. Fullard disposes  
of his seeds at the enormous price of one shilling  
for each, and that *plants* fit for setting out can be  
had at the low price of five shillings by the hun-  
dred,—if these vegetables be in fact the same or  
nearly similar varieties—the proof that they are  
so, must tend much to the growth of what possibly  
may be a very advantageous addition to the Green  
Crop system.

There are some persons who roundly assert that  
the Waterloo Cæsarian Cow-Cabbage, now put  
forth in the London newspapers is identical with  
the Cæsarian Kale cultivated in this country for  
the last 20 or 30 years, the seed of which can be  
had at any seed shop; and this opinion is stated  
to be supported by very high authority, but from  
which authority the writer has the misfortune to  
differ. He has ever been disposed to doubt the  
grounds of his own opinion, and be greatly in-  
clined to adopt that of the distinguished and scien-  
tific botanist alluded to—but here let facts be  
stated. Cæsarian Kale has been grown by the au-  
thor, but he has not now the plant to institute a  
comparison: writing from recollection, he thinks  
the leaf of the Cæsarian Kale is acuminated, some-  
what resembling in shape and colour that of the  
cauliflower, while the plants from Mr. Fullard's  
seed, and seed imported from Jersey, not distin-  
guishable from each other, are almost circular and  
slightly scalloped. The Cæsarian Kale never has  
attained the size reported of the Jersey and Mr.  
Fullard's variety, a stalk of the former of which  
11½ feet in length is now in Mr. Lawson's Museum,  
Edinburgh, and plants of which are also exhibited  
at the Bedford Conservatory, Covent Garden—six  
feet high. There are some of the cabbages alluded  
to in the article in the September number,  
from Jersey seed, now growing in the garden of a  
neighbour of mine, which are of an appearance to-  
tally different from the Cæsarian Kale. With very  
great respect, therefore, for the opinions of those  
persons, it is more than probable they may be  
mistaken.

The seeds mentioned in the preceding number,  
to have been sown in July, (viz : Mr. Fullard's  
and the Jersey), are now very forward, and nearly  
fit for transplantation. On a very careful compa-  
rison no difference can be observed. The author  
has about 4,000 of the *Jersey variety*, the excess of  
which over the number necessary for his own use,  
is very earnestly sought after by persons desirous  
of ascertaining the utility of this extraordinary  
vegetable production. THOMAS DE RENZY,  
*Cronyhorn, Carnew, 8th September, 1836.*

## POPULATION AND AGRICULTURE IN NORWAY.

The extent of cultivation in the Strath of the Myosen, extending up to this village (Lille Hammer), surprised me. It is not merely a fringe between the hill and the shore, but reaches far back among the hills and over the summits of the ordinary heights. I would compare its breadth to that of Strathmore, in Forfarshire. The farming cannot be very bad, for the crops of oats, bere, and rye, are excellent. Potatoes, which appear to occupy the place of the turnip in our farming, are clean and well horse-hoed. Draining and clearing new land of roots of trees and stones, are going on in various quarters, and lime was laid out at one place for spreading. Farms appeared to be of various sizes; I observed many so large that a bell was used, as in Scotland, to call the labourers to and from their work, which shows a certain regularity in their operations. Some are so small as to have only a few sheaves of corn or a rig or two of potatoes scattered among the trunks of the trees. These appear occupied by the farm servants, or cottars, of the main farm, paying probably in work for their houses and lands, as in Scotland. Very good houses these are; loghouses of four rooms, and all with glass windows. The light does not come down the chimney or through a hole in the wall, shut up at night with an old hat or a pair of old breeches, as in some cottages in the county of Edinburgh. The division of the land among children appears not, during the thousand years it has been in operation, to have had the effect of reducing the landed properties to the *minimum* size that will barely support human existence. I have counted from five-and-twenty to forty cows upon farms, and that in a country in which the farmer must, for at least seven months in the year, have winter provender and houses provided for all the cattle. It is evident that some cause or other, operating on aggregation of landed property, counteracts the dividing effects of partition among children. That cause can be no other than what I have long conjectured would be effective in such a social arrangement, viz., that in a country where land is held not in tenancy merely as in Ireland, but in full ownership, its aggregation by the deaths of coheirs, and by the marriages of female heirs among the body of landowners will balance its subdivision by the equal succession of children. The whole mass of property will, I conceive, be found in such a state of society to consist of as many estates of the class of 1,000*l.*, as many of 100*l.*, as many of 10*l.* a year, at one period as at another. The state of Ireland is generally adduced as a proof of the evil which would result from the abolition of primogeniture. Then it is stated the sons of the peasant marry and settle upon a portion of the father's farm, itself originally too small for one family, and by this system of subdivision the whole class of peasantry is reduced to a lower state in respect of decencies, comforts, and enjoyments, than any population which is ranked within the pale of civilized life. It has always appeared to me, however, that the state of Ireland, instead of being a case in point, proves the very reverse. There the land and other property is not disseminated in ownership or in small portions among the mass of the inhabitants. It is notoriously held in very large masses by a very small proportion of the population. The peasantry having no property nor any reasonable prospect of ever possessing any, have not those tastes, habits, modes of thinking, prudence, and foresight, which accompany the possession of property, and which altogether form the true and natural check upon the tendency of popu-

lation to exceed the means of subsistence. The Irish peasant gratifies the natural propensity to marriage, precisely because being destitute of property and of its influences on the human mind, he has grown up to manhood without any restraining propensity.—*Laing's Norway.*

## THE TITHE COMMUTATION BILL INVESTIGATED.

TO THE EDITOR OF THE HERTFORD TIMES.

SIR,—Some men consider the Tithe Commutation Bill as a measure of strict justice between tithe-payer and tithe-receiver. In that opinion I differ with them, for the following reasons:—

Is it just that the Tithe Commutation Bill should take from the land-owner the power of converting great tithe into small, without giving him any equivalent?

Is it just to take away all risk of the payment of tithe from the tithe-owner, and place that risk upon the land-owner without giving him any equivalent?

Is not the tithe annuity a great deal more valuable, if payable by the land-owner than by a land-occupier? Certainly it is. Suppose a tithe annuity of 100*l.* per annum is raised from arable land, this annuity could not be sold for more than from fifteen to twenty years purchase, that is 1500*l.* or 2000*l.*, suppose that annuity is converted into a rent charge upon the estate, it would be worth thirty year's purchase, or 3000*l.* To prove this, it is only necessary to refer to the old tithe laws. Under the old tithe law, the land-owner had the power of reducing a tithe annuity of 100*l.* to 50*l.*, by converting arable land into pasture land, if the utmost value of great or corn tithe was demanded by the tithe-owner, or, in other words, converting great tithe into small tithe, and reducing a fee-simple of 2000*l.* into a fee-simple of 1000*l.*, therefore it is very easy to comprehend how an annuity of 100*l.* arising out of the tithe under the old law was worth only 1500*l.* or 2000*l.*, shall, under the new law, be worth 3000*l.* There cannot be a doubt but that the fee-simple of tithe property throughout the kingdom will be increased in value from 25 to 30 per cent. by the operation of the Tithe Commutation Bill. I would appeal to any insurance office, in the habit of granting annuities, if this view of the case be not correct; all annuities are increased in value exactly in proportion to the diminution of the risk in the payment of the annuity; therefore it is evident that 70*l.* tithe annuity, under the new law, is as valuable as 100*l.* under the old law. Tithe is a *variable* not a *fixed annuity*, as it at present exists, therefore it is manifestly unjust to treat it as a fixed annuity, subject to no contingency. I admit it is very desirable for all classes of the community, and particularly for the agricultural portion of society, and also for the respectability and durability of the Established Church, that tithes should be commuted; but why should the land-owner and the land-occupier pay for all those advantages? Why should not the tithe-owner contribute his portion, for the immediate security given to his property by the payment being transferred from the land-occupier to the land-owner, &c.? The Tithe Commutation Bill is now the law of the land, but two years must elapse before the compulsory clause can be enforced; therefore we have abundance of time for the repeal of this law, and the passing of another more just in its enactments; but no time should be lost in petitioning the legislature to that effect.

A PRACTICAL AGRICULTURIST.

C Y P R I A N,  
Winner of the Oaks in 1830.

London: Published by J. Ferguson, 30vt. St. Martin's Lane.

## CYPRIAN ;

WINNER OF THE OAKS IN 1836.

*(Plate.)*

If, on the score of sagacity, the horse be inferior to that class of the brute creation which comes under the description of quadrumanous ; if he possess not the "half-reasoning of the elephant," or the still inferior capacity of the dog, it must be acknowledged that he is susceptible of friendship to a very considerable extent, and that he is also the most elegant quadruped in nature. To the Turf this country is indebted for a variety of the horse far superior to what can be found in any other part of the world : procured originally from the East, the English thorough-bred or courser presents an extraordinary proof of the wonderful effects of human genius in assisting the operations of Nature. The small, if not diminutive, animal found beneath the scorching heat of the tropics, by persevering industry, by care, and judicious management, attains a size far beyond original contemplation, preserving, at the same time, all those genuine qualities for which his progenitor is distinguished from all the other varieties of the tribe.

Cyprian is by Partisan, out of Frailty, by Filho da Puta, out of Agatha, by Orville, Star, Young Marske, &c. Cyprian ran third to Florentia at Northallerton, and won a stake at the last Catterick Meeting, beating Aveline. It was only a few weeks prior to Epsom Races that Cyprian appeared in the betting, having been kept quiet for the Oaks ; however, prior to the race, she stood at the head of the list, the decided favourite. Owing to the restiveness of Fair Jane, and particularly to bad management, uncommon delay took place at the starting post ; and, on account of this state of uncertainty, the pace at first was not brilliant : Cyprian, Destiny, Fair Jane, Promise, and Marmalade kept well together, till a short distance from home, when a very severe struggle ensued between Cyprian and Destiny, and the former proved successful, owing to the persevering jockeyship of Will Scott. Last year the Derby was won in much the same manner : Will Scott had measured the powers of Mundig, and on the day of trial contrived to make the most of them—to draw them out as fine as gold ; he had also ascertained the racing capabilities of Cyprian, and may be said to have proved successful from the accuracy of his judgment. The amount of the Oaks was 2,750*l*.

*(ORIGINAL.)*

## No 1.—OF HORNED CATTLE.

I think in my last paper I urged, as an excuse for troubling the public with these papers, "the intention of benefiting the farmer ;" and, therefore, pursuing this intent, I shall not confine myself to the treatment of any particular kind of stock, but allow the word "Cattle," to embrace every species of live stock in the shape of quadrupeds, viz., horned cattle, horses, and sheep ; neither shall I consider any of these continuously, that is to say, I shall shortly send you "No. 1. of the Horse," and so on. I think it will be unnecessary for me to enter into any expla-

nation of my reason for adopting this mode of publication, since the simple consideration, that the principal stock of our farmers consists of horned cattle, another of horses, and a third of sheep, or more commonly in a combination of all three—will furnish it to every one.

So numerous are the diseases arising from the digestive organs not performing their proper functions that I shall now consider them ; 1st, as to their formation ; 2ndly, as to their individual uses ; and, 3dly, as to the principal cause of their action being impeded.

I trust the reader will excuse, in this instance, the occurrence of some anatomical terms : these must necessarily occur in the description of the parts now under consideration : however, they shall be made as plain as possible.

Every one knows that the cow is a ruminating animal, possessing four stomachs, and, in these particulars differing from the horse. The cow, from the capaciousness of her gullet, eats much more quickly, and in a greater quantity than the horse : at least, in a much coarser state. To remedy the evil that would necessarily arise from this quick swallowing of the food, nature has provided her with the means of returning the food from the first stomach, or rumen, to undergo, a second time, the process of mastication ; whilst this is going forward the animal is said to ruminate. This ruminating power is, however, insufficient to avert the evils which arise from the greedy feeding of the cow, or rather, it is not called into action, from the anxiety of the beast to satisfy its appetite on any favourite food or fresh rich pasture ; hence we have hoven, blasting, and that train of disorders.

It would be unnatural to suppose that a second and perfect mastication could be effected after the beast had eaten any dry food, as beans, &c., without the aid of some moisture ; and how rarely do we see a cow attempt to supply this moisture by drinking previous to lying down to ruminate. A considerate Creator has, however, furnished the animal with the means of supplying itself with a fluid to assist mastication. This fluid is secreted in greater and lesser quantities as the food may possess or lack moisture. The first stomach or rumen is covered exteriorly by the peritonæum, and lined internally by an insensible membrane on which are numerous small eminences : it also possesses the properties of distension and contraction to an extraordinary degree ; since, in cases of hoven, we find it so far distended as to occupy a situation immediately betwixt the last rib and the hip-bone, when its natural situation does not occupy more than one-half of the abdominal cavity. We also find crossing the rumen, exteriorly, several bands which appear to have the power of contracting, and by so doing, forcing the swallowed food in portions, a second time into the mouth, for the evident purpose of more perfect mastication. After each portion of food has been properly masticated, it is passed forward by the œsophagus, which in the cow is continuous, into the second stomach. I know of no more appropriate name for this stomach than the "Honey-comb stomach." The peculiar similitude which it bears to the honey-comb will serve to distinguish it from the others. The name, however, which anatomists apply to it, is the "Reticulum." This stomach, like the rumen, is covered interiorly with small eminences, which in all probability have a like use. Some writers have asserted that the animal possesses the power of closing the orifice leading from the first stomach into the second. It may possess the power of doing so, but I am very loth to believe it makes use of it : or of what use would the net-work be which

we find extending itself across the duct leading from the second stomach: and do we not here observe the wonderful power of a Creator! The first two stomachs being insensible to a very great extent, renders the injury inflicted by hardened substances very trifling; but, from the extreme sensibility of the fourth stomach, their occurring there, would be attended with very serious consequences. To prevent this danger, we find a net-work placed across the orifice leading from the two insensible stomachs into the sensitive one, of such perfect construction as even to stop nails and pins from entering the fourth stomach; neither am I aware of any hardened substance which had entered by the œsophagus ever being found in the fourth stomach, although balls which had evidently been formed there, were found to exist. If, then, the beast passed the food forward to the third and fourth stomachs, without allowing it to undergo the *straining*, as it were, it is highly probable that we should find hardened substances existing in the fourth stomach; but as this is not the case, we must conclude that though the beast possesses the power (which it is impossible to disprove,) it never exercises it.

So far I have given a description of the first and second stomachs, we will now proceed to the third and fourth.

The third stomach is termed by anatomists the many-plus; its form is globular when filled, its internal surface presents a most singular appearance, being furnished with a number of leaves; these leaves are covered with small eminences, differing in form from those observable in the first and second stomachs; the use of this bag, or third stomach, is to cause a further preparation of the food previous to its entering the fourth, or true digesting stomach. The fourth stomach is called the abomasum; in this stomach the process of digestion is completed, and here the separation of the chyle and chyme takes place. There are numerous absorbent vessels called lacteals, by which the chyle is taken up and conveyed to the heart, where the further process of mixing it with the blood takes place.

Numerous interesting experiments have been prosecuted to ascertain how far the blood is dependent for its purity and healthy circulation, on the food by which the animal is supported. These, however, are not necessary here further than proving to us, that wholesome food, and such as is easy of digestion, preserve the animal in a state of health. This must be clear to every one, when it is an undoubted fact that the *extract* of the food is conveyed to the heart, and mixed among the blood, which is the very source of life; at any rate, upon its healthy circulation depends health. If then the food contains any hurtful ingredient, and this, by extraction, be impregnated with the blood, of course the worst results will follow. I am aware that by analysis we can seldom discover the existence of this hurtful ingredient in the blood, even when the worst effects are manifesting themselves, from its being partaken of;—but at the same time, we must bear in mind in what various forms it may exist, and still elude our discovery; it may combine with some other ingredient, and thus become neutral, though this neutrality will not render its effect neutral, though it may lessen it; it may evaporate by gas;—but independent of all this, we are perfectly aware that the quality of that secretion called milk, is materially changed by the food on which the cow subsists. I therefore argue that, as like causes, similarly acted upon, produce like effects, the blood contains a large portion of any noxious ingredient that may be conveyed into the system in the

shape of food, however undiscoverable it may be by analysis.

Having now considered the first two parts of our subject, (the formation and individual uses of the digestive organs,) I do not here include the liver, the kidneys, &c. &c., whose secretions so materially assist digestion—a description of which appears as each is treated upon) we now come to the fourth division, the *principal* cause of their functions being imperfect. This I attribute, as the reader will anticipate, to diet, and I by no means deny the effect of atmospheric changes on the constitution of Horned Cattle; but I will assert, that whatever diseases arise which are not constitutional, and these to a great extent, are produced by our mismanagement. It clearly appears that the digestive system is dependent for the performance of its functions to the nervous energy of the animal; if this becomes depressed, of course it follows that digestion is impeded. It therefore behoves us to preserve, as far as we are able, the nervous system in a healthy state, and by so doing we shall prevent, in a very great measure, indigestion in the cow.

Much injury undoubtedly arises from the animals being allowed to partake of unwholesome water;—this is a circumstance to which the farmers generally pay too little attention. Whether this is to be attributed to negligence, or ignorance of its ill effect, I am unable to determine; at any rate, I think if they were to consider the noxious substances which their cattle drink in extract, they would not treat the subject with such slight attention. However wholesome the food may be on which we feed our cattle, the impure state of the diluent will render it of little service. Numerous cases might be brought forward in proof of various diseases having arisen from animals having partaken of unwholesome water. I attribute red-water, in seven cases out of ten, to this cause, but so negligent and careless do the farmers appear of the prevention of these ill effects, that they allow their stock to quench their thirst from the drainings of dung-hills and stagnant fetid pools; and singular as it may appear, a beast that has been accustomed to this water, or rather extract of refuse, prefers it to the purest running stream, and will only drink of the latter from mere necessity. To these two causes, improper food and water, I attribute the principal derangement of the digestive powers of the cow. I have thus slightly described the process the food must undergo previous to its being rendered of such a form as enables the absorbents to take up that part which is necessary for them as maintenance of life. The reader would feel fatigued if I allowed this paper to extend to a greater length; I have therefore been obliged to confine my subject as much as possible, and some may think I have been too brief on so important a part of my papers;—this, perhaps, may be the case, though I trust I have stated at sufficient length what is requisite for my purpose. However, if I have done so, it is a fault easily remedied; not so, if I had tired the patience of the reader.

Your obedient servant,  
AGRICOLA.

TARTARY OATS.—A correspondent informs us, that crossing a field of Tartary oats a few days ago, in the parish of Holme-upon-Spalding Moor, he was led by curiosity to approach a cluster of stems growing very conspicuously at a distance. On examination, he found that there were nine stems growing from one single grain, and which bore altogether, upwards of 2000 grains. Four of the stems were four feet ten inches long, and the others were nearly of the same length.—*York Courier*.

## TANKS.

The fourth anniversary of the Royal Polytechnic Society of Cornwall was attended by several Professors and scientific men, who after examination of the Prize Models, expressed their admiration of the practical application by operative miners in this remote portion of the Empire, of those scientific principles on which it was their department at our Universities to Lecture. But as the success of the machinery for draining the mines sometimes deprived both men and cattle of that supply of good water which contributes to health and comfort—it was suggested this might be remedied by tanks similar to nine which had been eminently useful during the late three dry summers on the property of the President of this Society in Sussex, and as they are cheaply and easily constructed, and not liable to decay like wooden vessels, and as rain enough falls on every house in England for the use of its inhabitants, no family could be deficient in good soft water, who made a tank to *retain* it, and such tanks being paved over, take up no room.

The sizes at East Bourn vary, one of less than seven feet deep and wide has served two labourers' families for three years, whilst most of the springs in the neighbourhood were dry.

A tank twelve feet by seven feet has been found sufficient to supply with water a large family and six horses; this was surrounded by only four-and-half inch brick work resting solid against the sides, in consequence of being like a decanter smaller at the bottom than higher up, and the dome is constructed on the Egyptian plan by projecting horizontally each row of materials one-third of their length beyond those below, by filling up the back with earth as it proceeded to balance the weight of this projecting masonry.

At the East Bourn workhouse for 14 parishes, a tank has been made 23 feet deep by 11 wide of the roughest materials, being only flint stones, and though they require more mortar than if they had been regularly shaped, only 90 bushels of lime were allowed, including two coats of plaster, and the workmanship is executed like field walls at 10s per 100 square feet, the only essential being that no clay be used (which worms in time bore *through*) and that the lime or Parker's cement be good.

A current of air is said to promote the purity of water in tanks, which is easily effected by the earthenware or other pipe which conveys the water from the roof being of 6 or 8 inches in diameter and an opening left for the surplus water to run away, and where the prevailing winds do not blow soot and leaves on the house, the water remains good, even for drinking, without clearing out the rubbish more than once a year; but in some cases filtering by ascension may be found useful, and effected by the water being delivered by the pipe at the bottom of a cask or other vessel from which it cannot escape till it has risen through the holes in a board covered with pebbles, sand, or powdered charcoal.

Upwards of 20 labourers' gardens have been watered by the rain which formerly injured the public road, and was therefore turned into a sink well, which sink well, enlarged and surrounded by nine-inch masonry drawn up by a *cast iron curb*—was used in planting potatoes, and occasioned good crops in 1835, when sets not watered failed. And should the profitable mode of *stall feeding* now practising at Armagh be lappily extended to Cornwall, and that fattening oxen are kept *in pairs not tied up under shelter*, it will be found that preserving in tanks the water which falls on the barns and stalls will amply supply

them, whilst it saves the rain washing away the strength of the manure in the open yard.

Ponds have been made with equal success, dug four-and-half feet only below the surface, what is excavated being added to the sides covered and about one foot thick like a road with pebbles and good lime mortar. Such ponds are become general on the dry soil of the South Downs for watering the large flocks of sheep—and had such ponds been found in Romney Marsh, &c. during the last dry years, the sheep would not have died in such numbers as materially raised the price of meat in London, and would have raised it much higher if the large premiums given for many years by the Agricultural Society of Scotland had not enabled North Britain to supply a great proportion of the sheep, as well as oxen and oats consumed in London.

The improvements in husbandry by which this has been effected are detailed in the Quarterly Journals and prize essays of the Agricultural Society of Scotland, and to circulate these many agricultural half-crown book clubs have been formed by farmers in South Britain, "who wish to *know* how it is the Scotch are thriving," as much in agriculture as manufactures. The last Quarterly Journal recommends that such book-clubs should become general; they are patronized by the Earl of Burlington, whose property extends from Sussex to Lancashire, and the 32nd number to be had of Cadell, London, states that at the agricultural meeting in October last 325l were received for witnessing the delivery of the premiums, which are this year liberally thrown open to the whole of the United Kingdom.

Sept. 4, 1836.

USE OF BONES AS MANURE.—The employment of crushed bones as a fertilizing substance is not of a very ancient date, it was not one of the manures even mentioned by the early Agricultural writers, and for this disuse of bones several causes contributed. The necessary machinery for crushing them was, in the early ages of the world, totally unknown; and bones, when uncrushed, dissolve in the soil far too gradually to be of any striking immediate value as a fertilizer. It is a fact, that the refuse matters produced by the ivory and bone turners and cutlers, when the manufactories of Sheffield began to flourish and abound, soon accumulated in considerable heaps around the turners' shops, and this drew the Yorkshire farmers' attention to bone manure, and not till the close of the 18th century did the cultivators of the poor soils in the neighbourhood of that town begin to use those refuse matters for that purpose, which, first of all, the turners were glad to be relieved from by the farmers taking the trouble to carry away, but after a time a small charge was made per load which has gradually risen in amount. In the last twenty-five years, therefore, the consumption of crushed bones has been steadily increasing, but still it may be even now a mystery to many intelligent farmers, how pulverised bones can be good manure, and it may not be amiss to inform our readers, in general terms, that the component parts of this manure are all valuable substances in promoting the growth of vegetables—that the component parts of the bones are also the constituent ingredients in almost all vegetable substances, and that it is not the oily and other merely animal matters of the bones to which they owe their fertilizing properties; but that it is their earthy and saline matters to which the benefit must be with far greater justice attributed. In our next communication, if space will allow, and the information be thought valuable, we will give an outline of some of the experiments that have been already made in the use of this manure, together with the mode and effect of employing it, and some general directions.—*Sherborne Journal*.

## MALT LAWS.

MR. EDITOR,—I beg to enclose for the benefit of those connected with the malt trade, an abstract of the new Bill, brought in at the close of the last session, by the Right Hon. the Chancellor of the Exchequer and Mr. Baring, and intended to be passed into law early next session. The alterations are important and liberal, as well to the public as the manufacturing maltster. One of the alterations proposed has the effect of reducing the malt tax nearly 60,000*l*. per annum, and the other regulation gives great liberty and relief to the maltster.

Some idea may be formed of the oppressive state of the fiscal regulations contained in the malt laws previous to 1830, as in that year, at the instance of the Maltsters' Association, nearly two-thirds of the restrictions and penalties were repealed, and by this new Bill great additional relief will be given.

I am, Mr. Editor, your obdt. humble servt.  
W. F.  
London, Sept.

PS.—In 1830 the word "*conclusive*," in the 5th clause, was greatly objected to (and was promised to be omitted), inasmuch as it gives no discretionary power to the magistrates.

"1. 7th and 8th Geo. 4, c. 17, and 11th Geo. 4, c. 17, s. 3, regulating the keeping a barley book—repealed.

"2. All notices required to be given by maltsters, and the time of giving such notices, to be the same as required by existing laws for maltsters situate in a city.

"3. 7th and 8th Geo. 4, c. 52, s. 34, relating to compressed cistern or couch—repealed.

"4. 11th Geo. 4, c. 17, s. 17, relating to compressed corn in cistern or couch—repealed.

"5. New regulations proposed in lieu of the above 3 and 4—That in the event of suspected compression the officer shall throw out, or cause to be thrown out, all such corn, and return all such corn into cistern or couch from whence thrown; and if any increase shall be found over and above the former gauge in any greater proportion than those of five bushels in every one hundred bushels previous to the corn being emptied from cistern eight hours; or six bushels in every one hundred, if emptied from cistern eight hours, and not emptied sixteen hours, or seven bushels in every one hundred bushels; if emptied sixteen hours or upwards, the increase so respectively found to be deemed *conclusive* evidence of been forced or trodden. The penalty imposed as in 7 and 8 Geo. 4,—and any other evidence of forcing allowed.

"6. 11 Geo. 4, c. 17, s. 18, relating to time of sprinkling—REPEALED.

"7. New Regulations relating to sprinkling.—If corn be kept covered with water 50 hours, and no corn in same malt house that has been less than 50 hours covered with water, may wet or sprinkle at the expiration of six days, on giving 24 hours' notice to officer before wetting or sprinkling the same; but if sprinkled before 12 days, except under above regulations, to be liable to penalties imposed by 7 and 8 Geo. 4.

"8. 11 Geo. 4, c. 17, s. 21, relating to 17½ per cent. allowance for swell in couch—REPEALED.

"9. New regulations relating to allowance for swell.—There shall be allowed during the corn being in cistern, or 26 hours after being emptied into couch, 18½ per cent., and if not gauged or taken account of in couch previous to 26 hours, then, after the expiration of 30 hours, an allowance shall be

made of *one-half* before the corn is dried off and re-made from kiln.

"10. New regulation relating to number of floor, or quantities of corn in operation, existing law allows only five floors; new regulation proposes six floors.

"11. New regulation.—That officer shall upon each wetting being dried off into malt, and removed from kiln, enter on the specimen the number of bushels of malt with which the maltster shall be chargeable on such wetting, showing in such entry whether such charge has arisen from the cistern, couch, floor, or kiln."

SODA BREAD.—A correspondent of the *Newry Telegraph* gives the following receipt for making "soda bread," stating that "there is no bread to be had equal to it for invigorating the body, promoting digestion, strengthening the stomach, and improving the state of the bowels." He says, "put a pound and a half of good wheat meal into a large bowl, mix with it two teaspoonfuls of finely powdered salt, then take a large teaspoonful of super-carbonate of soda, dissolve it in half a tea-cupful of cold water, and add it to the meal; rub up all intimately together, then pour into the bowl as much very sour buttermilk as will make the whole into soft dough (it should be as soft as could possibly be handled, and the softer the better,) form it into a cake of about an inch thickness, and put it into a flat Dutch oven or frying-pan, with some metallic cover, such as an oven-lid or griddle, apply a moderate heat underneath for twenty minutes, then lay some clear live coals upon the lid, and keep it so for half an hour longer (the under heat being allowed to fall off gradually for the last fifteen minutes), taking off the cover occasionally to see that it does not burn. This, he concludes, when somewhat cooled and moderately buttered, is as wholesome food as ever entered man's stomach. Wm. Clacker, Esq., of Gosford, has ordered a sample of the bread to be prepared, and a quantity of the meal to be kept for sale at the Market-hill Temperance Soup and Coffee Rooms.

INGENIOUS SPADE.—An ingenious spade has lately been invented by Mr. Hugh Calderwood Blackbyres, Kenwick, Ayrshire, for cutting draining tiles of peat. The instrument is worked very easily, and forms the tile with one cut of the spade; the tiles being cut one out of the other expeditiously, and without waste of material. Their shape is something like clay tiles, but more massy. They are dried in the sun during summer, lying flat on the ground, and may be stacked like peats, ready for use when required. When properly dried and hardened, wetness will not soften or decompose them. Peats are frequently found in mosses which have been buried long ago by accident, still hard and fresh; and those that have been used for draining upwards of thirty years ago, have been taken out of the drains unimpaired and solid. It has even been asserted, that a well dried peat has been boiled for six months in a boiler at Catrie Cotton-works, which was taken out after that period solid and uninjured. There is no doubt, however, of the capability of dried peat to resist moisture. The large stacks of peat formed for the use of families in Ireland, where coal is unuseable or scarce, are never thatched. The invention of this spade tends to render draining of moorish land more practicable than hitherto, as with it a farmer may cast two or three thousand tiles a-day, within a very short distance of the ground he intends to drain, at one-fourth or one-fifth less expense than he could furnish himself with the same number of clay tiles; the frequent want of clay in such districts rendering the manufacture of clay tiles at hand impossible; and the cartage of them from the kiln to a great distance to the land is at all times an expensive operation. When laid in the trench, the peat tiles are placed with their grooved faces opposite each other, one of them serving as a sole.—*Glasgow Evening Post*.

## REFORM DINNER—HAMPSHIRE.

The following after-dinner-speeches, being upon subjects unconnected with politics, will be found of general interest:—

The dinner took place in the ball room of the George, where a large company sat down at five o'clock.

Mr. Shaw Lefevre in the chair; and Mr. Marsh in the vice-chair.

After the cloth had been removed, and the usual number of loyal toasts proposed from the Chair,

Mr. MANSFELD said, that he had now the agreeable duty to perform of giving "The health of the Members of the northern division of Hants." (*Loud cheers.*) They owed much to their exertions, but particularly to those of the hon. gentlemen which had been devoted to their agricultural relations (*hear, hear*); but he felt bound to say, that although he would give those exertions all the praise they deserved, yet that hon. gentleman did not, in his opinion, go far enough; and he (Mr. Marsh) desired to drag him still further. (*Hear.*) His hon. friend, in the report he had drawn up, had given the farmers but cold comfort when he told them that if they had skill, energy, and capital, and exercised them, they would do well. (*Hear.*) Now, he believed that the farmers of the country had both skill and energy, but he would ask where the capital was to come from? (*Hear.*) His hon. friend also advocated the repeal of the half of the malt tax, but he (Mr. Marsh) would say, that if that only was repealed, the expensive machinery employed in the collection of the remainder would be still the same as before. (*Hear.*) His hon. friend may say that he (Mr. Marsh) was a currency quack, but since that confiscatory measure called Peel's Bill had passed, the capital of the farmer had become dilapidated, and the only means of relief that could be administered to the agriculturists was either to bolster up the industry of the farmer to the amount of his burdens, or to reduce his burdens to a level with the produce of his industry. (*Hear.*) His friend, however, would tell them that the currency question could not now be touched, and if not, then the burdens upon the farmer should be reduced, and this could only be done by a revision of the entire system of taxation; and he contended that the *millionaire* and the absentee should be more highly, and the farmers less extensively, taxed, and that thus the latter would have a sufficiency for themselves, and a superfluity to the country. (*Hear, hear.*) He would be glad to hear his hon. friend's opinions on these points, and, meanwhile, he had great pleasure in proposing his health, and that of his colleagues. (*Loud cheers.*)

Mr. LEFEVRE returned thanks in an eloquent speech, in the course of which he observed that he was convinced that the repeal of Peel's Bill would have no effect in supplying capital to the farmer. He knew that the agriculturists had lost money in consequence of that measure, but even more mischief would result from any effort to retrace our steps. (*Cheers.*) When he sought and recommended a repeal of one-half the malt-tax, he did so with the sanction of a commission, of which Sir Henry Parnell was the head, and he knew that that reduction could take place and the revenue not suffer, if a reduction in the price of foreign barley was made at the same time. (*Hear, and cheers.*) Then in respect to the property-tax, which was advocated by his friend Mr. Marsh, he (Mr. Lefevre) was one of the same opinion, but upon examination he found that instead of such a tax affecting the *millionaire*, it would affect those individuals of the middle classes whose savings were vested in the funds, and who were the principal fundholders; for he found in consequence of a return for which he moved two years ago, that of 130,000 persons receiving dividends from the funds, at least 100,000 did not receive from them more than 10*l* a year; therefore it was not upon the *millionaire* the burden of a tax upon funded property would fall, but upon the middle classes, who had invested their savings in the funds. (*Hear.*) Besides

this, the effect of a property-tax upon the manufacturing interests would be deplorable, and would have the effect of driving the manufacturers and operatives of this country to the Continent and to America (*hear, hear*;) and they had now passed the Rubicon, and it did not remain to be decided whether this was an agricultural or a manufacturing country (*hear, hear*;) but they might rest assured that as long as manufactures flourished in Great Britain, so long would agriculture flourish with it; and whilst the population of England remained at its present extent, it was the duty of the Government to encourage the manufacturing interests, for those of agriculture would necessarily flourish in consequence, and the best prices be obtained for their fat stock and their malt and wheat. (*Cheers.*) He was sure then it would be allowed that nothing could be so mischievous as to damage the manufacturing interests, and drive the operatives to other countries. (*Cheers.*) As to the machinery for the collection of the remaining half of the malt-tax, which he proposed should remain, being expensive, it would be a mere nothing when compared with the reduction of the other moiety of the tax; and he had every reason to hope that the day was not far distant when the agricultural interests of the country would be as prosperous as ever. Scotland, which was more heavily burdened as regarded rent and rates, was in a high state of prosperity; and every witness examined before the agricultural committee last session stated that they had been in a high state of prosperity for the last four years. (*Hear, hear.*) What reason, then, was there for the depression in England? (*Hear, hear.*) He thought that if the farmers exerted themselves, and looked more to their own resources, and not to the belief, as they had been taught to do, that Parliament could save them, the result would be different from the circumstances in which the agricultural interests were now placed. (*Hear, and loud cheers.*) The hon. gentleman concluded by thanking them for the honour they had conferred on him.

Mr. SCOTT, in returning thanks, said that he agreed altogether with what had been stated by his hon. friend and colleague. (*Cheers.*) He had been recently through Scotland, making himself acquainted with the means through which the farmers there had so much improved their condition, and he found that these results had proceeded from their industry and economy, which he was persuaded did much more for them than any legislative measures could do. (*Hear, hear, hear.*) He intended to try their system himself, in order to afford a practical example of what he had seen in that country, where, instead of two horses to their plough, and three or four to their carts, they made one answer their purpose where one could do so, and where a rigid system of agricultural economy was observed. (*Hear, hear.*) He hoped that this example would soon be followed in this country, and prosperity would instantly follow. (*Cheers.*)

WASTE LANDS.—A very forcible exposition has been put forth of the advantages which would result from cultivating waste lands in Ireland. It is urged that emigrations to Australia and Canada might be superseded with a great saving to the State, and much benefit to the individuals. The Anglesea road from Newport to Thurles affords evidence of this. The sides of the mountains spontaneously irrigated would yield a splendid return for cultivation; yet here a large tract of land is almost wholly unimproved. It has been suggested that the settler or tenant should be assisted to build himself a stone cottage. Supposing the landlord to advance 5*l* for a farm of twenty acres, each tenant would then have to pay 5*s* yearly as interest besides rent; but for the first seven years no rent is to be claimed; the surplus produce in each year being laid out to improve the land. At the end of seven years, rent to commence at 1*s* per annum, which is to increase 1*s* every future year till the end of the lease, which is to terminate in twenty-one years. An experiment already made on this principle has been completely successful as far as it has been tried.

## REPORTS ON THE EPIDEMIC CATARRH, OR INFLUENZA,

PREVAILING AMONG THE SHEEP IN THE COLONY  
OF NEW SOUTH WALES, IN THE YEAR 1835.

By Messrs. BENNETT, GIBSON, and SHERWIN.

(From the *Veterinarian*.)

(We make no apology for the length to which these Reports extend, nor for substituting them for a Lecture in the present Number, for they have reference to a subject interesting to the British as well as the Colonial Agriculturist, and especially so to the veterinary practitioner. We are indebted to the kindness of Mr. Owen, the truly scientific curator of the Museum at the College of Surgeons, for the power of inserting these valuable documents.—Y.]

### REPORT.

By GEORGE BENNETT, Esq. M.R.C.S., F.L.S., &c.  
Sidney.

The first account I received of the appearance of the present epidemic in the colony was among the flocks of Robert Campbell, Esq., at Burrowa, about the middle of June 1834. The winter months previously had been very dry, with severe frosts; and, rain setting in, the sheep were attacked with the present epidemic. The deaths were numerous until about the middle of August, when they gradually diminished, fine mild weather setting in about this time. The mortality in Mr. Campbell's flock was as follows:—

Out of 700 wethers.....	400	died
— 2,600 breeding ewes	1,600	—
— 900 weaned lambs	500	—

No. of sheep . . . . . 4,200      Total loss 2,500

It is impossible to ascertain the precise number that died in the colony, but it was considerably more than seven thousand.

The character of the runs upon which the sheep fed was that of lofty ranges abounding in excellent pasturage and good water. The sheep, it may also be remarked, had depastured in the same locality for five or six years, and remained perfectly healthy. When the sheep were first attacked with the disease they were removed to another run, without any diminution of the severity of the disease.

**SYMPTOMS.**—The first observation I had of this disease led me to divide it into three stages; but as I wish to impress on the mind of the reader the importance of selecting and treating the sheep in the first stage of the malady, it may be of consequence to remark, that a careful observer may distinguish a sheep attacked by the disease nearly 36 hours before its ceasing to feed, by sneezing, and before it has exhibited any of the more marked symptoms which are placed under the first stage of the disease.

The disease commences with sneezing, more particularly at night, followed by general lassitude; and although at first the secretion from the nostrils merely bedews the surface, yet it soon becomes of a thick glairy consistence, and is secreted in a large quantity. The interior of the nose at this stage exhibits but little increase of vascularity. The eyes are suffused, and in some instances there is a profuse discharge of tears; in others, again, a discharge of matter from the meibomian glands is also observed, encrusting the eyelids. The animals cease to ruminate, and droop

the head. In some the respiration is affected as soon as the attack comes on. The tongue is parched, the secretions are diminished, except in the inflamed membranes; perspiration is obstructed, and general fever accompanies the attack. A restlessness is also perceived in the animals.

As the disease advances to the second stage, which varies in duration from four to twelve hours, all the foregoing symptoms increase in violence. The interior of the nose exhibits a florid hue, as if all the bloodvessels had been filled with minute injection; the secretion from the nostrils now becomes thick, of a yellow colour, and frequently hardens upon the orifices of the nostrils, impeding respiration.

The general fever is much increased; there is suppression of urine in many cases; costiveness is also occasionally observed, but is far from being general. The *tunica conjunctiva* of the eye displays an inflammatory character. There is a heaviness in the head, and an apparent desire on the part of the animal to rest the head on the hurdles, evidently appearing to suffer much pain. The respiration becomes more laboured, and a cough is also occasionally perceived.

The disease now advances to the third and last stage, in which the interior of the nostrils exhibit the highest state of inflammation (some parts displaying a leaden hue), and extending to the frontal sinuses; the secretion from the nose becomes lessened, very thick, and occasionally streaked with blood. The nostrils appear obstructed by the matter collected about them, occasioning a very laboured respiration. The animal now prefers lying down, and rests the head upon the ground; there is sometimes a troublesome cough; but a cough is found to prevail even in the animals recovering from the disease, and yet in many, again, the cough is not at any time observed as a symptom. The eye becomes glassy; the animals appear stupid, and unable to direct their steps; if permitted to leave the fold, they walk against a tree, or into a water-hole.

This stage may be considered as fatal; and as death advances, irregular but voluntary movements frequently continue; the appearance of dullness and stupor is increased, and there is a general diminution of sensibility. A general trembling is now observed in the animal, more especially in the fore extremities; it kneels down, remains for about the space of a minute in that position, falls down comatose, and after repeated struggles, and sometimes with a very laboured respiration, expires.

The length of time occupied by the disease in running through its different stages, or the intervals of time which elapse between each stage, varies. In some of the sheep attacked by this epidemic death has occurred in six hours after the first appearance of the symptoms; sometimes in twelve hours, and sometimes the animal lingered on until the third day; if he lived beyond that time, he usually recovered.

It has been remarked, that in the second and third stages the nostrils and face are much swollen; there is also a tumefaction of the lips, and in many I have observed an enlargement of the submaxillary glands. In some of the sheep the discharge was only observed to proceed from one nostril, in the first and second stages; but in the third stage the discharge has flowed from both; the animal at the time usually inclines its body to the side whence the discharge proceeds; the highly inflammatory state of the nostrils is as much ob-

served in this, as in that form of the disease in which the discharge proceeds equally from both nostrils.

A favourable prognosis may be formed when the animal commences eating, raises its head, and appears more lively; all these symptoms indicate returning good health; and I have observed the disease in some sheep pass through the different stages in a very mild manner. It is a curious fact, that, although bleeding the ewes in lamb was found to produce premature labour, yet the disease or high fever which accompanied it, when bleeding had been resorted to, seemed to produce the same effect in many of the ewes, several of which recovered from the disease; and this circumstance also obtains among females of the human race, as pregnant women attacked by influenza are apt to miscarry, and the flooding is in some cases fatal.

In many of the sheep that recover from this disease the general debility induced on the system remains for a long time; and in all the animals recovering from the disease, the high state of fever which accompanies the attack occasions them to lose all their wool, which very soon falls off, leaving the poor animals perfectly naked.

This epidemic catarrh differs from the common catarrh in the abruptness of its incursion, severity of its symptoms, and the rapidity of its transition; but varies in the severity of its symptoms according to the constitution of the animal, and is liable to occur at every season of the year when atmospheric changes are prevalent, which variability, I had frequently opportunities of observing, is very commonly the case in this colony.

**DISSECTIONS.**—On the examination of the bodies of the sheep which died from this epidemic, the cause of death was found to proceed either from inflammation of the immediate membranes of the brain, or from pulmonary disease. On examining the brain, the dura-mater was healthy; but on laying it back, the arachnoid membrane was found with its bloodvessels highly injected, both on the convexity of the hemispheres at the decussation of the optic nerves, and sometimes even in the interior of the ventricles. In some cases I observed a quantity of serous fluid secreted under the membrane, and a small quantity of similar fluid was found effused in the lateral ventricles. Occasionally the vessels of the pia-mater were found injected. The tunics of the cerebral nerves—especially the olfactory—displayed a beautiful ramification of injected bloodvessels encircling them. The sinuses of the brain were filled with clotted blood. The substance of the brain exhibited no trace of diseased structure. The frontal sinuses displayed indications of intense inflammation having existed, a sero-purulent matter being secreted, or the cavity was found filled with black coagulated blood. The whole of the nasal cavity presented, in every case, the most intense redness, from a florid to a dark red, mingled with patches of a leaden hue; the turbinated bones were unusually florid throughout the whole of their structure, as if they had been filled with an exceedingly minute injection: this was not confined to the membrane covering their surface, but extended throughout the whole of their substance; and, indeed, the enlarged injected bloodvessels reached through every part of the interior of the nasal cavity, and a very thick viscid matter was effused in the turbinated bones, as well as on the septum-narium, which could be scraped off with the knife. On cutting the substance of the nostrils, a

quantity of serous fluid or florid blood was discharged.

These were the appearances on the dissection of the brain when the cerebral organs were the seat of disease; but in many cases, although the same inflammation of the nasal cavity was found to exist in all that died from the present epidemic, yet no cerebral disease was found, the membranes being healthy; but the immediate cause of death existed in the larynx, trachea, and bronchiæ, or the substance of the lungs. In one case I found both extensive pulmonary disease, as well as cerebral; and from that circumstance we may infer, that disease might occur in both organs at the same time, although such has been of rare occurrence. Indeed, I should be inclined to adopt the opinion, that influenza centres (in the majority of instances) in the chest, although the whole body is affected by it—the head particularly—and in most cases the whole mucous lining of the throat, nares, and eyes, participates in the affection; the eyes becoming vascular, and the nose filled with a thick secretion. We also find in these animals, as in human subjects, an unusual languor and debility, disproportionate to the local affection. The heat of the animal is increased, the breath is hot, and a chillness is immediately felt on exposure to a current of air: the urine is scanty.

In some cases the pneumonic symptoms are severe, and in other cases they are less urgent, whilst the pain and heaviness of the head, and the dulness of the sensorial powers, is much increased. In the first, we may expect the lungs on dissection to be found the seat of the disease, and, in the latter, the cerebral organs.

The heart, when cerebral disease was found, was gorged with black blood, as well as the large veins; but when pulmonary disease existed, although all the large veins were equally gorged, yet I invariably found only the right auricle of the heart gorged, the left auricle and right and left ventricles being empty.

When the lungs were found to be the seat of disease, it evidently had assumed the features of acute pulmonary catarrh, or inflammation of the pulmonary mucous membrane, varying in its degree of intensity, and attended with great bronchial irritation. On dissection it appears that the right or left lobes of the lungs—I have observed the right to be more especially the seat of disease than the left—have the mucous membrane red to a greater or less extent, and with the appearance of a number of small red points, aggregated closely together. In other cases the lungs present an increase of weight and density; they are infiltrated with a frothy serosity in some quantity; the external surface is of a grey or violet colour; and these appearances indicate the disease to have been pneumonia. And again, we observe all the anatomical characters of pulmonary apoplexy in others, the lungs being of the degree of density of a hepatized lung, and the vessels filled with clotted blood. In many of the dissections a viscid mucus obstructed the bronchiæ; and the mucous membrane lining the bronchiæ, trachea, larynx, and extending even to the pharynx, was found inflamed, and a frothy mucus was effused in these passages. The stomach was found healthy, and in the majority of cases filled with well-digested food: the whole of the alimentary canal was perfectly healthy, and in very few was there any constipation observed: but where it did exist, the feces had accumulated in both the large and small intestines in large hard lumps, and evidently ap-

peared, both before or after death, to have produced abrasion of the mucous membrane of the intestines.

The liver was perfectly free from disease, and the gall-bladder filled with healthy bile; in some dissections I observed the gall-bladder verid much distended with bile. The remainder of the abdominal viscera were healthy. The pelvic viscera also were healthy, and the bladder unusually distended with urine.

**TREATMENT.**—It is only in the first stage of the disease that remedies can be applied with almost any probability of success; and as the first appearance of the disease is indicated by frequent sneezing—more particularly at night, and some time before any other of the more violent symptoms mark the invasion of the disease—it is at this period that I should recommend more particularly the treatment of the affected animals to commence; and no doubt at that time milder remedies will be more successful, before the inflammatory attack has advanced so far as to require severe treatment.

In the first symptoms of the disease blood may be abstracted, according to the age and constitution of the animal, and repeated, should the increase of the inflammatory symptoms seem to require it. After the venesection, a pint of lukewarm gruel, in which an ounce of Epsom salts has been dissolved, may be administered, and the lukewarm gruel repeated occasionally.

The bleeding may be either topical or general; the latter would probably be the most advisable, as the quantity abstracted can be regulated when taken from the jugular vein, whereas by topical bleeding a sufficient quantity cannot always be abstracted in a sufficiently short space of time. The extent of bleeding must in all cases be regulated by the severity of the disease, or the capabilities of the animal to suffer depletion. The abstraction of a small quantity of blood in an early stage of the disease, will probably mitigate the severe symptoms immediately; for on account of the great depression of strength, and dulness of the sensorial powers, it would be advisable, if possible, not to bleed largely, and perhaps occasion might not be required to draw blood a second time. Warm gruel should be repeated occasionally; and gentle exercise for the hospital flock will also be productive of benefit to them.

In preference, however, to the administration of any saline purgatives, turning the sick flock into a wheat paddock will be productive of the same aperient effect, and prove of more benefit to the sheep. I attribute the comparatively trifling loss among the sheep attacked by this epidemic at the station at Benbengaloo, to the sheep being taken and treated, in the first stage of the disease, in the manner I have just recommended: the deaths which did occur were principally among those that were not seen until the disease had advanced beyond the second stage.

The water gruel may be composed of one pound and a half of flour, half a pound of sugar, and thirty pints of water boiled, and given lukewarm. As a purgative, in the absence of green food, as before recommended, one ounce of Epsom salts may be administered internally, combined with a drachm of nitre in a pint of water gruel, given lukewarm; and the water gruel may be repeated three times daily afterwards.

I should recommend the overseers, on the appearance of this epidemic among their flocks, to frequently inspect all their sheep, and, noting the

first symptoms which appear in this epidemic, immediately separate the diseased from the healthy sheep. This ought to be done at least three or four times daily, and it would enable remedies to be employed in time, that would materially diminish the mortality in the flocks, and would be attended with less trouble if there should be a want of men. The treatment of the disease will be much aided by the sick sheep being folded in warm, dry, and sheltered situations, and having young green food, which is not only a valuable remedy when aperients are required, as in this malady; but the invalid sheep require a better and more nourishing diet, when in a weak and languid state, than when in the enjoyment of perfect health.

When the inflammatory symptoms are not very severe, topical bleeding, by opening a vein as near the seat of inflammation as possible, or by counter-irritants, may be recommended to subdue the inflammatory action; but as in this epidemic catarrh the lungs and bronchiæ are very liable to be affected sooner or later, according to the idiosyncrasy of the animals, it would be advisable, by all means, closely to watch the progress of the disease, and either resort to active treatment by the general abstraction of blood from the jugular vein, when the inflammatory symptoms run high, or to adopt milder measures in order to subdue the disease when it assumes a more gentle form.

It has happened, that many sheep have been treated by bleeding, &c., and yet the mortality was very great; but on careful inquiry it appeared that the animals were not treated until they reached the advanced or third stage, when all remedies were useless. As I have before observed, many localities, although good for healthy sheep, are yet too chilly for animals suffering from an epidemic attended with such languor, debility, fever, and depression of the vital powers, as this; consequently organic disease rapidly takes place, and speedily terminates in death. The sick sheep ought to be prevented from drinking cold water: with green food they would not require so much water as when feeding upon drier herbage. When water is given to the sick or diseased sheep, it should be tepid.

At Bureong, in the Lachlan, when the sheep were attacked by this epidemic, they were bled from the vein under the eye, in the ears, &c., and had lukewarm salt and water administered internally; but the whole treated in this manner died. Bleeding from the jugular vein was next resorted to, and Glauber's and Epsom salts, with warm gruel, were administered internally. Many of the affected sheep then recovered; but I could not ascertain whether they had been treated in the first stage of the disease. Tobacco water was also tried as an internal remedy; but the whole of the sheep died to whom it was administered.

In a few instances, some sheep proprietors injected spirits of turpentine up the nostrils of sheep affected by this disease; the result of which was, as might have been expected, immediate death. Blisters applied over the nostrils proved equally useless, because a local remedy was of little avail when the disease affected the whole constitution.

Lambs of a few days or a fortnight old were also attacked by the epidemic, and, on dissection, the same appearances presented themselves as in the old sheep. To most of the lambs attacked the disease proved speedily fatal, as the same remedies could not be so readily administered to them as to the older sheep.

It may be mentioned that Epsom salts, when

administered in cold water to the sheep, proved injurious, but were beneficial when given in warm gruel. Several of Captain Rossi's flock were bled, and Epsom salts, combined with a little nitre, given cold; but that mode of treatment was found to be injurious, the sheep dying two or three hours after it had been administered. The others were then treated with warm gruel and sugar, with a little common salt, after venesection, and this repeated for two or three days; this plan of treatment was found to be beneficial. Some sheep that had been bled were afterwards turned into a field of green barley; the whole were purged, and, out of a hundred, seventy recovered from the disease. It ought to be mentioned, that this sick flock was taken from the paddock, and placed during the night in the shearing shed, with clean straw.

Another flock was effectively treated by bleeding in the jugular vein; washing the nostrils clean from the discharge, and administering warm gruel with common salt, sugar, and a little nitre internally; the number of sheep treated in this manner was 360, out of which 342 recovered. The flocks were at the same time overlooked twice daily, and any that exhibited symptoms of the disease were immediately removed, bled according to the strength of the sheep, and the internal remedy administered, as I have just mentioned.

**THE CAUSES, CONTAGIOUS NATURE, &c. OF THE DISEASE.**—The causes of the present epidemic may be referred to two sources, an immediate or exciting, and a predisposing cause; and in the epidemic, the subject of our present inquiry, as it appeared among the sheep, a strict analogy in every symptom, and in all its modifications, will be found as when the same disease was prevalent among the human race.

The first or immediate cause is to be attributed to the state of the atmosphere; and all causes which operate to the injury of the animal frame may be correctly divided into external and internal; although sometimes a combination of both may give rise to many maladies. The principal external agencies are the atmosphere, with all its varieties of temperature, moisture, and dryness, specific contagious, noxious exhalations, &c. The internal causes are peculiarity of constitution, hereditary predisposition, all circumstances which produce debility, or superabundance or deficiency of the various secretions, &c.; and these latter may be classed among the predisposing causes. But some diseases are capable of being propagated, and the external cause can be demonstrated in a specific virus, capable of producing that distinct and peculiar affection. Thus smallpox, syphilis, &c., may be kept up and disseminated by their own original principle.

If the state and variability of the atmosphere was more studied during the visit and previous to the appearance of epidemical diseases, there would be much light thrown upon that cause, which is at the present day so readily assigned to contagion; indeed, we find the idiosyncrasy of different individuals such, that during the time the wind blows from a certain quarter, they feel indisposed, without any other assignable reason; and if wounded, the wound will not heal from the same cause: that others, again, suffer violent headaches when the atmosphere is charged with abundance of electric fluid, and which subside when that peculiar state of weather has passed.

Although I look upon a peculiar state of atmosphere as the immediate cause of this epidemical disease, yet the predisposing cause among sheep

may have originated in—first, breeding ewes twice in a season; second, the injurious effects which result from breeding in the same flocks, or what is technically termed, "breeding in-and-in," by which, although the quality of the wool may be improved, the constitution of the sheep is so weakened as to render them liable to disease, and susceptible of the atmospherical changes; and, third, the constitution of the sheep having been injured by mercurial remedies used in scab, as well as from the effects of that eruptive disease itself.

When engaged in the present investigation, a query arose, whether fine woolled sheep were more apt to suffer from the present epidemic than coarse woolled sheep; and I found that the finer woolled sheep had suffered severely, while the coarser woolled sheep had escaped entirely, or very slightly, except Mr. H. Hume's flock, which consisted of second class sheep; but then they were nearly all aged ewes.

The vicissitudes of the climate in this colony are found to be very great. I have often remarked that the mornings during the summer season are intensely hot, followed frequently during the afternoons and evenings by cold chilly winds, the temperature varying from 10° to 20°: it is therefore not uncommon for men working in the fields during harvest, nearly stripped of their clothing, when the sudden change of temperature takes place, to be attacked by head-achs, pains in the limbs, and general debility, frequently followed by catarrh. In Captain Rossi's flock, I am inclined to attribute one of the causes of the epidemic to change of locality, from a mild to a severe climate, exposed to a cold, chilly, variable atmosphere, with rain or snow; the animals being more predisposed to the disease by dry food, and being bred "in-and-in."

**CONCLUDING OBSERVATIONS.**—Catarrh among sheep, that is, in the form of what is called common catarrh, is not uncommon either in this colony or in Europe. But the appearance of this severer form of catarrh, the epidemic catarrh or influenza, in which the inflammatory symptoms are more increased than in the common form of the disease, I regard as novel, and am not aware that it has ever before appeared as an epidemic among sheep.

Before concluding this report I may be allowed to recommend to the sheep proprietor, that salt may be given to the sheep regularly, and in small quantities; it tends to strengthen the digestive organs, promotes secretion of bile, and is favourable to their general health. I recollect reading from some work, and making an extract in my note book at the time, that a gentleman resident in the county of Cumberland, in England, employed salt among his live stock daily for many years.

For Horses he gave.....	6 oz. per day
Milch Cows.....	4 ditto
Feeding Oxen.....	6 ditto
Yearlings.....	3 ditto
Calves.....	1 ditto
Sheep.....	2 to 4 per week,

if on dry pastures; but if they are feeding on turnips, &c., then they should have it more freely. Some give it to live stock on a slate or stone, and others lay lumps of it in the cribs or mangers. Many consider that if sheep are allowed free access to salt they will never be subject to a variety of diseases; and others, again, believe that it may even prove a cure for that formidable disease, which is considered to proceed from a worm of

the class *Entozoa*; the *Fasciola hepatica* of Linnæus—*Distoma hepaticum* of Abildgaard, and which has received the common appellation of the Liver Fluke.

In concluding this Report, I may observe, that, in giving directions for the treatment of any disease, whether found existing among human beings or the brute creation, the judgment of the practitioner must be always called into action; the habits and constitution of the patient under treatment ought to be minutely studied, and the practice should be modified according to these observations, whether the symptoms of the disease assume a severe or mild character. By such means alone can a successful termination of the disease be expected.

In sheep of very delicate constitutions, or high-bred sheep, a very moderate venesection—if even abstraction of blood can be resorted to at all with safety—must be adopted, and the animals carefully housed; but the coarse-woolled or stronger constitutioned sheep may receive, of course, according to the severity of the symptoms, the treatment before recommended: but at the same time the sheep proprietor must observe the necessity of treating the sick sheep according to their strength, classing them in small flocks agreeably to the nature of the disease. Housing them at night during the prevalence of the epidemic may also be advised. I am, however, fully aware that all directions will be useless unless the shepherds will pay minute attention to their flocks, which in too many instances has not been done. I attribute much of the mortality to this neglect of the men in charge of the sheep. Care being taken to treat the animals in the first stage of the disease, I have no doubt, will reduce the rate of mortality from this epidemic—should it re-occur, which is not at all improbable—to a very low amount.

*Sydney, Oct. 3, 1835.*

### LIVERPOOL AGRICULTURAL SOCIETY.

The annual meeting of this society, for the general show of live stock, implements of husbandry, seeds, &c. took place on the 6th of October. The yard was opened to members gratis, and to the public generally on payment of 2s. 6d. each, and at two o'clock the charge for admission was reduced to 1s. The show of live stock of all kinds was much superior to that of the last, or any preceding year, both with respect to the number and quality of the animals exhibited; and this marked improvement affords an additional proof, if any were wanted, of the great utility of the society, and the beneficial effects of that spirit of emulation which it has been the means of exciting amongst the agricultural classes of this and the surrounding districts. The show of horses was both numerous and good. About thirty stallions, principally of the heavy draught or cart kind, were exhibited, and many of them were splendid animals. Amongst them, the "Farmers' Glory," belonging to Mr. James Rimmer, of Scarisbrick, to whom the society's first prize of 10 sovereigns was awarded, is worthy of particular notice. A finer creature of the kind, both for bone, muscle, and symmetry, or one more deserving of the name bestowed upon him, has seldom, if ever, been seen. He stood 17 hands 3 inches high; and the manner in which he held his small and finely-formed head,—the arch of his

beautiful and massive neck, which measured seven feet in girth,—his neigh of triumph, and graceful caracoles, seemed to bespeak a consciousness of beauty and power, and of the general admiration which he excited. He is perfectly quiet and docile under ordinary circumstances,—but the congregation of so many animals of his own species in his immediate vicinity rendered him restless, and apparently anxious for a trial of strength with one or all of his neighbours, whose boundings and curvettings rendered a passage through this part of the yard a matter of some little difficulty, if not danger. The show of brood mares was good, though not numerous. There were also exhibited five pair of cart-horses, and about twenty three-year-olds, two-year-olds, and yearlings,—many of them very fine animals. There were fifteen fine, full-grown bulls, and about twenty yearling bulls and calves. The show of cows, heifers, and calves was both good and numerous; but some of the animals, having been driven a considerable distance to the place of exhibition, seemed rather out of condition. It is rather a singular circumstance that all the bulls, and we believe, the cows, were of the short-horned kind. Amongst the extra stock was a fat cow, the property of Captain Hampton, of Hannlys, Anglesea, which measured upwards of a yard across the loins, and weighed upwards of 1 ton 4 cwt. She is eight years old, and one of the first prizes for extra stock was awarded to the owner. She is descended from the celebrated Conct, which was sold by the owner for 1,000 guineas. The great improvement exhibited in the show of cattle, compared with that of last year, was subject of general remark amongst the best judges; and to no part of it does this observation apply more strongly than to the show of sheep, of which a great number of the Southdown and Leicester breeds, of all ages, were on the ground. The show of last year bore no comparison with the present, either with regard to number or quality. Some of the unshorn bore splendid fleeces, resembling silk in texture. The show of pigs, especially breeding sows, many of which had numerous progenies around them, was also much better than that of last year. One of them, a fat sow, belonging to Mr. James Hall, butcher, of this town, attracted general notice. Its weight was about thirty-five score. We must say, however, that to an uninitiated eye many of the poor porkers were objects rather of pity rather than admiration, inasmuch as they were so much overloaded with their own obesity as to be incapable either of standing or moving with any thing like comfort to themselves. In the shed for the exhibition of roots, plants, &c., several fine specimens were exhibited. There was a very fine collection of all sorts of grain,—both in the stalk and in seed, and of all the best sorts of grasses. Amongst the roots was a Swedish turnip, measuring a yard round, and weighing 26 lbs. with several of smaller dimensions, grown by Mr. Skirving, who deserves the utmost credit for the care and attention which he has bestowed, for several years past, on the cultivation and improvement of this most valuable root. They were remarkably sound, and clear from fangs, and presented a fine contrast with some plants of the same kind grown upon Chat Moss. There were also several fine specimens of mangel wurzel, both yellow, white, (the kind from which sugar is extracted,) and red. Four roots of the latter, grown at Halsall, weighed 20 lbs. There were two or three specimens of the Cæsarian cow cabbage, of which so much has re-

cently been said, and a very abundant supply of seeds intended for sale. There was not much demand for them, though we believe that they were so much the rage in London, a short time ago as to bring so much as a shilling for a single seed. They were now somewhat reduced in price, being offered at a shilling the package. One of the specimens exhibited consisted of a stalk about seven feet in length, with a straggling top, somewhat resembling the palm tree in shape. In the opinion of a competent judge, the Casarian cow cabbage cannot be recommended as a profitable plant for agricultural purposes, is not equal in value to the common cattle cabbage of this country, and is certainly more curious than useful. Several machines for cutting hay, turnips, &c., were exhibited; but there was not much novelty in either the principle or application of any of them.

## REPORT.

On the seventh anniversary it has become the pleasing duty of the Committee to inform the subscribers and the public that their efforts to improve the general agriculture of this district, have created such emulation that it is to be hoped the time is not far distant when the advantages of rewards will give such encouragement as to place it second to very few in the kingdom.

The show of live stock this day surpasses that of any preceding exhibition, not only in number, but also in the excellence of the animals, with, of course, a few exceptions; but very few amongst the horned cattle, pigs, and sheep, fully showing the advantages derived from seven years' competition.

The Committee again draw the attention of the agriculturists, and of landowners in particular, to the number of premiums which have been given for draining, an improvement which in the greater part of this district, is the most essential in our agriculture, and without which (in situations requiring it) all the efforts of the farmer are of little avail.

The Committee have great pleasure in stating that the second annual ploughing match took place last Spring at Newton, and satisfied the expectations they had when they came to a conclusion to form this branch of agricultural competition in this neighbourhood; as the second exhibition very greatly surpassed the first, both in number of competitors, and in the superiority of the ploughing.

The Committee cannot close their report without thanking the subscribers and the public for the very liberal support they have met with, and they trust there will be an increase to that support, to enable them to give such rewards as may induce more individuals to become candidates for the premiums.

This argument is respectfully urged upon the consideration of all non-subscribers who are interested in land, and they may be told that their support is absolutely necessary if the ploughing matches are to be continued, as they have entailed considerable additional expense upon this society.

For the gratuitous use of the yard for the exhibition of live stock, the thanks of the Committee are respectfully returned to the Mayor and Corporation of this great place; and to Mr. Lucas, the very liberal gentleman who affords the accommodation of the best room in the town for the dinner party to enjoy themselves in.

## PREMIUMS.

## CLASS I.—BEST CULTIVATED FARMS, &amp;c.

Premium 6. To Mr. John Burgess of Utlington, near Delamere Forest, (not solely dependant upon

farming,) for the best cultivated farm of 400 acres, a piece of plate, value seven sovereigns.

11. To R. W. Barton, Esq., of Derby House, Lower Bebbington, as owner and occupier of a farm of 200 acres, for laying 63,608 yards of drains for most effectually draining acres thereof, the Society's silver medal.

12. To Dr. Sillar, of Rainford, as owner and occupier of a farm of 80 acres, for laying 9,190 yards of drains for most effectually draining 19 acres thereof, the Society's silver medal.

13. To Mr. Wm. Backhouse, of Lathom, as tenant and occupier of a farm of 272 acres, for laying 6,464 yards of drains for most effectually draining 23 acres thereof, a piece of plate, value ten sovereigns.

14. To Mr. Nathan Loulady, of Huyton, as tenant and occupier of a farm of 140 acres, for laying 10,380 yards of drains for most effectually draining 21 acres thereof, a piece of plate, value seven sovereigns.

15. To Mr. Edward Ambrose, of Tarbuck, as tenant and occupier of a farm of 95 acres, for laying 5,637 yards of drains for most effectually draining 12½ acres thereof, a piece of plate, value 5 sovereigns.

15. To Mr. John Shuttleworth, of Tarbuck, as tenant and occupier of a farm of 74 acres, for laying 4,240 yards of drains, for most effectually draining 10 acres thereof, the Society's silver medal.

17. To Mr. William Burgess, of Delamere Park, Cheshire, as owner and occupier of a farm, for laying down 21 acres of permanent meadow, the Society's silver medal.

18. To Mr. John Dawson, of Gronant, near Holywell, as tenant and occupier of a farm, for laying down 21 acres for permanent meadow, a piece of plate value four sovereigns.

20. To Mr. John Warburton, of Sandiway, Cheshire, as tenant and occupier of a farm of 152 acres, for having judiciously covered with marl 17 acres, a piece of plate value five sovereigns.

21. To Daniel Magrath, Esq., of Chat Moss, as owner and occupier of a farm of 50 acres, for having judiciously covered with marl 14 acres, a piece of plate value three sovereigns.

26. To Mr. William Winstanley, of Speke, as tenant and occupier of a farm of 116 acres, for cutting, laying, and plashing, 349 perches of fence, a piece of plate, value five sovereigns.

12. To Richard Southern, labourer, of Speke, for cutting the hedges for the successful candidate, the sum of one pound.

## CLASS II.—CROPS AND PRODUCTIONS OF THE DAIRY.

Premium 1. To Sir Edward Mostyn, Bart, of Talacre, as owner and occupier, for the best crop of mangel wurzel of 3 acres, the Society's silver medal.

2. To Mr. John Dawson, of Gronant, near Holywell, as tenant and occupier, for the best crop of mangel wurzel of 7 acres, a piece of plate, value five sovereigns.

5. To Mr. William Boys, of Speke, as tenant and occupier, for the best crop of Swedish turnips of 6½ acres, a piece of plate value six sovereigns.

6. To Mr. Richard Almond, of Standish, as tenant and occupier, for the best crop of Swedish turnips of five acres, a piece of plate, value four sovereigns.

7. To Mr. George Wright, of Walton, as tenant and occupier, for the best crop of Swedish turnips of 2½ acres, a piece of plate, value three sovereigns.

## CHEESE.

9. To Mr. Robert Bennett, of Aston, as tenant for making 10 tons 16½ cwt of cheese, from 65 cows, a piece of plate, value eight sovereigns.

## CLASS III.—REWARDS.

6. To Thomas Griffiths, farmer's man servant to Mr. Thomas Whitley, of Brencoced, for 18 years servitude, four sovereigns.

7. To Robert Griffiths, farmer's man servant to Mr. Thomas Whitley, of Brencoced, for 16 years' servitude, two sovereigns.

8. To James Johnson, farming labourer to Peter Balmer, of Acton Grange, for 46 years' servitude, and for having conducted himself to the satisfaction of his employers during that period, four sovereigns.

9. To Samuel Griffiths, farming labourer to Mr. Thomas Whitley, of Brencoced, for 40 years' servitude, and for having conducted himself to the satisfaction of his employers during that period, two sovereigns.

To John Prow, farming labourer to Mr. Ralph Bolton, of Wigan, for 40 years' servitude, and for having conducted himself to the satisfaction of his employer, two sovereigns.

10. To Ann Aspinall, of Halsall, farmers' woman servant to Mr. Richard Coxhead, for 26 years' servitude, and for having conducted herself to the satisfaction of her employer during that period, three sovereigns.

11. To Ellen Gower, of Sephton, farmers' woman servant to Mrs. Gilbertson, for 25 years' servitude, and for having conducted herself to the satisfaction of her employer during that period, two sovereigns.

15. To Thomas Johnson, of Acton Grange, labourer in husbandry, for bringing up 12 legitimate children without parish relief, sovereigns.

15. To John Smith, of Sephton, labourer in husbandry, for bringing up 12 legitimate children without parish relief, sovereigns.

16. To William Hesketh, of Halsall, labourer in husbandry, for bringing up 10 legitimate children, without parish relief, sovereigns.

## CLASS IV.—LIVE STOCK.—HORNED CATTLE.

Premium 1. To Mr. Richard Almond, of Standish, for the best short-horned bull, 3 years old, fifteen sovereigns.

2. To R. B. Hollinshead, Esq., of West Derby, for the best short-horned bull,  $2\frac{1}{4}$  years old, the society's silver medal.

3. To Peter Greenall, Esq., of St. Helen's, for the best short-horned bull, 1 year old, a piece of plate value 5 sovereigns.

4. To Mr. William Howard, of Knowsley, (being solely dependant upon farming), for the best short-horned bull, 2 years and 3 months old, bred within the limits of the society, a piece of plate value eight sovereigns.

This bull was not considered worthy of so large a premium, but awarded being the property of the farmer, for the sake of encouragement.

7. To Mr. William Bloor, of Point of Ayr, (being solely dependant upon farming), for the best short-horned bull, 1 year 3 months old, bred within the limits of the society, a piece of plate value five sovereigns.

8. To Mr. Edward Webster, of Bold, (being solely dependant upon farming), for the second-best short horned bull, 1 year 6 months old, bred within the limits of the society, a piece of plate value three sovereigns.

9. To Sir Edward Mostyn, Bart., of Talacre, for the best dairy cow, the society's silver medal.

10. To Robert Statter, Esq., of Knowsley, for the second-best ditto, a piece of plate value four sovereigns.

11. To Richard Pilkington, Esq., of Windle, for

the best two-year-old heifer, a piece of plate value five sovereigns.

12. To ditto, for the best yearling heifer, a piece of plate value three sovereigns.

13. To Mrs. Margaret Palding, of Croxteth, (being solely dependant upon farming,) for the best two-year-old heifer, bred within the limits of the society, a piece of plate value five sovereigns.

15. To Mr. William Bloor, of Point of Ayr, (being solely dependant upon farming,) for the best one-year-old heifer, bred within the limits of the society, a piece of plate value three sovereigns.

16. To Mrs. Scotson, of Garston, (being solely dependant upon farming,) for the second-best one-year-old heifer, bred within the limits of the society, a piece of plate value one pound ten shillings.

18. To Peter Greenall, Esq., of St. Helen's, for the cow or heifer showing the most symmetry, fat, and weight, a piece of plate value five sovereigns.

20. To John Dawson, Esq., of Gronant, for the best cow for feeding after milking, a piece of plate value three sovereigns.

21. To Robert Statter, Esq., of Knowsley, for the second-best ditto, a piece of plate value two sovereigns.

## HORSES.

Premium 22. To Messrs. J. and J. Rimmer, of Scarisbrick, for the best stallion for the general purposes of agriculture, a piece of plate value ten sovereigns.

23. To Mr. Jas. Heaps, of Little Hulton, for the second best stallion for ditto ditto, a piece of plate value seven sovereigns.

24. To Mr. Peter Harrocks, of Aughton, for the best brood mare, for the general purposes of agriculture, a piece of plate value five sovereigns.

25. To Bennet Smith, Esq., of Ashton, for the second-best brood mare, for ditto ditto, a piece of plate value three sovereigns.

27. To Mr. Henry Swift, of Lathom, for the best yearling colt, gelding, or filly, for the general purposes of agriculture, a piece of plate value three sovereigns.

28. To Mr. R. Charnock, of Eccleston, for the best two-year-old colt, for the general purposes of agriculture, a piece of plate, value four sovereigns.

29. To Mr. Edward Webster, of Bold, for the best two-year-old gelding, or filly, for the general purposes of agriculture, a piece of plate value four sovereigns.

30. To Mr. James Cook, of Eccleston, for the best three-year-old gelding or filly, for the general purposes of agriculture, a piece of plate value five sovereigns.

51. To Joseph Swift, of Eccleston, (being solely dependant upon farming), for the best pair of horses for the general purposes of agriculture, a piece of plate, value five sovereigns.

32. To Mr. Thomas Harrison, of Orrell, (being solely dependant upon farming,) for the second best pair of horses for ditto ditto, a piece of plate, value three sovereigns.

## SHEEP.

33. To John Dawson, Esq., of Gronant, for the best pen of three yearling Leicester ewes, a piece of plate, value three sovereigns.

34. To Mr. Samuel Scotson, of Toxteth-park, for the second-best pen of three yearling Leicester ewes, a piece of plate value one sovereign.

35. To Mr. Robert Jenkins, of Mold, for the best pen of three yearling Southdown ewes, a piece of plate, value three sovereigns.

36. To Mr. Robert Lucas, of Allerton, for the

second best pen of three yearling Southdown ewes, a piece of plate, value one sovereign.

37. To Mr. J. C. Etches, West Derby, for the best Leicester ram, under three years old, a piece of plate, value two sovereigns.

38. To Mr. Samuel Scotson, of Toxteth-park, for the second-best Leicester ram, under three years old, a piece of plate, value one sovereign.

39. To Mr. Robert Lucas, of Allerton, for the best Southdown ram, a piece of plate value two sovereigns.

40. To Mr. Robert Johnson, of West Derby, for the second-best Southdown ram, a piece of plate value one sovereign.

43. To Sir Edward Mostyn, of Talacre, for the best pen of five fat ewes, a piece of plate value two sovereigns.

44. To John Dawson, Esq., of Gronant, for the second-best pen of five fat ewes, the society's silver medal.

45. To John Dawson, Esq., of Gronant, for the best pen of five Leicester lambs, a piece of plate value 2*l* 10*s*.

46. To Sir Edward Mostyn, of Talacre, for the second-best pen of five Leicester lambs, the society's silver medal.

47. To Mr. Robert Jenkins, of Mold, for the best pen of five Southdown lambs, a piece of plate value 2*l* 10*s*.

## PIGS.

49. To Mr. William Pickup, of Liverpool, for the best boar, two years old, a piece of plate value four sovereigns.

50. To Mr. John Dawson, of Gronant, for the second-best boar, 11 months old, a piece of plate value three sovereigns.

51. To Mr. Samuel Scotson, of Liverpool, for the best breeding sow, 2 years old, a piece of plate value three sovereigns.

52. To Mr. John Dawson, of Gronant, for the second-best sow, 1 year and 3 months old, a piece of plate, value two sovereigns.

53. To Mr. J. C. Etches, of Liverpool, for the best fat pig, 13 months old, a piece of plate, value two sovereigns.

54. To Mr. John Dawson, of Gronant, for the second-best fat pig, 11 months old, a piece of plate value 1*l* 10*s*.

## EXTRA STOCK.

56. To Richard Pilkington, Esq., of Toxteth-park, for the best cow of any breed, five sovereigns.

57. To Richard Pilkington, Esq., of Windle, for the best two-year-old heifer of any breed, two sovereigns.

58. To Mr. John Dawson, of Gronant, for the best one-year-old heifer of any breed, two sovereigns.

60. To Sir H. B. Hoghton, Bart., of Bold, for keeping the best bull of any breed, to serve the cows of his tenantry gratis, the society's silver medal.

61. To Sir E. Mostyn, Bart., of Talacre, for keeping the best boar to serve the sows of his tenantry gratis, the society's silver medal.

To Mr. James Heaps, of Hulton, for a good stallion, the society's silver medal.

To Robert Statter, Esq., of Knowsley, for his short-horned bull, four years and a half old, the society's silver medal.

To Robert Statter, Esq., of Knowsley, for his two-year-old heifer, the society's silver medal.

To John Dawson, Esq., for his short-horned cow, the society's silver medal.

To Captain Hampton, of Henllys, Anglesea, for a superior fat cow, the society's silver medal.

To Mr. William Lynn, for exhibiting six Chinese and six Neapolitan pigs, of a superior quality, the society's silver medal.

## SWEEPSTAKES.

1. To Richard Pilkington, Esq., of Windle, for the best short-horned bull, 3*l* 3*s*.

2. To Mr. William Bloor, of Point of Ayr, for the best two-year-old short-horned bull, 1*l* 11*s* 6*d*.

3. To Peter Greenall, Esq., of St. Helen's, for the best one-year-old short-horned bull, 1*l* 1*s*.

5. To Sir E. Mostyn, Bart., of Talacre, for the best short-horned cow, in calf or milk, not fed for the butcher, 5*l*.

6. To Richard Pilkington, Esq., of Windle, for the best cow of any breed, not fed for the butcher, 1*l* 1*s*.

8. To Richard Pilkington, Esq., of Windle, for the best two-year-old short-horned cow, 3*l* 3*s*.

9. To Peter Greenall, Esq., of St. Helen's, for the best one-year-old short-horned heifer, 1*l* 11*s* 6*d*.

10. To Richard Pilkington, Esq., of Windle, for the best bull calf, under one year old, 2*l* 2*s*.

11. To Richard Pilkington, Esq., of Windle, for the best cow calf, under one year old, 1*l* 1*s*.

13. To Mr. Thomas Robinson, of Bold, for the best stallion, for agricultural purposes, 2*l*.

19. To Sir Edward Mostyn, of Talacre, for the best ram, 1*l*.

20. To John Dawson, Esq., of Gronant, for the best one shear ram, 1*s*.

20. To Mr. Samuel Scotson, of Toxteth-Park, for the best Leicester ewe, 1*l*.

21. To John Dawson, Esq., of Gronant, for the best boar, 1*l* 1*s*.

22. To John Dawson, Esq., of Gronant, for the best sow, 1*l* 1*s*.

23. To Mr. James Hall, of Liverpool, for the best fat pig, 1*l* 1*s*.

26. To Mr. William Ashcroft, of Halsall, for the best mangel wurtzel, 10*s*.

## IMPLEMENTS.

To Mr. Robert Jones, of Warrington, for a cheese press of a new construction, the society's silver medal.

## ROOTS, &amp;c.

To Messrs. Thomas Gibbs and Co., of London, for exhibiting a specimen of the Whittington new white wheat, the society's silver medal.

To Mr. Thomas Harrison, of West Derby, for exhibiting some superior specimens of Swedish turnip and mangel wurtzel, the society's silver medal.

To Daniel Magrath, Esq., Chat Moss, for a superior specimen of flax grown on Chat Moss, the society's silver medal.

## THE DINNER.

The annual dinner took place in the large room at Lucas's Repository, Great Charlotte-street. The chair was occupied by Lord Viscount Molyneux, supported on the right by R. B. Wilbraham, Esq., M.P., and on the left by William Blundell, Esq., of Crosby. Amongst the gentlemen in the immediate vicinity of the chair, we observed John Formby Esq., Peter Greenall, Esq., of St. Helen's, J. Worrall, Esq., of Knotty Ash, Robert Statter, Esq., W. E. Hall, Esq., Thomas White, Esq., and a considerable number of gentlemen from the Principality.

The cloth was drawn ten minutes before six o'clock. The following toasts were drunk:—

“The King,—the Duke of Lancaster.”

“The Queen.”

"The Princess Victoria, and the other branches of the Royal family."

"The Army and Navy."

"The Patron of this Society, Lord Derby."

"Prosperity to the Liverpool Agricultural Society." (*Three times three*).

The Hon. R. B. WILBRAHAM then rose and said it was his pleasing duty to give a toast, which he was sure, in that room would be received with the greatest approbation that could possibly be shown. He regretted that their noble President who usually occupied the chair was absent, but he was sure they would all agree with him, that it was at present as well filled as they could possibly wish it to be on such an occasion. (*Cheers*.) In giving the health of the noble Viscount who sat on his left hand, he felt it to be a most pleasing duty, for he felt the highest regard for that noble man, and he was sure he was addressing an assembly who fully appreciated his merits, which were more particularly shown in the light of a country gentleman residing upon his property, (*cheers*) encouraging by every means in his power, not only agricultural pursuits, and agricultural labour, but aiding and encouraging in every possible way that he could agricultural sports—himself a leader in those sports, and not to be surpassed by anyone. (*Cheers*.) The Hon. gentleman concluded by proposing the health of

"Lord Molyneux, the farmers' friend." (*Three times three*.)

His LORDSHIP returned thanks, and concluded by giving—

"Lord Stanley."—(*Drunk with three times three*.)

The CHAIRMAN then proposed the health of the Vice-Presidents, Sir Edward Mostyn, Bright Crosses, Esq., and James Aspinall, Esq.

The CHAIRMAN said that the success of this meeting was not a little owing to the excellent place in which they had an opportunity of seeing the cattle to be shown, and they were very much obliged to the Mayor and Corporation for the advantages which they derived from the use of the yard.

"The Mayor and Corporation of Liverpool."

The CHAIRMAN said they were much indebted to the gentlemen who had assisted in awarding the prizes, and proposed the healths of

"John Binns, Esq., of Lancaster; James Fawcett, Esq., of Carlisle; and F. Paley, Esq., of Leeds"—the Judges of the cattle. (*Great applause*.)

Mr. BINNS, in returning thanks for himself and his colleagues, begged leave to express the great satisfaction they had felt in seeing so many valuable cattle as had had been shown that day. They hoped that the cattle would be the parents of a valuable stock in this part of Lancashire at a future day. (*Applause*.) Although they thought it right to speak thus in favour of the generality of the stock exhibited, at the same time it was only candid to say that part of the stock shown was not so creditable as the judges could have wished, though there certainly was a great improvement. They had given a premium to a part of the stock belonging to a farmer, which, had it belonged to breeder or a gentleman amateur, they certainly would not have deemed worthy of a premium. (*Hear, hear*.) They had given a premium of 8l for an animal which they considered far from good, but they had done it with a view to encourage farmers to bring stock to the show, and breed better stock in future. (*Applause*.) Experience had shown that the best sort of stock

were not only the best to sell, but the cheapest to keep and bring to market. (*Applause*.) He therefore recommended the farmers to make use of the good animals exhibited in order to improve their stock, and he was sure that gentlemen would encourage them to do so. (*Applause*.) Societies of this kind were doing a great deal of good in the country, but they were still only beginning to learn agriculture. Such was his opinion, and that of many others. Every inch of this country ought to be like a garden. It was, however, in a very poor state of cultivation. By growing clover, turnips, and grass crops alternately,—by keeping cattle more economically, providing food for them in the house, and reserving the manure for the ground, the land would be enriched to five times its present extent; there would be an increase of corn, as well as of cattle; and the county would be much richer than it was. He had not the least hesitation in saying that England ought to be an exporting country, both for sheep, cattle, and corn. This might reduce the price of corn, but the reduction in price would be amply made up by the increased quantity produced. They ought to imitate the example of the manufacturers who exported a great quantity of the goods they produced. If the agriculturists exerted themselves in the same way, if they became exporters of all kinds of produce from the ground, the nation would be a much richer one than it was. (*Applause*.)

The CHAIRMAN said they had had an excellent speech from Mr. Binns, and he only regretted that that gentleman had not gone on much longer, for he was quite certain that the hints Mr. Binns had given to the agriculturalists of this county would be of the greatest possible use. It was, therefore, to be regretted that he had not been much more prolix than he had been. It now became their duty to drink the health of the gentlemen who had officiated as judges of the horses. His Lordship proposed the healths of

"Christopher Johnson, Esq., of Lancaster, and Peter Carter, Esq., the judges of horses."

Mr. JOHNSON returned thanks. He was extremely sorry that he and his colleague could not say quite so much in praise of the horses shown that day as his friend Mr. Binns had said with regard to the cattle. He hoped, however, to see as much improvement another year as would meet their most sanguine expectations.

"The members for the County." (*Great Applause*.)

Mr. WILBRAHAM in returning thanks on the part of his colleagues and himself, begged to say that so far as he was individually concerned, no one was more interested in the prosperity of agriculture, and of the varied interests of this county than himself; but he regretted to say that as a practical farmer he could claim no great merit, and, in fact, knew very little about it. The duties which they had imposed upon him amply filled his hands during those months which were to the farmer of the highest importance, he meant the earlier part of the year when Parliament was sitting. It gave him very great pleasure to hear one of the gentlemen who officiated as judges, give it as his opinion that the stock of cattle was improving; and he trusted that the remarks made by that gentleman would be beneficially received, and induce those who heard them to turn them to some very good account. The gentleman had stated that the judges had given one prize to a farmer, but that the stock produced was not that which they as judges considered of the first quality.

That they had given that prize was to him a subject of gratification, because he was quite sure that in doing that they had done more to forward the objects of the society than could have been done in any other mode. (*Applause.*) He knew that gentlemen who were first-rate breeders of cattle would, if applied to, be very glad to afford farmers the use of their prime stock; and he trusted that, in succeeding years, the farmers would bear away the prizes from the gentlemen. (*Applause.*) He thanked them for the very flattering manner in which they had drunk the toast, and begged leave to drink all their good healths in return. (*Cheers.*)

The CHAIRMAN was happy to inform them that the report had now arrived, and, if it were their pleasure, it should be read from beginning to end. As, however, it was a very long one, and as they would have an opportunity of reading it in all the newspapers of the town, he thought it would be much better if the prizes were distributed now, and the report were read at their leisure. (*Hear, hear.*) There was, however, one part of the report on which he felt called upon to make a few remarks. He alluded to the rewards given to those individuals of a humbler class of life for long and faithful service in the employment of one master. (*Hear, hear.*) Servants were induced by their own good feelings in the first instance, and by the hope of reward in the second, to serve their masters faithfully, and he could not help thinking that one of the best services rendered by the society to the community was the offering of premiums of this sort. (*Applause.*) There were eleven farm labourers who had served, one 46 years; one 44; one 40; one 39; two 33; two 30; and three 26 years in the employ of the same master; and perhaps there were eleven times eleven who had had the modesty not to claim the reward. (*Applause.*) There were six claims from female servants, one of whom had served 26½ years, another 25½ years,—the ladies seen to deal in halves,—(*laughter.*) one 23 years, another 18½ years, another 18 years, and another 16 years. There were six premiums for farm labourers bringing up large families without parish relief. (*Cheers.*) Two of them had brought up twelve children each, two eleven, one ten, and another nine. He thought it right to read this in order that they might know in what way the society was rewarding honesty, fidelity, and industry in the humbler classes. (*Cheers.*) He then observed that in order to economize time, he would give such individuals as had gained more prizes than one the whole at once, instead of calling them up to receive each of them separately. His Lordship then distributed the prizes to the successful candidates, addressing a few words of congratulation to each. The first was Mr. John Dawson, of Flintshire, who received a whole trayful of prizes, nine in number. The names of the other successful candidates, and the description of the prizes awarded to them, will be found in the list. After a considerable time had been occupied in the distribution of prizes,

Mr. WILBRAHAM rose and said, that as this was but dry work for all but the successful candidates, he had obtained permission from the Chairman to propose a toast. He gave—

“The Town and Trade of Liverpool, and the prosperity thereof.” (*Great applause.*)

The CHAIRMAN, in handing a prize to Mr. Webster, the inspector of crops, expressed his great regret that the society was about to lose the benefit of his valuable services. On giving a prize to Mr. Bloor, his Lordship said that there was none

to whom the society was more indebted than to that gentleman, and to his excellent landlord, Sir Edward Mostyn.

The CHAIRMAN, in proposing the next toast, begged leave to express the gratitude the society owed to the individual whose health he was about to propose, and who had done more towards the success of the meeting than any other—he alluded to Mr. Lucas. They were indebted to him for the use of that room, which he gave to them gratuitously. It was one of the most beautiful rooms, he (the chairman) had ever seen for a public dinner, and Mr. Lucas had given it to them gratuitously at very great inconvenience to himself. They therefore owed it to him to drink his health in the most cordial manner. Mr. Lucas had this year made his first appearance as a farmer, and a successful one. He had not only won prizes himself, but seemed determined to carry off those of others, for he had bought their best bull. He was sorry that Mr. Lucas was not present, in consequence of indisposition, but in his absence he begged leave to propose

“Mr. Lucas:—better health to him, and thanks for the use of his room.” (*Loud cheers.*)

Mr. LUCAS, JUN. returned thanks for his father. He was sure that no member had more at heart the prosperity and ultimate success of the society, or viewed with greater pleasure the advance which it had made towards prosperity.

The CHAIRMAN said he had now got through the pleasing task of handing the premiums to the successful candidates. There was also a long list of prizes in money and medals, which they would see printed in the public papers. He ought not, however, to omit mentioning one premium of an extraordinary nature which had been obtained. He alluded to that awarded to Mr. M'Grath, for a very superior specimen of flax, grown upon a part of Chat Moss, which had very lately been redeemed from the waste. (*Cheers.*) His Lordship then proposed the health of

“Mr. Dawson and the successful candidates.”

Mr. DAWSON returned thanks for the very flattering manner in which his health had been drunk as one of the successful candidates. He wanted words to express his feelings. He attributed the success of the Welshmen at the show to the spirited society in their small county, which had been encouraged very much by the landowners in every possible way; and he was happy to hear that the Lancashire noblemen and gentry were likewise the farmer's friends. (*Cheers.*) He was sure that, were it not for the encouragement held out by the society in the county of Flint, the Welshmen would not be able to send stock fit to compete with the stock shown in the great county of Lancaster. (*Applause.*)

The CHAIRMAN said that they would still be in error if they separated without paying a debt of gratitude to those who were always at work for them, and seldom at play. He begged leave to propose the health of the Committee,—and more particularly that of Mr. White, the Secretary. (*Cheers.*) He was sure that if Mr. White was as indefatigable in other things as he had been in his exertions to procure a president for them, he deserved well of the society. (*Loud cheers.*)

Mr. WHITE begged leave to thank them most cordially for the very kind manner in which they had drunk his health. It was highly gratifying to himself that their labours had been so well rewarded that day. It was now some years since the first meeting had taken place for the purpose of

establishing this society. At the first meeting, in November, 1829, there were only thirteen members present. It was not a little gratifying to see that the thirteen had now been multiplied into 500; it was not a little gratifying to see that year by year they had gone on, so far as he was able to judge, decidedly improving in the cultivation of the soil, and producing improved breeds of horned cattle, sheep, and horses. (*Applause.*) His labours that day had been rather heavy, and he was sure they would excuse him for cutting short his remarks. In his own behalf and that of the Committee, he thanked them for the very kind manner in which the toast had been received. (*Applause.*)

Mr. WILBRAHAM begged leave from the noble President to propose a toast, which, he was sure, would be received with great approbation:—

“The health of Lord Sefton, the sire of our noble President, and success and prosperity to the house of Croxteth.”—(*Loud cheers.*)

There were now in the world, besides the noble President, two very young members of that noble house, and he hoped they would walk in the steps of their father, and be as great favourites as he was with the county. The toast was drunk in the most enthusiastic manner.

The CHAIRMAN in returning thanks said,—“Unfortunately,—I may say unfortunately, you see very little of the nobleman whose health you have now drunk,—but there is not a better supporter of the agricultural interest than he is. (*Cheers.*) I will venture to challenge the whole field of landlords to produce a better. That is saying a great deal for one so nearly connected with him, and it may be deemed presumptuous in me to say so much; but I will appeal to his tenants to say whether I am not telling the simple truth of him. (*Cheers.*) Ever since he came into possession of the estate, he has done nothing but his best to improve the condition of his tenants, in improving their buildings, and setting those over them who would make them do their best. May God long avert that day in which I shall derive the benefit of what he has done for that estate! (*Cheers.*) But I am quite certain that when that day does arrive, the estate will be worth ten times as much as it was when he came to the possession of it,—and that not by drawing from the tenant more than the tenant can give, or less, but by making him give that rent which his industry would fairly enable to give. I believe that that is real liberality and real humanity towards the tenant; and I only hope that I may one day be found following just in my father's steps. I thank you most cordially in his name. There is no one in the world to whom he is dearer than to me. To manage the estate as he has done—to be respected by his tenantry—and loved by all who knew him—is the highest object of my ambition; and I hope that his health may be drunk in this room as often as we meet in it. (*Cheers.*)

His Lordship retired at twenty minutes after nine o'clock, and was followed by the principal part of the company. The rest remained under the superintendence of Mr. Formby, and the festivity of the evening was kept up for some time longer.

A FLOATING FARM YARD.—The following sketch of a family floating down the Ohio on a raft is at once highly graphic and characteristic of our inland emigration:—“To-day we have passed two large rafts, lashed together, by which simple conveyance several families from New England were transporting themselves and their property to the land of promise in the

western woods. Each raft was eighty or ninety feet long, with a small house erected on it, and on each was a stack of hay, round which several horses and cows were feeding, while the paraphernalia of a farm-yard, the ploughs, waggons, pigs, children, and poultry, carelessly distributed, gave to the whole more the appearance of a permanent residence than of a caravan of adventurers seeking a home. A respectable looking old lady, with spectacles on her nose, was seated on a chair at the door of one of the cabins, employed in knitting; another female was at the wash-tub; the men were chewing their tobacco with as much complacency as if they had been in the land of steady habits; and the various avocations seemed to go on with the steadiness of clockwork. In this manner our western emigrants travel at slight expense. They carry with them their own provisions; their raft floats with the current, and honest Jonathan, surrounded with his scolding, squalling, grunting, howling, and neighing dependents, floats to the point proposed, without leaving his own fireside; and on his arrival there, may go on shore with his household, and commence business, with as little ceremony as a grave personage, who, on his marriage with a rich widow, said he had “nothing to do but walk in and hang up his hat.”—*American paper.*

#### THE AGRICULTURAL WORLD CHALLENGED!—SPADE LABOUR AGAINST ALL PLOUGH LABOUR, PLOUGH MATCHES, &c., &c.

A poor man, named James Serbutt, with a broken leg, being an old pensioner with an industrious foreign wife and three children, hath produced from thirty lugs of land or the third part of a quarter of an acre, rented with upwards of five hundred tenants of the Lord Bishop of Bath and Wells, the amazing quantity of eighteen bushels of cleaned excellent wheat, or at the rate of eighty-six bushels per acre, besides what the birds stole, and what was wasted in gathering of the bearded or blue ball sort. From thirty to forty bushels per acre is a great crop for plough inventions to save manual labour. Let but the industrious poor have what the Maker of Man intended he should have, namely to till the land and dress it, and such a beneficial change will be effected for the better in twenty years in this country, as has never entered the mind of man to conceive. If any one doubt this state ment let him or her come and see the beautiful splendid sight now blooming of a kitchen garden full of the bounties of Providence, of one hundred acres subdivided, from four to five hundred industrious, I will not call them poor but happy allotment tenants, just now gathering in the profits of their own and children's labour. This statement is witnessed by me, Joseph Emery, druggist, High-street, Wells, Somerset, who let out and managed the allotments for the first ten years.

Joseph Emery, James Serbutt owner,  
Wm. John Loxton, John Fry, Wm.  
Creyghton, Henry Foster, Richard  
Joice.

Dated this 19th day of September, 1836.

At Mr. Emery's cottage in the middle of the hundred acre garden.

N. B. We humbly call upon all who have time and means to come and see us. They shall find a John Bull hearty welcome. The garden is half a mile, a delightful walk, from the residence of the Bishop and the Town Hall of Wells.

THE TONGUE OF THE DUCK.—When we consider the particular use which the duck makes of its tongue, we shall immediately perceive that it is endowed with great and unusual sensibility. The duck, unlike all other birds, discriminates its food, not by sight or by smell, but by the touch of its tongue. It thrusts its bill into the mud, just as a fisherman throws his net into the sea, and brings up whatever it contains: from this mouthful of stuff it selects, by the tongue alone, what is good for food, and every thing else is rejected.—*Swainson's History of Birds.*

## BRISTOL AGRICULTURAL SOCIETY.

## PLOWING MATCH FOR 1836.

The annual Ploughing Match of the above Society took place on Wednesday, Oct. 12, on a piece of land in the parish of Siston, Gloucestershire. Sixteen ploughs were entered, and much interest was excited by viewing the labours of the several competitors. The ground was rather unfavourable for showing the skill of the ploughmen to the best advantage, but on the whole the performance was very good. The labours of the field were concluded about four o'clock, after which about fifty gentlemen sat down to a substantial dinner, provided at the Horse Shoe Inn, Downend, W. Miles, Esq., M.P., President of the Society, in the Chair, supported on his right by Col Sealy, T. Kington, and M. H. Castle, Esq., and on his left by the Sheriff of the borough of Bristol, D. Cave, Esq., and G. W. Hall, Esq.; E. H. Sampson, Esq., of Henbury, presided at a second table.

On the removal of the cloth the usual loyal toasts were drank.

D. Cave, Esq., proposed the health of "Mr. Wm. Miles, the President of our Society." (*Cheers*).

The CHAIRMAN.—Mr. Cave and gentlemen, I really feel exceedingly obliged for the kind manner in which my name has been proposed and received. As president of this society, I feel that very peculiar duties devolve upon me, for as the society unites, in Bristol, a numerous class of persons who look more particularly to the commercial and manufacturing interests, it may be thought, by others, that their success is somewhat disconnected from that of the cultivators of the soil. But, much as I have read, and much as I have thought upon the subject, I cannot bring myself to believe otherwise than that the prosperity of the three great interests into which the country is divided—the interests of commerce, manufactures, and agriculture—are intimately blended. I certainly do regard agriculture as the mother upon whose prosperity the welfare of its offspring, manufacture and commerce, depends, but still, the intimate connection, the sympathy, I might say, subsisting between the three is such, that the prosperity of the one is mainly dependent upon that of the other. If there should be any doubt of the truth of this, I would ask the agriculturists to recollect in what circumstances they were placed at the close of 1825, when the commerce of the country was paralyzed. What then was their condition? They had to meet very many reverses, but the worst feature of all was, that they had no customers, and that, consequently, the value of their products declined beyond a remunerating price. I am delighted with this opportunity of speaking to facts which must tend to disabuse the minds of the yeomanry of the fallacies which, indeed, were but too much promulgated by the committee which sat in 1823. It is now proved that, in average years, this country grows a sufficient quantity of corn for its own consumption, and that, in any thing like a superabundant year, it produces more than is sufficient for its use; and I allude to these facts to show what a folly it is to look for high prices, and to show, further, that any amelioration of their present condition can only result in an alteration of the contracts between landlords and tenants, and the result of my inquiries is,—and I have paid considerable attention to the subject,—that where, in fixing agreements, the average has been taken at 60 or 65, they must fall to 50 or 55, before they can be placed upon a footing satisfactory to both parties. (*Cheers*.) I speak this as a member of the committee appointed in the last session to inquire into the causes of agricultural distress, and I believe I speak the sentiments of almost every member of that body.

The CHAIRMAN then proposed "The Vice-Presidents of the Society."

E. SAMPSON, Esq., returned thanks.

The CHAIRMAN then read the report of the Judges, Messrs. Thomas Lawrence, Winterborne Court; Henry Escott, Christon, (Somersetshire); and Charles Hockey, Dyrham and Ilinton, and the following bounties were awarded:—

To William Anstey, of Gloucester-Road Farm, in the

parish of Frampton Cotterell, the owner of the best plough—Five Pounds.

To Isaac Simmonds, manager of the best plough—a Society's Coat and Buttons, and One Pound.

To Robert Marsh, manager of the second best—a Society's Coat and Buttons.

To Daniel Sharp, manager of the third best—One Pound.

To Mr. Thomas Howe and James Froud, for having performed their work in a masterly manner—Bounties of Ten Shillings each.

To William Tanner—a Bounty of Seven Shillings and Sixpence. And

To John Young, John Cooper, Robert Pinnell, Stephen Baber, Henry Parker, Thomas Guest, John Hewett, George Wookey, Thomas Selvey, and William Hunt—Bounties of Five Shillings each.

During the reading of the report, the whole of the competitors were in attendance, and the several successful candidates were successively addressed in a kind and familiar manner by the respected chairman. The unsuccessful candidates were also encouraged by him to redouble their efforts on a future occasion.

The CHAIRMAN then gave "Speed the Plough."

E. SAMPSON, Esq., begged permission to give a toast—"Mr. Hall, and the yeomanry of the Bristol Agricultural Society."

G. W. HALL, Esq., after some prefatory observations, said, I am anxious, however inefficient, to follow up what has been said by our excellent Chairman, bearing upon the objects and utility of the society. The farmer is, in fact, like the hull of a vessel, and as that, without the aid of canvas, would be useless for the purpose for which it is designed, so would the efforts of the farmer also be unavailing, unless they were fostered and assisted by those to whom they ought to look up as to their natural protectors, and with whose interest their own is intimately blended. I respond most cordially to the sentiment expressed by our respected Chairman, that it is a great delusion to expect high prices. But there are other means from which assistance is to be had, and they are within the reach of every one who chooses to employ them. I have lately visited some of the agricultural districts; I have been on the estates of Mr. Coke, of Norfolk, and to Scotland, and I find improvements there in practice which my neighbours have yet to learn. You need not, however, go so far as that to see what can be done by ingenuity and economy, for you may go to the manufactories of Bristol, and there you may learn how it is that, by combining these excellent qualities, the proprietors are enabled, with small profits, to drive a lucrative trade, and to amass wealth—and here I must take leave to say that among this class the society numbers some of its earliest and best supporters. You may go to their establishments, and see the perfectibility of their machinery, and then come home and apply the lessons you may there learn to the improvement of your own implements, for it is only by applying similar skill in your own occupation that you can expect to thrive.

Any protection we may seem to have from the competition of foreign countries is purely artificial, and all that now remains for us to do is, to make the best of the situation in which we find ourselves. With respect to the labouring classes, we are all interested in their welfare, and I contend that it is as much the interest of the farmer to promote their comfort as it is his interest to increase his crops, or improve the breed of his animals; surely the animal who most assists him in the prosecution of his labours is most deserving of his consideration; and this is one reason why agricultural societies do good: they tend to make the men more skilful, and, in that way, they are productive of a great deal of benefit. Let the farmers, then, go a little farther than their own hedges—let them go to Mr. Marnont's office, and enter their names as subscribers—for, even here, the sinews of strength must be kept up—let them follow the advice I give them, and if, in return, they get but one additional idea, it will be like the seed they sow, productive of a ten-fold increase. It was said by Lord Nelson, "England expects every man to do his duty;" let, then, every farmer do his duty, and thus

will be promoted the well-being of the noblest country on the face of the globe. (*Cheers.*)

"The health of the Censors, Messrs. T. Lawrence, H. Escott, and C. Hokey."

Mr. LAWRENCE returned thanks.

The CHAIRMAN proposed the health of Mr. Marmont, the honorary secretary.

Mr. MARMONT returned thanks.

T. KINGSTON, Esq. proposed "The Members for the County of Somerset."

The CHAIRMAN—I little expected the compliment now paid me, as one of the representatives of the county of Somerset, and I can assure you, when I relate to my hon. colleagues—and one of them, Mr. Sanford, I hope to meet on Saturday next—they, no less than myself, will feel greatly obliged for your present kindness. I am sure I can say, with perfect sincerity, that we have endeavoured as much as possible to discharge our duties for the benefit of society generally. Though born into and connected with the commercial interest, I may say I have been bred an agriculturist; but, as I said before, I am favourable to all classes, for I am persuaded that, in proportion as the interests of each become more intimately blended, the better it will be for happiness and prosperity of the country generally. I will again take the liberty to warn my agricultural friends not to indulge in any expectation of relief from the government, for it is not in the power of any legislature, no matter what party may be in power, to give it; and why? because we are not now consumers of foreign corn; you are now your own growers, and all you can now look to is to effect such improvements as may be likely to be profitable and useful. Much has been done in the last session to effect this; two bills having passed, to which I would now call your attention, namely, the Tithe bill and a bill for facilitating the Inclosure of Common Field Lands; and I would beg of you who have any grounds uninclosed to look to it, as you have the means of doing yourselves great service without the necessity of going to Parliament and incurring a heavy expense for its sanction. To the Tithe bill, during its progress, I devoted considerable attention, and I can now state that, though it may not be the best that could have been devised, it is nevertheless a useful measure, and calculated to be beneficial to all classes interested, though I believe its advantages are more on the side of the agriculturist than on that of the minister, for whatever capital may be expended on lands in bringing them into cultivation, the rector hereafter will not be able to come to the occupier and demand of him the tenth of the produce resulting from such improvement. The Legislature has given you to to the 6th of October, 1838, to effect an amicable adjustment with the tithe owner; but if, by that time, no arrangement should be entered into, then the commissioners will step in and make the settlement of the question compulsory, and you will have, in addition, to pay the expenses of the surveyors. Mr. M. concluded by recommending his friends, the yeomanry, seriously to consider the means of improving the present system of cultivation, and by assuring them of his determination to introduce to their notice, through the medium of the society, every recent improvement.

Several other toasts followed, and, in conclusion, D. Cave, Esq. once more proposed the health of their worthy president as "The Chairman on that occasion."

The toast was received with three times three, and after a few further remarks from Mr. MILES, he vacated the chair, and the company broke up, highly delighted with the entertainment of the evening.

### THE GREAT SALE OF CROWN ESTATES.

NEWARK-UPON-TRENT, NOTTS.—The auction of the important and valuable freehold in the vicinity of this town, belonging to his Majesty, proceeds with unabated interest, principally occasioned by its being known that the purchasers will have the power of creating many new voters by building, subletting,

&c. The property is exonerated from land tax, and the greater part is tithe free. It comprises the manor of Newark, valuable demesne lands, containing about 800 acres of rich meadow and arable land, with productive garden ground, with eligible sites for building purposes, the King's Hall, and numerous dwelling-houses and shops in Newark. The whole of Lincoln-row, three wharfs, a dry dock for building vessels, &c. &c. This great estate is divided into 213 lots, and is sold by order of the Commissioners of Woods, Forests, and Land Revenue. The manor and 204 lots are leased to the Duke of Newcastle for a term which will expire at Lady-day next. The Town Hall is daily crowded. Messrs. Driver are the officiating auctioneers. This day's sale was considered the most important, and comprised the following lots:—

High Pig Ley Closes,	3A. 5P. ....	£450	
of 4A., with a wind-	4A. 2R. 23P. ....	530	
mill and stable . . .	4A. 19P. ....	520	
4A., with a barn . . .	3A. 1R. 26P. and stable	480	
4A. of arable ground .	5A. 3R. 25P. ....	800	
4A. 3R. 33P. of arable	2A. 3R. 8P. ....	250	
3A. 18P of ditto . . .	16A. 2R. 3P. ....	1750	
5A. 1R. 32P. ....	A windmill and garden	160	
3A. 1R. ....	300	A windmill, cottage,	
3A. 1R. ....	300	sheds, and 2A. ....	
Ditto with mill & stable	260	1A. 1R. 22P. meadow . .	
THE FORE SAND CLOSES.			
4A. 1R. 6P., with barn	440	3A. 2R. 10P. ....	
4 ditto ditto . . .	320	1A. 2R. 22P. ....	
8A. of arable . . .	610	2A. 2R. 25P. ....	
Ditto . . .	620	3A. 1R. 6P. ....	
7A. of ditto . . .	570	3A. 1R. 8P. ....	
4 ditto . . .	370	FARNDOWN TOWNSHIP.	
4 ditto and building .	469	3A. 3R. meadow . . .	230
4 ditto . . .	430	Ditto . . .	450
4 ditto . . .	300	2A. 2R. ....	320
10A. 2R, 24P. ....	810	Ditto . . .	480
HIGH TOWNLER CLOSE,			4A. 3R. 38P. ....
STORE.			11A. 2R. 26P. ....
4A. 4P. of meadow . .	590	3A. 2R. ....	400
3A, 6P. ditto . . .	470	Ditto . . .	440
Ditto . . .	470	Ditto . . .	410
3A. 7P. ....	470	Ditto . . .	450

SATURDAY.—The result of the last day's sale has been equal, if not more in amount, taking into account the value of the lots, than any of the preceding. The plots of land in Low Pig Ley Closes in Sand Pit ditto; in the township of Balderton, in Farndon township, and at the North and South Clifton, produced high prices. The valuable manor of Newark, with its rights, royalties, and privileges, was withdrawn, but it was understood that the Duke of Newcastle, who holds it on lease from the Crown, will retain possession. Produce of the day's sale, 22,945*l.*, as announced by Messrs. Driver.

Summary of the whole:—

First day's sale . . . . .	£18,005
Second ditto . . . . .	25,800
Third ditto . . . . .	23,500
Fourth (and last) . . . . .	22,945

Total . . . . . £90,250

A NEW ARTICLE OF EXPORT.—Driving coals to Newcastle, and salt to Dysart, used to be thought absurd; but what would have been said of the driving of hay to America. This, in consequence of the failure of the crop there, is actually the case. There are at present, in the two export sheds here, 2500 stones of that commodity, ready to be shipped on board the Amity of Aberdeen, which is just about to be laid on for Miramichi. It is expected that she will take 10,000 stones. A larger vessel than the Amity is also to be dispatched from the Clyde to America with this novel article of export.—*Dundee Advertiser.*

## GRANTHAM AGRICULTURAL ASSOCIATION.

At the annual meeting of the Grantham agricultural association, held on Friday the 14th Oct., the premiums were awarded as follows :

For the best ploughman, with a swing plough and two horses abreast, 3*l.*—Wm. Worlidge, servant to Mr. Pindar, Barrowby.

For the second best ditto, 2*l.*—John Hallam, servant to W. Shield, Esq., Frieston.

For the third best ditto, 1*l.*—Mat. Baxter, servant to Mr. Glen, Sproxton.

For the best ploughman under 18 years of age, 3*l.*—Sam Staple, servant to Mr. Savidge, Leadenham.

For the second best ditto, 2*l.*—Wm. Bullock, ser to Mr. G. Sill, Honnington.

For the labourer in husbandry with a swing plough and two horses abreast.—H. Hayto, servant to Mr. Wyles, Ponton.

For the second best labourer in husbandry with a swing plough and two horses abreast., 2*l.*—J. Boyall, servant to the Rev. J. Plasket, Harlaxton.

For the Farmer's son not in business, with a swing plough and two horses abreast, a silver cup value 3*l.*—Matthew, son of Mr. Savidge, Leadenham.

For the labourer in husbandry who shall bring up (within 15 miles of Grantham) the largest family without parochial relief; those who have received the premium at Lincoln to be deemed disqualified, 3*l.*—Jos. Singleton, servant to Mrs. Lieusley, Stragglethorpe.

For the second best ditto, 2*l.*—C. Bembridge, servant to Mr. G. Sills.

For the servant in husbandry (bona fide) who shall have lived not less than five years in his last place (within 15 miles of Grantham,) character being particularly attended to, 3*l.*—J. Theekett, servant to W. Dolby, Esq., Marston.

For the second best ditto, 2*l.*—Wm. Burgin, servant to Mr. G. Sills.

For the third best ditto, 1*l.*—J. Everitt, servant to Mr. Annis, Sproxton.

For the female who has lived a widow for the longest period (resident within 15 miles of Grantham) and who has not received parochial relief; number of family and character to be particularly considered, 2*l.*—Mary Goding, Grantham.

For the second best ditto, 1*l.* 10*s.*—Mary Tyres, Ingoldsby.

For the third best ditto, 1*l.*—Ann Morris, Branston.

For the shepherd who reared in 1836 (within 15 miles of Grantham) the greatest proportionate number of lambs from any number of ewes not less than 100, 3*l.*—John Wade, servant to Mr. Dickinson, of Ponton; reared 254 lambs from 235 ewes put to the ram.

For the second best ditto, 2*l.*—Robert Frances, servant to Mr. F. Musson: reared 322 lambs from 310 ewes put to the ram.

Class I. For the best two-year-old cart gelding or filly, bred by the exhibitor, and bona fide his property at the time of showing, 3*l.*—Mr. F. Vincent, Barrowby.

2. For the best bull, which shall, from the 1st of January, 1836, have served cows up to the time of showing, at not exceeding half a guinea per cow, 5*l.*—Mr. Baker, Cottesmore.

3. For the second best ditto, 2*l.*—Mr. Casswell, Osbourneby.

4. For the best milch cow or heifer, having produced a calf within ten months, and in milk at the time of showing, 3*l.*—Mr. J. Green, Grantham.

5. For the second best ditto, 2*l.*—Mr. Baker, Cottesmore.

6. For the best heifer, not exceeding two years and six months at the time of showing, 2*l.*—Mr. Baker, Cottesmore.

7. For the second best ditto, 1*l.*—Sir T. Whichcote, Aswarby.

8. For the best pen of six ewes, that have suckled to the 1st of August, 3*l.*—Mr. Sills, Casthorpe.

9. For the second best ditto, 2*l.*—Mr. Pindar, Barrowby.

10. For the best pen of 6 gimmers, 3*l.*—Mr. F. Vincent, Barrowby.

12. For the best pen of six shearlings, 3*l.*—Mr. G. Sills, Honnington.

13. For the second best ditto, 2*l.* Mr. T. Roberts, Ponton.

14. For the best boar of any age, 2*l.*—Sir T. Whichcote, Aswarby.

15. For the second best ditto, 1*l.*—Mr. W. Large, Grantham.

16. For the best breeding sow of any age, 2*l.*—Mr. J. Millhouse, Barrowby.

17. For the 2d best ditto, 1*l.*—Mr. C. Baker, Grantham.

Amongst the extra stock which was considered worthy of commendation, were a heifer, the property of Mr. Hickson, and two sheep belonging to Mr. Pindar of Barrowby. Mr. Baker liberally returned two sovereigns, the amount of the prize awarded to him for the second best cow.

The stock exhibited at the above meeting was considered to be superior, and more numerous than that on any former occasion. The pens of ewes were all excellent, and the competition in that class consequently much more spirited than usual. The dinner, as usual, took place at the Guildhall, at which Sir W. E. Welby, Bart. presided, in the absence of his son, G. E. Welby, Esq., M.P., who was so much indisposed as to be unable to attend.—The successful candidates in the classes of ploughmen, servants, and widows, were severally introduced in the course of the afternoon, and had the prizes delivered to them by the worthy chairman, who accompanied the presentation of each with appropriate and encouraging remarks.

## THE GRAVESEND AND ROCHESTER AGRICULTURAL ASSOCIATION,

FOR THE ENCOURAGEMENT OF SERVANTS AND LABOURERS, ESTABLISHED 1834.

The annual ploughing match was held on Thursday, 20th October, and the weather being extremely favourable, it attracted a considerable number of spectators, including the greater portion of the farmers and land proprietors in the district. The ploughing took place in a large clover ley on the farm in the occupation of Messrs. Henry and William Solomon, called Cheney's farm, at Thong, near Gravesend. Thirty ploughs, twenty-eight of which were four-horse ploughs, started for the prizes. The whole of the work was done in the first style, and the judges had some difficulty in awarding the prizes, which were ultimately delivered as under:—

No. 1. The best ploughman, with a turnriste, or other plough, with four horses, 3*l.*; won by James Ward, servant to Mr. William Russel, of Swanscomb. The driver, 12*s.*

No. 2. Second best ploughman, 2*l.* 10*s.*; won by Thomas Roll, servant to Mr. John Selby, of WOULDHAM. The driver, 10*s.*

No. 3. Third best ploughman, 2*l.*; won by Richard Blake, servant to Mr. Figgus, of Northfleet. The driver, 8*s.*

No. 4. Fourth best ploughman, 1*l.* 10*s.*; won by James Semark, servant to Messrs. Knight, of Cliffe. The driver, 6*s.*

No. 5. Fifth best ploughman, 1*l.* 5*s.*; won by William Hutchins, servant to Mr. George Comport, of Cooling. The driver, 4*s.*

No. 6. The best ploughman, with a turnriste or other plough, with three horses, 2*l.* There was no competitor for this prize, one plough only starting; but 10*s.* were awarded to the ploughman, George Burt, for the excellence of the work.

No. 7. The shepherd who has reared the greatest number of lambs from a flock of ewes, from 100 to 300, from Michaelmas, 1835, to the 20th of July, 1836,

- 3l; won by John Tomlin, servant to Mr. Carlow, of Wouldham.
- No. 8. Ditto, who has the second number, 1/ 10s; won by John Botting, servant to Messrs. H. and W. Solomon, of Thong.
- No. 9. The shepherd who has reared the greatest number of lambs from a flock of ewes, exceeding 300, from Michaelmas, 1835, to the 20th of July, 1836, 3l; won by George Maddocks, servant to Messrs. Knight, of Cliffe.
- No. 10. Ditto, who has the second number, 1/ 10s; won by ———, servant to Mr. Bargrove, of Northfleet.
- No. 11. The shepherd who has had the care and management of a wether flock, not less than 150, and the least loss to every hundred sheep within the year from Michaelmas, 1835, to Michaelmas, 1836, 2l; won by William Smith, servant to Mr. W. Russell, of Swanscomb.
- No. 12. Ditto, Second, 1l; won by William Olliffe.
- No. 13. The labourer who has worked for the same family or on the same farm, the greatest number of years, 3l; won by Alexander Young, servant to Mr. Wells, of Southfleet, for 54 years.
- No. 14. The second, 1/ 10s; won by William Lane, servant to Captain Edmeades, of Rusead, for 51 years.
- No. 15. The labourer who has brought up the largest family, and received no parochial relief, 3l; won by Thomas Lane, servant to Mr. Bargrove, of Northfleet.
- No. 16. The second, 1/ 10s; won by Moses Semark, servant to Messrs. Knight, of Cliffe.

Several minor prizes were voted to other ploughmen for good work, and not within the precise regulations.

The company reassembled in the evening at Gravesend, when about 80 gentlemen sat down to an excellent dinner, provided at the New Inn, at which W. M. Smith, Esq., of Carner, presided. The Chairman, in a neat address, congratulated the company on the flourishing state of the Association, and the beneficial results it had produced. Several other appropriate speeches were made in the course of the evening, and the excellent singing of Mr. George Hodges, and also of several professional vocalists, detained the company to a late hour.

JUDGES.—Mr. James Edmeades, Hever Court; Mr. M. Comport, Decoy; Mr. George Knight, Perry Hill; Mr. A. Spong, Frindsbury; Mr. John Murton, Cooling Castle; Mr. William Wells, Cobham; Mr. William Bargrove, Dundale.

### BRESLAW AUTUMN WOOL FAIR.

The following communications which have been received by mercantile houses in Leeds, relative to the above fair, held during the present month, will, we trust, be of service to the manufacturing interest in this district. No reduction in prices appears to have taken place since the last great wool fairs there:—

"BRESLAW, OCT. 6, 1836.

"Immediately after the spring fair a flatness, but of a very short duration, manifested itself in our wool market; but such being generally the case after the first immediate want of an article having been supplied it caused neither fear nor surprise, for at the end of July this dullness gave way to a better demand, owing to some of our English friends coming again and buying very freely of the middle sorts of wool, prices being the same as in the clip. The principal purchases were made in Polish fleeces and Silesian lambs,

"Our English friends were now joined by others, as well by the manufacturers from the Netherlands, as the inland staplers, and by the middle of August our trade was very brisk and prices firm. The prices

of the great sales in London, coming about this time somewhat lower, produced no change in our markets,—for, simultaneously with the account from London, we received information of the great wool fair at Pesh, where above 60,000 cwts. of wool was sold at higher prices. Adding to this the fact of New South Wales wool, even at the reduced prices, being considerably dearer than German wool, the transactions in the latter became more extensive, and prices had an upward tendency. The accounts from England up to this time were also very fair, and if they perhaps were not quite as favourable as the year before, they at all events offered a favourable prospect for the autumn trade, as it was well known that the English manufacturers had as yet bought very sparingly.

"Such was the position of the wool trade up to the middle of last month, when the political as well as the commercial horizon became at once overcast and gloomy. The unsatisfactory state of political events in Spain and Portugal, added to the continued export of gold from England, which induced the Bank of England to raise the discount on all commercial bills, which was followed by all the banking interest, as well in England as on the continent, created a scarcity of money which, I am free to confess led me and other experienced merchants to fear the result of the coming wool fair. And yet, contrary to all expectation, a great number of buyers came from all parts of the continent. The greatest competition was between the inland manufacturers who, returning from the Leipzig fair, where they had disposed of the stock of their woollen cloths at fair and remunerating prices, now endeavoured to supply themselves with a stock of middle sorts of wool. But their being too small a supply for the demand, the whole, consisting only of 8,000 cwt., was bought very rapidly at an advance of 1d. to 1½d. per lb. Fine Silesian summer wool was also in great demand, and commanded high prices. From 18,000 cwt., which was the whole quantum brought to market, 14,000 cwt. were sold, and what is left is mere rubbish.

"If our manufacturers should continue to increase as they have done for some years past, we shall be independent of the English market, particularly in the middle qualities of wool.

"In the finer qualities not much is done by our manufacturers yet, but we observe that they begin buying odd flocks.

"The stock of wool in Breslaw is about 7,000 cwt.; in Berlin, 18,000 cwt.; and in Hamburg, 20,000 cwt. The wool on hand in Breslaw may be left out entirely, as it is not suitable for your market. In Berlin the greater part consists of Polish wool from 2s. 3d. and 2s. 6d., and could have been sold, had the holders been disposed to take last year's prices; but they ask 2d. and 3d. per lb. more, and as it is chiefly in the hands of those who can hold it, they are sure to obtain their price in November or in the coming spring. Of the stock in Hamburg we cannot judge so accurately, as it consists of Danish lambs and Hanoverian wool, and other kinds; but if we take the stock of wool fit for cloth there to be from 12 to 14,000 cwt., we should be very near the truth."

Breslaw, 8th October, 1836.

"I found prices higher than I expected. The inland manufacturers, who had a very good market for their cloth at the last Leipzig fair, bought freely, and certainly paid high prices, particularly for the middle qualities.

"At the beginning of the fair there was a backwardness on the part of the buyers. I am glad that

I bought then, or I could not have bought at all; at the end of the fair I could have re-sold with a profit.

"I don't think the prices higher than at the last fair here, but the wools then were of a better character. The English buyers were exceedingly cautious, and bought very little; but for the inland manufacturers buying so freely, prices certainly would have drooped a little. The quantity for sale was about 16,000 cwt., of which about two-thirds were sold: the remainder was principally Polish wool, at high prices, the holders of which were not concerned to sell. From what has transpired here, you need not fear much decline in the value of German wool."

"BRISLAW, Oct. 6, 1836.—The quantity of wool offered for sale at this fair amounts to 17,500 cwt. or about 5,000 bags. The prices at which the sales were effected were considered quite equal to those realized at the Spring fair; some sorts fetched a little more. Fine Silesian Summer Wools were readily bought for inland consumption. Locks and fine Silesian Lambs were eagerly sought, and of the latter all were sold. About 6,000 cwt. only remains unsold, and, as very little more is to be expected, good prices are expected to be realized."

## TO THE EDITOR OF THE FARMER'S MAGAZINE.

*Spilsby, East Fen, Oct. 12.*

SIR,—I write to inform you what kind of a season we have had in Lincolnshire, and I think I may say there has not been one so unkind for many years. The spring was very wet, which caused the seed time to be very late, particularly upon low lands and clay soils, which has proved a very great injury to the crops in such cases, especially in the Fens, where the soil is light. The weather took up about three weeks before May-day, and continued very dry with a cold north and north-east wind, with sharp frosty nights through the month of May and part of June, which upon light soils cut off all the late sown crops in the Fens, and ruined hundreds and thousands of acres, both of wheat and oats, and I should say from the knowledge I have of the state of crops, that wheat is by far the lightest crop this year, than it has been for these last twenty years: a great deal will not average more than two quarters per acre, and thousands of acres not so much as that. Oats are not more than half an average crop. The barley crop is not so light as either the wheat or the oats, and is tolerably good in quality, but a great deal must be spoiled in the fields, that is for making malt; the weather is wet and cold—a great deal yet in the field, and last week many hundred acres yet standing, looked quite green, both upon the wolds and in many other parts of Lincolnshire.

The turnip crop is a complete failure, both upon the Wolds and in the Fens; they came up very well, and plenty of plants in most places, but the weather continuing extremely dry, the fly soon appeared, and made very destructive ravages amongst the young plants; there is also another kind of vermin, grub or insect, called the Rag-Jack, which has proved very destructive to the turnip crop this year,—indeed the turnip and cole were never known to be worse than they now are. The cabbage is also in many instances very bad, the leaves being covered with a kind of filth, and wherever it happens, they quite destroy the plant. I believe the filth to be bred by the Lady-cow, as I have found many nearly all eaten away with these vermin, and upon examination, I have found as many as fifty of these Lady-cows upon the leaves and stalk of one plant. I pulled up some plants which seemed to be dying, to examine the cause, and found as many as from one to two hundred short white grubs at the root of each of those plants. These noxious insects are quite ruinous to the cabbage plant wherever they happen to come,

and should the winter be severe, sheep-keep will be found to be very scarce, and dear. I think if the mangel wurzel had been planted upon a larger scale, it would have been of great importance to the farmers this year, as what I have seen of that vegetable is a tolerable good crop, but the article is not so much in vogue as it was some years since, and moreover as the hay crop have not been so light for many years, the farmers in general seem to be ill-prepared to meet a hard winter. The wheat seed time has commenced, but the weather is unfavourable at present for that business.—I am Sir, yours, &c. A LINCOLNSHIRE FARMER.

## GLENKENS' AGRICULTURAL SOCIETY.

The Glenkens' Agricultural Society held their Annual Show at New-Galloway, on Thursday the 6th October current, and, notwithstanding the unpropitious state of the weather, a very considerable number of gentlemen from different and distant districts of the county were present. The Judges—Messrs. Reid of Kirkennan, Stewart of Barharrow, M<sup>o</sup>Queen of Auchenbay, for the different classes of cattle; and Messrs. M<sup>o</sup>Turk of Hastings Hall, and Moffat of Craigleaving, for the sheep stock—then commenced their labours, and after a careful and critical examination, awarded the premiums as under:—

For the best bull of the Galloway breed, Mr. Cannon, Milton Park.  
 Second best ditto, Mr. Grierson, Craigmuaie.  
 For the best cows and calves, Mr. Grierson, Craigmuaie.  
 Second best ditto, Mr. Shaw, Parkrobin.  
 For the best grey, Mr. Cannon, Shield.  
 Second best ditto, Mr. M<sup>o</sup>Quhir, Barnshalloch.  
 For the best stirks, Mr. Shaw, Parkrobin.  
 Second best ditto, Mr. Hyslop, Glenlee.  
 For the best tup hogs, Mr. Jamieson, Holm.  
 Second best ditto, Mr. Wallace, Knockgrey.  
 For the best gimmers, Messrs. Shaw, Waterhead.  
 Second best ditto, Mr. M<sup>o</sup>Turk, Barley.  
 For the best Ayrshire cow, Rev. James Maitland of Kells.  
 Second best ditto, Mr. M<sup>o</sup>Turk, Waterside.

After the exhibition, about sixty gentlemen sat down to a most excellent and substantial dinner, provided by Mrs. Wilson of the Kenmore Arms. The Rev. James Maitland of Kells, in the chair; and Captain Walker, of Bells-Bank, croupier. It would far exceed our present limits to report the many excellent speeches delivered in proposing the numerous toasts which were drunk, and the eloquent replies made by gentlemen present; but all who know the amiable, excellent, and learned qualifications of the gentleman who presided, added to the general intelligence of the yeomen of the district, may easily conceive, what really was the case, that the meeting was harmonious and happy in the extreme.

AGRICULTURAL SOCIETIES. — It is certainly gratifying to observe the interest which appears to be excited in this part of the county in favour of the recently established agricultural society, and our readers will, we are sure, peruse with pleasure the report of their late meeting at Beddingham. The extension of such societies as this, forcing, as they do, upon the observation of all classes connected with agriculture, from the titled laird to the hard-fisted ploughman the truth that their interests are all bound together in the same bond—inciting the farmer to avail himself of improvements in the practice of his profession, and encouraging the labourer to new exertions of industry and independence, would effect more actual good for the agricultural interest, than a hundred committees in Parliament, and all the currency theorists put together.—*Sussex Advertiser.*

## AGRICULTURAL REPORTS.

### BERKS.

Ever since our last report the weather has been very unsettled, and there has been scarcely three dry days together these six weeks. In this county the harvest is not yet finished, for at the time while writing there are some small patches of both barley and oats to carry in almost every part of the county. The weather has been so cold, that very little corn has been injured by sprouting; but full half of the barley is uncommonly stained, and there is but a very small portion indeed that is quite bright; much of the barley has been carried together in a damp state, the weather having been so unsettled that it was impossible to get it completely dry. The barley crop is, in our opinion, a deficient one, and good bright barley must be very scarce; but there was a greater breadth of barley sown last year than usual, and this perhaps may nearly or quite make up the deficiency in the produce. The crop of oats is also a short one, but the extent of ground sown was greater than common, many of the farmers last season having sown oats instead of wheat, because of the shortness of manure, and because of the low price at which wheat was selling: most of the oats are much stained and carried in bad condition, and are unfit at present to feed horses, and old oats are in consequence selling for more money. The beans are podded well, and are of good size and yield well, and although short in the straw, yet we think them an average crop; but the weather has been so unsettled that they have been obliged to be carried in a soft state, and will be entirely unfit to give the horses until the spring. Old beans are advanced in price, and are now worth 46s per qr. A considerable breadth of wheat has been sown during the last week, and most of the ground worked well, and is got down tolerably firm, after being well rolled and trodden with the sheep: the sowing of wheat is probably now about half finished, but it will be some weeks before it is all done, as a considerable delay must take place in waiting for the making of manure, and some little hindrance occur while finishing the harvest. The advance in the price of wheat will induce most of the farmers to sow this year their usual number of acres, and many have commenced dressing their seed wheat who never done so before, they having now become most thoroughly sick of the smut. If the present wet weather continues, the wheat sowing will go uncommonly heavy, and the same will be retarded until a late season. Drilling of wheat (except on light soils) is getting out of fashion, it having been proved to yield less per acre than that which was sown. Immediately after our last report was written, the black maggot made its appearance among the turnips, and utterly destroyed, or most seriously injured, a great proportion of the young growing turnips; and a large brown grub also at the same time helped to increase the injury, and we are sorry to say that the crop of turnips altogether is a deficient one, and we lament this circumstance the more, because there is so short a stock of hay and straw in the county, and because the straw and fodder is so washed and stained by the wet as to afford little or no nourishment to the cattle that eat it. The long white bell turnip seems to be the sort that has best escaped the ravages of the fly and the maggot, and we think it

probable that the taste of this sort of turnip is not so palatable to these insects as other sorts, for we observe some few pieces of good bell turnips, while all the other sorts around have been nearly destroyed. There are some Swedes and a few pieces of rape in these parts, but if there should come a long and severe winter, we do not know what will become of the stock. We have now had three successive years of failure in the turnip crop. Many farmers who are short of keep are already disposing of part of their stock, and the late fairs have been very much overdone, and sheep, particularly wether sheep, are reduced in price; it is probable that mutton will be again scarce in the spring, as there seems but little opportunity to fat sheep, except with corn. Horses, cows, and pigs are somewhat lower in price, and this depression is no doubt principally caused by the scarcity of keep. Vetches yield uncommonly well out of the straw, and in some places the produce is greater than we expected; a vast breadth has been sown and they continue to be worth from 4s to 5s per bushel. A pretty fair portion of trifolium has been sown, many persons being desirous to give it one more trial; but we have not much opinion of its merits, as it will not grow where broad clover has recently grown, and it affords but little spring feed when it is most wanted, namely, after a hard winter. The winter oat does not answer the expectation of the farmer, for it produces little feed in the autumn, and is not near so good as vetches in the spring; but it may be useful to sow amongst vetches instead of rye, for we think it more palatable food, and does not so soon get hard in the stalk. Winter beans continue to be planted in a few places, and they are more certain of pods than the common sort, but the time in the autumn is so occupied in getting in the wheat crop, that the farmer cannot conveniently attend to winter beans, and it is also very difficult as well as expensive to keep the rooks from pulling them up in the winter. There is less cloverseed saved in this part of the country than we ever knew, and the weather has been very unpropitious for securing the same, it is expected to be tolerably productive; but if there is not an extraordinary quantity of foreign imported, seed must be very dear. There was a vast quantity of barley and oats left behind in the fields this season, it being impossible to rake it up clean, and the weather being wet the pigs have done uncommonly well in the stubble, but there being no acorns or beech mast in the woods, the pigs must be brought earlier into the market than usual, and we think that the stock of pigs in the country is far less than it was last year at this time. Walnuts and nuts are very plentiful, but apples and pears are rather a failing crop. Potatoes yield very well, and will most likely be cheap, this may be detrimental to the wheat grower, but still we cannot but rejoice, for it will enable the poor man who has a large family to wriggle through the winter, even if his earnings should not be very great. The price of labour is from 8s to 10s per week, and 8s per acre has been the price generally given for reaping of wheat, and 2s 6d per acre for mowing and cocking barley. This has been a sad year for bees, and not one-half of the stocks have gathered a sufficient quantity of honey to last the winter; but, notwithstanding this deficiency, there is so much imported from other countries that the cottager cannot obtain

more than 6d per lb for honey, and 1s 4d per lb for wax. The yield of wheat out of the straw is full as good, and in some instances rather better than we anticipated, but the crop per acre will be under an average, except on some of the very best cultivated land in the vale of White horse. A considerable quantity of wheat has been already brought into the market, but nearly the whole of it has been cleared off, for every clean parcel has been regularly purchased for seed, and every dry parcel has been purchased by the millers, and nothing hangs on hand but the soft and smutty. The barns of many farmers are beginning to get empty, and it will not do for the prudent man to commence too soon upon the ricks as they are so small in size and few in number. A short straw year is generally a ruinous year to the poor and needy farmer, for he being continually pressed for money, proceeds rapidly on with his thrashing, without a thought how soon his stock will be exhausted, and generally he finds his produce and money both gone so long before another harvest, and he becomes so involved, as to give up in despair or is so crippled as never to be able to recover himself again; we generally have observed more failures amongst the farmers in such years than in any other. The New Tithe Bill seems to attract but little attention amongst the occupiers of the soil, and we as yet scarcely hear of an instance of its being about to be acted upon in this county; both parties seem to be afraid they shall be taken in, but if the commissioners are men of business and integrity, we do not much fear the result, nor can we find any great fault in the principle of the measure. It seems that the share of the title owner's poor rates (and which has been generally paid by the farmer) is to be added to the amount paid for tithes, and the whole converted into bushels of corn, and which for ever is to be the *quantity* fixed on the farm. Now in many parishes this will be a great injustice to the proprietor of the land, as it is well known that it was the practice of many tenants to thrash their corn with machines, and in the winter turn nearly all their men on the roads, and let a great many go round by the yard lands and make the overseer pay the whole, and in every way lessen their own labour and swell the poor rates; they also kept the weekly price of labour, each man, as low as possible, and paid all above two or three children out of the poor book, and by these and various other schemes have so enhanced the parish rates, that it will, we conceive, be extremely unfair, because the tenant has paid a large proportion of his labour and expences out of, or by way of, rate, that the landlord's property shall be saddled for ever with an extra number of bushels of corn. It will well become all landlords to look well to this, or they will have much the worst of the bargain.—Oct. 3.

#### DERBYSHIRE.

Since my last report we have had a great variety of weather, but in general very little favourable to vegetation, the uncongeniality of the past months is remarkably evident in the alarming devastation made upon the turnip crop; the actual damage sustained in the midland counties by the loss of this crop is immense. There exists a diversity of opinion as to the cause of this crop being damaged. The smother-fly has attacked almost every field and every plant; farmers in general attribute the loss of this crop to the ravages of the fly, without considering the real cause of the decomposition of the plants. If we take a cursory survey of the different turnip fields within our observation, it will become evident to the most careless observer, what is the real cause of the loss of this crop. Wherever the plants were

thin set and on a more dry and elevated situation, we invariably find the fly to have commenced its early ravages;—and from what cause? because that part of the field has offered to them a more sumptuous repast. The rays of the sun during the last three months, with their concommitting evils, have had a more free and easy access to those parts of the fields that were not shielded with the plants, there we find that evaporation has gone on more rapidly, and of course left the growth without moisture sufficient to succour the plant; a state of decomposition has of course succeeded, the plant has begun to recede, a stench the most horrid has succeeded, as that of course might be expected. All this has taken place before the fly, as one of the greatest blessings sent by Providence, has attacked the plants. Here then we find it evident that the flies are not the cause of the havoc made in the turnip crop, but that they are carrying off the effects of the uncongeniality of the last two months. Where the plants are thicker set, so as to form a complete cover to the ground, and exclude the vivifying rays of the sun, evaporation has gone on to a very small extent, so that the plant has had a sufficient degree of moisture to keep it in a healthy state, there we find that the fly has done comparatively little damage. The gelatinous parts of the plant have not been sufficiently decomposed to allow the fly to feed upon them. This, then, is a secondary corroboration of what I before stated, that the fly is not the cause of the decay in plants, but that they are carrying off the effects of some other cause, for we invariably find that they never attack any healthy plants. Animal and vegetable matter may be considered as nearly allied in regard of putrefaction. When you see a dead carcase lying upon the ground in a high state of putrefaction, you invariably find it attacked by the large flesh fly; would it not then be preposterous to say that that fly was the cause of the death of the animal because it was then attacking the putrefying carcase? Most certainly it would. It must appear evident to every superficial observer, that the fly is carrying off the effects of some other cause. Just so is it in regard of vegetable matter, the fly never will attack a plant till it is arrived at a certain state of decomposition, so as to separate the gelatinous from the fibrous matter to a certain degree. Here, then, we see the kind hand of Providence, in sending the fly to carry off the astonishing great mass of putrefied matter, which, if allowed to remain unmolested upon the surface of the earth, would undoubtedly create some severe pestilential disease throughout the country; but, instead of remaining, the fly by feeding upon it, converts the greater part of it into living matter. A pretty general idea of the decomposition of plants may be formed from what I about to mention. Last Thursday week, the neighbourhood of Mansfield, Nottinghamshire, and about seven miles around it, was covered with a dense mass of flies resembling the common gnat in size, so that it was impossible for any person to proceed along without having their eyes filled with them. This very probably did originate from the decomposition of plants, which gave support to the flies, Mansfield standing in the very heart of the turnip country. Some heavy rain, however, coming on silenced these troublesome fellows, and the frosty nights that have succeeded since, will undoubtedly check their increase. I should have wished to have dilated more fully upon the loss of this crop, but the limits of a letter forbids it. The same may be said of spring tares that were sown late for Autumnal reaping, the fly has attacked them in a similar manner; though, as I said before, I do not think the fly the cause of the destruction of plants,

but carrying off the effects; I have had one field completely destroyed in a similar manner. Cabbage, mangel wurtzel, and almost all other kinds of vegetable substance have suffered more or less from similar causes. Keep of all kinds is extremely scarce and very high: clover eddishes, to be mown and taken off the ground have been sold at 4l per acre, remote from towns. Hay is selling from 6l to 8l per ton, and is extremely scarce; the harvest is not completely finished in the Western parts of the county, some oats and a little wheat remaining abroad. There seems to be what I might almost term a sensible mania, seizing the farmers this year in regard to the Winter tares, they are sowing an amazing quantity almost everywhere; by suffering so severely the last summer it has taught them an important lesson against another. The farmers are extremely busy now in preparing their fallow ground for wheat, some little has been sown but not become general; many of them are sowing rye for Spring eating for the sheep. We have not had sufficient rain to saturate the ground to that degree so as to make it plough kind upon leys and stubbles. Wheat continues to come into the market very coarse and smutted, and very inferior in every degree to last year's growth. It is said by farmers, generally, not to yield so well neither in corn nor straw, to what it has done for the last three years; and I confidently affirm in opposition to other reports which you took from the *Morning Herald*, &c., that the crop is altogether inferior to what it has been for the last three or four years. Smut now forms the substance of the farmers' chit-chat at the market tables, most of them are feeling the effects of it, and wish to avoid it for the future if possible, some produce one thing and some another, but as to the real preventive, that remains still in obscurity. One humorous receipt I heard to-day, I will mention; it is this:—to take quick lime and riddle it amongst the corn in the barn during the time it is in the chaff. It is amongst the number of the mysteries that still surround the agriculturist. Oats are rather scarce, and I think they are likely to remain so: the farmer, from the scarcity of hay, will undoubtedly cut a great portion of them up, straw and corn together, for his cattle, being much cheaper than hay at its present prices. Barley continues to come into market extremely coarse and deficient in weight and quality. Our corn markets are now becoming more steady than they have been for some time. Wheat, from 18s to 20s per load; oats, at about 14d per stone; barley, from 36s to 42s per qr; Winter tares about 7s per bushel: there is a fair quantity of fine old wheat in the markets, which is much in request, the new being very much out of condition. Our fat stock markets are rather depressed, arising from a scarcity of food, the farmers being obliged to bring their stock to market to make room for those at home, but we shall undoubtedly find a reaction after a time, the stock that is now coming to market ought to remain at home at least two months longer, but the scarcity of keep compels the farmer to bring it to market prematurely, so that the stock he now brings to market and which ought to remain at home, will be wanted after a time. Lean stock is unsaleable, but few feeling inclined to buy.

October 7th.

S. P. G.

#### NORTH DEVON.

Since our last, the weather has in general been very boisterous, and attended with so much rain as to prevent the saving of corn, until the 4th inst.; on the morning of that day, and the two succeeding ones, we had a sharp white frost, and to the afternoon of the 8th the weather, with the exception of a

few light showers, was dry and pleasant, and the farmers were enabled to carry a considerable quantity of grain, which had been exposed for the previous two or three weeks. There were some (as is too frequently the case in such unfavourable seasons) who put their corn together on the first dry day, it may naturally be concluded that a great portion of this will be spoiled. The air has in general been cold, to this we may attribute the few complaints we have of grain sprouting, but where the best attendance has been bestowed, it is stained, and in some wet and exposed situations, the corn has been entirely spoiled. Those farmers who have estates on, or near coarse Moorlands, have still some thousands of acres of barley and oats in the fields, and much of the latter nearly as green as in the month of May; this cannot ripen, and doubts are entertained whether any part will be saved in a fit condition for market. We have had an opportunity since our last of inspecting a variety of produce, and find we can add little to what we have already said respecting wheat; smut is very prevalent, in other respects the quality is equal to the produce of last year, the yielding will be good, though from the deficiency in straw, it will be considerably below an average produce. New wheat is still very soft and unfit for use, at present this is of little importance, as the farmers have still much old wheat on hand; their expectations are raised with respect to the future value of this article, they are now getting for clean new samples fit for seed from 7s to 8s per bushel, and calculate on an increased price: how far their ideas will be realized must remain to be proved till the seeding time is over, we are not quite so sanguine in our opinions. In a few districts of the best barley land, where the farmers were enabled to sow the seed early, the harvest has been finished several weeks, the colour and quality of the grain saved in those places will be equal to the best runs of last year, with an average produce; on more inferior lands it is full bodied, coarse, and high coloured, straw thin, and the yielding under an average; much of the barley sown late, is supposed will not yield more than from 10 to 12 bushels per acre, the whole crop, if all now in the fields can be secured, will be at least  $\frac{1}{4}$  below an average. Oats are in general of a rusty colour, such as were sown early, will weigh nearly equal to the produce of last year; the sowings that succeeded will be found from three to four pounds per bushel less, and a large portion of the latter sown, is reckoned will not yield more than from 8 to 14 bushels per acre, we have even heard of a few fields, offered for sale at five bushels per acre; it is calculated that this grain will be found deficient of about one half of the produce of last year. The principal part of the spring corn, is like the wheat, out of condition, and unfit for market. The black caterpillars have in great part destroyed the turnip crop, and the bulbs that remain have been so much injured as to prevent their increase in size; most of the wheat arishes that were cleared early have been sown with turnip seed, a method not much practised here, though in the hope of its affording some assistance during the winter (fodder of every description being so scarce) it has been generally tried. In some situations potatoes look well, and a fair yielding is expected, but in general, and more particularly with the late sorts, we have never known so bad an appearance; yet as there is a great breadth planted, sufficient will be found for home consumption, though few can be reckoned on for exportation. Vetches have been known in this part only a few years, their usefulness was proved in so satisfactory a manner in the last spring, that a considerable quantity is now sowing, many

have been saved here in the past Summer of good quality, and are now selling at a low rate, which encourages the farmer to increase his tillage of the article. There was an abundant show of superior cattle at Barnstaple Fair on the 19th ult., and a greater number sold than has been known for many years; scarcely a fat, or half fat bullock remained unsold, though at a reduction of price, the former from 8s 6d to 9s per score, the latter about 7s 6d; store cattle realized about 5s per score. The supply of sheep was small, the few that were sold did not exceed 5d per pound. The number of horses exhibited was greater than known at any former fair, they consisted chiefly of those for draught, or inferior saddle horses, or ponies; the last descriptions were scarce, those that were prime, fit either for saddle or harness, obtained high prices, and were soon caught up, but the sale on good cart horses was dull, though a number of the common sort were sold at extremely low prices. Torrington Fair on the 3rd inst., was thinly supplied with cattle, and as the farmers stood out for higher prices than was obtained at Barnstaple, most of the beasts remained unsold.—13th Oct.

#### PERTSHIRE.

It is our painful duty at this late period of the season to state that a very considerable part of the crop throughout this large county, as well as throughout the higher districts of Scotland generally, is still exposed either in the stook, or standing in an unripe condition. Throughout the month of September the weather was cold and showery, with frequent gusts of boisterous winds, often accompanied with rain. On low swampy lands hoar frost had blackened the potatoe foliage by the middle of the month of September, and thereby put a final stop to future swelling. In the lower districts autumn sown wheats were got in before the last week in September, but much was cut in rather a green state, and carried to the barn yard before it was thoroughly dried, consequently, although the return in proportion to the area occupied may reach near an average, the sample in many instances will be coarse. On higher grounds, and near the limits of cultivating this grain, which, in this quarter is from 400 to 450 feet above the level of the sea, wheat is still standing, or in the stook, little having been carted on such altitudes. Barley has ripened for the most part unequally, and will produce rather a light and inferior sample even in favourable situations; it has for the most part been cut, but much still remains in the field on high and late lands. Oats for the most part are still standing, and many fields appear green, and this part of the crop will be sadly deficient in quality and quantity. Beans and peas will form a poor substitute for horse corn, as they are still exposed, and from the threatening aspect of the weather not likely to be secured in good condition. Oatmeal in many districts of Scotland forms a considerable part of the food of the lower classes, and is already rising in price. Potatoes were blanky, and having received an early check, will consequently be deficient in acreable produce. Turnips have been prevented from acquiring their usual size by the cold and drenching rains. Good samples of wheat for seed are in demand, and some famed English varieties have reached us, amongst which the Hickling, the Whittington, and the Uxbridge varieties are the most popular. Of the Hickling we have had a trial, and it appears to be early, as well as fine and prolific. The Uxbridge is well known, and yields a beautiful white sample. Of the reds, we esteem the blood red, as the most prolific, tolerably early, not liable to lodge, and a fine round sample. Of spring wheats,

we, after repeated trials, esteem the white bearded Tuscany, an early and prolific wheat; and this late season will teach us in Scotland to appreciate early varieties. Prices of grain are generally looking up with us; of live stock we have to report quite the reverse. The great cattle show at Perth was well attended on the 7th, an account of which will likely have reached London by this time. There were many eminent English agriculturists present, and, at the dinner, we heard them speak in most flattering terms of the stock brought forward; indeed we thought our Scotch agriculturists sufficiently proud of the eminence they had attained, and sufficiently sparing of their acknowledgements to their brethren in the south, from whose stocks the best specimens of Teeswater or short-horn cattle, and south-down sheep originally emanated. In one thing, we believe, we do need our English neighbours at such shows; and that is, in the vast display of grains, roots, and grasses, from public and private agricultural museums, which exhibit rare and useful varieties for culture, and which afford opportunities for improving pastures and corn fields by judicious selection. In England, and in many societies of Scotland, an overbearing anxiety is manifested for building the greatest quantity of beef, on the fittest forms, and at the least trouble, without paying any attention to improving the material that goes to make the beef.—Oct. 12.

#### DURHAM REPORT FOR SEPTEMBER AND OCTOBER.

For the last month or five weeks we have rarely had a fair day, and the last three weeks have been almost incessantly wet, and the corn which is standing out has a most miserable appearance, and must be unsound. A great portion of the wheat on the poor land districts is still out, and a great portion of which is to be cut. Nearly the whole of the oats on those lands are out, and many hundreds of acres will never be ripe. The land is in such a state that it is impossible for a horse or draught to come upon it, and the prospect of getting the wheat sown is gloomy beyond precedent. The wheat which has been got is scarcely fit to grind except without mixing with old, and it is well there is a good quantity of old stock left. The turnip is almost a total failure. The bean and pea crop will be entirely lost.

#### BRISTOL,

10TH MONTH, 20TH.—ANNUAL REPORT.

In consequence of the harvest having been protracted by so much wet weather, I have delayed my annual circular, not having been able to obtain, at an earlier date, such correct information, from the various parts of the kingdom, as would enable me to come to a conclusion relative to the crops. Wheat.—While cutting complaints were almost universal, and, owing to the small quantity of straw, most farmers spoke of a very serious deficiency; but, since thrashing has become general, the crop has not proved so defective as was anticipated, as the straw yields well. I do not consider that the produce will be equal to the last three seasons; but I am of opinion there is a full average, as compared with the general run of years. It has been considered all through the season, that there was a less breadth of land sown to wheat: I have no doubt of the fact, but not near to the extent calculated on; and, to counteract the effect of this, it must be borne in mind, that farmers are every year adopting a higher cultivation of their land; and from their now superior mode of management, it is made to produce a much greater quantity per acre than formerly: the produce,

from this circumstance, is, in some of the corn counties, prodigious. The quality in some districts, is very superior; but generally, it will be found of a rough, coarse grain, although weighing much better than could have been expected, and a great deal damp and smutty. The above remarks, as to the yield, may be generally applied to the South of Ireland: the quality is somewhat better than last season, but much of it brought to market in a very damp state, which creates a great loss in kiln-drying. In the North of Ireland, a great breadth of wheat land was last year sown to flax, which will cause a considerable deficiency in the shipments from that part of the kingdom. Barley is not a good crop; but from a portion of land having been sown with this grain, instead of wheat, I consider the gross produce to be a full average. The quality will be generally inferior; and a greater proportion than usual must be appropriated to grinding; but there will be some very superior. From a smaller quantity being fit for malting, the exhausted state of the last year's stock, and the great consumption, prices will no doubt range high through the season. Oats I consider to be fair in quantity, and the quality of a small proportion is superior to last season; but generally they are very much affected by the wet weather, which has so much retarded the harvest. Prices may be expected to range proportionably higher than wheat, owing to the increased consumption that must arise from the scarcity and high price of hay. Beans are defective. A part is of fine, bright, dry quality, but they are mostly in a soft damp state, and not fit for storing until they have been seasoned by frosty weather. Peas are about an average, and some kinds are of excellent quality. Potatoes are, of late, much more favourably spoken of than earlier in the season, and the produce is expected to be good, in many districts.

Taking a general view of the state of the Markets and of future prices, I do not expect the value of wheat or the trade, to be so depressed as for some years past; and we may calculate on prices not varying so materially as they have at the different periods of some seasons, unless there should be an unfavourable appearance of the growing crops in the Spring of the year. Much of the wheat, being put together in a damp state, will require some drying winds before it can be brought to market freely; and barley being in good demand at high prices will cause farmers to be less eager to thrash wheat, unless they can obtain fair prices for it. On the other hand, although in consequence of the backward harvest, we have been several weeks longer on the consumption of old wheat, and a portion having also been used last year for feeding cattle, still there is a large stock of old with the farmers. Before harvest, when prices were ranging about the highest, the holders of many years' growth were willing to sell, and kept the markets regularly supplied, until prices began to fall;—this disposition must have a great tendency to check any material advance.

#### GREAT YARMOUTH.

##### OCTOBER 5.—ANNUAL REPORT.

I solicit your attention to my report of the harvest, which has been later by three weeks than the two previous years. The latter part has been very tedious from great quantities of wet. Wheat is an average growth, but not near the quantity of 1834 and 1835, to include all the variety of soils in this county and Suffolk. The finest land, though not great in bulk of straw, was a standing crop till shorn, and will not only yield a great produce, but finer quality in many instances than last year. Some will suffer from want of patience in the grower, though the Wheat was entirely secured before any of our rains. Smut not to the extent expected; weight equal to last year's. Barley as fine a standing crop as ever remembered, with the exception of some lands given to scald, and others where the cultivation has been let very low; however, the produce as a whole is likely to far exceed last year's and prove more than an average growth. The quality very variable; full as much got bright and dry as the growth of last season, and a great part fine and fit for any malting; weight a little under last year's; not perhaps an eighth

abroad in the two counties when the heavy rains set in; and a great proportion of this was in a small circuit twenty miles to the north of Yarmouth; with this, the farmer has been obliged to contend with near a month of much fickle and unseasonable weather, it may now be considered as nearly all got, but too recently to speak to its condition, but it cannot be good; its colour is from dingy to black, but not so much grown as expected. Maple and Dunn Peas are most abundant crops, and all secured before any rain, in the finest possible order; very handsome and of great weight. Of White Peas the yield is proportionably small, secured well, but much injured by vermin. Oats deficient, secured well, and about the same weight as last year. Beans about two-thirds a crop, the quality promised small and handsome, but the weather must have been very destructive, if not to their soundness, to their condition—many yet unharvested. The harvest of 1835 has proved larger for Wheat and Barley than expected, but not so of other grain; all stocks exhausted in the extreme, except Wheat, of which there is some quantity, but not more than half that was held at the same time last season.

#### LYNN.

##### OCTOBER 11.—ANNUAL REPORT.

The unfavourable weather for the latter harvest has occasioned some delay in the publishing my report of the crops in this neighbourhood, and there is yet a considerable quantity of oats and beans to secure. A few years ago I had to report a large increase in the breadth of wheat, (particularly by the improved drainage in the Fens,) which having been the case in many other parts of the country with the subsequent abundant produce tended to the very low prices of this grain.—A reaction has been the consequence, and much less wheat was sown last Autumn, particularly upon the light soils. Owing to the backward Spring and very cold Summer, vegetation was so much checked, that all descriptions of grain were short in the straw and consequently are of apparently small bulk. Upon the high lands about three-fourths, and in the Fens and Marshland about half the crop of wheat was secured in good order, the remainder being mostly hurried up comes to hand in a damp state. The quality generally is good, although in some districts smut prevails to a considerable degree. The yield per acre proves much better than was expected, probably upon the whole a seventh over an average. Rye is of fine quality and yields well. Barley I consider barely an average crop; the early sown is decidedly the best, both as to quantity and quality, but from the ungenial season it varies materially according to the quality of the land; from half to two-thirds was secured before the rain, and although of rather a coarse yellow skin it is of good malting quality, especially the Chevalier; the remainder would have sustained much more injury but for the cool atmosphere during the rains. A considerable quantity must come in a very damp state although but little stained or sprouted, and this proportion is better than might have been expected. Oats are altogether much worse than for many years, very deficient in quantity and of light inferior quality, upon the high lands they were mostly harvested previously, but in the Fens very few were secured before the rain. Beans are below an average yield, but the breadth sown was large, scarcely any were stacked in good order, and those now in the fields will be much injured. Peas (grey or maple) were secured in fine order, they yield well and are of very handsome quality; very few white are now grown hereabouts. Wheat excepted, (and now not much of that), the stocks of all old corn are quite exhausted.

From all our information, we are led to the following estimate of the crops.

We consider WHEAT south of the Humber, above an average in quantity, and the bulk secured in good order, with a great deal of old left over from the former season: the quality and condition of the new crop as an average, may be pronounced fine, though not equal to the growth of the two preceding years, which were very superior: in the new Wheat this season there

are many unripe Corns, perhaps from the Wheat having been cut rather prematurely, or hurried in harvesting, or from the prevalence of an *under growth* of ears, by which means, all did not ripen together; but the yield per acre, notwithstanding the short straw and the generally reported thinness of the crop on the ground, has in numerous instances been found great, beyond all former experience. In Yorkshire we consider Wheat a full average in quantity, but the great bulk of the crop secured in poor condition, north of Yorkshire, and throughout Scotland, and all the late districts, we cannot but believe that the crop will prove very unproductive, owing to the wet ungenial weather, they have experienced for their harvest,—the last two months with hardly a sunny day,—and that there will, in consequence, be a large drain for the North on the southern crop. In Ireland the great bulk of their Wheat was secured in good, fair condition, and is superior in quality and yield to the two former seasons, but as applied to Ireland, we believe there is something in the general remark, of a very diminished breadth sown with Wheat this year, (though, as applied to England, we would not build upon such an assertion as a fact, to any extent) add to which, the exhaustion and absence of all stocks of old Wheat in Ireland, and we think that country will be troubled to keep its extensive mills moving this season, by its own produce. Under all the circumstances, we now relinquish the expectation of any considerably lower scale of prices for Wheat this season.

BARLEY is estimated as an average in quantity, but one third of the crop of the Empire has suffered more or less from the wet, bad weather. Our great Barley Counties, south of the Humber, were so fortunate as to secure the bulk of the crop in good condition, just prior to the wet weather setting in; but even in these counties, we must allow a considerable deduction for waste, from the wet weather overtaking their latter harvest. There seems hardly a bushel of old Barley left all over the country to meet the new crop, and taking into account the immense consumption of the article, and the great deduction of malting qualities from the crop, in consequence of the unfavorable weather the last two months, we shall be surprised if our top prices for fine malting Barleys do not rule nearer 50s than 40s per qr in this market, the greater part of the season. There has been an effort made to get some quantity of Barley abroad, for shipment this Autumn, but we believe it will fail to any extent, owing to the absence of stocks of old Barley of good quality, and to the probability of the Winter closing the Continental Ports till the Spring, before any quantity of the new crop can be collected. In the Spring, we doubt not, large quantities might be procured, if the closing of the malting season did not give reason to apprehend a fall in the averages, and consequent rise in the duties. From the late Continental quotations, Barley would stand 24s to 30s per qr in the Thames, in bond.

The crops of Oats or Barley were much later ready for the sickle this year than Wheat, and consequently, came in for the wet season, which the Wheat, in a great measure, escaped. OATS are a rather deficient crop in quantity, in England, and a great portion harvested in poor condition, and much weathered. In the South of Ireland, and along the East Coast of that Country, Oats have been harvested in good order, and are a great crop, both in yield and in breadth of land sown; but on the north-west side of Ireland and on their mountain lands, where the cultivation of them is extensive, also in Scotland and in the late districts of England, a great part of the crop was stated, only a few days back, to be still in the fields, and a great deal green and uncut: many calculate that under these circumstances a considerable portion of the crop in these parts can never mature and ripen, and that much will be lost. No doubt Oats will bear much bad weather, and we do not feel ourselves competent to decide whether, with fine weather, the growth in these parts may not be yet secured, though of inferior quality. We were led to believe there was a prospect of a good crop of Oats in Scotland, had the

weather proved propitious. Oats have set in very high in price: it would be prudent in the trade, before going into stock at such rates, to consider whether this is not to be attributed rather to a temporary scarcity, arising from short stocks of old, than to any decided deficiency in the new crop: our opinion is that present prices for new Oats cannot be sustained through the Winter and Spring, whatever want of the article may exhibit itself next Summer and Autumn. Neither consumers nor traders will hold stock up to prices which would admit of foreign importations in the Spring and Summer. Good foreign feed in Bond may be laid in at 15s to 16s per qr, and Brew at about 20s per qr in the Thames.

PEAS are a great crop and got dry and handsome, but owing to the scarcity of grinding Barley, old Oats and fodder of all descriptions, they are likely to maintain a high price all the season. NEW BEANS have of course, as our latest crop, been harvested in soft bad condition, and though they vary in places, are considered upon the whole a very deficient crop. Old Beans are getting scarce and dear. HAY and TURNIPS are stated to be very deficient throughout the country, and in the event of a severe Winter, it is calculated, this will materially influence the consumption and prices of Spring corn. Linseed cakes are already at 13l per 1000.

The quantity of corn under lock, by the last return, was—

Wheat.....	594,160 qrs.
Barley.....	34,953 —
Oats.....	244,044 —
Rye.....	4,861 —
Peas.....	2,108 —
Beans.....	61,218 —
Flour.....	103,996 cwts.

of which were in London—

Wheat.....	239,181 qrs.
Barley.....	8,405 —
Oats.....	74,372 —
Rye.....	— —
Peas.....	53 —
Beans.....	7,908 —
Flour.....	36,729 cwts

There have been frequent inquiries for Wheat under lock, for export, for some months past, but at very poor prices, say 22s to 26s for soft Russian; hard and good German red, 28s to 34s; fine Danzig is higher, and the demand has never been very brisk or decided, and we conceive the bulk exported has been on the proprietors' own account. The only vent that could have afforded holders any satisfactory results would have been the home market at a moderate duty. The present Corn Bill has answered the purpose for which it was intended—the protection of the landed and agricultural interest of this country; but it has proved a delusive Bill to the trade, and has been a perfect quicksand to the capital embarked under it: such has been its character hitherto, and such we expect it will continue.

The growth of other articles, as oats, barley, beans, and peas, seems more uncertain than wheat, or the produce less than our consumption of these articles, as we have frequently of late years required importations of them. To judge by experience, the average and duty on oats is set too high to afford the importer a fair chance, even when the country requires a supply of this article.

With regard to the money market, and its bearing on corn trade, we do not expect the present alarm and caution of our great monied interests will occasion any depression or inconvenience to the trade, as their engagements generally were never lighter. We expect the great advance in most articles this time twelve months was rather a reaction on very low prices than the effect of any unseasonable change in our currency.

GILES, SON, & CO.

GENERAL AGRICULTURAL REPORT FOR OCTOBER.

We feel great pleasure in observing that every description of agricultural turbulence—whether practicable, impracticable, political, or theoretical—has dissolved, this month, into a halcyon calm, by the assemblage of associations of landlords and tenants, and other laudable gratifications and enjoyments, after the good old English fashion; uniting for the purpose of awarding premiums and commendations, to all branches, from the most humble to the most noble and exalted members of the agricultural community. This is far more instructive, and greatly preferable, as the last session clearly proved, to an appeal to the legislature.

As relates to practical farming, notwithstanding the frequent turbulence and humidity of the atmosphere, it has proceeded with comparatively little interruption, and is, in every respect, well in its place. We rejoice, too, at having been, in the course of the month, informed, from several highly respectable sources, that, a considerable number of landlords, who are, at this time, letting large farms, have, at several of their present year's Michaelmas audits—in addition to making a voluntary abatement on their last half year's rent—agreed to receive their rent, according to the present pretty general system, viz., their first half year's rent, not till a year is due; and signified it to be their intention, to reduce their farms to the average standard of 1787, except those which have been, in great part, reclaimed from bog or common wastes.

As relates to the present month's complexion of the whole range of low vegetation, it surpasses our own recollection, or that of the oldest farmers with whom we have been acquainted, to have ever witnessed. "Now enters October," says the following extract from an agricultural calendar of the year 1765, "which many times gives us earnest of what we are to expect in the winter succeeding," adding the following brief poetic distich:—

"The sun declines, and now no comfort yields  
Unto the fading offspring of the fields.  
The tree is scarce adorned with one wan leaf,  
And Ceres dwells no longer at the sheaf."

"If it prove windy as it usually doth, it finishes the fall of the leaf;" but we do not recollect an October so near the end of which—though it has been, throughout the greater part of it, visited by a dense, and not unfrequently humid and turbulent, atmosphere, followed by some white frosty nights, whilst gossamer has been hanging on the fruit trees and hedges, and thistle-down flying about during nearly, or quite, the whole of it—with vegetation in so fresh a state. The pastures and crop grass lands, sheep downs, &c., are tinged with a deeper and, we think, richer verdure, than at any period of the past summer, whilst the foliage of both fruit and forest trees, though in most situations, beginning to assume its autumnal complexion, has yet fallen but to a comparatively limited extent. The fattening sheep and beasts, too, continue to do well in their pastures; the ewe flocks, on the sheep downs, and other live farm stock is described as being, generally, in a healthy state. Yet we are somewhat surprised to witness so great a proportion of the beasts which have appeared in Smithfield, both in this month and last, of very indifferent quality: whilst the sheep have been unusually good.

The hop and latter hay harvests have nearly, or

quite, reached their conclusion, under auspicious circumstances: and there will be a good crop of potatoes, the greater part of which have been already secured, for winter consumption, though some of the market gardeners find fault with their part of it.

There appears to be considerable breadths of barley, oats, and beans still unharvested in the north of Scotland, as also, to some extent, in the most northern parts of England, and the north-westerly parts of Ireland. We have ourselves frequently seen in the neighbourhood of Aberdeen patches both of barley, oats, and beans lying about the fields in the middle of November.

As relates to the prices of farm produce generally those of corn and pulse have been somewhat vibrating, but not far from stationary; of malt, seeds, hops, and flour, with both fat and lean graziers' stock and horses a little drooping; of wool, dairy produce, and poultry a little on the advance; of game somewhat on the decline.

The following is a retrospect of the supplies and prices of fat stock sold in Smithfield and Islington cattle markets on the days of the respective dates:—

SUPPLIES.

Total .....		891	13130	12	—
Supply of preceding month.		1381	12841	29	—

It appears, by the foregoing statements, that the bullock supplies of Smithfield have increased in the course of the month, to the number of 4,100, the sheep 2,180, and the pigs 1,195, whilst calves have decreased in do., 210.

At Islington, there has been, in the course of the same period, a decrease of its bullock supplies to the number of 490, of calves 17, and an increase of sheep, 289, whilst there have been no pigs throughout the month.

About 14,430 of the above beasts is not far from equal numbers of short-horns, Herefords, and Welsh runts, with about 600 Scots and Norfolk home-breds, and about 400 Irish beasts have come from Lincolnshire, Leicestershire, Northampton-

shire, and others of our northern and north-western grazing districts; the numbers having been up the St. Alban's road, about 9,900; the other northern roads, about 4,530; about 2,220, chiefly runts, Devons, and Herefords, with a few Irish beasts, from our western and midland districts; about 920, mostly Herefords, Devons, Welsh runts, and Irish beasts, with some, but not many, Staffordshire cows, steers, heifers, &c., from Norfolk, Suffolk, Essex, and Cambridgeshire; about 150 horned and polled Scots, but chiefly the latter, by sea, from Scotland; about 220, for the most part, Devons, with a few Sussex steers, cows, and heifers from Kent, Surrey, and Sussex, but few of them from the latter county; and most of the remainder, embracing a few of all the before mentioned breeds, and about 250 lusty and lean town-end cows, and about 300 poor Irish store beasts, and as many store Devons, and a few store Staffords, from the marshmen, cattle lodgers, cow keepers, &c., near to, and within a few miles of, London.

	PRICES.		Sept. 26.		Oct. 24.	
	s.	d.	s.	d.	s.	d.
Inferior Beef	2	0 to 2	4	..	2	0 to 2
Middling, do.	2	6 to 3	0	..	2	8 to 3
Prime, do.	3	2 to 4	0	..	3	4 to 4
Inferior Mutton	2	4 to 2	6	..	2	4 to 2
Middling, do.	2	8 to 3	0	..	2	8 to 3
Prime, ditto	3	6 to 4	4	..	3	6 to 4
Veal	3	8 to 4	8	..	3	10 to 4
Pork	3	6 to 4	6	..	3	2 to 4

It will be seen, by the preceding abstract, that, this month, beef, veal, and pork have produced somewhat advanced prices; whilst those of mutton have been stationary.

Here follows our yearly comparison of the supplies and prices of fat stock exhibited and sold in Smithfield Cattle Market, on Monday, October, 26, 1835, and Monday, October 24, 1836:—

At per 8lbs, sinking the offals.

	Oct. 26, 1835.		Oct. 24, 1836.	
	s. d.	s. d.	s. d.	s. d.
Coarse and inferior beasts	2	0 to 2	2	.. 2 0 to 2 4
Second quality do.	2	6 to 2	8	.. 2 8 to 3 2
Prime large oxen	3	4 to 3	6	.. 3 4 to 3 8
Prime Scots, &c.	3	8 to 4	0	.. 3 10 to 4 2
Coarse and inferior sheep	2	4 to 2	6	.. 2 4 to 2 6
Second quality do.	2	8 to 3	0	.. 2 8 to 3 0
Prime coarse-wooled sheep	3	4 to 3	6	.. 3 4 to 3 10
Prime South Downs do.	3	8 to 4	0	.. 3 4 to 4 4

Prime small do.	4	4 to 4	8	.. 4 4 to 4 10
Large hogs	3	0 to 3	10	.. 3 2 to 3 8
Neat small porkers	4	0 to 4	4	.. 4 4 to 4 8

SUPPLIES.

Oct. 26, 1835. Oct. 24, 1836.

Beasts	3,480	3,150
Sheep	31,850	23,500
Calves	380	230
Pigs	450	380

It appears, by the above comparison, that all kinds of meat were somewhat dearer, on Monday, October 24, 1836, than on Monday October 26, 1835; whilst the supply of the former market day embraced 330 beasts, 8,350 sheep, 150 calves, and 170 pigs less, than that of the latter.

This month's Smithfield supplies of sheep, as last month, comprised about equal numbers of old and new Leicesters, Kents, Kentish half-breeds, old Lincolns, and South Downs, with a somewhat, but not very considerably, decreased number of Norfolk sheep, horned Dorsets and Somersets, white-faced polled Gloucester sheep, horned and polled English-fed Scotch and Welch Sheep, &c.

The number of sheep, by sea, from Scotland, has not exceeded 100.

Fully three-fourths of the beasts, exhibited at Islington market, have been short-horns; the remainder, in about equal numbers of Devons and Irish beasts, with a few Scots and Herefords; the sheep supplies, at the above market have principally consisted of old Lincolns and old and new Leicesters; with a few South Downs, Kents, Kentish half-breeds, white faced Gloucesters, and horned Somersets.

Grass lambs have been, nearly, or quite, the whole of the month, considered to have become mutton, consequently out of season.

There has been but little slaughtered meat, in the course of the month from Scotland; but, from different parts of England, supplies of it have been rather large.

The opinion of the Bishop of Exeter, relative to the new Tithes Act, expressed at the recent Exeter visitation—the particulars of which were fully stated, in the Mark Lane Express of the 17th—is said to be severely animadverted upon, by the landed interests, especially by the payers of impropriated tithes.

EXPERIMENTS, &c., IN THE USE OF CRUSHED BONES AS MANURE.—In the experiments hitherto made, light dry soils are most benefited by bone manure, such as dry sands, lime-stone, chalk, light loams, and peat. It is true that some experiments have shewn an excellent result from their application to even wet heavy soils, but this happened chiefly in the dry seasons of 1826 and 7:—those who theoretically recommend crushed bones for such soils, because they will render them more friable, forget the small quantity in which they are employed. A farmer, however, near Nantwich, relates that on a clay loam, scarcely twelve inches deep, on a sub-soil of grey sand, mixed with clay, he finds that bone manure causes a good herbage of white clover and trefoil to grow where only some grass grew before. From the result of the enquiries of the Doncaster Agricultural Association, it appeared to be the opinion of those who had employed crushed bones—that they are superior to the best stable manure.

In respect to the quality of the Corn, as to 5  
 ..... quantity ..... 5 to 4  
 ..... durability of effect ..... 3 to 2

They have been long used for turnips, to a very great extent, on the light sands of the wolds in Lincolnshire, the farmers of that great agricultural county have no doubt of their value. General directions, and some remarks on the mode and effect of applying bone manure, in our next.

FERTILITY OF THE LAND IN THE MOUNTAINS OF GLAMORGANSHIRE.—A few years ago, a large piece of ground on the side of a bleak mountain, whose unpromising declivity exactly faces the north, was reclaimed and cultivated by J. B. Bruce, Esq. It may be observed that the sun does not shine at all upon it for three months in the year; nevertheless, it produced last year a beautiful crop of wheat, and this year, such an extraordinary quantity of fine oats, that the most experienced among the reapers declared they never saw such abundance before. It will scarcely be credited, but it is no less true, that upon one straw which grew upon it 280 oat grains were produced! How pleasant it is to observe industrious perseverance so amply rewarded. It may be added, that on this piece of land, a labourer, whilst engaged in removing an old wall, once found about 300 pieces of silver coin, supposed to have been hid in the time of Cromwell's usurpation, from whence the field had not been unaptly denominated "Maes-yr-Arian," or the Silver Field.—*Glamorgan Guardian.*

## AGRICULTURAL INTELLIGENCE, FAIRS, &c.

**SHERBORNE PACK FAIR** was very fully attended, and produced the greatest number of sheep known for many years, there being little short of 14,000 penned, which, in consequence of the extreme shortness of keep, experienced a very dull sale, and nearly one half returned unsold. Prices were as follow:—Down lambs, from 14s to 24s per head; horned lambs, from 12s to 16s per head; store wethers, from 22s to 32s; ewes, from 24s to 34s; mutton, 5d to 6d per lb. Fleshy wethers were the only sheep inquired after; very poor ones being a complete drug. The bullock fair was rather short, and very little good beef was produced; prices ranged from 6s to 9s per score. Poor oxen were not numerous, but the supply was greater than the demand, and none but those in very high condition could find customers, but such were in request. Very few of any other description could be converted into money. The horse fair produced a great number of inferior horses, which it was impossible to sell. There was a considerable number of colts of the cart kind, from one to two-years-old, and although offered at greatly reduced prices very few changed hands; in fact, from the extreme scarcity of winter keep, everybody seems disposed to reduce their establishments, and the fair may be considered as among the dullest known for many years. Wool was also a very dull sale, and to effect a demand, lower prices must be submitted to.

**COLCHESTER FAIR.**—There was a large and excellent supply of beasts, and from the fineness of the day they appeared to the best advantage, which was not lost sight of by the sellers, who asked very high prices, which in some instances for the first qualities were complied with; but towards the latter part of the day the buyers became a little more particular, the sellers gave way, and considerable sales were effected at prices quite equal to those of last year. The supply of sheep was ample, and the trade was full as brisk as was expected, and a very considerable number changed hands at rather higher prices. The business in the horse fair was tolerably brisk considering the quality; there were no really good horses exhibited. There were a few cart colts tolerably good, but generally the quality was inferior.

**AT ST. IVES (CAMBRIDGE) FAIR** the stock market was more largely supplied than for years; it were upwards of 2,020 fat and lean, long and short-horned, beasts, and about 3,000 store sheep, with a good supply of pigs. The cheese fair was full, and all sorts went off at high prices—two-meal, 5s to 6s; new milk, 7s to 8s; and double Cottenham, at 10s per stone. Onions, at 1s 9d to 3s per bushel. A large supply of two-year-old colts and other horses, nearly all of which sold at good prices.

**AT DEVIZES GREEN FAIR** the number of sheep penned far exceeded that at any former fair. Sales very dull, at a reduction in price, on some descriptions, of from 1s to 3s per head.

**MANFIELD FAIR** was well attended, particularly in the afternoon, the weather being fine. The quantity of cheese pitched for sale was much less than recollected in former years, and before night was all sold off—blend milk fetched from 51s to 60s; new milk, 65s to 68s; a few good dairies, 69s to 72s. Good onions averaged 1s 3d per peck. The show of cattle was good, and dealers inclined to sell on lower terms, in consequence of the scarcity of grass, and the expected high price of fodder the ensuing winter. Useful hack horses for immediate work, sold well. Half grown pigs for feeding, sold on better terms than at some of the late neighbouring fairs.

**BLYTHER FAIR.**—There was a very indifferent show of horses, and few were sold. The supply of fat beasts was only small, and fetched fair prices. Of lean cattle there was also an indifferent show, and few purchases were effected. The supply of sheep was very extensive, and obtained a fair market price.

**HULL FAIR.**—The show of foals at this fair was

large; good ones very scarce, and fetched high prices. A hunting foal, the property of Mr. Windas, of Beverley, was sold at 28l; a coaching foal, the property of Mr. F. Monkman, of the neighbourhood of Hull, was sold for 26l; the next that were any way superior, were sold from 20l to 25l each. Inferior bad to dispose of.

**WARWICK CATTLE FAIR** was abundantly supplied with sheep and cows, the beef, which was not of the first-rate quality, did not realize more than from 5½d to 6d, and mutton fetched from 5d to 6d according to quality, lamb sold from ½d to 1d per lb more.

**BEDFORD MICHAELMAS FAIR** was plentifully supplied with all sorts of cattle and sheep, which fetched good prices.

**WEYHILL FAIR.**—Monday last Weyhill Fair commenced. About nine purchasing generally began, and the sales went on briskly. "Good things" obtained good prices, and, as is usually the case, inferior things met with prices accordingly. The number of Sheep penned was nearly, if not quite equal to those on the hill last year—say from 115 to 120,000. This large flock generally looked healthy and in good condition, but the wetness of the morning rendered their appearance anything but comely; this alone is in favour of the purchaser. The prices may be quoted as under:—Down Ewes, from 20s to 30s; some choice lots, 32s. Down Lambs, from 18s to 24s; some choice lots, 30s. Two-tooth Wethers, from 20s to 28s; Four tooth, from 28s to 40s. Dorset Ewes, from 30s to 35s. Somerset Ewes, from 35s to 40s. Nearly the whole were sold by the evening.—In the Horse Fair, owing to the disease which has of late so much prevailed amongst coach horses, the demand for harness-horses is very great. Cart-horses, and particularly two-year-old cart colts, are purchased freely for the London brewer and coal-merchant, Welsh colts, forest ponies, and indeed all kinds of useful hacks. from 10l to 25l in price, are in great numbers.

**IDLE CATTLE FAIR.**—The show of Horned Cattle was pretty good. Fresh Milch Cows were in demand and fetched high prices. The show of Horses was only moderate, and consisted principally of draft and backs of a second quality; good hacks were inquired after, and prices in general run high.

**EARLSTOUN FAIR.**—There was a full market of cattle for turnips and the straw-yard, but few fat cattle. Good beasts of every description met with a ready sale, at prices nearly similar to the midsummer market, and rather lower than Jedburgh fair. A great many cattle of inferior description remained unsold. Fat from 5s to 5s 9d per stone. In the horse market a considerable number of horses were shown, though of an inferior description, which were selling at various prices.

**BAKEWELL FAIR.**—The supply of cattle was small. Beef varied from 5s 9d to 6s per stone, and Mutton fetched 5s per stone. A few carts of good cheese sold at 63s, but the average was from 57s to 60s.

**GROSMONT FAIR** was plentifully supplied with stock of every description; among which were some particularly fine Herefordshire steers, and fat sheep, which met with purchasers at prices satisfactory to the sellers. Pigs also were in request, and sold at good prices; but stores, both of cattle and sheep, were driven home unsold from the same cause which has created a dullness at other fairs, namely, the general scarcity of keep.

**SHEEPWASH FAIR** was well supplied with cattle; the bullocks were of the fine North Devon breed, in high order, and a great part of them met ready sale; cows and calves were much in request. There were many hundred sheep penned, and the greatest part sold and fetched good prices; ewes and those fit for the butcher, met the quickest sale. Horses were but few and very little business done. The day was very fine, and the pleasure fair was well attended.

**GLOUCESTER MONTHLY MARKET.**—There

was a large supply both of Beef and Mutton; the prime Beef scarcely realized 6d per lb, and old inferior animals, 4½d to 5d; prime wether Sheep sold at 6d, inferior and Ewes, at 5d to 5½ per lb. The trade was altogether flat, and great numbers were driven home unsold.

The Fair at Mitchell was the largest ever remembered at that place. The show of farm stock of every description was exceedingly abundant, purchasers were in plenty, and much business was done. Between 3 and 4,000 sheep were offered, and averaged 5½d per lb. Beef averaged 45s per cwt.

**SALE OF THE SHOW STOCK.**—The sale of portions of the stock exhibited on Friday took place next day at the Depot. Prime cattle, whose chief recommendation was their readiness for the butcher, brought good prices, but the lean and breeding stock did not obtain generally the prices anticipated, and much left the ground unsold. Two very heavy four-year-old oxen of the Fife breed, raised by Lord Loughborough, brought 90l; Mr. Maule's pair of the original Scotch breed, also four-year-olds, brought 48l 10s: two six year-olds, West Highlanders, bred by Mr. Donald Stewart, Glenlyon, sold one for 38l, and the other 29l; a three-year-old heifer, a cross of the Ayrshire, reared by Messrs. Ritchie of the Rhyn, brought 30l. There was none of the Horses sold; and of the Bulls offered, we could learn of only one, a three-year-old, which fetched 25l. For the Swine there was much brisker demand; one two-year-old, fattened at Lynedoch, brought 8l 5s; three from Scone sold respectively at 4l 11s, 4l 6s, and 4l 5s, the first was the prize sow, nine months old, and weighed when slaughtered, sinking offal, 26 stone imperial.—*Perth Courier.*

**EXTENSIVE SALE OF STOCK.**—Pursuant to advertisement, published in the two last numbers of this paper, an extensive sale of cattle and sheep took place on Wednesday last, at Cassington, in the parish of Kirk-michael. The stock belonged to those spirited farmers and dealers, Messrs. Duncan and Cowan, and its condition was highly creditable to them, comprising as it did, a proportion of the thorough-bred Teeswater stock of the late Earl of Cassilis, which was well-known, not only to our local farmers and dealers, but to others resident in distant parts of the kingdom. In the hands of Duncan and Cowan, the stock had suffered no deterioration, but, on the contrary, appeared to have been improved by their skilful management, and the consequence was, that the biddings went on with a degree of spirit rarely witnessed, and seldom if ever exceeded in Scotland. The attendance of farmers and dealers was numerous and respectable, embracing many of the best judges of bestial in our county. The fleshers purchased freely and largely of the fat stock, which was reckoned very fine, and which, it is probable, will adorn their respective stands before Yull. The farmers picked up the approved breeding stock with avidity, and high prices were given for many of the lots; we subjoin a note or two of them. Mr. McClymont, Balsaggart, gave 3l 7s for a Leicester tup hog; Mr. Wright, Woodlands, Girvan, paid 4l 4s, and Mr. Girdwood, Greenfield, gave about 3l for animals of the same breed, and the Leicester ewe hogs averaged 2l 2s each; a two-year-old pure Teeswater quey was bought by Mr. Wright, Woodlands, at 9l 16s; Mr. Arbuckle, Ayr, paid 4l 4s for an Ayrshire calf; and a small Highland cow was bought by Mr. J. Rodger, Ayr, at 9l 14s; but the most extraordinary price was that paid for a black Galloway calf then on the cow—this fine animal fetched the long price of 5l 6s, was bought by Mr. Guthrie, flesher, Irvine, and the mother of the calf brought 5l 10s, being only 4s more than her offspring. We know not whether the breeding-purchasers were stimulated to give these prices in consequence of the emulation created by the Ayrshire Agricultural Association, but certainly they may be taken as indications of an earnest desire to improve the stock of the county. The total sales amounted to within a perfect trille of one thousand pounds sterling, and so extensive was the stock on hand, that night approached before a large portion of it could be put up; and the sale of the re-

mainder, consisting of breeding mares and foals, cart and coaching horses, colts and fillies, &c. was adjourned.—*Ayr Observer.*

A very important sale of stock took place at Mr. Denton's, of Haraby, adjoining Carlisle, on Thursday, Oct. 13. The excellence of the stock has long been so noted, that strangers came from a considerable distance to make purchases. Mr. Wetherell, the auctioneer, acquitted himself in a manner which gained for him the approbation of every one present. The principal purchaser was a gentleman from Ireland, deputed by the Earl of Courtoun. We select a few of the principal purchases:—

**BULLS.**

Priam—five years old, by Shorthorns, dam by Hellem, by Norman Willy; 125 guineas.

Tom—red, four months old, by Priam; 15 gs.

Jerry—red, two months old, by Priam, 10 gs.

Logic—fleck'd, eight months old, by Pretender; 9 gs.

Hero—red, one year old, by a son of Carleton; 6 gs.

**COWS.**

Dione—red, four years old, by Monarch; 69 gs.

Netherby—roan, four years old, by Monarch; 55 gs.

Io—roan, four years old, by Sir Thomas; 43 gs.

Bianca—roan, four years old, by Bloxham; 43 gs.

Clio—roan, four years old, by Sir Thomas; 36 gs.

Duchess—roan, three years old, by Mr. Crofton's Catterick; 31 gs.

Sarah—roan, six years old, by Forect; 28 gs.

Laura—roan, four years old, by Young Rockingham; 25 gs.

\* \* \* Duchess was bulled by Maximus; and all the others were bulled by Priam.

**TWO-YEAR-OLD HEIFERS.**

Cora—roan, by Carlton, bulled by Priam; 70 gs.

Emma—roan, bulled by Priam; 35 gs.

**ONE-YEAR-OLD HEIFER.**

Daisy—red and white, by Gainford; 35 gs

**HEIFER CALVES.**

Ceres—red, by Priam; 19 gs.

Sabina—roan, by Pretender; 13 gs.

**THE URY SALE.**—For ten years past, there has been at Ury an annual sale of pure short-horn bull calves. Until last year, prices ranged for each from 16l to 20l; that year, some were sold at 45l, and all at a high price, leaving many competitors unprovided and disappointed. Notwithstanding of the lamentable state of the crops, and the continued rains, the Captain's sale at Ury, on the 14th instant, went off in a manner which must have been most satisfactory to himself, as it was the subject of astonishment to the lookers-on. The bull calves for sale were limited to ten. One was knocked out at 43l, another at 67l, a third at 70l, and the remainder at prices varying from 20l to 40l. The average price of the whole was 37l 10s per head; and, such was the demand, that, in addition to those advertised, the owner was induced to part with four, only a few weeks old, and not intended for sale.

**SHEEP SALE AT PENGILLYEY'S ALPHINGTON.**—On Wednesday last a considerable assemblage of gentlemen connected with Agriculture, and desirous of improving their breeds of sheep, took place at the residence of Mr. Samuel Drew, Pengillye's, Alphington, Mr. Thomas Hussey offering for sale 100 store ewes from Mr. Drew's prime flock. These consisted of 60 two-teeth, and 40 full-mouthed ewes. They were put up in lots of five each, and the competition was lively; indeed it was an excellent and quick sale, the whole being disposed of at an average of 6d per lb.—*Exeter Flying Post.*

A correspondent of the *Hercford Journal* says he has successfully employed the following mixture for the last sixteen years to provide against smutty wheat:—"Two ounces of blue vitriol to a gallon of water, or a pound to eight gallons, and so on according to the quantity of wheat to be sown, and the size of the tub or vessel it is steeped in. The vitriol should be dissolved in a few gallons of hot water, and what more is wanted to make up the quantity may be added cold. The wheat to be steeped in a kipe, and limed in the usual way the night before sowing."

**FALKIRK OCTOBER TRYST.**—The last of the three trysts for the year, commenced with sheep, on Monday the 10th inst. The number on the ground was estimated, by competent judges, to be not less than 70,000, a much greater number than has been brought forward for many years. The day was most unfavourable, and rained incessantly.—The market was evidently over-stocked. Mr. Paterson, from Sutherlandshire, sold his three-year-old white-faced wethers and ewes, 1,000 in each lot; the wethers brought 27s, the ewes 19s. These were considered to be the best sheep in the market, and were purchased by a dealer from Dumfries. The best lot of black-faced wethers brought 24s. Current prices for Cheviot wethers, 21s to 25s; current prices for black-faced wethers, 14s to 21s. Cheviot ewes, top price, 19s; current, 15s to 18s. Black-faced ewes, top price, 14s 6d; current, 7s to 12s. In the evening a very considerable number remained unsold, and on the Tuesday the greater part of these were disposed of, but at prices a shade lower.—The result of the sheep market, compared to the last September tryst, was a fall of 2s to 3s a-head, but compared to the corresponding October tryst of last year, 1s a-head higher on the average. Yesterday the 11th inst., the cattle market commenced. The number on the ground was at least 35,000, and considered to be a very full market. The weather fortunately cleared up, and the day continued fine. The market presented a much more animated appearance betwixt buyers and sellers, than in the sheep market on Monday. Fat cattle were scarce, consequently in demand, and sold readily. Good half-fat heavy cattle, four years' old, brought 14s as the top price; a lot of forty good beasts, 12/ 15s. Three-year-olds, in good in condition, 8/ to 11.—Two-year-old Highland stots, as usual, in good demand, and selling from 7/ to 10/; inferior sorts, 4/ to 6/. The result of the cattle market was, upon the whole, favorable. All the best cattle were sold, and realized much about the same prices as at last September tryst, and fully equal to the October tryst of last year. Of inferior beasts on lean stock of all descriptions, the holders had to submit to extreme low prices, and next to unsaleable, from the apparent scarcity and dearth of winter keep. A great show of horses, sales dull, and prices low.

**WEST SUFFOLK AGRICULTURAL ASSOCIATION.**—The fourth annual Autumnal show of the above association was held on Friday se'night. The show was not so large as last year. The company was of the first respectability, but not quite so numerous as we have seen at preceding exhibitions. The show of sheep and cart mares was very superior. Some Devons belonging to the Duke of Norfolk, which obtained the prize, attracted much notice. The Southdown tups of Mr. Lugar, of Hengrave, which gained the prizes, were particularly admired for their symmetry and quality of wool. Two extraordinary merino sheep, belonging to Lord Western, were exhibited as extra stock. They were not shorn till they were three years old, when 27lbs of wool was clipped from each sheep. The locks of wool were 14 inches long. Three Merino ram lambs belonging to the same noble lord, were also exhibited. A remarkably handsome Durham bull, the property of the Rev. Daniel Gwilt, of Icklingham, excited the admiration of all present. There was an excellent variety of other stock, which we have not space to particularize. A fact respecting a cart mare belonging to Col. Rushbrooke, M.P., which was shown for the prize, is deserving of particular notice. The mare had a lock-jaw, of which she was completely cured by pouring cold water from a water-pot along her back, as recommended by an eminent veterinary surgeon. The general impression, we believe, is, that horses with locked jaws are mostly incurable. This simple remedy is deserving of trial.

**ROXWELL PLOUGHING MATCH.**—This match took place on Wednesday se'night, in a clover ley, near Screens, belonging to T. W. Bramston, Esq., M.P., in the occupation of Mr. Thomas Everard, called Rainbow Field. The weather proving auspicious induced the attendance of Mr. and Mrs. Bramston and their friends, including Mr. and Mrs. Selwin, John F. For-

tescue, Esq. — Tower, jun. Esq., the Hon. and Rev. Bond Grosvenor, Rev. J. F. G. Fortescue, and many other of the neighbouring clergy, gentry, and practical farmers, who expressed their approval of the arrangements of the day. The scene presenting 16 ploughmen with their horses and ploughs in one field, all actively contending for the prizes, was truly gratifying to all who consider that upon the success of agriculture all other interests in a great measure depend. The land was in excellent condition, and the ploughing, which was good, exceeded many matches which have recently taken place. That of Lines, the winner of the first prize, was considered to be very superior; as was also that of James Little, the winner of the second prize. Mr. James Lucking and Mr. George Darby were chosen Judges, and the esteemed member for South Essex (who was actively engaged throughout the day), with his usual kind expression of feeling delivered each of the prizes as awarded, accompanied with an appropriate address and comment upon the result of these trials of skill. The active exertions of Messrs. J. Joslin and Flowerday tended greatly to promote the regularity and gratification of the day. We trust that this match may prove an example to the neighbouring parishes.

### HOP INTELLIGENCE.

**BORO', Oct. 24.**—During last week we experienced less inquiry for Hops; prices have given way a trifle; ordinary sorts may be considered from 4s to 6s per cwt lower; fine in demand at full prices. The estimated duty still remains at 175m.

#### PRESENT PRICES.

**WEYHILL HOP FAIR.**—(From our own Correspondent.)—On Monday and Tuesday Weyhill presented a most interesting appearance from the number of very fine teams collected in the Farnham and country roads, as well as from the liberal freight of hops in process of removal to the respective booths of the planters. The quantity of hops pitched in the country row may be stated at about 5,250 pockets, in the Farnham row at about 3,100. The quality is universally allowed never to have been equalled. The opening price of Farnham's ranged from 10/ to 11/, of country's from 8/ to 9/. A few fine growths were purchased the first day at nearly those rates, and one lot of fine country's realized 9/, which may be quoted as the highest price obtained. The second day ruled very dull, and growers gave way in price from 10s. to 11. per cwt., and even at such reductions very little business was transacted. The following day opened better, and a large quantity of hops changed hands at from 7/ 7s. to 8/ 8s. From 2,000 to 3,000 pockets were taken by London houses, which gave a firm tone to the market, and made the west country dealers commence in real earnest to supply themselves with an article so excellent in quality, and so moderate in price, as compared with the value which should obtain from an estimated duty of 170,000/. We were certainly surprised at the difference of judgment between some of the planters, and we must give great credit to Mr. James Messenger for his very superior tact as a salesman in having realized 9/ for Sir Thomas Millar's growth, while Mr. Cobden, of Binsted, tamely submitted to so low a price as 7/ for a hop fully equal in quality. The hops which had been manured by Lance's Animalized Carbon were observed to be superior in quality to those which had been cultivated in the usual way.

## REVIEW OF THE CORN TRADE

DURING THE MONTH OF OCTOBER.

The weather during the past month has been marked by those vicissitudes which characterise the climate of the British Isles. In the early part of October rain and cold prevailed, preventing the farmers from making any progress in securing the remainder of the crops in the more Southern divisions of the kingdom, and in the Northern not only seriously impeding agricultural operations, but preventing the unripe grain from arriving at maturity; in the middle of the month the rain partially abated, and the temperature became more genial, the farmers exerted the utmost endeavours, during the intervals of fine weather, to cart their grain, and consequently the condition is much affected, and requires kiln-drying or drying cold winds, to render it marketable; and where oats have been standing uncut, the dampness of the atmosphere has checked any rapid progress towards maturity. As regards the crop of wheat in those counties from whence the metropolis more particularly draws its supply, it may be stated, that though there has been a diminution in the amount of land sown with wheat, yet the decrease is not to the extent generally calculated upon, and less than in other counties. The straw is decidedly short in bulk, but the sheaves in thrashing have yielded a larger return than was anticipated, which is attributed to the fact, that at that critical period of the season, the blossoming of the plant, the weather which prevailed being warm and genial, with the intensity of the sun's rays partially clouded, caused the juices supplied to each grain, to set full and healthy, and hence few seasons have been experienced in which there was less deficiency of corn in the ears. The produce, though much below the yield of the years 1834 and 1835, may, in these districts, be ranked at a moderate common average crop, the weight being nearly equal to that of last season, and in some instances the quality superior, though much more infected with smut. The condition varies according to locality and mode of harvesting, many parcels having been prematurely hurried from the field, are unfit for millers' purposes, and will be scarcely marketable until the Spring; and though a considerable breadth was secured before the wet, yet the condition on the aggregate is much inferior to the crop of 1835. The markets up to the present time have been scantily supplied with the finer qualities of new wheat, as farmers, owing to the precarious state of the weather in the later portions of the kingdom, particularly in Scotland and Ireland, and having obtained remunerating prices for all other kinds of agricultural produce, have little necessity, and therefore no inclination to bring forward their better samples at the present uncertain range of prices; more especially as the currencies in Mark-Lane have been latterly depressed, and a pressure generally existing on the trade, which has been in great measure produced by the proceedings of the Bank Directors raising the amount of interest on discount, and paralyzing for the moment all money operations. Parties interested in grain have, in consequence, become extremely cautious in their purchases and speculations, preferring rather to await

the result of the money market. The supplies, therefore, have been dependent on a consumption confined to its narrowest limits, millers only buying to the extent of their immediate wants, and the market unrelieved by purchases from any other channel, has been languid. The bonded trade has been also similarly influenced; but, as money becomes more readily attainable, and which is now beginning to be the case, and investments are made in the finer descriptions of corn, old qualities, as well as selected dry new samples, are likely to feel the impulse, and the range of the currencies, between the two extreme points, will be wider extended than at present; but at the same time, as far as the foreign importer is concerned, these circumstances do not hold out much encouragement to his speculations for the home consumption, as the average value of wheat is not likely to be much affected by the improvement in price of the superior qualities; the advance being checked by the low rates of the smutty and inferior descriptions.

Barley is estimated at an average in quantity, but one-third of the crop of the kingdom has suffered more or less from the wet, bad weather. Our principal barley counties were so fortunate as to secure the greater part of the crop in good condition prior to the wet weather setting in, but even in those counties we must allow a considerable deduction for waste, from the wet weather overtaking their later harvest. Of old barley there is evidently but a small quantity on hand to meet the new crop, and taking into account the immense consumption of the article, and the great deductions of malting qualities from the crop, in consequence of the unfavourable weather the last two months, it is to be expected that our extreme prices for fine malting barley are likely to be at present maintained.

Oats are a rather deficient crop in quantity in England, and a great portion harvested in poor condition, but much weathered. In the South of Ireland, and along the East Coast of that country, oats have been harvested in good order, and are a great crop, both in yield and in breadth of land sown; but on the North West side of Ireland, and on the mountain lands, where the cultivation of the grain is extensive, also in Scotland, and in the late districts of England, a great part of the crop was stated, only a few days back, to be still in the fields, and a great deal green and uncut. Indeed the reports from Scotland and Ireland continue very unfavourable from the more northern portions of each kingdom. Oats in many parts of the Highlands are still green, and as frost and even snow has been already experienced, all hope of the crop arriving at full maturity seems past; and when it is recollected that a failure in this article affects the inhabitants of these mountainous districts in the same way as a failure in the wheat crops would England,—the privations of the poorer classes in their "Bannocks and Brose" must be lamentably extensive.

During the past month many causes have operated to enhance the value of wheat throughout the kingdom, and though the currencies have advanced less

rapidly than they would have done, had it not been for the pressure on the money market, which has effectually checked any extensive speculations on investment in corn. Prices have however risen about 4s to 5s at all the leading markets in England, Scotland, and Ireland; in Mark Lane white wheat must be noted 7s per qr. higher, and red 5s; but the improvement has been experienced to this amount only on the fine fresh descriptions of old wheat and prime dry new qualities; ordinary sorts not having advanced more than 2s, and in the quotations of inferior and smutty parcels, little alteration has taken place. The farmers have been firm in requiring higher rates, and having kept the markets shortly supplied, they have been enabled to realize their demands; as the remunerating rates they have obtained for Summer grain, have not rendered them anxious to dispose of their wheats unless at enhanced currencies. The London and home country markets are likely also to be affected by the fact of the receipt of orders from Scotland, thus early in the season, principally for fine dry new qualities, corroborating beyond doubt, the inferior character of the Scotch crop. In Ireland, the condition of the new wheats has rendered holders unwilling to quit their stocks unless at advanced rates.

Owing to the advanced prices of wheat and flour in the United States, bonded wheat has remained firm, and the finer qualities of red have improved in value; but as the shipments during October have been principally on owners' account, there has not been much actual business transacting on the market. The exports have comprised about 7,000 qrs to Baltimore, 3,300 qrs to New York, 500 qrs to Boston, and a few hundred to Philadelphia; 1,300 qrs to Sydney, and a few hundred to Launceston, Halifax, and Madeira.

The progressive improvement in wheat has enabled the town millers to realize the top quotations for their flour, and had it not been for the large supply of flour received coastways towards the close of the month, they would in all probability, have succeeded in advancing the prices to 50s. Ship flour, owing to short supplies, and the bakers having only a limited stock has advanced 2s to 3s per sack since the end of September. Flour in Bond, has met a brisk demand for export, principally to the West Indies, where the increased value of the article is exhibiting the influence, which the diminutions in the receipts from the United States, is already effecting; prices are 2s to 3s per barrel higher, Hamburg and Danzig qualities being worth 25s to 27s, and supplies on arrival meet ready purchasers; at Jamaica it will be seen by the advices, the quotations are ranging very high; about 17,000 to 18,000 cwt. have been shipped to Mauritius and West Indies, exclusive of 2,300 cwt. to Pernambuco, and a few hundred cwt. to New South Wales, Halifax, &c.

The alteration in the duties consist of an advance of 1s per qr on wheat, making the duty 39s 8d, but a deduction of 3s on barley, 1s 6d on rye, 1s 6d on beans, and 2s 9d on peas, the duty on oats remaining unaltered.

The supplies of barley at the beginning of the past month having come sparingly to hand, and great disparity existing in the quality, some samples being much discoloured, others indicating symptoms of being mow-burnt and some out of condition, rendered the demand active on the part of maltsters for the finer descriptions of Chevalier and Norfolk and Suffolk samples, which obtained in many instances an advance of 1s to 2s per qr, being noted at 44s to 45s for extra parcels; the arrival of vessels having however been detained by boisterous and adverse

winds, which coming to hand towards the close of the month, the accumulated supply checked any farther advance, and reduced the general currencies to 43s, though selected fine Chevalier from the ale-brewers would still have brought rather more money. The distillers being out of stock have been obliged to submit to an advance of 1s per qr, paying 37s for good stout parcels, and in some cases even 38s; grinding has participated in the improvement, and good qualities are worth 35s, and even 36s, but purchasers at these rates are confining their operations, and the aspect of the trade is much less animated. Few of the numerous orders transmitted abroad are being executed from want of quality and condition in the new crops in Mecklenburg and Denmark; the Saale and Magdeburg samples which arrive at Hamburg are likely to obtain therefore high rates, as they are mostly of kindly quality, and much has been secured before the wet weather set in; the quantity which can reach England before the winter sets in, will be very limited, and spring shipments will barely arrive before the termination of the malting season; Saale and Bohemian barley is being shipped at Hamburg at 25s to 25s 6d per qr free on board, and Silesian at Stettin at 23s to 24s.

The unfavourable accounts of the oat crop from Scotland and Ireland, and north of England, and complaints being also made from Lincolnshire as to quality and condition, the supplies at the same time proving limited with a high range of currency in Scotland and Ireland, have caused the prices in the London market to continue to advance, and are noted 1s 6d to 2s per qr. higher than on the close of last month, and dealers and consumers having been bare of stock, they have been compelled to accede to the enhanced terms of the factors. As however, there are large supplies on their passage from the Sister Isle, which have been detained by contrary winds, the quotations are not likely further to advance: feed oats generally are noted at 25s to 27s; fine, 29s to 29s 6d; extra, 30s to 33s. There are few oats offering free on board from Ireland by the shippers, as the rates are too high to induce purchasers to come forward, the latest quotations were Limerick for shipment in October, November, and December 12s 9d to 13s per barrel; do. in January, February, and March 15s to 13s 6d; Derry and Ballina 13s. Black Youghal, Cork or Waterford 13s to 13s 6d; Galway, 12s to 12s 6d. Oats in Bond have been in demand at 15s to 16s, fine, 17s per qr, and Brew at 20s to 22s for shipment to the West Indies, to which destination a few thousand quarters have been shipped.

The demand has been brisk for old beans, and dry new samples, and the article being extremely scarce must be noted 2s to 4s per qr. dearer, and firm at the improvement; new beans came to hand extremely soft, and out of condition, and are dull at former rates.

White boiling peas have continued in short supply, and meeting a steady demand, must be quoted 2s to 3s dearer; grey and maple are also worth 2s per qr. more money.

During the month of October the following quantities of Grain and Flour have arrived in the Port of London.

In Canada prices of wheat and flour are on the advance, owing to the high range both articles are maintaining in the United States, and the large purchases made in Upper Canada by the American millers. Flour has advanced to 42s 6d per barrel, the last quotations received having been only 32s 6d for fine qualities. Wheat has been selling at from 6s 3d for Hamburg red, up to 7s per 60lbs. for Upper Canada qualities, and several contracts had been made on delivery at 6s 6d, 7s per 60lbs being now the current rates. The reports from the agricultural districts have continued favourable both in Upper and Lower Canada; and in the latter division of the colony the injury sustained by the wheat from fly and maggot is much less than had been anticipated. From Halifax and New Brunswick the weather is represented as favourable for agricultural operations, and the crops promise an average return.

At Sydney, New South Wales, the markets were being better supplied, and wheat was dull at 10s to 11s 6d per bushel. Flour was declining, and firsts were noted at 28s per 100lbs. At Launceston, Van Diemen's Land, owing to the reported decline at Sydney, Wheat had fallen to 7s 6d and 8s per bushel, but had again rallied, and was worth 9s 6d to 10s 6d per bushel.

The prices of flour in the West Indies are ranging at high rates from the falling off in the receipts from America. At Jamaica on the 23rd August good German flour had obtained 83s 4d currency per barrel, and some fine American qualities in small parcels realized as much as 133s 4d. Indian corn meal 54s 2d per barrel. No biscuits in importers' hands, and Indian corn very scarce. The supplies of flour during the present year, ending the 22d August, were 16,526 barrels and 702 half-ditto less than the corresponding period of 1835.

The continuance of wet unfavourable weather in France has given rise to apprehensions for the sowing of wheat, especially on the stiff clayey lands, and holders of old wheat and fine new qualities evince little disposition to sell unless at higher prices, more particularly as the crops have proved so deficient in the central and southern departments. Flour meets ready sale for all descriptions at fully the improved currencies. At Paris the arrivals of wheat are very limited, and the southern and northern districts from whence supplies have usually reached the metropolis are having their surplus corn taken off in a different direction, leaving little more than enough for the actual consumption. Rye is also scarce, and held at 19s to 20s; the plant is reported unfavourably, and the demand which is experienced from Holland, Belgium, and the Baltic, for America, is adding its influence on the prices in France. Oats at Paris are steady, but not dearer, and the demand at different points is attributed more to the inferior quality of the article in Normandy this season, than failure in quantity. At Nantes a demand was being again experienced for shipment to Bordeaux and the southern ports. At Bordeaux a fair extent of business had been transacted in wheat, for immediate as well as future delivery, at from 45s to 49s, and the trade

firmer than the previous week for all the finer qualities. At Marseille, however, the market was dull both for Home and foreign growth of wheat; Loire quality was worth 48s to 50s; Barletta free 56s to 57s. At Rouen flour was advancing in price, and shipments continuing to the southern ports. At Dunkirk a gradual improvement was being experienced in wheat; white was worth 41s 6d to 45s 9d, and red 42s 6d to 43s 8d per qr.

At Odessa the new wheats had appeared at market, fine qualities were eagerly sought after, and being rather scarce obtained from 18s to 22s 9d, according to sample.

At St. Petersburg some sales of rye had been effected for America at 18s 6d, and there were several purchases for spring delivery of the article at 15s 11d. Kubanka wheat was noted at 32s 6d to 33s 5d.

At Riga rye had been contracted for at 18s 2d, deliverable in May. A small parcel of new linseed had appeared at market, and the quality proved very satisfactory, but the quantity was too small to fix any price, and generally the offers for delivery from the interior were limited too high to admit of present purchases.

At Konigsberg some sensation was created on 'Change by the accounts received from the Prussian minister in the United States, and published by government, intimating, that owing to the total failure of the crops in America, our trans-atlantic brethren would require a million and a quarter qrs. of grain, which had caused an extra degree of firmness in the trade; high mixed wheat of 1834 was noted at 34s to 36s; 1835, 27s 3d to 28s 5d. New linseed was noted at 45s 3d, 48s to 50s 10d per qr.

At Danzig the demand from the last accounts had lessened and prices given way, and purchases were made at 1s to 1s 6d per qr under the currencies of the previous week. Flour, on the contrary, was much inquired after, and there was much difficulty in making contracts for Spring delivery. Wheat was quoted 32s to 37s; high mixed, 29s to 31s; mixed 27s to 29s; red, and ordinary, 25s to 26s. But a small proportion of the stocks in granary are reported as belonging to corn merchants, the main portion being held by British speculators. The freight to America 16s per qr, and 5 per cent.

At Stettin the weather has been rainy, cold, and ungenial, and in fact throughout the lower districts of the Baltic, the same reports are made. Barley was scarce and held at improved rates at the above port, owing to the damage the new grain has sustained, and shipments could not be made under 20s 6d to 21s. Holders of oats for the same reasons were not inclined to sell. Wheat could be shipped at 25s to 28s.

At Rostock there is no old barley in store, and the demand must therefore be entirely met by the new crop, which will be of various qualities, in consequence of exposure to the wet. Wheat in demand at 28s, and freight to America 9s, and 5 per cent. In Holstein the rain was much impeding the harvest, and as there was a good deal of barley outstanding, the quality was likely to be deteriorated. Fine old and new wheat mixed, of 62 lbs to 63 l, was offering for shipment to America at 30s to 31s.

At Hamburg old red Marks wheat was worth 32s 6d to 33s; new 29s to 29s 6d; new Anhalt and Magdeburg 31s to 32s. Flour was in animated request for America and English account, as well as wheat, so that prices were not expected to recede until the supplies of new increased. New Saxe and Bohemian barley bright in colour had obtained 25s 6d for England, and Holstein and Mecklenburg

17s 6d to 18s; and in the Danish Islands old have obtained 17s 9d. Peas in request at 22s. Beans are outstanding and suffering from the wet. Clover seed very firm.

At New York considerable fluctuations had taken place in the prices both of wheat and flour, during the previous twelve days; Western canal flour, which had reached as high as 9 dollars 75 cents, or 43s 10d fancy brands, and 42s 9d common marks, had receded as low as 39s 4d, but again rallied and remained at 40s 6d to 42s 9d. Wheat had experienced a decline of as much as 11s per qr owing to rather an influx of arrivals, but had, at the date of the last letters, nearly regained its value; Genesee had brought 73s 4d; inferior North Carolina, 56s 6d, still prices were nearly 7s lower than the previous fortnight, which may in part be attributed to inferiority of quality, as at Philadelphia it appears millers had determined not to accede to the demands of holders for the common runs of wheat, as they had been paying much too disproportionate rates, considering the quality offering, and though prime samples have sustained little alteration, yet the ordinary descriptions have been brought nearer their relative value. Flour remained at 42s 9d, with limited demand. At Baltimore the trade was heavy; flour had not given way in price, being noted at 42s 9d, but wheat had materially declined, good new red wheat having been sold at 66s, which was considered the general currency for that description; very inferior, 47s 8d; best white fine wheat for family flour had brought 76s 8d. Reports appear in some of the morning papers, that America will require 1,200,000 qrs of wheat to make up her deficiencies; this is a vague calculation and unsubstantiated by facts; the United States have enough for their own consumption, and a little for export, but millers and merchants having been accustomed to export to the annual amount of nearly 2,000,000 barrels of flour, have been wont from year to year to enter into large contracts for future delivery, not however, to the full amount of the total exports of all the States, and they therefore now require the raw material to fulfil their speculative sales, which, however, may be set down at a considerable less gross amount than a million quarters.

**LIVERPOOL.**

WEEK ENDING OCTOBER 24.

SCOTCH WOOL.—We cannot yet quote any improvement in the inquiry for Scotch wools. The state of the money market has the present effect of completely suspending all operations. As far as we can ascertain holders are not anxious to press their stocks on the market at present.

	per stone of 24 lbs.

White do.....	32s 0d	36s 0d
Import for the week.....	268 bags.	
Previously this year.....	17551 do.	

The transactions in our wool market this week have been on a very contracted scale, and the market remains in the same inactive state as reported in our last. There have been no transactions in Cheviot or cross wool, and very little demand for English or Irish. The prices may be quoted generally as a shade lower, but in several sorts it would be difficult to effect sales even at a reduction of 1d. In foreign wools, East India only has improved in demand, but in these also the prices have suffered a slight decline.

ENGLISH WOOL.—Down ewes and wethers, 19d to 20d; Down tegs, 20d to 23d; combing fleeces, 19d to 20d; combing skin, 18d to 20d; super. skin, 19d to 20d; head skin, 17d to 19d.

IRISH WOOL.—Irish fleeces, mixed lots, 17d to 18d; Irish wethers, 16½d to 17d; Irish hogs, 18½d to 19½d; Irish combing skin, 16d to 17d; Irish short skin 14½d to 16½d per lb. Imports this week, 58 bags; ditto this year, 5,117 bags.

FOREIGN WOOL.—Russian wool, 8½d to 9½d; Odessa, fine, 2s to 3s 6d; Buenos Ayres, 4d to 5½d; Mogadore and Barbary, 4½d to 6d; washed Peruvian, 14d to 16d; unwashed ditto, 11d to 12d; Portugal R., 1s 5d to 1s 7d; ditto, low marks, 1s 0½d to 1s 2½d; German fleeces, 2s 2d to 2s 6d; ditto assorted, 2s 6d to 2s 9d; ditto lambs, 2s 6d to 3s 6d; Spanish R., 2s 6d to 2s 9d; ditto F S, 2s 2d to 2s 4d; New South Wales, 2s 4d to 3s. Imports this week, 2,275 bags; ditto this year, 28,994 bags.

THE BONE MARKET.

LONDON, Oct. 22.

The demand from the Crushers for Rough Bones continues still brisk, the supply on hand very scarce; 5s per chaldron, free on board, was paid for the last cargo. In Hull, Bones have risen still further, and parcels are eagerly bought up from 98s to 100s per ton.

In the principal ports on the continent, Bones continue to be very scarce, with a brisk demand from this country and Scotland. The prices last paid was equal to 90s per ton, free on board.

The additional export duty levied by the Austrian Government is quite prohibitory, and it is expected that in Prussia the exportation will be prohibited altogether very soon.

BONES.

Since our last there have passed the SOUND or ELSINORE, the GREAT BELT, and the HOLSTEIN CANAL, ships loaded with Bones, bound for Hull, 2; Fisherow, 1; other parts of England, 1.

TURF INTELLIGENCE.

Since we had last an opportunity of addressing our readers on this subject, the Second October Newmarket Meeting has taken place, as well as many provincial races; two of the latter are entitled to particular notice; namely, York and Holywell; the former on account of its dissatisfactory proceedings, a characteristic which, we are sorry to observe, too often distinguishes the meetings at this once celebrated Racing Establishment; the latter in regard to its high respectability, its growing importance, and the consideration in which it is held as forming the conclusion of the provincial racing season.

Last year it became our painful, but imperious, duty, to notice, in terms of unqualified reprehension, the *Budget affair* at York; at the last August Meeting at this place, The Cauld Lad unquestionably lost his race, owing to the foul jockeyship of the person who rode The Bard: on the present occasion (the York October Meeting) the race for the "Ladies' Plate," is not calculated to elevate the racing character of old Ebor in general estimation, or prevent it from sinking into that state of insignificance and contempt to which it appears hastening as fast as possible.

Having remarked that the Holywell Hunt Meeting is considered the close of the provincial racing season, it becomes necessary further to state, that some few racing events are appointed for decision at a later period, but they are of minor importance; and therefore

as Chester Meeting is regarded as the commencement of the racing campaign, Holywell Hunt Races are generally understood to form its conclusion or finish.

In one of our previous numbers we observed, that Mr. Mostyn's stud, though not remarkably extensive, was inferior to none in the kingdom in regard to the quality of the individuals of which it is composed; and the Holywell Races show that it still maintains its superior character or pre-eminent distinction. Birdlime, who defeated there doubtless General Chasse at the Liverpool Summer Meeting, and won the Trade Cup, has particularly distinguished himself on the present occasion; and a similar observation will apply to Trapball. It will be in the recollection of our readers that Queen of Trumps did not make her appearance, according to expectation for the Doncaster Cup in September last: she had been tried a short time previously, and found to be amiss: to such perfection has racing arrived in this country, that its event may be said to be weighed like gold in a balance, and therefore the most trifling deficiency incapacitates a racer from successful competition or rivalry; Mr. Mostyn consequently acted wisely in not subjecting the Cambrian Queen to the risk of tarnishing her well earned laurels by bringing her to the starting post, when she was not exactly all right. Indeed, when we found our favourite did not come out for the Doncaster Cup, we

were fearful her splendidly triumphant racing career had been cut short, aware that her fore legs were scarcely to be depended on. However, we were much pleased to find that she appeared at the meeting under consideration, and carried off the Post Sweepstakes in her usual style.

The Holywell Hunt Meeting comprises a considerable number of events, a more than usual number of which, on the present occasion, have been uncontestedly decided. But, when we take into consideration the late period of the season, and that therefore a considerable number of racers must have been put *hors du combat*, by previous exertions, such a circumstance can excite no surprise, though, at the moment, it may produce regret.

The Newmarket Second October Meeting requires no elucidation in this place. At the same time it may be remarked that, though the list of the odds for the ensuing Derby presents a formidable appearance, no great extent of business has yet been transacted on that important stake.

The running at Nottingham was of a superior description; but, unfortunately, the decision of the judge for the King's Hundred was called in question. Mundig won the first heat by half a length; the second was also given in his favour, though an eye-witness thus describes the heat systematically:—"In the second heat, Mundig led at starting, being closely followed by Goldbeater and Sylvan. Sylvan soon passed Goldbeater, and the race was between the former and Mundig; soon after they had passed the distance post, Sylvan crept past Mundig, and maintained her place by an entire head: (for we stood in a direct line with the two sight posts of the judges, and at a very short distance;) but the judge decided in favour of Mundig, to the no small astonishment of those who considered themselves competent to give an opinion of the result. We know several debts to have been actually paid on the heat, ere the parties were aware of the judge's decision, which were afterwards repaid!" As every convenience is afforded the judge for the part he has to perform, if he pronounce an incorrect decision, he does so knowingly and wilfully. The judge should take his seat with clear hands, which is impossible if he be in the habit of betting: such a circumstance gives to his orbs of vision a sinister sort of Strabism, or a degree of obliquity which is sure to lean or incline towards the interested side of his betting book. Is the Nottingham judge a betting man? Our columns will be found as open to his defence as they have been to his accusation. His conduct, as a public functionary, is a legitimate subject of animadversion through the medium of the press.

## VOLUNTARY COMMUTATION OF TITHES.

The first step to be taken with a view to effect a voluntary commutation of Tithes is by giving notice of a parochial meeting for that purpose, which notice must be signed *either* by landowners whose interest is not less than one-fourth part of the whole value of the land subject to tithes" or by "tithe-owners whose interest is not less than one-fourth of the whole value of the tithes."

It should be premised that land-owners or tithe-owners may appoint an agent, with full powers to act and vote for them. The form of the power of attorney for that purpose will be found in the 16th section of the Act. It is "under hand," not under seal. It should be attested by one witness, not the wife of the party. The original should be kept, and "a copy, authenticated by two credible witnesses, appended to every agreement executed by such agent, and sent with it to the office of the commissioners." An owner of land, being also owner of tithes and patron, may be treated and may act and vote in each separate capacity. When a land-owner, tithe-owner, patron, or any person interested, is a minor or labours under any legal disability, he may act by his legal representative; and in default of such the commissioners may name a person to represent him.

The 12th section defines who shall be comprehended under the terms "land-owner" and "tithe-owners," see also note (k) to 12th sect. of the Act, *Farmer's Magazine* for September. The principal difficulty in determining ownership will be in respect to "joint-owners." These suggestions being intended for the use of unprofessional readers, any statement of the law upon the subject of "joint-ownership" would be misplaced. Wherever such cases may arise it will be desirable to obtain professional assistance.

The value of lands or tithes possessed by persons signing the notice, as well as by those who proceed to make a parochial assessment must be ascertained by the "sum at which such lands are rated to the relief of the poor." When all the lands or Tithes are rated, no difficulty will arise but where lands are extra parochial or where there is no rate, then the value "must be estimated according to the rules by which property of the same kind is by law rateable to the relief of the poor," and here there may be some difficulty. At present property is rated in different parishes in different ways; in some cases at the full value—in some at *two-thirds* of the value—in many at *one-half* the value. These different modes of rating occasion much inconvenience, and will speedily be remedied, the Poor Law Commissioners being directed by the 6 and 7 W. 4, c. 96, s. 1, to order one uniform rating throughout the country upon the *net amount of value*, free of all charges &c. Whenever any property is not rated, and it becomes necessary for the purposes of the Tithe Act to settle the amount of rate, it must be borne in mind that such property must be assessed in the same proportion as the property already rated in the same parish or district where the tithes are to be commuted.

That is having ascertained the full amount of rate at rack rent, the value must be estimated upon *two-thirds* or *one-half*, like the land already rated as the

case may be. Land should be assessed upon the rack rent after deducting all rates, charges, and outgoings. Where land is subject to an extraordinary charge for drainage a proportionate deduction should be made on that account. And it has been said that where the land tax is redeemed it should also be deducted.

In respect to the rating of Tithes a sum of money given under an Inclosure Act in lieu of Tithes is rateable, unless specially exempted. An annual rent awarded to the rector in lieu of Tithes is rateable. Vicarial Tithes are liable to poor rate. A person who farms tithes of the parson and agrees with the tenant to receive a sum of money for the whole Tithe is rateable and not the tenant.

Where by a private Act of Parliament "lands, houses, and tenements," were liable to be assessed, the word "*tenements*" was held to include *Tithes*. The interest of the parties having been ascertained in the manner above described, notice according to the form supplied by the Tithe Commissioners (see *Farmer's Magazine* for October, pages 268—9,) properly signed, must be "affixed at least twenty-one days before such meeting on the principal outer door of the church or in some public and conspicuous place within the limits of the parish, and twice at least during such twenty-one days inserted in some newspaper generally circulated within the county in which such parish is situated." This notice is free of advertisement duty.

It will be seen, by the directions of the Tithe Commissioners sent with the forms of notices, and which will be found in pages 268 and 269 of the "*Farmer's Magazine*," that a copy of the notice must be forwarded by post to them on the day upon which it is affixed. Reference should be made to these directions, as they contain other particulars which must be attended to.

The first business of the meeting called as above directed will be to elect a chairman who must be chosen by the majority of the land-owners and tithe-owners there present.

It may properly be noticed here that a Commissioner or Assistant-Commissioner may attend at any meeting, take part in the discussion, and aid by his advice, but not interfere further. A proper book for entering minutes of the proceedings should be procured before the meeting takes place, and correct minutes should be kept.

The first duty of the chairman is to "ascertain the interest of the land-owners and tithe-owners then present in person or by their agents," which must be done in the manner above directed. Upon the amount of interest of the parties present will depend the question, whether the meeting is empowered to make a "parochial agreement" at once, or only to make a "provisional agreement."

If upon examination it shall be found that "there are present owners whose interest is not less than

Two-thirds of the land subject to tithes,  
Two-thirds of the great tithes,  
And two-thirds of the small tithes,"

they may proceed to make and execute a parochial

agreement for the payment of a sum by way of rent-charge in lieu of tithes.

The following form of agreement, with directions, has been issued by the commissioners:—

ARTICLES OF AGREEMENT for the *Commutation of the Tithes of the parish of* \_\_\_\_\_ *in the county of* \_\_\_\_\_ *in pursuance of the Act for the Commutation of Tithes (a) in England and Wales, made and executed at a meeting duly called and holden at* \_\_\_\_\_ *in the said parish on the* \_\_\_\_\_ *day of* \_\_\_\_\_ *in the year of* \_\_\_\_\_ *Lord one thousand eight hundred and thirty* \_\_\_\_\_ *according to the provisions of the said act, by and between the several bodies politic and persons, owners of land, within the said parish, by whom (b) [or by whose agents duly authorized in that behalf] these presents are executed, and the interest of which land-owners in the lands of the said parish is not less than two-thirds of the lands therein subject to tithes, of the one part; and the reverend J. K., clerk, (c) rector of the said parish, and*

(a) The instrument must bear date on the day on which the first signature is attached thereto, (see sect. 21 of the act), and if a parochial meeting has been duly called, although the persons attending it may not have a sufficient interest to execute an agreement binding on all parties interested, the parties actually present may make a provisional agreement, which if duly executed within six months by parties having the required quantum of interest, will be binding, (see the 15th sect. of the act). When the agreement is provisional in the first instance, say, "Provisional Articles of Agreement, &c." and after the date add the words, "and since perfected." When the first signature is attached at an adjourned meeting, after the word "holden," add the words, "and adjourned from time to time, and holden by adjournment."

It is advisable that the instrument should be written on parchment.

(b) The words within brackets [ ] are only to be used when an agent or agents is or are appointed, and executes or execute the agreement: when such is the case, the power or powers of attorney by which such agent or agents is or are appointed, must be appended to the agreement and sent with it to the commissioners, (see sect. 16 of the act). If any land-owner or tithe-owner is labouring under any of the legal disabilities mentioned in the 15th sect. of the act, and any person authorised duly acts for him in this matter, that fact must appear; say in that case after the words, "Owners of land," "Substitutes for owners of lands, according to the provisions of the said act."

(c) Where the case is not of this simple kind, but the interest in the tithes is divided amongst several bodies politic or persons, or is vested in the same person in different characters, or by different titles, bodies politic and persons who have an interest in at least two-thirds of the great tithes, and bodies politic and persons who have an interest in at least two-thirds of the small tithes, must be parties to the agreement of the second part.

For instance, if the great tithes of the parish are impropriated or appropriated, the impropriator or appropriator must be a party, and described according to the nature of his interest. Again, if any person is entitled to a *portion* of tithes within the parish, he must be described as such portionist, if he be made a party of the second part to the agreement; the necessity of his

owner of all the tithes, as well great as small, thereof, of the other part.

IT IS BY THESE PRESENTS WITNESSED, That at the said meeting it hath been and is mutually agreed upon by and between all the said parties to these presents, in manner following: that is to say, That the annual sum of (a) \_\_\_\_\_ pounds \_\_\_\_\_ shillings and \_\_\_\_\_ pence by way of rent-charge (subject to variation, as in the said act provided, and subject to the other provisions therein contained) shall be payable and paid to the said J. K., as rector of the said parish and owner of the tithes thereof, and to his successors, instead of all the tithes, as well great as small, of the lands of the said parish, subject to tithes and all (b) *modus* and compositions real and prescriptive, and customary payments payable in respect of such lands or the produce thereof; in testimony whereof, the said parties to these presents, or their respective agents thereunto duly authorized in their names and on their behalf, have to these presents subscribed and set their respective hands and seals.

being so or not will depend upon the fact, whether the agreement is or not executed by other parties having the quantum of interest in the tithes required by the act.

The same observation applies to all cases in which other bodies politic or persons than the incumbent of the living has any interest in the tithes. Of course, if the incumbent is vicar or perpetual curate, he must be so described, if he signs the agreement as a party of the second part. The interest of each tithe-owner in the tithes of the parish must distinctly appear upon the agreement.

(a) It must be observed, that by the 21st sect. of the act it is enacted, that every agreement must state in words at length the sum agreed to be paid instead of tithes and instead of all *modus* and compositions real, prescriptive and customary payments, if any, and must distinguish if there is more than one tithe-owner, the sum payable to every tithe-owner, and where the tithes of different lands in the same parish are payable to different tithe-owners, or to the same tithe-owner in different rights, the sum payable in respect of such different lands must be distinguished. *The variation of recital necessary in each varying case will, generally speaking, be quite obvious and of course; but in case of any doubt or difficulty, application should be made to the commissioners, who will send the requisite instructions.*

(b) Observe that no parochial agreement will extend to the extinguishment or discharge of any Easter offerings, mortuaries, or surplice fees, or to the tithes of fish or fishing, or to any personal tithes other than the tithes of mills, or any mineral tithes, unless by special provision, (see the 90th sect. of the act.)

If any suit be pending touching the right to any tithes, or there be any question as to the existence of any *modus*, or composition real or prescriptive, or customary payment or any claim or exemption from, or non-liability to tithes, or touching the boundary of any lands, or if any difference shall arise whereby the execution of any agreement shall be hindered, the same may be submitted to reference in the manner prescribed by the 24th section of the act. Land to the extent of 20 acres may be given to the incumbent of any benefice as part of the commutation for tithe (see the 29th and 62d sect. of the act,) and in such cases the special matter must be fully shown, as directed by the act.

(To be continued.)

A FIFE SHIRE BULL,

The property of Colonel Lindsay of Dundee, exhibited at the late meeting of the Highland Society held at Perth Oct 17, 1836

[VOL. V.

## THE PLATE.

The subject of the Plate is a Bull of the Fifeshire breed, six years and ten months old, the property of Colonel LINDSAY, of Balcarras, in Scotland; and which obtained a premium of fifteen sovereigns at the late Meeting of the Highland Society at Perth, as the "best bull," there being five others shown in competition. An Honorary Premium was also awarded to Mr. THOMSON, of Orkie, as the breeder of this bull. Much discussion has arisen regarding a resolution of the Society not to give Premiums for the direct propagation of the Fife breed, and an article upon this subject will be found in this Magazine. We also beg to refer our readers to some valuable observations upon this breed of cattle, by Mr. DICKSON, of Edinburgh, which will be found in the Fourth Volume of the Farmer's Magazine, Page 277.

### FIFESHIRE BREED OF CATTLE.

It is generally known that on 30th January, 1835, a Committee of the Highland Society reported as to the Fifeshire breed of black cattle (Highland Society's Transactions, Vol. X. p. 401), "That though very fine animals under this name are often reared by the care and skill of particular breeders, yet that in its general character the breed of Fifeshire is inferior to what the district is capable of producing." Adopting the spirit of this report, the Directors advertised no premiums for breeding stock of the Fifeshire cattle, in the very competition most nearly affecting the county, viz.—that for 1836, lately held at Perth.

In consequence of a representation made to the Directors on behalf of the Fifeshire agricultural interest, supported by a body of important evidence in favour of the breed, this mistaken and unwise exclusion was not enforced. That after the result of the recent exhibition at Perth, the original deliverance of the Society's Committee should have been reiterated, and praise exclusively bestowed upon the gentlemen producing the stock, in terms evidently meant to disparage the breed generally, has astonished a great proportion of those who inspected the stock upon that occasion. However much this eminent national institution have found it wise and expedient specially to encourage the adoption of the short-horned breed in no other case have they ceased to encourage any of the well known native breeds of the several districts in Scotland. The position now resumed by the Society, or rather by the Committee of Directors who attended at Perth, must be held to rest upon the assumption that the Fife breed is decidedly inferior, not to the short-horned breed only, but to all and each of the several breeds still receiving direct encouragement from this National Society.

The assertion that fine specimens of the Fife breed are the rare results of uncommon pains, expense, and a more than careful selection by the producers, is unfortunately in direct variance with the facts of the case. To the breeders of the short-horns this praise is supremely due, no pains, expense, nor

care in selection and improvement of the stock having been spared, and no advantage in grazing and stall-feeding having been withheld. Whatever pains may have been taken by the Fife farmers in rearing and feeding their native breed, they are as yet laggards in this matter, compared with the breeders of the short-horns, insomuch that the true merits of the Fife breed will not be sufficiently tested, until still greater care in the selection of the parents, and a more generous system in grazing and rearing the young stock, be, under the fostering care of the Highland Society, and increasing enterprise of the local agriculturists, more generally bestowed. But further, the statement in the report is opposed to the facts of the case, as seen in the numbers and merit of the stock exhibited at Perth. In 1833, at Stirling, the first prize for the best ox of any breed was awarded to a Fife ox, while, at the recent exhibition at Perth, the Fife breed, so far from affording only one or two solitary specimens, conveying honour to the breeder, rather than to the breed, was, in fact, exhibited in greater numbers and excellence, in proportion to the extent of the district, than either the short-horned or polled breed.

Instead of sixteen, as erroneously reported by the Society, twenty-four animals of the Fife breed were exhibited, viz., six bulls, six cows, one five-year-old, seven four-year old, two three-year-old, and two two-year-old oxen. Of these the cows were so fine, that, in the opinion of many judges of noted skill, no six of the eleven short-horned, nor of the several polled cows shown, could have been selected to match, far less surpass them.

The Fifeshire fat stock, twelve in number, were much admired by many first-rate English breeders, and were declared to be among the finest exhibited. The prize ox of the four-year-old class (had the rules of the society permitted it to be entered for both) would, almost to a certainty, have received the prize awarded to the best ox of any breed. The five-year-old Fife ox was an animal of exquisite symmetry and beauty, and the whole stock of a description calculated to raise in public opinion this valuable breed.

The mutual congratulations of the Fife breeders

upon the high place which the Fife stock maintained at this splendid exhibition, and the assurance that this superior and hardy breed, would henceforth be estimated by the Society according to its merits, were speedily checked by the terms of the authorized report of the exhibition. That, under the circumstances above detailed, the highly honourable and enlightened members of the Committee should have so rigidly adhered to their former dicta, can be attributed solely to the natural leaning, which the most conscientious persons have, to adhere to their preconceived opinions, and to the difficulty of inducing even the judicious to retract a serious and honest, but perhaps prematurely formed opinion. It is probable, however, that after a full examination of the evidence connected with this matter of public interest, the great body of members of this national institution will disavow the opinion there given, and recall this marked and solitary proscription of one of the most valuable of the pure Scotch breeds. Without at present entering further into detail, it may suffice to say, that the following statements can be completely established by ample and concurrent testimony of eminent agriculturists and dealers, both within the county and also beyond its limits.

1. That the Fife breed of black cattle has not yet received the same degree of solicitous attention and liberal outlay in selection, improvement, and management, so laudably bestowed in perfecting the short-horned and polled breeds, so that, under the fostering care of the Highland Society, and the increasing enterprise of the Fife agriculturists, this superior breed may be brought to still greater excellence.

2. That Fife oxen, when placed under equal treatment with the short-horns, reach nearly to an equal weight, while the former yield a higher price per stone (sufficient to compensate the difference, if any, in weight) in consequence of their superior quality, and of their greater fitness for travelling.

3. That the short-horned breed is suitable only to that small proportion of the county, which is eminently a grain and not a breeding district, and in the great proportion of the climate and soil of Fife is not found to thrive; while the first cross between that and the Fife breed alone is found to be of advantage to the feeder.

4. That the Fife black cattle as a dairy breed are found to be superior to the short-horned, or even the polled breed.

5. That even in the opinion of those who may think the above rather an over estimate of the Fife breed, and who may recommend a more general adoption of the short-horned breed within the county, the proscription of this large and native hardy breed, by withdrawing premiums for its breeding stock, is an unprecedented and unwise restriction, and that the view expressed in the report of 1835, and reiterated in the recent report of the exhibition, condemning the breed generally, is not borne out by the facts of the case.—*Correspondent of Fife Herald.*

A *Correspondent* recommends that in the present scarcity of turnips (from 8l to 10l per acre), masters of hounds and sportsmen should, as much as possible, refrain from riding over turnip fields, and use every endeavour to prevent farmers' sons and gentlemen's servants from doing so. The destruction which frost occasions to a bruised turnip is sufficiently known, and it is somewhat singular that farmers joining the hunt appear usually the last persons to pay any attention thereto.

## COUNTY RATES.

EXTRACT from the Report of the Commissioners for inquiry into County Rates and other matters connected therewith, presented to both Houses of Parliament in June, 1836.

TABLE showing the amount of Expenditure of County Rate in the several Counties of England and Wales in the year 1834; also the rate in the pound in that year, supposing the County Rate to have been levied on the annual value of Real Property as assessed to the Property Tax in April, 1815.

## TO THE FARMERS OF ENGLAND.

*A sure Remedy to ensure a Crop of Turnip or Cole Seed against the destructive ravages of the Fly.*

GENTLEMEN,—Having the two last years witnessed the devastation that the turnip fly has caused to the crops thereof, and more especially this year having been an eye-witness of their ravages through an extent of country southward, in a journey of four hundred miles, I think that the following observations I have to make on this subject may tend to draw the attention of agriculturists thereto, which may in future years have a very beneficial effect towards promoting the growth of so useful a plant.

I have now been a farmer upwards of twenty-four years, and have had under a course of cultivation three sorts of turnip land, viz., a sandy soil, a gravelly soil, and a peat or loamy soil, and, to the best of my knowledge, I have never yet failed in my turnips on either of these different soils, though my neighbours around me have frequently so done. I think I may therefore venture to pass my opinion on the grand cause of the failure of so many turnip crops in this country; and I shall not scruple to pass my animadversion on farmers in general, from their deficiency of attention towards the promotion of the growth of so useful a winter plant; for no crop in its nature is more beneficial or necessary for the support of our sheep, on which man so much depends, both for his food and clothing.

Ever since I was a boy (and that is many years back) I have constantly heard of the ravages of the turnip fly, and of the remedies resorted to by farmers for their destruction or for the prevention of their devastation.

Rolling the field by moon-light has been one remedy recommended; sprinkling the young turnips with lime has been another; steeping the seed in a mixture of arsenic has been a third, in order to destroy the egg, absurdly enough supposed to be deposited therein; and another remedy recommended has been this, the use of short and rotten manure in preference to long; and I could mention numerous other foolish experiments that have been resorted to for the destruction of the fly, or for the prevention of their ravages, but all have been hitherto tried to no purpose. The fly are still found to be as destructive as ever to the turnip crops of this country, and never more so than the two last years, the winters of which have been extremely mild, and consequently not so destructive of the egg or worm from which, in all probability, they assume their being.

I shall not enter upon a dissertation of the origin of these insects (whether they are viviparous and so are generated as a worm, or weevil in the first instance, and thus live in that state throughout the winter on the roots of herbs or plants, or in the bean; or whether they are the progeny of a fly, a caterpillar, or a species of chrysonela; or whether they are oviparous, and so produce their own eggs, either in the bean flower at the latter end of summer, or in the roots of plants or weeds, at which they may easily get through the crevices of the earth at that time of the year, or whether they derive their origin from the eggs of any other fly, caterpillar, or chrysonela). I shall not venture to give an opinion as it little concerns farmers to know how or from whence they derive their existence; but I shall content myself with the knowledge that they commence committing their ravages on the young

clovers and charlock weed in the early part of the year, before the turnip crops are thought of, or the seed thereof committed to the ground.

Moreover, of this I am well aware, that they either (like the ant) are a most sapient, or (like the gnat) are a most spiteful insect; for where the young plants are thin upon the ground, there their devastation is first directed, so that they invariably destroy the thinnest parts of a crop first, possibly for this reason, that they may have a succession of plants, or plants of another sowing.

Any farmer may observe, in his late-sown turnip field, that where by accident the seed from the hand has been deposited thick upon the ground, the turnip fly is seldom known to attack destructively those plants which spring from such deposits, until they have cleared the field of the plants that have sprung from seed more judiciously sown.

Also the fly is always found to be more destructive to the young plants, when the surface of the ground is incrustated over from the effect of the rain, and consequently cracked, in the crevices of which they are sheltered from wind and storm; and possibly it is for this reason that they are found to be more destructive among long manure than they are among short; for no insect seems to be more shy of wind and stormy weather than they are, for in such weather scarcely a fly can be discerned in a turnip field, where the day before, in a milder state of the atmosphere, probably the same field might have been covered with them.

When the ground is in this incrustated state, there is little prospect of a crop of turnips, unless the farmer has his senses about him. He either should immediately harrow over his land again, if the seed should not have vegetated, or otherwise (if it should have vegetated) he should directly use his roller, night or day; and before rolling, he should sow more seed in such places where the fly has already destroyed the young plants. The roller in no case should be used after the seed is sown, except in this instance, on an incrustated surface, as the harrow (if then used) would destroy too many of the plants: and where the seed has been drilled, the horse-hoe should be immediately used, whether the plant has vegetated or not, as it acts between the drills.

The turnip plant is tender, and requires the soil to be light and friable, so that it may vegetate freely; for if the land be incrustated and set by rain, the plant will take more than twice the time before it assumes its broad leaf, which is somewhat erroneously supposed to be beyond the ravages of the fly. But the grand cause of the failure of the turnip crops so generally throughout this country is this, viz., "the quantity as well as quality of the seed sown."

Place before a hungry man 2½ lb. of beef steaks, and he probably would make much havoc among them; but give him five pounds to devour in the same time, and he would in all probability leave a fair portion for the good of the house.—It is so with the fly. Treat him only with the produce of 2½ lb. of seed, and when the weather will permit him to feed thereon, he will make strange havoc among them; but treat him to the plants of five pounds of seed, and he will show himself to be equally generous with his landlord, by leaving a fair portion for the good of the farm. I shall mention a few instances of this sort I have lately seen in my neighbouring parishes. A gentleman took me to his turnip field in the first week in September,—excellent land for the purpose. He

had he told me sown the field five times over, but only with  $2\frac{1}{2}$  lb. of seed each time per acre; the consequence was, that after the fifth sowing I did not see literally one plant in the field, which possibly might consist of twenty acres. His neighbour, who had a field opposite of about the same dimensions, had also sown most part of his five times over; sowing he told me about 3 lb. of seed per acre, which was the usual quantity he used, unless it was new seed, and in that case he sowed only  $2\frac{1}{2}$  lb. per acre: this farmer beat the gentleman before spoken of, for there was to be seen here and there a few patches of turnips,—perhaps in the whole there might be about four acres; this was also first-rate land for turnips. Another farmer nearer home had also sown most part of a field five times over, but using, he told me, only 2 lb. of seed per acre: this gentleman had, I think, been a farmer for fifty years, and I will venture to say would not have sown more if you had given him fifty pounds: it was in all probability the quantity used by his forefathers, perhaps up to the time of the flood: the consequence has been, that last year he got about two acres of turnips out of twenty; and this year he has been more lucky—that after five sowings, he has a few patches which perhaps may amount to five acres.

I could mention innumerable other instances of the same sort round my parish; and I have seen this year thousands, and tens of thousands of acres, of the best turnip lands of this kingdom in the same state of nudity, and from precisely the same reasons, with scarcely a turnip thereon.

Those crops that had withstood the ravages of the fly I generally found (after enquiry) were the produce of from four to five pounds of seed per acre.

Are not these instances, therefore, evident proof of the cause of such a lamentable failure of the turnip crops of this country?

In some seasons, when the fly is not numerous, (and that generally happens after a severe winter,) there is no doubt that  $2\frac{1}{2}$  lb. of seed, or 3 lb. may be sufficient to ensure a crop of turnips; but when the weather is hot and gleamy, and the fly abounding, no farmer should sow less than four pounds of seed per acre; and if that quantity should fail, (which is not often the case if he attend to the harrowing and rolling I have recommended on an incrustated surface,) he then should sow not less than five pounds per acre,—for he is then aware that the enemy is at hand, and will certainly remain so throughout the summer months.

A succession of ploughing does not extirpate the insect, but possibly makes him more voracious, and with a keener appetite he glories in each successive crop.

I always sow four pounds of seed the first time per acre, and I seldom have had occasion to sow again, (always attending to the rule before-mentioned with regard to harrowing and rolling,) but the fly has sometimes so judiciously set the plants out, about nine inches apart, that I have had no occasion for a man to hoe them. This year on three different sorts of land my turnips are excellent, to the surprise of every one: and I had no deficiency of plants last year, except in the middle of a field, where about two acres had been sown by a man unaccustomed to it with only about  $2\frac{1}{2}$  lb. of seed per acre, and those two acres were patchy and bad.

I have three sorts of turnips this year on three different sorts of land, viz., white stone, red globe, and green top, as well as three acres of coleseed,

and each sort are very good. In the seasons when the fly does not commit its ravages, of course in that case the plants are much too numerous, but a harrow will always remedy that evil; besides the harrowing of young turnips (when they get to a proper size) is as beneficial to them as a hoeing.

It is lamentable to think of the great premature destruction that must take place this year among the sheep of the country, as well as other cattle from the general failure of the turnip crops. Good breeding ewes in thousands have been traversing the roads to London, and other great towns, from the deficiency of winter food, as well as lamb-hogs in countless numbers.

Since therefore through the deficiency of the turnip crops, the welfare of the sheep of the country is at stake, as well as the food and clothing of man, and since the population of this kingdom is trebled in comparison with the population some centuries back, when our forefathers were so penurious with regard to their turnip seed, surely it now behoves farmers to pay more attention to the promotion of the growth of so useful and beneficial a plant, and it would well become all of them hereafter to remember, “that one good sowing, and in season,” is better than twenty bad ones; and that they may better bear in mind the rules I have laid down for always obtaining a crop of turnips, I have given them the following stanza, which if they would get by heart and teach their children after them, they will never fail of success:—

“Having well manur'd, convert the land to dust,  
Four pounds or five per acre sow you must;  
If seed they yet be, harrow the incrust'd soil,  
But be they plants, roll: 'twill pay well your toil.”

Remaining Gentlemen, your obedient servant,  
JOHN THOS. TRYON.

*Bulwick Rectory, Nov. 18th.*

#### TO THE EDITOR OF THE DONCASTER GAZETTE.

Sir,—I observed in your paper of the 29th of October that you had published a paragraph from the Lincoln newspaper respecting a maggot found in bones, and which was said to produce the fly which has this year done so much injury to the turnip crop. I beg to state that the fly which is said to have done so much mischief was not produced from a maggot; neither did the fly (although the first cause) do the actual injury. It was the larva or young of a species of fly called *Aphides* that destroyed some hundreds of acres in this neighbourhood (of the latest sown turnips). These deposit their eggs on the underside of the leaf and are soon hatched and produce the larva that destroy the turnips. About the beginning of October some of these got wings, and by the middle of October, on a fine day, the whole country was so full that they resembled a swarm of bees in miniature; and I heard from a gentleman returning from Newcastle by the coach, that he was much annoyed by their flying into his eyes. These insects do not appear to have attacked the turnips that were sown early, but those sown late in July or beginning of August are all destroyed. The turnips that were sown in June have not been injured, although manured with bones. Therefore I write you this in order that the inquiry may be attributed to its true cause, and not to bone manure, which has proved to be so valuable to the nation.—I am sir, yours truly,

JOHN HORNCastle.

*Manton, Nov. 1.*

## THE USE OF CRUSHED BONES AS MANURE.

Mr. C. W. Johnson, in a pamphlet recently published, has shown that this subject is highly deserving the serious attention of farmers in this great agricultural county. The author says—

“In the experiments hitherto made, light dry soils are most benefited by bone manure; such as dry sands, limestone, chalk, light loams, and peat. It is true that some experiments have shown an excellent result from their application to even wet, heavy soils, but this happened chiefly in the dry seasons of 1826 and 1827. Those who theoretically recommend crushed bones for such soils, because they will render them more friable, forget the small quantity in which they are employed.

“A farmer, however, near Nantwich, relates, that on a clay loam scarcely twelve inches deep, on a sub soil of grey sand mixed with clay, he finds that bone manure causes a good herbage of white clover and trefoil to grow where only sour grass grew before.

“From the result of the inquiries of the Doncaster Agricultural Association, it appeared to be the opinion of those who had employed crushed bones, that they are superior to the best stable manure—in respect to the quality of the corn, as 7 to 5; quantity, 5 to 4; and durability of effect, 3 to 2.”

The turnip crop appears to be the most benefited by the application of bones, and numerous experiments are given, demonstrating their great value for this purpose.

“In the year 1831, on a thin chalky soil, in the neighbourhood of Amesbury, in Wiltshire, Mr. Devenish employed bone manure of the quality called ‘fine,’ drilled at the rate of 24 bushels per acre, with the turnip seed, on a portion of a field of about ten acres. Part of the same field was manured with spit dung, at the rate of about 20 tons per acre, and another portion of the same field remained without any manure. The Swedish turnips produced on the boned soil, were of four times the value of those grown upon the land manured with spit manure. Those grown on the soil without any manure, were deemed scarcely worth hoeing.”

The large and increasing consumption of bones by farmers of the North of England and Scotland, has rendered it necessary to import them from all parts of Europe, and even from Buenos Ayres and North America. This novel trade has been steadily increasing for the last fifteen years. In 1821 the declared value of the foreign bones imported for agricultural purposes amounted to 15,898/12s 11d; in 1828 it had increased to 59,782/9s 11d; and in 1835, to 127,131/14s 10d.

The author gives in conclusion the following practical general directions:—

“The crushed bones have been invariably found more immediately beneficial as a fertilizer, when suffered to remain previously for some weeks, mixed with earth in heaps, exposed to the action of the atmosphere. By being thus fermented and dissolved, they are necessarily more speedily serviceable as food to the plants to which they are applied; and this observation more especially re-

lates to the oat, barley, and other spring corn, since these do not remain on the ground for so long a period as other agricultural crops. The proportion is 50 bushels of bones, with five loads of earth or clay; or 40 bushels to five loads of common dung. For wheat and pasture lands the previous fermentation of the bones is, for this reason, not so essential to the production of immediate relief. It is impossible to give any general directions for the quantity of bones to be applied per acre, since soil, situation, and climate, must all be taken into the farmer's consideration. The following facts, however, have been ascertained by numerous experiments, at some of which I have personally attended:—

“That crushed bones remain in the soil for a length of time proportionate to the size of the pieces; the dust producing the most immediate effect, the larger pieces continuing to show the longest advantage. On arable land their good effects continue for four years; on pasture land for eight.

“On turnips, oats, barley, and wheat, the quantity applied has been from 25 to 30 bushels per acre; on pasture land, from 25 to 40 bushels of bone dust, early in the spring.

“The best mode of application is by the drill, with the seed corn.

“The bones should, when first used, be always applied, for the sake of correct information, in varying quantities per acre; and on no account should the farmer omit to leave, by way of comparison, a fair portion of the field without any manure.”

## TO THE EDITOR OF THE SUSSEX ADVERTISER.

Sir,—As the severe weather we have had last week may be the harbinger of a hard winter, I wish to communicate, through your paper, to the Farmers in general, and to those on the Downs in particular, an expedient, I have tried with perfect success in removing the snow into furrows on pasture land so as to enable the stock to remain out, and more particularly sheep; it is merely by joining two oak slabs *edgeway* at a triangle so as to scrape about ten feet of snow each turn, which places the snow into ridges; one of these scrapers drawn by a pair of horses, will go over 15 acres in a day, and might be very useful in cleaning Turnpike Roads, at a small expense.—I remain, your obedient servant,

A. H.

Wadhurst, Nov. 2nd, 1836.

SHIPS' BISCUITS.—The Society of Arts has conferred its large gold medal on Mr. T. Grant, of Weovil, near Portsmouth, for the construction of a steam apparatus for preparing ships' biscuits, with superior economy, cleanliness and expedition. Formerly the feet of men were employed to tread and knead the dough, and its admixture by this means was oftentimes so imperfect that the moister portions of the mixture retained cells of water which became boiling hot, and in this state reacted upon the starch of the flour, so as to impart to the biscuit a glassy, stony hardness, which rendered it very unfit for mastication. In Mr. Grant's apparatus the labour is performed by steam power, and the mixture is thus rendered perfectly uniform. The first apparatus was erected at Weovil, under the superintendence of Sir John Romiee. Messrs. Fraser and Hullah, of Wapping, have also adopted the plan with slight modifications.

## UPON THE SMUT BALL OR BLADDERS IN WHEAT.

TO THE EDITOR OF THE ESSEX HERALD.

SIR,—In a former article I intimated my intention of giving you some further information respecting the infection of the wheat plant by smut ball, or, as is usually termed in Essex, the bladders or bags.

Some experiments by Mr. Smyth Lungley, of Church Hall, Kelvedon, have since been published in the *Essex Herald*, which alone are sufficient to prove the infectious quality of the smut ball, and that the evil may be remedied either in whole or in part, by preparation of the seed wheat previous to sowing, and showing more especially that arsenic may be used as a certain preventive. From the notice he has taken of the application of salt, as recommended by me, it would appear that it is not equally so; but Mr. Lungley, in making the experiment, did not wash the grain previously to applying the salt, which I have always advocated as the primary means, whereby the infection may be prevented.

“The knowledge of a disease is half its cure” is an old adage, which will equally apply in this case; it may be therefore necessary to investigate the origin of the disease, and the causes by which it has extended for several years past.

The infection is produced by the seeds of a *parasitic Fungus* of the genus *uredo*, which are exceedingly minute—and are produced from the smut ball or bladder of the preceding year. These smut balls, from the process of thrashing, become broken, and the seeds (which consist of the dark powdery substance they contain) are dispersed amongst the grain, where they become attached in the crevices, and at the bearded ends, from which it is very difficult to expel them; and being afterwards absorbed by the root tips, or spongelets of the wheat plant, during the process of germination, are propelled by the sap, and the infection appears the following year in the young germen or ovum of the wheat, where it vegetates and prevents the development of the parts necessary to produce the complete fructification of the plant, consequently no embryo is formed in the germen affected, but it notwithstanding continues to grow as long as the sound grains, from which they are easily distinguishable by their dark green colour which are afterwards ripened in due order with the sound grains; these appearances are as well known that it will be useless to describe them; it may however be necessary to remark that the stigma, or as it is termed the blossom of the wheat, may be found partially formed and attached at the end; but which (as is the case from disease produced by the maggot) never protrudes from the chaff similar to those in a healthy state; upon breaking the skin a dark paste (which upon ripening has the appearance of a dark brown powder) is found which produces a foetid putrid offensive odour, and, from this distinguishing characteristic, is termed the *uredo foetida*. That the smut ball contains all these properties and more, I have been able, after long investigation, to determine; if one of the smut balls is broken, immersed in water, and submitted to the microscope, an animalcule of an eel-like shape will be discovered; this has been noticed by Roget, in the early part of the late Bridgewater treatise, and at one time led persons to suppose that it was the *cause*, but it is now fully ascertained that it is only an effect and is produced as other animalcule, and has no-

thing to do in the further production of the disease.

I have from direct experiments a long time proved that the disease arises entirely from infection, for if any number of sound grains are rubbed with the smut ball and planted, and others planted without being thus infected, this result will be generally proved; but not always, as the full carrying out of the process will sometimes fail in peculiar seasons. I will, however, mention a few instances that must, to minds not prejudiced, be convincing.

In the year 1832, experiments were made and have been since continued—by rubbing a portion with the smut balls, and by planting a part thus infected and a part not—it has proved almost invariably that the former has produced smutty ears whilst the latter has not.

In the process of dressing wheat much infected with smut by a dressing-machine, (the barn doors opening upon a field sown with wheat) the crop was afterwards infected, within the circuit that the dust was blown and in quantity corresponding with the distance from the machine; in another instance a quantity of the dust was strewed upon the land already sown with wheat and produced the same result.

Wheat sown dry will produce smut ball, but if properly wetted will not; this has been proved in many instances but more especially in the last season, when the corners of the field that were last dug and sown with dry wheat produced smutty ears in abundance, whilst the other parts of the field was not infected.

A quantity of seed wheat procured from a distant county was divided amongst four individuals in different parishes—three produced smut and the other did not—the latter was sated.

My conclusion from these investigations and experiments are, that the infection may be prevented by immersing wheat in *any solution strong enough* to destroy the vegetation of the smut ball without injuring the wheat, which from its delicate nature it is not easy to effect.

For this purpose leys, brine, salt, arsenic, sulphate of copper, &c. may all be recommended as effectual—but the disinfecting may be impossible from steeping in these solutions alone, unless great care is taken by carefully washing, and skimming the surface, as, from the exceeding minuteness of the seeds of fungi, they are not easily eradicated.

My process is to select a pure stock—and, indeed, this is the main object that the farmer should have in view, and is the cause why some produce their crops without infection, and without taking any unusual precaution—I then immerse the wheat in strong lime water, and have it well skimmed; the wheat is washed in two separate tubs, and to facilitate this, a basket is used, which should be nearly as large as the tub in which it is immersed; the wheat is then put down upon a floor, and from 1 to 2lb. of salt per bushel added; in half an hour the salt will be dissolved, and after well stirring over the wheat, fresh slaked lime should be then added, and a further quantity added twelve hours afterwards, if required for drilling. The lime water is made in the proportion of one bushel of unslaked lime to 45 gallons of water.

The above process, if carefully conducted, will seldom fail. The business is usually left to servants to complete, after the usual day's employment is finished, and to men thus entrusted the getting through the operation *quickly* is the only object; this is effected by placing the wheat upon

a floor, and merely sprinkling with a watering-pot, by which more than one half the grains escape wetting, and none are thoroughly washed.

Many other processes, I have no doubt, are equally good—but this is simple and effectual. Arsenic I never used, but of its efficacy I have no doubt. I however think it too dangerous an article to introduce into practice, from the great hazard attending its use. I have witnessed its fatal effects upon poultry and game, when used for this purpose, and the disastrous consequences that might be produced by its general introduction are incalculable.

Some seasons, more especially dry ones, are more favourable to the infection than others. I am convinced that a barn floor, once infected by smutty wheat, will communicate it to other wheat, not infected, that may be afterwards thrashed upon it. The manure arising from infected straw may also have a tendency to carry on the disease to future crops.

It is a point so important as to require the serious consideration of farmers, and if each would make his own experiments and deduce therefrom his observations and make them known, a time may arrive when the disease may be unknown.

For further information I beg to refer your readers to some very able papers on the subject, by Mr. Francis Bauer, to whom I acknowledge myself much indebted.

I am Sir, yours, &c.  
ROBT. BAKER.

Writtle, Oct. 24th. 1836.

## AGRICULTURE.

### DOES LIME ACT AS A MANURE?

This question is often asked by practical men, and as often answered by others, that it does not. One will say, "that it is injurious to some crops, that where a lump of lime had laid, there the fly or other insects had taken or destroyed all the young vegetation." Others say, "that they can see no difference between where it was laid, and where it was not, no difference in any of the crops;" others, "that it does not act as a manure to give vigour and luxuriance to a crop, although it may help to corn the straw;" "it may act in making other manure more active, that if you lime your land, you ought to dung also;" "that the lime might have something to act upon." To these practical remarks, an answer may be found in the language of the camelion, (fable.)

"You all are right, you all are wrong,  
When next you talk of what you view,  
Think others see as well as you;  
Nor wonder, if you find that none  
Prefer your eyesight to his own."

Lime when in a caustic state, is injurious to vegetation, when slacked to a powder, it becomes hydrate of lime; this after being exposed to the atmosphere for a time, imbibes carbon, and thus becomes again carbonate of lime, as it was originally in the quarry.

Lime acts in two ways: 1st, in giving energy and weight to a corn crop, it holds carbonic acid, and gives it out to growing vegetation; soils having a due proportion of lime never dries up, always has moisture for vegetation. 2d, Lime enters into the composition of grain, particularly wheat, hence its use in forming the bones of man and other animals. The shells of birds and fish are formed of the calcareous matter they take in with their food; the shells of birds become thinner as the chick is formed within it, the substance going to form the bones, thus, the carbonate of lime, of which shells are formed, are converted into phosphate of lime, (bones). Shell-fish flourish only on calcareous coasts.

Manures are good or bad, in proportion to the quantity of lime, of potash, and carbon which they contain; this subject is particularly set forth in "Lance's Golden Farmer," which has become an authority amongst scientific agriculturists; his cottage farmer contains the analysis of various manures; by which we learn that gypsum is a sulphate of lime; bones, a phosphate of lime; sugar scum and soap ashes, consist principally of carbonate of lime; stable dung contains lime in proportion to the quantity of grain consumed in the food. But of all manures, the best in general, must be that which has lately been introduced to the notice of the agricultural public; known as "*Lance's Animalized Carbon*," which has lime in a chemical and mechanical union with human *feces*, in a permeable state, fit food for immediate nourishment of plants. Man feels much on wheat food, together with other vegetables and animal fibre; hence his *excrementum* contains lime in the various states in which it is required by vegetation, together with potash and carbon dissolvable with water.

Lime can be held in solution by water, and yet be perfectly transparent; nature can do the same with silex (sand), which enters into the composition of all straws and grasses. That lime will not shew its efficacy on calcareous soils, is most evident, it is like putting sand on silex. That lime will decompose vegetable fibre, and make it dissolvable with water, so to be taken up by the mouths of vegetables is also evident; and that it will also make the young vegetation, the cotyledons of plants, very grateful to the taste of insects, is also easily to be conceived; but how lime can form one of the constituent parts of grain, and not enter the mouths of plants, we are at a loss to conjecture, therefore we can conclude in no other way, than in saying, that lime held solvent in water *must be a manure* to all grain crops; and if we wish to be convinced to the contrary we must see the facts through our own eyes, and not through those of our informant. L.

### THE WINTER.

We are not certain that all the grain crops in the later districts of Dumfries-shire and Galloway are yet secured; and, without doubt, many of the potatoes are still in the field; yet our winter has already commenced, and that, too, with the greatest severity. During the last fortnight we have had repeated frosts, more resembling the setting in of a storm towards the close of December, than the thin cold weather usually experienced at this season of the year. Accordingly, we much fear, that when full accounts shall have been received from the various districts around us, it will be found that the potatoes have been injured to a very considerable extent. When potatoes are not productive, as has been too generally the case this season, they do not indeed swell so near the surface, as when the crop is good, and consequently the injury cannot have been so great this year in proportion as it would have been, had the crop been abundant. Still, from the keenness of the frost we have experienced, they must have received very considerable damage; and, altogether we suspect the supply of this article this year will be a very scanty one. When the grain crops are abundant, a deficiency in that of potatoes does not lead to any very grievous results. But this year we fear the late harvest, and unequal ripening, will render the produce of grain, in this quarter, the reverse of plentiful. If so, the winter must be a severe one to many. It may, however, be questioned on whom it will fall with the greatest severity. The labouring classes will unquestionably be among the sufferers; but it is very doubtful if a considerable class of our farmers will suffer less severely. When all producers of grain are equally affected by an unfavourable season, the suffering is consequently equal, and that suffering is often not so great as at first sight some are apt to imagine: for, under a limited produce, a better price is generally obtained. But when the better parts of our own country, as well as the nations around, have a fair crop, it is plain that the farmers, in our later and

worse districts, must suffer severely in being obliged to take for their produce, not what they would in fair remuneration require, but what they can obtain, in competition with those to whom nature has been more bountiful. Painful, however, as it is to think that hardships should fall upon any one class of society, we could wish that the abundance of the richer and earlier parts of the earth would prevent the rise of markets amongst ourselves to any great extent. Our farmers in late districts, though by no means a small body, are few, in comparison with the labouring classes of the community, and, besides, have often means of relief, which the labouring classes have not. Their later tillage is often connected with the pastures of the hills, and still more generally with the extensive grazing of cattle, the profits of which, though not quite so great of late years as those derived from sheep, have not, this year, been amiss. They have likewise the power of appealing to their landlords, who, it is but justice to say, are generally considerate when real difficulty is presented to their view. On the other hand, however, high prices of the ordinary means of support extend over a vast breadth of population—a breadth which beneficence itself could scarcely cover—and lead not only to much suffering, but to much disquiet in the State. The poorer classes in the country may bear with patience; but the labouring classes in our larger cities and towns, in the midst of the unequal price of labour and victuals, become dissatisfied and refractory; and none need be told that in these days of political agitation, such a state of things would but too surely enable the demagogues of the land to feed their passion by exciting dissatisfaction against the State; for when men are hungry, it is not difficult to convince them that their suffering is the result of misrule.

Under the most favourable view we can take of the whole matter, we look forward to rather a severe winter for our labouring classes of society. Granting that the excess of food in other districts may prevent deficiency in our own, we will at least undergo a change from the rates of an exporting to an importing district, which will be no slight change to those whose wages cannot be expected to undergo any favourable alteration on that account. But this will not be all. For in proportion as the farmers of this quarter receive lower prices in consequence of competition with other districts, while they have comparatively little to sell, the amount of labour they will be enabled to give will consequently be comparatively limited; and this decrease of employment happening to men whose usual supply of potatoes is deficient—so deficient that they will not even have the benefit of a fatted pig in defraying the expenses of their family—must bear very heavy upon them. Under these circumstances, we would call upon all on whom the sun of prosperity has shone, to mark the state of society, and consider the case of the poor. To relieve all to the extent of comfort is perhaps impossible; but it is not out of the power of beneficence to preserve all from the miseries of want.—*Dumfries Herald*. X. Y. Z.

## BRITISH WOOL.

(FROM THE FIRST NUMBER OF DENISON'S LITERARY CHRONICLE, PUBLISHED ON SATURDAY, NOV. 5.)

Winchester was the first place that possessed a manufactory, and hence we may reasonably conclude that through the first 900 years of the Christian era wool in England was not entirely neglected. About the year 925 a fleece was valued at two-fifths of the whole sheep, the value of sheep continuing the same through several centuries; but in 1135 it declined 50 per cent., whilst wool at the same time greatly increased in price. The number of sheep in the kingdom was very inconsiderable before the time of Edgar, on account of the numerous herds of wolves which retarded their increase; but the measures adopted by that prince to destroy these animals, which are the natural enemies of sheep, manifested a degree of solicitude for the preservation of the flocks which could

scarcely be expected at a period so early, and were admirably adapted to promote that attention to them which contributed to their improvement. It appears that the bettering of the fleece did not keep pace with the inclination of the people for fine clothes. In the reign of Henry II. Spanish wool, on account of its superior excellence, was imported and manufactured in this kingdom, but the policy of the age did not long permit it. The Mayor of London was ordered to burn every piece of cloth made of it. Yet again this tended to destroy the commercial spirit which began to manifest itself, and to throw the best materials into the hands of foreigners. About 1240 the importation of fine clothes in England began to be encouraged, although the effects upon the fleeces of the country, and upon the interest of the farmers must have been more pernicious than the manufactory of Spanish wool could possibly have been, had not the restless spirit of commerce counteracted the evil tendency, and carried out the surplus of wool which it was calculated to create. The surplus of wool continued constantly to increase from the time of Henry II. down to that of Edward III., and exportation as regularly took it off the hands of the growers—accordingly we find in the southern parts of the Island, where the manufacture was most attended to, and from which the largest quantity was exported, that the flocks were in the best condition, and the quality of the staple most desirable. Soon after this the importation of foreign cloth was prohibited, and in 1647 Parliament interdicted the exportation of wool,—a law which was finally established soon after the Restoration of 1660.

PEAT TILES FOR DRAINING LAND.—We have seen a specimen of draining tiles in the shop of Messrs. Sampson and Co., seedsmen, Kilmarnock, made of peat; they were sent there for the inspection of those interested in such matters, by Mr. Hugh Calderwood, Blackbyers, Fenwick, who has invented a spade which cuts them, one out of the other, in an expeditious manner. They are shaped something like a tile made of clay, and on moorlands will answer the purpose equally well. In such districts clay is not to be had, and the expence of carting clay tiles would be heavy. With Mr. Calderwood's spade, a farmer may cast 2000 or 3000 tiles a day, expose them to dry in the sun, and lay them in his drains within a few yards of the place where they were cut. When properly dried, they are very porous, and will not be softened with wetness. Peats are often met with on moors which have been buried by accident, and they are found not to be softened or decomposed, and an instance has lately happened (we believe at Catrine), where a peat remained in the boiler of a steam engine for months, and came out as hard as when put in. We earnestly recommend a trial of this mode of draining to farmers who dwell in the moorland districts of our country. The adoption of such an improvement would soon make their moors assume a very different aspect, and contribute most materially to the healthiness of our climate.—*Kilmarnock Journal*, et-*Scotsman*.

AGRICULTURAL POPULATION.—DECREASE IN ITS AMOUNT SINCE 1811.—In 1811 the centesimal proportions for great Britain were—Agriculture 35.2, Trade and Manufacture 44.4, other occupations 20.4. In 1831, Agricultural 28.2, Trade and Manufacture, 42.3, other occupations 29.8; whence it appears that the quantity of food, whose production twenty years ago required the labour of five families, may now be produced by the labour of four families; a fact of considerable importance in estimating the probability of the country's continuing its present rapid progress in manufactures, without the supply of agricultural produce being exhausted. This evidence of improvement in agriculture is strongly confirmed by another and very different examination of the subject.—*Athenæum*.

ON THOROUGH DRAINING AND DEEP PLOUGHING.

BY JAMES SMITH, ESQ., OF DEANSTON WORKS.

In the Messrs. Drummonds' Report of their Agricultural exhibition, published in March 1833, the writer of this article contributed a paper on the subject of Thorough Draining and Deep Ploughing, which has received considerable attention, both from speculative and practical agriculturists, and has

led to the introduction of the system there explained and advocated, in districts where it had not before been known, and in all instances with the most eminent success. This system when applied with any degree of care, soon speaks so prominently for itself, by its wonderful effects, that all assent to its excellence, and proprietors and tenants who have any spirit for improvement follow out the practice as far as their means will allow.

This system, as explained in the paper alluded to,

has generally been pretty clearly understood, but those unaccustomed to reckon by the Scotch acre, and the Scotch grain measure, have complained that it was somewhat difficult for them to understand, and some points in the detail of the plan of operations laid down, appear to want a more lucid exposition, which, having been suggested to the writer, he has deemed it the best plan to go over the whole subject anew in the present paper, that he may introduce what the remarks of friends and his own further experience have brought under his notice.

It is unnecessary here to go over that part of the former paper which treats of the history of the introduction of the thorough draining into Scotland, as the merits of the various introducers will be elsewhere more permanently recorded, and the extensive introduction of the system, within a few years will be their best reward.

Various systems of draining had from time to time been in vogue, and although all of these have proved more or less beneficial, according to the nature of the soil and substrata in which they were applied, still, their success was various and uncertain, and much land was unavoidably left in a very wet and unproductive state.

Cutting off the springs by very deep cross drains was one system, and which is still advocated and practised by many otherwise intelligent men. Elkington introduced a mode which was much gone into at one period. The principle of this mode was to make perforations or bores, or to dig wells into the understrata, so that the water might pass from an impervious to an open stratum.

To those who know any thing of the nature and structure of the superficial stratification of the crust of the earth in this country, this principle must, of course, have appeared of very limited and uncertain application; nevertheless it was all the rage for a time, and much money was thrown away in its application, under circumstances not at all suited to the principle.

The portion of land wetted by water springing from below bears but a very small proportion to that which is in a wet state, from the retention of the water which falls upon the surface in the state of rain, and a vast extent of the arable land of Scotland and England, generally esteemed dry, is yet so far injured by the tardy and imperfect escape of the water, especially in winter, and during long periods of wet weather, in spring and summer, that the workings of the land is often difficult and precarious, and its fertility much below what would uniformly exist under a state of thorough dryness. A system of drainage, therefore, generally applicable, and effecting complete and uniform dryness, is of the utmost importance to the agricultural interests, and, through them, to all the interests of the country. By the system here recommended this is attained, whilst the expense is moderate, and the permanency greater than on any other system yet known.

The drains as applied in the Carse, have been named "Wedge Drains," from their form, and from being filled with wedges or keys to preserve the opening in their bottoms. They are sometimes called *farrow drains*, from their being placed under the water furrows of the ridges; but these terms give no exposition of the principle upon which the effect of this mode of draining depends.

The principle of the system is, the providing of frequent opportunities for the water rising from below or falling on the surface, to pass freely and completely off; and, therefore, the most appropriate appellation for it seems to be, "*The Frequent Drain System.*"

In the natural circumstances of the soil on the sur-

face of the earth, the drainage is extremely various from that of the light dry loam incumbent on deep beds of open sand or gravel, to that of the thin sterile crust of soil incumbent on massive beds of impervious till. In the former, there is no water springing to the soil from below, and whatever falls upon the surface in the shape of rain, is instantly absorbed, and passes through the sand or gravel to some outlet at a lower level. In the latter case, water, whether springing from below, or falling upon the surface in the shape of rain, must either run slowly off over the surface, however great the distance, or in the event of a horizontal surface, must remain stagnant till evaporated by the sun, for adsorbed by the atmosphere. On such a subsoil a sufficient depth of *active soil* can never be long maintained; for, even if trenched and enriched by lime and dung, it will bear but scanty and precarious crops; and, if laid out for pasture, will, in a few years, revert to its former thin crust, producing but the coarsest herbage. Some soils are incumbent on subsoils, partially or slowly pervious to water—such, by judicious management, produce sometimes good crops in favourable seasons; but, when much rain prevails, the crops are neither bulky nor of good quality. Soils so situated are unfit for wheat, as the alternate frosts and thaws of winter acting on the water in the soil, are sure to throw out the plants. When soil is immediately incumbent on open rock, especially on whin or green stone, which is very open from its many fissures, the land is always uniformly fertile.

If, therefore, we observe carefully the operations of nature, we shall never be at a loss for principles to guide us in the cultivation of the soil. In the last stated example the open rock under the soil affords frequent and pretty uniform channels of escape for the water; hence the obvious suggestion of the *frequent drain system*.

In proceeding to apply this system of drainage to a farm, the first object is to attain a sufficient fall or level, as it is commonly termed, for a main drain to receive the water flowing from the ordinary or parallel drains.

This drain should be directed along the bottom of the chief hollow or valley of the grounds, where the whole or greater portion of the drains can be led into it. If any less hollows occur in the field, they must also have their proportional mains or leaders.

The bottom of the main should be at least three feet, and, if possible  $3\frac{1}{2}$  or 4 feet under the surface where it passes along; and it should have throughout as uniform a fall as the nature of the ground will admit.

It should be flagged in the bottom, or, where flagstones are expensive, built as an inverted arch, to prevent the possibility of washing away under the side building. The dimensions necessary will depend on the fall or declivity, and the area of land from which it has to receive water. With a fall in no place less than one foot in 100 yards, a drain 10 inches wide, and 18 inches deep, will void the rain water from 100 acres. It is of great importance to make the open area of such drains narrow and high, as smaller bottoms and covers will suit, and be less liable to give way; and the current of water being more confined, mud and sand will be less apt to settle in the bottom. Let the sides be smoothly and securely built with flat stones either with or without mortar; and let strong flat covers be placed over, (see fig. 1) or, where such are not to be found, rough, simple arches may be built with thin stones and mortar for the bottom and cover (as shewn fig. 2), packing the haunches of the arch well up to the sides of the cut.

Where less hollows occur crossing the fields, it is necessary to cut submains along their bottoms about 3 or 3½ feet deep, and having openings of suitable dimensions formed by inverted stone couples, or with drain tiles, or, where a very large flow of water has to be provided for, with an inverted tile, and a covering tile placed above the bottom one, or with larger tiles made on purpose. (See figures 3, 4, 5, and 6.)

There should be a cross submain at the bottom of every field or stretch of drains, to receive the water from all the parallel drains, and such drain should always be cut six inches deeper than the drains running into it, that the water may have a free drop, which will prevent the lodgment of mud or sand at their junctions or mouths. (See fig. 6.) Open cuts or ditches, either as mains or submains, should never, except from necessity, be adopted, being apt to get filled with mud and grass, by which water is thrown back into the drains, which often chokes them; besides the loss of land, annoyance in ploughing, constant expense of cleaning, and the unsightly appearance of the thing, are serious objections.

Having thus provided a main drain, with submains flowing into it, matters are prepared for setting off and executing the parallel frequent drains in the body of the field. The drains can be executed at any season when the weather will permit, but the spring and summer are most suitable for the work. It is best to execute the drains when the field is in grass, as it can then be done in all weathers in a more cleanly manner.

In laying off the drains, the first object for consideration is, the nature of the subsoil. If it consists of a stiff strong till, or a dead sandy clay, then the distance from drain to drain should not exceed from 10 to 15 feet; if a lighter and more porous subsoil, a distance of from 18 to 24 feet will be close enough, and in very open subsoils 40 feet distance may be sufficient. When the ridges of the field have been formerly much raised, it suits very well to run a drain up every furrow, which saves some depth of cutting. The *feering*\* being thereafter made over the drains, the hollow is filled up, and the general surface ultimately becomes level. When the field is again ridged, the drains may be kept in the crowns or middle of the ridges, but if it is intended to work the field so as to alternate the crowns and furrows, then the ridges should be of a breadth equal to double the distance from drain to drain, and by setting off the furrows in the middle betwixt two drains, the crowns will be in a similar position, so that when the furrows take place of the crowns they will still be in the middle betwixt two drains, which will prevent the risk of surface water getting access to the drain from the water furrows by any direct opening. It is, however, preferable to work thorough drained fields without ridges, preserving a uniform surface, so that the water falling on the surface may percolate from where it falls to the drains, and all currents of water and consequent washing or running of the surface is avoided; besides the crop will be more uniform and less liable to lodge, and will give a higher average, and the handsome appearance of the fields in grain or in grass is very gratifying.

Some farmers object to the want of ridges as causing difficulty in sowing and reaping. A slight rut with a single horse plough serves to regulate the sower, and the small inconvenience in reaping is far overbalanced by the many advantages. Besides, it is probable that the reaping machine will, ere long, become a powerful auxiliary implement of the har-

vest, and be in the hands of every extensive and good farmer. The absence of ridges, and the presence of a uniform and smooth surface, will tend much to facilitate its application, for furrows and gathered ridges have hitherto been its chief obstructions. At whatever distances the drains are placed, they should be run parallel to the ridges, which is commonly in the steepest descent. The drains should be run parallel to each other, and at regular distances, and should be carried throughout the whole field, without reference to the wet or dry appearance of portions of the field, as *uniform and complete dryness* is the object; and portions of the land, which may be considered dry in their natural state, will appear wet when compared with those parts which have been properly drained.

A 3 feet drain should be carried along the ends of these drains at the top of the field, and at a distance of about 9 feet from the fence, especially if it is a hedge fence. Such a drain is necessary for the growth of the hedge, and to render the end ridges, where there is much carting and turning, completely dry; but if made nearer than 9 feet, the roots of the hedge are apt to get into drain, and choke it up by degrees.

It is of importance to be accurate in laying off the drains as described, as it secures uniformity of dryness, and in all future operations, or at any time, it is easy to ascertain the line of any drain. Some people are still prone to the practice of throwing in a cross drain, or to branches going off at right angles, which is of no farther avail in drying the land, whilst it increases the length of drain without any increase of the area drained.

It may prove of great use in after times to have a plan of each field, with the lining of the parallel drains and main drains accurately laid down, and the lengths and distances marked in figures, to remain as a reference.

It has been pretty generally believed and argued, that drains laid off in this manner on a steep, will not be so effectual in catching water, but this notion can be shown to be erroneous. Drains drawn across a steep, cut the strata or layers of subsoil transversely, and as the stratification generally lies in sheets at an angle to the surface, it will be seen, on reference to fig. 7, that the water passing in or between the strata, immediately below the bottom of one drain, nearly comes to the surface before reaching the next lower drain as *a a a*. But as water seeks the lowest level in all directions, if the strata be cut longitudinally by a drain directed down the steeps, the bottom of which cuts each stratum to the same distance from the surface, as represented in fig. 7, by the line *b b b*, the water will flow into the drain at the intersecting point of each sheet or layer, on a level with the bottom of the drain, leaving one uniform depth of dry soil.

This applies alike to water flowing from below or falling on the surface; the truth of this has been practically proved on a large scale, in soils of various natures, where spouty banks have been completely dried without a single cross drain. It does sometimes happen that there exists what is called an "eye spring," arising from some accidental tubular opening in the substratum. In such case it may be necessary to run a small branch drain, from the nearest parallel drain, into the eye of the spring. This, however, is of rare occurrence.

A very important advantage of having the drains down the steep, is the prevention of any lodgment of mud or sand, the current having force from the declivity to carry them along to the main drain; besides, in the event of any accident choking a drain,

\* A Scotch term for the first furrow in breaking.

the water will either, by its altitudinal pressure, force through the obstruction, or, by bursting out at the surface, will show very nearly the spot where the evil exists. Whereas cross drains, having little declivity, are often filled high up with water for years before the insidious cause of mischief is discovered.

It has lately been asserted that drains so placed are apt to burst out, or *blow*, as it is sometimes termed. This can only take place when the drains have been executed in an imperfect manner, whereby an obstruction of the flow of water is caused; for a well executed drain will void more water running down the steep than if across, and so much rain water cannot at any time fall as to fill up the open area of interstice of the broken stones.

It is quite necessary to fill drains directed down the steep with stones of a small size—say  $2\frac{1}{2}$  inches in diameter—or with danders or gravel, to prevent the current of water from cutting or running the bottom of the drains.

The filling of drains with small sized material is in other respects preferable—no pressure will crush it, so as to fill up the interstices where the water flows—the sides of the drain are more closely and uniformly pressed, which prevents falling in or wasting—no moles, rats, or mice, or other such vermin, can make way into the drains, or force such a quantity of earth in from the sides as to stop the flow of water—besides, material for such is more generally and easily found, and the execution is cheaper, unless the masses, from which the stones have to be broken, are very large—by collecting, from the surface of the fields, all stones not larger than a hen's egg, as many can be found in most dry field situations as will serve to drain completely a field of equal extent. These smaller stones requiring no breaking, and being gathered by women and children, cost very much less. It has been plausibly maintained by some theorists, that small materials filling a drain, will be apt to catch earthy matter from the water flowing along, and become in a few years, a dense mass of stony earth, altogether ceasing to form a drain. Without meeting this objection by a train of reasoning, which could be satisfactorily done, it may be quite sufficient to state, as fact, from experience, that such result does not take place.

Indeed, the water passing into the drains, by filtration, being perfectly pure, has no sediment to deposit; for, even during the heaviest rains, the water passing from a properly made drain has merely a slight milky tinge. Tiles for such drains are very expensive, costing more for tiles alone, in most circumstances, than the whole cost of a broken stone drain; besides, they are precarious as to durability, as one tile yielding may stop a great length of drain.

There are situations, however, where, from the want of stony materials, tiles must be resorted to. It is generally in flat carse land where tiles are used; also in districts of extensive fields of clay, with a scanty supply of stones. Fig. 8 represents a transverse section of the tiles commonly used, *a* being the covering tile, 4 inches wide, and 6 inches deep, *b* the sole or bottom tile. In hard bottomed land the sole tile is unnecessary. The tiles are generally from 12 to 14 inches long; they are sold by the maker at from 3s to 3s per thousand, and, where soles are included about 50s per thousand; but I have been assured by an intelligent gentleman, that he can furnish them in his own ground, where coals cost 4s per ton, at 14s per thousand, and with soles at 21s per thousand, not including any charge for implements, &c., necessary in the manufacture, such as a clay mill, drying sheds, and a burning kiln; but

these are not very expensive, and will last for many years with little repair, and one such establishment will furnish tiles for a large district of country. When tiles are used it is not necessary to cut the drains so deep as where stones are to be used, 24 inches is quite enough. Mr. M'Ewan of Blackdub, on the Blairdrummond Estate, near Stirling, has with much ingenuity and perseverance, perfected a plough, which, in the carse land, throws out a furrow of from 16 to 18 inches deep, leaving 6 inches to be taken out with the spade for the seat of the tile. This he gets done and the tile placed for 6d per rood of 36 yards. The plough requires from 8 to 12 horses, and 7 men, who can execute with ease 324 roods of 36 yards per day; taking 12 horses at 4s each, and 7 men at 2s, the amount will be 62s, being about 2d per rood. Taking tiles at an average of 15 inches, and allowing for breakage, about 100 will lay a rood of 36 yards, which will make the cost of tiles furnished on the ground 1s 5d per rood, when flats or bottom tiles are used, they will cost in addition 8d, making in all 2s 1d for tiles and bottoms. But when tiles and bottoms are bought and carried, they will cost at least 6s per rood.

As much sandstone as will fill a rood with broken stones, say two cart loads, can be in most circumstances quarried, carted a mile, and broken to pass through at  $2\frac{1}{2}$  inch ring for 3s 6d. When flat thin stones can be procured, many people still make their drains with what is called a coupled bottom. Fig. 9 represents the common form of coupling. Fig. 10 the inverted couple, which is by far the most preferable when couples are at all used.

Coupled drains are, however, objectionable, being very liable to occasional, if not frequent failures, admitting moles, rats, &c. to travel in them, and being more apt to allow cutting of the bottoms of the drains in steep parts. Box drains are expensive, and liable to all the objections to coupled drains, with the additional fault of having a broad flat bottom, in which mud and sand are apt to accumulate and lodge—sometimes to the complete filling of the open area of the drains. (Fig. 11 shows a box drain.) In some parts of the country, where thin bedded rock prevails, the bottom filling of the drains is frequently done by placing three or more stones on edge, side by side, as shown in fig. 12, having openings betwixt them for the water to pass; this mode may do very well, and under some circumstances may be cheaper, but I do not consider it so secure as broken stones, especially where the drain is on a steep, or where the bottom is soft. The broken stones constantly check any tendency to a rapid flow of the water, and in soft bottoms they press on many points, and fall in to fill any hole that may eventually take place, and so prevent further mischief. Filling of drains with great irregular stones, some of them closing nearly the whole cross sectional area of what should be the open way of the drain, is too slovenly and absurd a practice to require any refutation. When the work is altogether done at the expense of the tenant, prudence or necessity will often lead to less expensive filling, such as using the stones larger and fewer of them, but when permanency is wanted, the greater expense and care should always be incurred, as much of the permanency depends on careful filling with proper material.

The lines of drains having been marked off in the field, the drainer begins by cutting with a spade on a line, then removing a first spading of about 13 or 14 inches wide all along; another follows with a narrower and a tapering spade made for the purpose, taking out another spading, and when picking becomes necessary, a third man follows with a pick,

and a fourth with a large scoop-shovel to cast out the earth—a smaller scoop-shovel is used to clean out the bottom, which should be cut as narrow as will allow the last drainer a footing, generally about 3 or 4 inches. From 2 to 2½ feet from the surface, are the best depths for such drains, the latter always to be preferred. The bottom should be cut as straight and uniform as possible, so that the water may flow freely along at all places, and it is better to cut a little deeper when there is any sudden rise of the surface, than to follow it; and where sudden hollows occur, the cutting may on the same principle be less deep; attention to this also admits of after straightening or levelling of the surface, without any injury to the drains. The workmen, in cutting, should throw the earth to the right and left from each alternate drain, so that allows the plough to go regularly and fully occupied *boutings*,\* in filling in the earth, whilst each alternate ridge or space is left for getting in the stones free from the earth thrown out. The stones may either be laid down at intervals by the sides of the drains, to be there broken, or being broken in masses at some convenient spot, and at such convenient seasons as best suit for the employment of spare labour, can be brought by the carts ready to be filled in. No stones should be filled in, till the whole line of drain has been cut out and inspected, but the sooner drains are completed after having been cut the better, and they should always be filled from the higher level downwards. Sometimes when there is much tendency of the sides to fall in, it becomes necessary to fill in going along. Cutting in the Summer, when there is little water in the soil, or in any dry season, saves much of this. In soft or sandy bottoms, by cutting the drains to half the depth in the first instance, and allowing them to remain so until the water has been voided from the upper stratum of the soil, the lower part may then be cut out with more safety from falling in. The stones should not be filled nearer to the surface than 18 inches, leaving 16 inches free for deep ploughing.

The upper surface of stones having been made straight and uniform, the whole should be neatly and closely covered with a thin thatch or *flauchier divot* or turf, cut from the adjoining surface, or brought from some suitable place. *Strict attention to the correct execution of this operation is of the greatest importance, as many drains are ruined at once from the running in of loose earth.* Thick turfs are objectionable, from the difficulty of getting them to fit close. Straw, rushes, broom, whins, and other like materials, are very objectionable, affording no certain or uniform security, and forming a receptacle for vermin; peat moss, in a thin layer well beat down, may be used to advantage. When the deepest ploughing has been executed, there should always remain a firm crust of earth undisturbed over the stones of the drain; and no surface water should ever have access to the free way of a drain by any direct opening, but should find its way by percolation or filtration through the subsoil, and should always enter by the sides of the drains. It may be of advantage to tramp or beat down closely the first 2 inches of soil put over the turf, in order to form the permanent crust.

The cost of executing such drains varies, of course, according to circumstances—the cutting costing from 1s 6d to 2s 6d per rood of 36 yards, according to the hardness of the subsoil; the stones,

if collected on the adjoining fields, will cost from 1s to 1s 6d per rood, the breaking from 9d to 1s per rood; about 1½ cubic yards of broken stones will fill a rood of a narrow and well cut drain; the putting in of the stones may be calculated to cost about 3d per rood, and the turfing about 1d; the filling in of the earth over the stones with the plough will cost about 1d per rood. The whole cost per rood of common drains may be taken at 4s 8d, or, including a charge to cover proportion of main drains, 5s.

The tables at the end of this article exhibit the cost per Scotch acre, and per statute acre, of draining in this method, at various distances between the drains; and such forming a permanent improvement of the land, it is presumed the proprietor should defray part of the expense.

The tables are therefore constructed to show how much it will cost the landlord in money to do the cutting, furnishing, breaking, and filling in of the stones, and turfing; and how much the horse work, &c. to be performed by the tenant, will cost, charged at the ordinary rates.

In cases where time or capital are wanting to complete the drainage at once, each alternate drain may be executed in the first instance, and the remainder can be done next time the field is to be broken up.

After the drainage has been completed, a crop of oats may be taken from the field; and immediately after that crop shall have been separated from the ground, the field should be gone thoroughly over with the Subsoil Plough, crossing the lines of drains at right angles.

The SUBSOIL PLOUGH, as exhibited at Messrs. Drummonds', (a figure and description of which will be found in this Report), has been constructed on principles appearing the best fitted to break up the subsoil completely, to a depth sufficient for most thorough cultivation, say 14 to 16 inches, allowing the active soil still to remain on the surface—to be of the easiest possible draught in reference to the depth of furrow and firmness of the subsoil—to have strength and massive weight sufficient to penetrate the hardest stratum—to resist the shocks from fast stones, and to throw out all stones under 200lbs in weight. All this has been accomplished and practically proved, over an extent of at least 200 acres of various soils; and reports of the successful application of those ploughs in various parts of England and Scotland, during the last and this season, have been received. The plough requires 4 good horses, an active ploughman, and a lad to drive the horses and manage them at the turnings. Six horses yoked three and three a-breast, may be necessary in some very stiff or stony soils. A common plough, drawn by a pair goes before the subsoil plough, throwing out a large open furrow of the active soil. The subsoil plough following, slits up thoroughly and breaks the bottom, when the next furrow of active soil is thrown over it; the stones brought to the surface by the subsoil plough being thrown aside on the ploughed part of the land by a lad, and so on till the whole field is gone over. The lad should carry a bag of wooden pins that he may mark the site of the large fast stones which the plough cannot throw out, and which must afterwards be dug out with the pick, and perhaps blasted.

The large plough is a sort of *horse pick*, breaking up without raising to the surface the subsoil. Channels are thus regularly formed for the water to flow from all parts towards the drains. The atmospheric air being also by this means freely admitted to the

\* A Scotch term for a rotation or traverse of the plough.

subsoil, the most sterile and obdurate till becomes gradually meliorated, and the common plough may ever after be wrought to a depth of from 10 to 12 inches without obstruction, and with the power of three horses, yoked a-breast, and managed with ease by the ploughman without any person to drive—being thus yoked together, and near the point of resistance, the horses have great power. The furrow turned over being broad in proportion, nearly as much ground will be gone over in a day as with a plough and a half drawn by a pair of horses. The charge of subsoil ploughing an acre may be estimated at 24s, being one-fifth of what a similar depth with the spade would cost, and, upon the whole, as effectually done. A subsoil plough weighing 4 cwt, with apparatus will cost from 7*l* to 8*l*. When land which has been opened up by the subsoil plough shall have undergone the first rotation of cropping, the soil may then be turned up and mixed to the full depth previously penetrated by the subsoil plough say 16 inches. This is executed by a plough either made in the form of Wilkie's plough, having all its dimensions made of double size, or what is found to answer fully as well, by a plough in the fashion of the old Scotch plough, but also of double the dimensions. Such ploughs require six horses, yoked three and three a-breast, with two men to do the work effectually. This operation should be performed in turning over the winter furrow preparatory for green crop, and the sooner the work is performed after harvest the better. In estimating the expense of this operation, the horses may be charged at 4s each, to cover all expenses tear and wear, &c., which will amount to 24s; two men at 2s—1s; and an attendant lad to pick out stones 1s, in all 29s. As the work is heavy, the motion of the horses is necessarily slow, and it will in general take eight hours working to accomplish one Scotch acre or 1½ statute acre. The expense of this operation may appear alarming, but when it is considered that one such ploughing will be more effectual in killing weeds, and in exposing the soil to the air, than two ordinary ploughings, we may deduct the cost of two such—20s, leaving 9s, to be charged against the deep working. All who have ever studied or experienced the most common gardening must be aware of the important advantages of deep working, and when it can be attained in the broad field of farming at so small a cost, they may easily believe that the whole will be more than doubly repaid, in every succeeding crop, and abundantly even in pasture. When land has been thoroughly drained, deeply wrought, and well manured, the most unpromising sterile soil becomes a deep rich loam, rivalling in fertility, the best natural land of the country, and from being fitted for raising only scanty crops of common oats, will bear good crops of from 32 to 43 bushels of wheat, 30 to 40 bushels of beans, 40 to 60 bushels of barley, and from 48 to 70 bushels of early oats per statute acre, besides potatoes, turnips, mangel wurzel, and carrot, as green crops, and which all good agriculturists know are the abundant producers of the best manure. It is hardly possible to estimate all the advantages of dry and deep land. Every operation in husbandry is thereby facilitated and cheapened, less seed and less manure produce a full effect, the chances of a good and early tid\* for sowing are greatly increased—a matter of great importance in our precarious climate,—and there can be no doubt that even the climate itself will be much

improved by the general prevalence of dry land. When this subject was treated of in the former report, published in March, 1833, the system was just beginning to be adopted in a few places in a very few districts of Scotland, England, and Ireland, and in most instances on a very limited scale. Since then the intrinsic merits and evident outspeaking results of the system have raised its character, even with many of its former opponents; and one cannot now travel almost any where in the country, without seeing, either on a large or small scale the operation of thorough draining going on. The deep ploughing is not yet so general, but it will undoubtedly follow: and it is to be regretted that in the mean time, some zealous and good farmers, not aware of its advantages, are filling their drains so near the surface as to mar the future thorough application of the system of deep working.

Thorough draining is the foundation of all good husbandry, and when combined with deep ploughing insure a general and uniform fertility, assisted no doubt by the essentials, thorough working and cleaning, ample manuring, and a proper rotation of crops.

In making a survey of the agricultural aspect of Scotland, and great part of England, it must be evident to every one skilled in agriculture, that by much the greatest proportion of the arable land, indeed we may assume three-fourths of the whole, is under very indifferent culture, arising mainly from the want of complete draining and deep working; and looking even to the best farmed districts with the eye of an experienced farmer in the thorough system, much of the land will be seen suffering under wet or damp. All the heavy lands of the Lothians, Berwickshire, Fife, Strathmore, Clydesdale, &c., would be greatly benefited by the introduction of the system, and if generally adopted we would hear no more of "stiff clays," "cold retentive soils," and the like, in the Agricultural Reports.

There is no want of employment for all the spare labour and spare capital of the country, in the general thorough cultivation of the soil, and if properly gone about, it will afford ample remuneration to the individual possessors and farmers of the land, while the riches of the country will be greatly increased.

The cultivation of the inferior soils will tend to lower the value of the high rented lands, but the general rental of the country will be much increased whilst the prices of all agricultural produce will be lowered, thereby affording cheaper sustenance to the manufacturers, which will enable them to meet more effectually the cheap labour of other countries; and it is not at all improbable that Britain may become an exporting country in grain in the course of the next twenty years, thereby overthrowing the bugbear corn laws without a political struggle. This may appear a very bold anticipation, but to those who know intimately the history of the progress of the wonderful improvements which have taken place in the various leading manufactures of the country, in the course of the last twenty years, and who can appreciate the vast improvement of which agriculture is yet susceptible, it will seem as no very hopeless prospect. Often was it thought that the perfection of these arts had been attained, when, by the application of science, capital, division of labour, and industry, some new and extensive step was gained whereby the cost of production was cheapened, and immediately the field of consumption was extended. In most cases those steps of improvement were urged, more by the necessity arising from low profits, and extensive rivalry, than from the encouragement of high profits and extensive demand. So is it

\* "Tid," a Scotch term for that state of the ploughed soil which is most suitable for receiving the seed—neither too moist nor too dry.

now operating with the agriculturist. During the reign of high prices, any sort of farming was sure to pay; but now, when prices are low, nothing but skill and capital, and well regulated industry will do; and since higher prices are scarcely to be looked for, the only hope of the landowner and the farmer, is to use every means to produce their articles cheaper and in greater quantity. From the progress which the system of thorough drainage has already made, the lists are fairly entered by the hitherto con-

sidered poorer soils against the rich, the rivalry cannot be stopped, and the result will shortly be, a greater agricultural advancement in Great Britain than has ever before taken place. The grand natural prompter, *self-interest*, will in due time sufficiently work out such results. Yet much may be done in assistance by the exertions of proprietors, and agricultural associations; and by the national legislature, in the case of entailed lands.

## WEEDS.

Experience would soon teach a man, when he was necessitated to raise the greatest possible produce from the land to meet the urgent demands upon it, that the existence of weeds in the land was injurious to his crops; that weeds which are the natural production of the soil were more easily fostered with manure, and less liable to be affected by the vicissitudes of the weather, than the cultivated corn crops. He would soon discover that it was not by a repudiation of these corn crops that the weeds would be subdued; but that, on the contrary, every year would only give additional strength to them, so that in a few years the ground would be so matted together by the interlacing of their roots, that no tender plant, like any of the cultivated ones, could possibly penetrate through such a mass of living net-work. Experience would soon teach all this. And yet in spite of this experience, which must be within the reach of every man who cultivates the ground on a large or small scale, the slovenly practice of allowing weeds to grow on cultivated lands is too much countenanced in the agriculture of the Principality. Corn crops must be sown early in the spring, and as the whole summer is required to bring them to maturity, winter can be the only period of leisure under such wretched management, in which the land can be cleaned; but to attempt to kill weeds in a season when the progress of the plough and harrow is generally arrested by rain or frost, is impracticable. The culture of green and white crops alternately, is a successful expedient in checking the growth of weeds, in maintaining the fertility of land, and enjoying the benefit of a crop.

But still experience, that hard and uncompromising master, places an obstacle to the success of even the plausible expedient of man. But how can he help it? Paltry as these weeds are, they effectually prevent the growth of his crops, and he is driven to this expedient, namely, following by shear necessity. He must clean his land, or lose the greater part of his labour in cropping the soil. This alternative will not permit of hesitation. Hence, then, the object of all following is to clean the land, and hence also no following, but that in summer, will effectually do it. A strong crop of turnips, and part of it eaten off by sheep, assist very much in cleaning the land even of root weeds. But will summer fallow keep land clean? Undoubtedly it will, if properly performed. It gives the opportunity of working land in June and July when the sun is so powerful, and the atmosphere so warm and dry, as to kill every plant that has not a hold of the ground. It must be confessed that following is too often worked very negligently. The farmers display great negligence and ignorance in thinking that weeds ploughed down afford nourishment to the soil, when that soil has been exhausting itself in bearing the crops of weeds. The world is always in a state of pupillage; some are learning what others know; and the observations which to the young are interesting, are to the experienced and wise trifling and superfluous. So it must be with essays on agricultural subjects, which can only be directed to the general instruction of the experienced; while the practised and sagacious agriculturist must be requested to pardon the particularity with which things well known to him are so tediously written down.—*Salopian Journal*.

## SUBSOIL PLOUGH.

## SUBSOIL PLOUGH AND DEEP FURROW PLOUGH.

By JAMES SMITH, Esq., of Deanston Works.

The Subsoil Plough, of which an elevation and bird's eye view are given on the above plate, was designed by the writer of this article, about nine years ago, for the purpose of opening up the close subsoil of the farm of Deanston.

In the design, two essential points were kept in view.—1. The construction of an instrument that would effectually open up the subsoil without throwing any of it to the surface, or mixing it with the active or surface soil.—2. To have an implement of the easiest possible draft for the horses, while it was of sufficient strength and weight to penetrate the firmest ground, and resist the shocks on the largest stones.

The extreme length of the plough is about 15 feet. From the socket at the point of the beam to the first

stile or upright, 6 feet; from thence to the back of second stile, 19 inches; from thence to the outer end of holding handles, 7 feet; from the sole to the bottom of beam at stiles, 19 inches; length of head or sole bar, 30 inches; from head of sole to point of sock, 46 inches; broadest part of sock, 8 inches. The coulters are curved, and in order to prevent its point being driven from its place by stones, it is inserted to the depth of an inch in a socket (*a*). The lateral dimensions of the sole piece are 2 inches square. This is covered on the bottom and land side with a cast-iron sole piece to prevent wear. The sock goes on to the head in the usual way, and from its feather rises the spur piece (*b*), for the purpose of breaking the subsoil furrow. When the subsoil consists of very firm clay or other hard and compact earth, the feather and spur piece may be dispensed with, and a plain wedge or spear pointed sock, such as those of the old Scotch plough, may be used. The draft bar (*c*) of 1½ inch round iron, is attached to the beam at the strong eye (*d*), and passing through an eye in the upright needle (*e*), is adjust-

able to any height or lateral direction, being moveable in the socket (*f*), at the point of the beam, and can be made fast at any point by a pinning screw wrought by the lever (*g*). By the proper setting of the draft rod, the direction of the power of the horses is so regulated as to render the guiding of the plough easy at any depth or width of furrow. The beam is about 5 inches deep at the middle, and  $\frac{1}{4}$  inch in thickness—towards the draft end it tapers to 3 inches deep, and 1 inch thick; at the holding end where the handles branch off, it is 2 inches by 1. The whole weighs 440 lbs imperial. This appears an enormous weight, and most people are alarmed at the strength and weight of the implement, but after repeated trials with lighter ploughs, those of the dimensions and weight now described have been found to be at once the most efficient, the most easy of draft, and the easiest for the ploughman to manage.

Four ordinary farm horses are generally sufficient to draw this plough in breaking up subsoil of ordinary firmness; but on very tough clays or in hard till, it may be found necessary to use six horses. When four are used, they are yoked two and two, by draft bars and chains, as shewn in fig. 4. When six are used, they are yoked three and three, by draft bars and chains, as shewn in fig. 3. The main chain for the leading horses to pull by is hung, in both cases, by links from the collars of the rear horses, to keep it up from their legs, and the trace bars of the leaders are kept close up to their hams by cross straps on their quarters.

When horses, which have been accustomed to work in pairs, are first put to work in this plough, they are apt to be a little restive, and do not at first pull well together, and this is especially the case when the subsoil is stony. The ploughman also finds some difficulty in balancing the plough at first, and if he is not a man of quiet and firm temper, the whole affair puts on the appearance of an arduous and hopeless undertaking; a few hours or days at most, however, of temperate perseverance will overcome all difficulties, and horses and men will work together with steadiness and effect. The work is, indeed, in most cases severe, and the horses are frequently warm and fatigued; but to insure good farming, the work *must* be done, and will amply repay all the trouble and expense. When a field or farm has been once efficiently gone over with the subsoil plough, it is not again necessary to repeat the operation, as the original stratum or the subsoil has been completely broken up, and all land stones which offer any serious obstruction to the plough have been removed. In after operations of deep ploughing, the work should be performed by an implement in all respects resembling the common plough, either Small's, Wilkie's, or the old Scotch plough, but of double the dimensions in all parts. In free soils, four horses yoked two and two, are sufficient to plough to a depth of 16 inches; but in heavier soils, six horses, yoked three and three, will be found necessary. This plough, which may be called a trench plough, should be applied once in each rotation of cropping, and the best time is in giving the first furrow for green crop, or in the event of summer fallow being followed, in the first furrow of that operation; this plough makes a mixture of the soil and subsoil, for which the latter has been prepared by the admission of air and water from the effects of the subsoil plough.

The operation, both with the subsoil and trench plough, should run at right angles to the line of drains, as channels are thereby opened for the rain water to flow towards the drains. When drains have been sometime executed, innumerable small fissures will be found in the subsoil, extending from

drain to drain; these are caused by the contraction of the substance of the soil arising from its drier state—the contraction being greatest in the stiffest clays—the operation of the subsoil plough admitting the air to a greater depth, the fissures take place under its operations, and generally reach to the level of the bottom of the drains. These fissures will get more or less silted or glutted up from time to time by the minute diluvial particles carried down and left in filtration by the rain water, but the constant expansion and contraction of the unremoved subsoil, by the alternations of wet and dry, has a perpetual tendency to renew them; so that so long as the drains flow freely there will never be wanting minute channels for the percolation of the water from all parts towards the drains.

A subsoil plough costs from 7*l* to 8*l*, and a full-sized trench plough from 4*l* to 5*l*; and it is hoped that any plough-maker will be able to make them from the preceding description and plate.

Mr. Murray of Polmaise has just had a plough constructed on the principle of the subsoil plough, but of smaller dimensions, and weighing only 168 lbs imperial, which in dryfield soil, with a *moorband* bottom, has been drawn to the depth of 16 inches, and proved effective in breaking up the subsoil, and turning out stones of considerable size.

In the experiment alluded to, the plough was drawn by three horses, so yoked that two go in the furrow, and one on the unploughed land.

Price of this plough about 3*l* 5*s*.

## A CASE OF ACUTE FOUNDER IN BOTH HIND FEET.

By MR. CHARLES CLARK, LONDON.

(From the Veterinarian.)

The subject was a brown mare, seven years old, purchased at the last Lincoln fair by a west-end dealer, who brought her up to town in the string with a number of other horses. She was docked and shod after the fair, and left Lincoln sound; but after the first day's journey appeared to favour the off hind foot, which induced the owner to have the shoe removed, when, however, no cause was found for the lameness; and as it was not severe at first, they continued to travel her towards town. On the morning I saw her she had come nearly thirty miles; she was very lame in the off leg, and partially so in the near one. After standing a short time she became worse; and the blame being still imputed to the farrier, we contrived with great difficulty, to raise the foot far enough from the ground to take off the shoe, when I was surprised to find that the wall was particularly good and strong; and the nails had all been driven with such unequivocal safety, that I at once exonerated poor Vulcan (in this instance) from all share of blame. The near shoe we could not then take off, for the mare would not stand a moment on the other feet. The symptoms now became exceedingly puzzling. The feet themselves did not feel very hot, but the legs were uncommonly so. She kept shifting them quickly, and the muscles of the thighs and loins were constricted and quivering in a manner I never saw before to such a degree. The pulse was accelerated, and eyes staring with pain; but she kept snatching small quantities of food, and drank freely.

She was bled largely, had a mild dose of aloes, and

repeated clysters, with warm fomentations and bandages to all legs.

May 3d.—Much worse; equally in pain with both legs; muscles more contracted and rigid; head and tail staring. Has lain down at full length for some hours, and got up again with difficulty: every appearance, excepting this last circumstance of her lying down, denotes approaching tetanus. Reverting, therefore, to the recent docking, I began to consider the symptoms as dependent on this operation, aggravated by her having travelled so sharply, and almost all the way in hard rain, which might have chilled the spinal column, and produced these effects.

Under this erroneous impression, I took the liberty to amputate an inch and a half more of the caudal extremity, according to the old prescribed custom, being not quite clear in my view of the case, and willing to adopt any suggestion that was not injurious. The depletives were persisted in, and warm fomentations and clysters kept up without much intermission. The bowels are open, but we have not seen her stale; and the wetness of the litter prevents our judging on that point.

May 4th.—Every way much worse. A veterinary friend concurs with me that it is tetanus; the locked jaw and the twitching of the membrana nictitans alone are wanting to make it a perfect case: but resulting, as we imagine, from docking, it may affect the hind extremities principally at first. She stands almost immovable, with the muscles hard and rigid.

May 6th.—From appearances I observed this morning, and the absence of the proper tetanic symptoms, I determined to investigate the feet most thoroughly, for I began to suspect, both being now alike, that it might be acute founder. Accordingly, with the greatest difficulty, and not without throwing her down, we contrived to pare out one foot; the nailing had been so safe, and the sole looked so white and firm, that as we removed slice after slice, I could hardly believe there was any ground for our search; but at length a slight redness was perceivable; it increased, and shortly after it became palpable that the highest degree of inflammation was existing in this apparently sound and perfect organ. To such an extent had it proceeded, that we could procure no blood from the congested vessels: the podophyllous structure was destroyed in the front of the foot, and separated from the keraphylla. The other foot was found to be nearly in as bad a condition, under the same fair outside appearance.

In a few hours after they were pared out and dressed, the fungous portion of the podophylla burst out at the coronets in both feet, like a piece of iron sponge, followed by a red ichorous discharge. I now gave up all thoughts of saving the mare, and ordered her to be destroyed the next morning; however, she died in the night, in great pain. I secured both feet, and some idea may be formed of her sufferings, and the extent of mischief, when I was enabled to extract one of the feet at once from the hoof, so much was the attachment broken up throughout. The other required but little maceration.

It is most likely that from the first time I saw her little assistance could have been rendered; but the various circumstances I have mentioned contributed to obscure the truth. The exciting cause can only be guessed at. She was a fine mare, and they said a remarkably fast trotter; and as to the feet they were in figure and strength all that could appear desirable.

PRICES—BANK PAPER—RATE OF TAXATION.

(From the Appendix to the Third Report of the Commons' Committee on Agriculture.)

Abstract of a return, showing the crops and price of wheat from 1815 to 1835 inclusive; the amount, decrease, and increase, of bank paper for the same period; and depreciation of British produce; the population: official value of manufactures, &c.

Date.	Price of Wheat per Quarter.	Total of Bank of England and Country Bank Paper.	Average Price of Wheat for Periods of Five Years.

## BRAMPTON AGRICULTURAL MEETING AND CATTLE SHOW.

The agricultural meeting and cattle show took place at Brampton on Monday, October 24, and owing to various causes was not so well attended as on former occasions. One obvious reason for this deficiency was, that far advanced as we are in Autumn, yet there is a considerable quantity of corn to be gathered in from the land, and therefore the neighbouring farmers took advantage of the fine weather on Monday morning to advance the harvest. Another reason may be this—the, what to us appears, impolitic and short-sighted policy—of awarding premiums to those animals only which are bred in the district, and which consequently offers no encouragement to superior breeds being introduced from a distance. The show of horses was good, both as regards numbers and quality, but we cannot say so much for any description of cattle.

The judges appointed for the occasion were Mr. Moses, of Tarn House; Mr. Tweddle, of the Barn; Mr. Brown, of the Red Hills; and Mr. Brown, of Angus Well.

After the show a party of gentlemen sat down to a plentiful dinner at the Howard's Arms Inn, John Ramshay, Esq., steward to the Earl of Carlisle, in the chair, supported by R. Ferguson, Esq., of Harker; H. Farrer, Esq., of Scaley Hall; G. H. Hewitt, Esq., of Burghby-Sands; Joseph Dixon, Esq., Broadwath; T. James, Esq., Brampton; W. Carrick, Esq., coroner for the district, &c.

After the usual loyal toasts, the CHAIRMAN said—the next toast upon my list, gentlemen, is the successful candidates, but as the judges are at present out of the room, for the purpose of making the awards, we must skip over that toast, and by way of filling up the omission I will give success to the Brampton Cattle Show. Certainly the exhibition this day has not been so numerous as I could have wished, but perhaps next year the Committee will provide some better arrangements with regard to short-horned stock, which will ensure a greater attendance, and consequently more competition.

The CHAIRMAN then gave in succession, the Members for the City of Carlisle, and the Earl of Carlisle. The Secretary then read the list of premiums, as follows:—

### Short-horned Bulls above 2 years old—Premium 5l 5s.

- 1.—William Bell, Highberries.—Only one entry, (premium.)

### Short-horned Bulls under 2 years old—Premium 2l 2s.

- 3.—Daniel Sewell, Newlands (premium).
- 2.—Joseph Dixon, Broadwath.

### Galloway Bulls above 2 years old—Premium 5l 5s.

- 4.—Thomas Wannop, Holmgate, (premium).
- 5.—Thomas Warwick, Warwick.
- 6.—William Pig, Mosside.

### Galloway Bulls under 2 years old—Premium 2l 2s.

- 7.—John Johnstone, Pedderhill, (premium).
- 8.—Thomas Warwick, Warwick.
- 9.—Robert Holiday, Stonehouse.
- 10.—James Thompson, Cumrew.
- 11.—John Hodgson, Newtown.

### Short-horned Heifers, 2 years old, in calf—Premium 3l 3s.

- 14.—Joseph Dixon, Broadwath, (premium).
- 12.—Thomas Bell, Townfoot.
- 13.—John Thompson, Coathill.
- 15.—Matthew Brown, Low Cummersdale.

### Galloway Heifers, 2 years old, in calf—Premium 3l 3s.

- 24.—William Gilkerson, Beaumont, (premium).
- 16.—John Johnstone, Pedderhill.
- 17.—Thomas Warwick, Warwick.
- 18.—Robert Holiday, Stonehouse.
- 19.—John Hodgson, Abbey Bridge-end.
- 20.—Ditto, ditto.
- 21.—William Richardson, Cumcatch.
- 22.—Thomas Knott, Sandhouse.
- 23.—Ditto, ditto.

### Galloway Bullocks under 2 years old—Premium 3l 3s.

- 28.—John Hetherington, Milton-hill, (premium).
- 25.—William Gilkerson, Beaumont.
- 26.—James Burgh, Ryeclouse.
- 27.—John Thompson, Coathill.
- 29.—William Graham, Lawstown.

### Galloway Heifers under 2 years old—Premium 3l 3s.

- 31.—John Johnstone, Pedderhill, (premium).
- 30.—John Thompson, Coathill.

### Short-horned Heifers under 2 years old—Premium 3l 3s.

- 33.—H. A. Aglionby, Esq., M.P., Newbiggin Hall, (premium).
- 32.—Matthew Brown, Low Cummersdale.
- 34.—Joseph Dixon, Broadwath.

### Leicester Tups of any age—Premium 2l 2s.

- 38.—William Bell, Highberries, (premium).
- 35.—Mr. Farrer, Scaley Hall.
- 36.—H. A. Aglionby, Esq., Newbiggin Hall.
- 37.—William Saitler, Hill.
- 39.—Thomas Mitchell, Stanwix.
- 40.—James Thompson, Cumrew.
- 41.—Ditto, ditto.
- 42.—Thomas Bell, Townfoot.

### Cheviot Tups of any age—Premium 1l 1s.

- 43.—Joseph Ewart, Crookburn, (premium).
- 44.—Ditto, ditto.

### Black-faced Tups of any age—Premium 1l 1s.

- 45.—James Dobson, Gelstone, (premium).
- 46.—John Atkinson, Breckonthwaite.

### Pen of three Leicester Gimmers—Premium 2l 2s.

- 48.—William Bell, Highberries, (premium).
- 47.—Mr. Farrer, Scaley Hall.
- 49.—W. S. Denton, Haraby.

### Pen of four Cheviot Ewe Hogs—Premium 2l 2s.

- 50.—Thomas Bell, Townfoot, (premium).
- 51.—Joseph Ewart, Crookburn.
- 52.—James Dobson, Gelstone.
- 53.—Christopher Parker, Brampton.
- 54.—Christopher Tweddle, Barns.

### Three Leicester Ewes—Premium 1l 1s.

- 57.—William Bell, Highberries, (premium).
- 55.—H. A. Aglionby, Esq., M.P., Newbiggin Hall.
- 56.—Mr. Farrer, Scaley Hall.
- 58.—Thomas Bell, Townfoot.
- 59.—John Hodgson, Newtown.

### Three Cheviot Ewes—Premium 1l 1s.

- 60.—Joseph Ewart, Crookburn, (premium).
- 61.—Jacob Moses, Tarnhouse.
- 62.—James Dobson, Gelstone.

### Three Black-faced Ewes—Premium 1l 1s.

- 63.—Jacob Moses, Tarnhouse, (premium).
- 64.—James Dobson, Gelstone.

### Draught Colt or Filly 2 years old—Premium 2l 2s.

- 66.—William Bell, Highberries, (premium).
- 65.—Robert Wilkin, Guards.
- 67.—John Atkinson, Breckonthwaite.

### Coaching Colt or Filly 2 years old—Premium 2l 2s.

- 71.—James Fawcett, Scaley Castle, (premium).
- 68.—Thomas Little, Watchcross.
- 69.—Thomas Wannop, Holmgate.
- 70.—Ditto, ditto.

### Draught Mares—Premium 2l 2s.

- 72.—Robert Wilkin, Guards, (premium).
- 73.—Christopher Tweddle, Barns.

### Boars—Premium 1l 1s.

- 74.—James Hetherington, Tithington, (premium).
- 75.—Joseph Ewart, Crookburn.
- 76.—John Hodgson, Newtown.

### Sows—Premium 1l 1s.

- 77.—Joseph Ewart, Crookburn, (premium.)

The CHAIRMAN then said—Gentlemen, if you will allow me, I will now propose the health of the successful candidates; and as there is one who seems to

have had a more than ordinary share of good luck, I think we cannot do better than to couple his name with the toast. I mean Mr. Bell, of Highberries. (*Great applause*).

Mr. BELL said he could assure the company that his success had been far above his most sanguine expectations; he felt great pleasure in witnessing such exhibitions as they had beheld that day, because they tended to the improvement of stock and the cultivation of soil in a proportionate degree, and the reclaiming, as a matter of course, of many unpromising and unprolific mosses; and though he did not expect, nor would it be expedient, to grow corn upon Tindall Fell or Christonbury Craggs, still he hoped that, by means of the encouragement held out by this and similar societies, and by the industry and enterprise of the agricultural population, to find that the morass would yield to the cultivating hand of man, and nature put on her smiling universal robe. (*Loud cheering*.)

The CHAIRMAN: Gentlemen, I think we ought to drink the unsuccessful candidates, coupling with that toast the health of Mr. Farrer, who, although he has made many entries, I am sorry to say has not succeeded in one.

Mr. FARRER said, I must stand up, Gentlemen, to return thanks, because I suppose no other one will stand up in the name of the unsuccessful candidates, and I have therefore the honour of standing alone. I am sorry that we can only say, with reference to our stock, that we must endeavour to amend as far as we can, and try if we can better ourselves. We have been favoured by what we have seen to-day, particularly with regard to the Galloway stock, and I wish you success at all your future meetings, and that you may have a better show of short-horns next year; and if we cannot exceed our competitors, I only wish that next year we may equal them. (*Cheers*.) I have, in conclusion, a favour to beg, that of proposing the health of the judges, those gentlemen who have done us the kindness to attend here this day, to take upon themselves the important and onerous office of judges this day; for although we may have plenty of cash, and abundance of stock shown without judges we could not make the awards (*Cheers*.)

Mr. MOSES returned thanks.

The CHAIRMAN then said, Gentlemen, we ought not, on this occasion, to forget similar societies in this county, and if you allow me, I will propose success to the Carlisle Society, coupling with it the name of Mr. Hewit, of Burgh, who is a prominent member of that Society.—(*Drank with three times three*.)

Mr. Hewit said, I thank you, Gentlemen, for the kind manner in which you have been pleased to drink my health; yet, although my name has been coupled with the Carlisle District Society, I am convinced there are others present to whom the honour is more justly due; and although my attachment may be strong towards the Carlisle district, it extends to the Penrith branch, to this society, to that in the western part of the county, and to every agricultural association in the kingdom; for I look upon this as a ground on which all agriculturists ought to unite, in order to make every possible improvement. Agriculture has certainly been for a considerable time in a very depressed state, but not being a croaker I will not dilate further upon that matter; yet nevertheless I am not such a croaker as some, and now, when agriculture wears a brighter face, I should wish us to use our utmost exertions to improve and make the very best use of our stock and crop. And if such societies as this are properly encouraged, there is not a doubt that improvements must take place; for although some of the good farmers, my neighbours, are somewhat prejudiced against meetings of this sort, the younger farmers will no doubt enter them with spirit, will compete and show good stock, so that when they come to manage their father's farms, they will have a good breed to begin with. It certainly requires a farmer to use his utmost endeavours, at this day, to improve agriculture as well as all the other produce of industry; for we know that if the manufacturers of this country were not to take opinions, inquire as to the newest discoveries, and to use the best materials of trade, if they did not do so the commerce

of this country would not flourish in the way it has done. But although Englishmen have been called a nation of shopkeepers, they may be proud of it; it is but a small spot of land, yet it contains many individuals who are in themselves a treasure of infinite worth, and so long as they are usefully employed, so long will England be considered the greatest nation upon the face of the globe. Agriculture may in some measure make the same improvements as have been made in commerce, if agriculturists make the same exertions as commercial men; and I doubt not that agricultural societies will improve the situation of the farmers in the same way, so that they may arrive at a pitch of perfection and prosperity, almost equal to the former times. The small farmers here are a most industrious, worthy race of men, and it is owing to that, perhaps, that they have stood out prosperous against the great difficulties which they have had to encounter. I hope we shall all experience the benefit of these societies, especially with reference to male animals. The cow raises but one animal in the year, a bull raises a great many; and such societies as this are particularly calculated to improve the breed of animals, by introducing the best male animals into the district. I would also take this opportunity of alluding to the usual language of the newspapers, with respect to agricultural matters, although there are two editors present, but I hope they will forgive me; they do not, I think, enquire into all the particulars of the state of our markets, but content themselves with merely saying that it was a good market, good stock sold well, and bad stock hap an indifferent demand. Now let us endeavour to get more of the good stock, and banish the bad stock from the land. Good stock improves the finances of the farmer; it is much more desirable to look upon, and it is good every way. With regard to horses, I would say, that perhaps we have fallen into the error of looking at the lowest priced horses. Perhaps I am not so learned in agriculture as many present, yet although my opinion may not be so valuable as some, I will yield to none in attachment to it, for I am sure agriculture is in its infancy. Nothing is known of it, I am convinced, which will be known of it fifty years hence. I am sure that there is no class who possess more integrity, and none more worthy to be encouraged, than the Cumberland farmer. I have seen here this day a very excellent show of Galloway cattle and sheep, and the short-horned breed, although not numerous, was good. I am glad to see such a good company here, and I am sorry to say the only want I perceive here, although it may be considered presumption in me to say so, and though it may give offence, is, that the great land-owners are not present amongst us. (*Loud applause*.) And although I am not intimately acquainted with you, yet I feel equal respect to every farmer, let him be who he may; but there is no individual who could not do something towards promoting the success of this and similar societies, by exerting themselves to increase a knowledge of a better order of things.

The CHAIRMAN then proposed the health of Mr. Blamire, the title commissioner, a great friend of the farmer, and although the duties of his new situation called upon him to preside in another place, still he had the success of the society at heart, and had he been at home would certainly have been there that day.

Mr. FERGUSON then proposed the health of the Chairman, in a bumper toast, with three times three, and one cheer more.

The CHAIRMAN said, I feel exceedingly grateful for the kindness you have shown to me. I feel a deep interest, perhaps as much as any man, in the welfare of agriculture; and although I cannot address you so well, nor make so many pertinent observations as my friend Mr. Hewit, yet no one has the interest of the farmer more at heart than myself; and I am sorry that being disappointed in getting a better chairman, I am compelled to take the chair myself, and although this meeting has not been so numerously attended, yet some kinds of stock have been superior. Some time ago we had a discussion as to the propriety of joining some other societies in the county, and it was suggested that the Carlisle and Brampton societies might be united, the Carlisle having the spring show, and the Brampton the au-

turn one; but for some cause or other the union did not take place, which I sincerely regret, because I think it might be of advantage to both societies. I know it is not for me to dictate to other societies, but I merely mention this, throwing it out as a hint for future consideration.

The CHAIRMAN next proposed the health of Mr. Joseph Dixon, and success to the Inglewood Fox Hounds.

Mr. Dixon returned thanks, and in conclusion proposed the Magistracy of the County, connecting with that toast the name of Mr. Ferguson, who returned thanks.

The healths of the Editors of the Carlisle papers were next drank, and Mr. Steel and Mr. H Brooke severally acknowledged the compliment.

A number of excellent songs were sung, and the harmony of the evening was protracted until a late hour.

## WEST CUMBERLAND AGRICULTURAL SOCIETY.

The annual show of this society took place at Egremont on Friday, Oct. 27; the weather was highly favourable, but the attendance upon the ground was not so great as at the show in 1835. Amongst the company in the field were the Earl of Lonsdale, the hon. George O'Callaghan, Thos. Irwin, Esq., High Sheriff of the county, Edward Stanley, Esq., M.P., Milham Hartley, Esq., Rev. H. Lowther, Thos. Hartley, Esq., Joseph Burrow, Esq., Isaac Littledale, Esq., Charles Parker, Esq., of Park Nook, Rev. W. H. Leech, W. B. Jones, Esq., of Drigg Hall, Richard Barker, Esq., John Bowman, Esq., Hodyoad, &c. &c.

The show of horses was both numerous and good, especially the cart and coaching kinds, which were superior to those exhibited at any previous show of the society. The show of bulls was limited, and in quality not equal to those of last year. The show of cross bred heifers was very poor; but that of cows in calf and in milk could scarcely be excelled. The show of pigs was both numerous and good, and a few really prime white-faced and mountain rams were exhibited.

The exhibition closed about two o'clock, and the company almost immediately afterwards left the field. Shortly after that hour a party of 150 sat down to dinner in a large tent contiguous to the King's Arms inn, under the presidency of Thomas Hartley, Esq., of Gillfoot, Joseph Burrow, Esq., of Carleton Hall, acting as Vice.

After the usual loyal toasts,

The CHAIRMAN said they had been honoured with the presence of the High Sheriff; he begged to propose his health, and desired that it might be drank with three times three.

THOMAS IRWIN, Esq., of Calder Abbey, High Sheriff of the county, returned thanks.

The CHAIRMAN next gave the Lord Lieutenant of the county, and though he had proposed him in that high character he would digress a little, and give him as a most excellent landlord. (*Cheers.*)

The CHAIRMAN in rising to propose the next toast said he thought he might safely congratulate the meeting on the excellence of the stock which they had that day seen. The show was perhaps not numerous, but upon the whole he had no doubt they were progressing, certainly improving, in all kinds of stock. On this point he thought all would agree with him. On the other side of the county—at Penrith, a few weeks ago, there was such a show as had never before been seen in the North of England, and certainly never equalled in Cumberland; yet he believed he had good authority for saying that there was stock to be found in West Cumberland very little inferior to those of their neighbours in the East. If those around them would but send their cattle to Egremont he thought there would not be much room to boast of superiority in other parts of the county, but they seemed afraid to send least they should not obtain prizes. This was not the way to arrive at perfection. (*Cheers.*) Next year he hoped the show would be

more numerous, and he had not the least doubt but it would be better. In conclusion Mr. Hartley proposed "Success to the West Cumberland Agricultural Association." (*Drank with three times three.*)

The CHAIRMAN said the next toast he had to propose was the Members for West Cumberland, and he was extremely glad to see them. (*Drank with three times three, and one cheer more.*)

EDWARD STANLEY, Esq., M.P., begged for the kindness with which they had received the last toast proposed from the chair, and the manner in which they had drunk his health, in conjunction with the hon. colleague, to return them his grateful thanks and acknowledgements. Feeling as he did warmly interested for the success and welfare of the Association, he could not but congratulate them upon the respectable exhibition of stock which they had that day witnessed; and although some gentlemen, whom he knew to be well wishers to the society, might laugh at and joke them upon their long horns, and a variety of different breeds of cattle, (all said, he had no doubt, in the most perfect good humour,) which were to be seen in the West of Cumberland; still he thought it ought to be remembered that other societies of a similar kind had had precedence of theirs in point of existence: theirs was only in its infancy: and it had had—and still had, many difficulties to struggle through; yet notwithstanding those disadvantages, he thought from the show of stock that day brought into the field that they might flatter themselves, from the zeal and industry which characterised the agriculturists of West Cumberland, that the society would annually increase in consequence and importance. It would thus prove a growing benefit to the agricultural interest, the prosperity of which must always contribute in an eminent degree to the comfort, contentment, and happiness of the community at large. He begged strongly to impress upon their attention, that it was necessary, in order to uphold and render agricultural associations generally beneficial, a great deal must depend upon the cordial support and the union and co-operation of all parties, without which its effects could not be rendered so extensively useful as its most sanguine friends were anxious to see realised. (*Heard.*)

SAMUEL IRTON, Esq., M.P., was extremely glad to hear from the Chairman that the stock in West Cumberland was improving, and that the show was superior to that of last year. Every description of commerce had for some time been in the highest state of prosperity, and it always struck him that that prosperity could not but in the long run extend to the landed interest. He had not been disappointed, for the change he had anticipated had taken place. There was one thing to which he was desirous of directing the attention of the farmers, namely, their paying more attention, if possible, to the breeding of stock than to the cultivation of land for the produce of grain. The prosperity of agriculture must in a great measure depend upon manufacturing industry, for he considered it next to impossible for agriculture to flourish whilst the other languished; and it was indispensable to the prosperity of manufactures that corn should not be at a high price, otherwise we could not expect the home manufacturer to meet the manufacturers of another country where the necessaries of life were cheap. If corn should reach what might be called a high price, and maintain it, the consequence would be the abolition of the Corn Laws, and with them would be swept away a large class of agriculturists and farmers, the most useful class of persons of whom the country could boast. Whatever might be the result of this, in the process of time, he had no doubt but the first effect would be to change the relative positions of a large class of the community. Mr. Irton concluded by thanking the company for their attention, and assured them that as long as their interests were confided to him, along with his honourable colleague, he would attend and watch over them with all the zeal and ability in his power. (*Cheers.*)

The CHAIRMAN then begged to propose the health of two gentlemen who had been warm promoters of the association and had done much for it—Mr. Browne and Mr. Benn. (*Drank with three times three.*)

Mr. BENN expressed himself much obliged for the

very flattering manner in which his health had been drank, but regretted the absence of Mr. Browne, who, had he been present, would have said enough for them both. He was particularly glad to see so good a show of stock as they had that day witnessed, especially after what Mr. Browne had said at Penrith about their cross-bred heifers, which, by the way, were that day both few and poor, the farmers he presumed had been deterred from bringing them owing to what Mr. Browne had said. To show that the strange breed which Mr. Browne had described did really exist, he might state that at the last spring show at Cockermonth, just as he was entering the town, he chanced to meet a bull whose surpassing beauty attracted his attention, and on inquiry he found it belonged to Mr. Browne, and was one of the exact breed of animals that gentleman had described at Penrith. (*Laughter, and cries of it had been one of Gwordy's breed*) He had read Mr. Browne's speech with some degree of surprise, and either he had fallen into error relative to the stock in West Cumberland, or the reporters had done him injustice; or it might be that Mr. Browne intended his description to apply to his own stock only, and in that case he was willing to confess he was pretty near the truth. He would be extremely sorry to speak desparagingly of their stock, for he was quite satisfied that the breeds of different kinds of cattle were improved as well as in East Cumberland. (*Cheers*). He would beg to call their attention to the superior stock which had sprung from the late Mr. Curwen's breed of short-horns as well in East Cumberland as in West, and which he was sure could not be excelled. Let them also look at Mr. Hartley's, Mr. Burrow's, and many others, which could scarcely be equalled. He need not call their attention to the cattle exhibited by Mr. Hartley that day—not for premiums but merely for show; and a finer specimen could perhaps no where be met with. (*Hear, hear*.) He questioned with all their boasts, that they could show better or even as good, in East Cumberland. (*Cheers*).—Mr. B. concluded by thanking the company for the honour they had done him, and sat down amidst loud cheering from all parts of the tent.

The CHAIRMAN remarked that they would be anxious to hear the names of the successful competitors, and as they had just been put into his hands he would read them. He then read as follows:—

<i>Cart Colt or Filly, rising four years old.</i>		£ s.
1	Wilson Fisher, Cleator Moor.....	4 0
2	John Fisher, Skelsmere .....	2 0
3	Richard Barker, Woodbank .....	1 0
<i>Coaching Colt or Filly, rising five years.</i>		
1	William Stable, Millom .....	4 0
2	John Levens, Irton .....	2 0
<i>Short-horned Heifers, pure-bred.</i>		
1	Wm. Benn, Middleton Place.....	4 0
2	Wm. Holliday, Calder Bridge .....	2 0
<i>Long-horned Heifers, thorough-bred.</i>		
1	James Jackson, Pallafat.....	4 0
2	John Taylor, Gosforth.....	2 0
<i>Cross-bred Heifers, two years old.</i>		
1	Wm. Bragg, Esq., Egremont.....	4 0
2	Wm. Mossop, Catgill.....	2 0
<i>Mountain Rams.</i>		
1	John Dixon, Kirkland.....	2 10
2	John Thwaite, Blackenthwaite .....	1 10
3	Robert Briggs, Wasdale Head .....	1 0
<i>White-faced Rams.</i>		
1	Wm. Browne, Esq., Tallentire Hall.....	2 10
2	Do. Do. ....	1 10
<i>Boars.</i>		
1	Isaac Mawson, Gosforth .....	2 0
2	Stephen Hartley, Egremont .....	1 0
<i>Sows.</i>		
1	Wm. Holliday, Calder Bridge .....	2 0
2	Thomas Wilson, Snellings .....	1 0
<i>Cottager's Sows.</i>		
2	Thomas Hartley, Egremont.....	1 10
1	G. B. Williams, Egremont.....	0 10

*Short-eared Boars.—Bacon Curer's premium.* £ s.  
1 John Wilson, Kirkland Howe..... 2 0

*Short-eared Sows.—Bacon Curer's premium.*  
1 Isaac Mawson, Gosforth..... 2 0  
2 Stephen Hartley, Hale Mill..... 1 0

*Heifers in Calf or Milk.—Member's premium.*  
1 Wm. Benn, Middleton Place..... 5 0

*Short-horned Bulls; Sweepstakes, with the Society's premium of two pounds.*  
William Thompson, Ravenglass.

*Heifers or Cows in Calf or Milk, for Sweepstakes, with the Society's premium of two pounds.*  
Gilfred Hartley, Esq., Rose Hill.

*Draught Mare in Foal; Sweepstakes, with Society's premium of one pound.*  
John Ewart, Lorton.

*Breeding Sows, for Sweepstakes.*  
Thomas Crosthwaite, Rank End.

*Pen of Five White-faced Sheep—Sweepstakes.*  
M. N. Paumier, Esq. Ulcoats.

*Ten Fleeces of Wool—Sweepstakes.*  
William Dickinson, Mosses.... No competition.

*Fat Cow or Heifers for Sweepstakes, with the addition of Mr. J. Gunson's two pounds.*  
Gilfred Hartley, Esq., Rose Hill.

*Best Mangel Wurzel, for the premium.*  
William Holliday, Calder Bridge,..... 1 10

The CHAIRMAN said the next toast he had to propose was the health of the Judges—Mr. Bell and Mr. Fair. (3 times 3.)

Mr. FAIR begged to thank the company with the utmost sincerity for the honour they had done himself and Mr. Bell. He could assure them that it was difficult, as the chairman observed, to give satisfaction. Prejudice was not easy to overcome, but they had done their best, and he might inform them that the decisions they had come to were unanimous. He had no hesitation in saying that the cattle shown that day were better than those of the same description exhibited last year. He had attended many agricultural shows, particularly in Liverpool and those of the Highland Society, and they were not only fit for those places, but were as fine a lot of animals as he ever saw together at any time or in any place. (*Cheers*.)

The CHAIRMAN then gave the successful candidates, which was drunk with 3 times 3.

Mr. HOLLIDAY of Calder Bridge, briefly returned thanks as one of the successful candidates; and assured the company that the society had his best wishes for its success.

Mr. ISAAC MAWSON also returned thanks.

The CHAIRMAN was very happy to inform the meeting that he had found a President for next year, who, he was quite sure, would do all in his power to forward the interests of the society. The gentleman he had made choice of was Mr. Stanley, of Ponsonby Hall. (*Cheers*.) The health of the President elect was afterwards proposed and drunk with 3 times 3.

Mr. STANLEY said in again thanking them for drinking his health he begged at once to assure them, without making a speech upon the subject, that if it were their desire that he should occupy the chair at the next meeting, he should consider it his duty to act in obedience to their wishes, and therefore he would accept the office. He begged to take that opportunity to draw their attention to a subject connected with the association, and to make a proposition which, if favourably received, would give him much pleasure. He alluded to the absence of any premium being offered by the society for the superior cultivation and good management of land, making every allowance for the alteration which ought to be paid to the production of stock, and which was perhaps of paramount importance: and if it met with their approbation he proposed to give not as a county member, but simply as chairman and a landed proprietor in the neighbourhood, the sum of ten

guineas as a prize to be contended for next year. (*Cheers.*)

The CHAIRMAN begged to give success to the Association, and a happy meeting next year.

This was the last toast previous to the chair being vacated, and the chief part of the gentlemen at the head of the tables almost immediately quitted the tent. The meeting throughout was well conducted; the proceedings betrayed great good humour and spirit, and went off with much *eclat*.

### KIRKALDY AGRICULTURAL SOCIETY.

The Autumnal Meeting of this Society was held on Friday, Oct. 14. The show of stock on the occasion was of a very superior description—such, indeed, as in the opinion of the judges, had never before been paralleled in the district, and even in one or two respects to outstrip the recent exhibition at Perth. This was particularly the case in respect of horses. Some excellent specimens of cattle were also present; and an ox of the Fife breed attracted great attention, as one of the most perfect specimens of the class which had yet been produced. The judges also expressed themselves much pleased with a Teeswater bull calf, belonging to Mr. Boswell, of Balmutto. The specimens of turnips and potatoes sent by the Earl of Rothes, were likewise greatly admired.

The following is a list of the prizes which were awarded:—

For the best six calves, stots, or queys, Fife breed—Robert Hutchison, Fosterton, 1*l*.

For the best bull calf ditto—W. Veitch, Grange, 10*s*.

For the best six-year-olds, stots or queys, ditto—James Prentice, Kilrie, 1*l*.

For the best pair of two-year-old stots, ditto—ditto, 1*l*.

For the best pair of two-year-old queys, ditto—J. Kilgour, Bowhouse, 1*l*.

For the best pair of three-year-old stots, ditto—Andrew Watt, Balburton, 1*l*.

For the best foal for agricultural purposes, to be weaned four weeks previous to show, to be bred by the exhibitor, or a member of the society—George Beveridge, Orrock, 1*l*.

For the best year-old colt, bred by ditto, ditto—George Prentice, Bankhead, 1*l*.

For the best two-year-old gelding, ditto, ditto—Alexander Scott, Bowhill, 1*l*.

For the best three-year old ditto, ditto, ditto—Walter Veitch, Grange, 1*l*.

For the best year-old filly, ditto, ditto—Robert Hutchison, Fosterton, 1*l*.

For the best two-year-old ditto, ditto, ditto—James Prentice, Kilrie, 1*l*.

For the best three-year-old ditto, ditto, ditto—Henry Paterson, Balmule, 1*l*. 10*s*.

For the best ten quarters seed wheat—George Lewis, Boghillie, 1*l*.

#### SWEEPSTAKES, HALF A SOVEREIGN EACH.

For the best cow of the Fife breed—Robert Hutchison.

For the best cow of any breed—John Stocks.

For the best year-old bull, Fife breed—Robert Dowie.

For the best bull calf, Fife breed—Walter Veitch.

For the best Teeswater quey calf—Thomas Stocks.

For the best pair of four-year-old stots of any breed—Loughborough.

For the best pair of three-year-old stots of any breed—Andrew Watt.

For the best four calves of any breed—J. Liddell.

For the best two-year-old queys, Teeswater breed—James Aitken.

For the best foal for agricultural purposes, to be weaned four weeks previous to the show—George Beveridge.

For the best colt or filly for agricultural purposes, foaled in 1835—George Prentice, jun.

For the best gelding or filly for agricultural purposes, foaled in 1834—Alexander Scott.

For the best gelding or filly for ditto, foaled in 1833—Walter Veitch.

For the best colt or filly for road or field, foaled in 1835—Robert Lindsay.

For the best colt or filly for ditto, foaled in 1834—Henry Balfour.

For the best quarter of white wheat for seed—George Lewis.

For the best quarter of Hunter's wheat for seed—James Kinnimonth.

For the best quarter of Chevalie barley for malting—Walter Veitch.

For the best quarter of potatoe oats—Andrew Watt.

For the best quarter of Hopetoun oats—ditto.

For the best three acres of Swedish turnips—Walter Veitch. The seed was supplied by Mr. James Tough, seedsman, Kirkaldy.

For the best eight acres of potatoes—George Prentice, jun.

For the best turkey cooked for table—James Bogie.

For the best bacon ham cooked for table—Thomas Ronald.

After the exhibition, upwards of a hundred gentlemen connected with the association sat down to an excellent dinner which had been prepared for the occasion in the Town-Hall. Lord Loughborough acted as Chairman, and Messrs. Prentice, Haig, and Veitch as croupiers.

After the customary preliminary toasts, the CHAIRMAN again rose—He said, he had now to direct their attention to the toast of the evening, and he did so with no small degree of pride and gratification when he recollected that he had himself aided in the formation of the Society. The present very numerous and highly respectable attendance was the best proof of their opinion of the advantages which were to be derived from such associations. These advantages were manifold, and not confined by any means to those individuals immediately engaged in the business of competition, but extended themselves in a multitude of directions. By such meetings as the present they not only cultivated friendly relations with each other but were always learning something new either in the way of exploding old errors or acquiring useful truths. Their exhibition of to-day he felt particular gratification in stating shewed them to be advancing rapidly on the road of improvement. Their stock was not only, generally speaking, most decidedly of a very superior description, but in respect of horses they could boast of having even outstripped in the race of competition the Highland Society itself. (*Great cheers.*) It was also most gratifying to mark the very distinguished place which Fife stock occupied at the recent exhibition at Perth. (*Cheers.*) He begged to propose the Kirkaldy Agricultural Society, and success to it.

Mr. FERGUS, M.P., had the agreeable duty allotted to him of proposing the health of their noble Preses, (*Great cheering.*) He felt that it was an honour which they ought to pay him, not so much in his character of Preses, ably as he supported that character—not so much for the mere patronage which he extended to the society, as for his able, zealous, and most laudable efforts in improving the agriculture of the district. He had set them a truly noble example in that respect, which already had done much good, and was destined, he trusted, to do still a great deal more. It was Lord Loughborough who first brought the thorough drainage system into practical working among them—that system which was operating like magic in enhancing the crops wherever it had been adopted. The agricultural profession had certainly before it a rich field of improvement, and those who pursued it in a proper spirit, he thought could not fail, while they were doing a vast service to the country, to reap a substantial golden reward.

Lord LOUGHBOROUGH was afraid that he scarcely merited the very flattering compliment just paid him. If, while seeking his own advantage, however, he had done any thing deserving of their approbation, he had certainly been amply compensated for his labours, and he assured them that one of the compensations which he valued not the least, was the numerous friendships he had formed in the course of his agricultural pursuits.

The CHAIRMAN next proposed "The health of Mr. Ferguson, the first President of the Society." (*Tremendous cheering.*)

Mr. FERGUSON said, he felt it no easy matter to make adequate acknowledgments to them for the very flattering manner in which his name had been received. He knew of no more agreeable description of meetings than those where landlords and tenants met together unalloyed, as this meeting was in the present case, and as such meetings always ought to be, by even the most distant approach to party politics. (*Cheers.*) He looked to the happiest and most important consequences arising from such associations as the present, and he felt, he he said, rather sorry on their account that he himself happened to be so far advanced in years. (*Laughter.*) *Much as had been done within the time of his recollection in the improvement of agriculture, still the act seemed but yet in its infancy, and every day was bringing forth something fresh to gratify and astonish them. He trusted much to the hearty and enlightened co-operation of landlord and tenant in yet conferring upon agriculture the highest degree of prosperity.*

The CHAIRMAN said, that there were among them several distinguished strangers, some of the first judges of stock in the country. In particular, he would name Messrs. Watson, Dick, and Tod. He proposed to devote a bumper to the strangers. (*Drunk with all the honours.*)

Mr. WATSON, of Keilor, returned thanks. That day's exhibition was one of which they might well feel proud. The judges had had, he could assure them, a most arduous duty to perform, and, where the difference was so small between the merits of the successful and unsuccessful candidates, he would not at all be astonished if many should feel sore at the award given. Already their show of horses had been pronounced, upon the best authority, to be decidedly superior to that which lately took place at Perth. He would almost go as far in regard to the show of cattle. But there was one remark he would make, and that was, that he expected to have seen more character in the Fife stock. Although there were among them many excellent, and some first-rate animals, still he thought there was an absence of a general distinctive character to mark the breed. If he was asked what ought to be the character of the Fife ox, he would point to the animal that day exhibited in the street as what he might term a perfect specimen. That ox, if not the first or the second, ranked at all events as the third best ox at Perth of any breed. (*Cheers.*)

The CHAIRMAN proposed "the health of Mr. R. Hutchison," who had a two-fold claim of distinction. First, as being at the head of the successful competitors, and, secondly, as holding the office of Secretary of the Association, the duties of which, he need not say, how well he discharged. (*Drunk with great enthusiasm.*)

Mr. HUTCHISON, in returning thanks, took occasion to observe, that as the society had now got a nest egg of 100*l.*, it was not unlikely that the amount of the premiums for next year would be somewhat increased.

Mr. VEITCH proposed the "Unsuccessful Competitors."

Lord LOUGHBOROUGH made some jocular remarks in reply.

After some other toasts had been given, The CHAIRMAN proposed "The manufacturing interests of the country." He said that how much soever depressed agriculture had been, he felt convinced that but for our manufacturing prosperity it would have been much worse. He had just sold two fat stots to the Messrs. Hutchison for 100*l.*, and although feeding to such an extent was not regarded as the most profitable department, still he had no objections to go on with it at all, were he assured of always obtaining a like price, which, without good trade, however, and its consequence, good wages to the labouring classes, was not to be expected.

Provost LANDALE said, in reply, that he considered the trade of the country at present in as good and healthy a state as ever it had been in. He hoped it would long continue such. At the same time he hesitated not to affirm that commercial prosperity was much

aided by such societies as the present, which by stimulating agricultural improvement, lessened the price of provisions, which constituted the main staple of manufacturing industry. Certainly agriculture had no cause to regret the prosperity of manufactures. He recollected in his boyhood that such was the state of matters that the farmers were accustomed bringing in their barley to the Kirkaldy distillery on the backs of horses. He need not say how much, in consequence no doubt in a great measure of our commercial prosperity, our means of internal communication have become improved. Both agriculturists and commercialists, he thought, had great reason to thank God that they were in a much better state than their forefathers.

Mr. AINSLIE rose to propose as a toast, "Increase to steam power ashore and afloat." This was a toast which at the first blush might appear to have little to do with agriculture. He trusted, however, that it would not be difficult to make it appear that, upon the fostering of inventions and enterprises connected with steam power, the very best interests of British agriculture were immediately dependent. When it was called to mind that it was in and through the manifold applications of steam that British commerce and British manufactures had in recent times attained to such an unprecedented magnitude—a magnitude which had, he might truly affirm, determined the character of the country, and constituted the prime mover of her prosperity, then it would at once be seen how much they had been and still were indebted to steam—that power which had stimulated production of every sort, and which though not as yet applied directly to any great extent to agriculture, had indirectly been most extensively and efficiently operative in promoting its advancement. But they might be well assured that however much steam had accomplished, it had not by any means exhausted its energies. How much, he would ask, did there remain for steam still to do in the way of facilitating intercourse! He shortly noticed its effects on intercommunication and the vast consequences which in this way it was calculated to produce. But even, looking at Fife alone, with her large extent of coast, he conceived that by means of steam power a spirited proprietary might do a great deal in aid of the agricultural interest. He could not, for example, see the propriety of sending our agricultural produce in small boats to be reshipped in Leith roads, when it might with much more safety and at a great deal less expense be directly exported from the county. The shipping and transhipping of cattle too, had to be done at a period of the year, when the weather was generally the most boisterous. Were the Fife proprietary to take up the subject with energy they might soon have their produce directly shipped from their own coast, and he felt assured that, so far as the landlord was concerned, with whom he was more particularly concerned, that no exertion would be wanting on his part, to aid in so desirable an undertaking. (*Cheers.*)

Mr. GEORGE PRENTICE gave the Landlords of Fife, to which Mr. Ferguson of Raith replied.

The Chairman next proposed "the Tenantry of Fife."

Mr. ROBERT BALLINGALL, in name of the Tenantry returned thanks. The legislature of the country lately informed us that they had appointed a committee to inquire into agricultural distress. But that body could come to no definite opinion upon the subject, and consequently did not even report upon it. But at the same time gave the advice that each proprietor and tenant must work out his own difficulty. Conceiving that the tenantry of Fife still labor under some disabilities, he should make a few brief remarks upon a local usage, and one which deserved the undivided attention of both proprietor and tenant in this county; that is, the unnecessary waste of farming capital, consequent upon the present mode of letting land. It might not be generally known amongst the tenantry, that a very important alteration had been effected in the law of Hypothec during the last session of Parliament. Formerly the landlord had it in his power to compel grain dealers to refund payment for all grain sold under sequestration, unless exposed in a stock market.

This was now altered, and as a body of farmers and grain dealers, he conceived they were entitled to return thanks to the proprietors for having conceded the point. But he should turn the attention of the meeting to another portion of the law of Hypothec—that is the straw, to which the proprietor has an undoubted right at the expiry of the lease. But surely no lengthened illustration was necessary to point out the bad effects of the system. When he mentioned the fact, that there was one farm in the county where the Hypothec valuation of the straw had actually been ascertained to be removed from the ground five times in nineteen years. A few possessions had undergone the same course process four during the same period; a still greater number three times; and during his own experience he had known one case where the straw was removed twice in seven years, and another twice in thirteen years, and they all knew that when a tenant was shifted the straw was removed once in nineteen years. Was it reasonable to expect a thriving tenant under a system like this. He humbly conceived that the legitimate source of land rent must flow from that portion of agricultural produce, which is surplus and left over paying the cost price of production and the maintenance of the farmer's family and his stock; therefore, any system or practice such as that he had attempted to describe must fall as a direct tax upon the industry and capital of the occupier, by diverting a large proportion of labour into an unprofitable channel, in collecting manure from distant parts of the country, to supply the want of the straw, of which the farm never ought to have been deprived. He referred to the practice of East Lothian, Berwickshire, and Roxburghshire, where no such tampering with the fertility of the soil was known. There, although a tenant was changed, the sinews of agriculture were not removed with them as in the county of Fife. He would sum up these remarks by two short questions for the consideration of proprietor and tenant. First—Whether it is likely that the rental of the proprietor is to be best supported from an acre of ground in high condition, or from an acre in the last stage of exhaustion? Second, Whether the tenant is justified in offering more for an acre of ground with manure lying within 500 yards of it, or for the same acre when the dunghill is removed five miles from it? He sincerely hoped that many of those proprietors who give their support in every respect to agriculture by their precepts, would also operate by their examples.

Sir R. C. FERGUSON, on rising to propose the health of Mr. Coke, of Norfolk, and the agriculturists of England, was received with tremendous applause. After passing a high eulogium on Mr. Coke, the General proceeded to remark on the Fife breed of cattle, contending from its frequent crossings that it had completely lost its character as an original breed. He stated what Mr. Coke had done under somewhat singular circumstances, and that was to import an entirely new breed. The original in Suffolk was one of the worst possible. He first tried to supplant them by a breed from Hereford, but these he found would not do. He at length attempted the Devons, and completely succeeded, and these cattle were now established all over Norfolk, every body approving of them. It was objected that the climate of Fife would not answer for the Devonshire breed, but this he felt perfectly assured was a complete mistake, as Norfolk was a colder and more exposed and boisterous county in every respect than Fife.

Mr. WATSON, of Keilor, subsequently spoke in explanation. Although he certainly considered the Fife breed to be awaiting in a proper distinctive character, still he was far from denying that there were not a class of animals in Fife highly deserving of being propagated.

Mr. FERGUSON, of Raith, in proposing "The healths of the Croupiers," took occasion to bring under the notice of the meeting the scheme of Mr. Lewis, of Boghillie, for instituting an experimental farm. He mentioned that he understood Mr. Lewis wished his plan not to be brought immediately under discussion by

the Highland Society, but the consideration of it to be delayed until next annual meeting, when a better opportunity would thus be afforded for arriving at a matured judgment on the subject.

The CHAIRMAN proposed "The health of Professor Dick."

Mr. DICK returned thanks, and strongly urged upon the attention of the meeting the propriety of only breeding from stock of the first quality, in respect of health, spirit, and symmetry, as not only the best means of obtaining good animals, but as the best prophylactic which could be employed.

Mr. AINSIE proposed "The Highland and Agricultural Society of Scotland." They had heard many and just observations on what had been done for Fife by means of her Agricultural Associations, and these, he had no doubt, would always look with a filial regard to the Highland Society, not only as the parent from whom they had derived their original existence, but as the kind and fostering parent who still cared for them. (*Cheers.*) Were he called upon to give an example of the good which the Highland Society had directly effected for the agriculture of the country, he did not know that he could fix upon any more emphatic instance than that of a district he had lately travelled over. He alluded to the formerly wild and dreary country of Badenoch, lying one thousand feet above the level of the sea, and which one might have supposed was destined forever to continue under the dominion of its native heath. Even that country, however, he was happy to say, was now in a very high state of cultivation, yielding rich crops, and these, he felt something like shame to confess, were in a more forward state than those of many parts of their own county.

A number of other toasts were given in the course of the evening, and some excellent songs sung. Altogether the proceedings were conducted in the best possible spirit, and in such a manner as must redound not a little to the credit of the institution.

## AGRICULTURAL MUSEUM OF THE UNIVERSITY OF EDINBURGH.

We have been sincerely gratified by an inspection of this establishment, which is now in the course of being formed, in consequence of a grant made by the authority of Government from the funds of the Board of the Trustees, for founding an agricultural museum in connection with the Chair of Agriculture. It is intended to embrace a collection of the various objects suited for instruction in the science and practice of agriculture, as models of the implements of the farm—of machines having relation to the arts immediately connected with agriculture—of rural erections, as farm buildings, vegetable productions, soils, and the like. Amongst the many objects which this important institution embraces, there is one which has, in a peculiar manner, attracted our attention. This is a collection of paintings illustrative of the domestic animals of the country. Nothing can be more happy than the execution of this design. The animals are portraits of large size, the sheep being the size of life, and the oxen about half the natural size, all selected with vast attention from the best specimens of the kingdom, and from the stocks of the most distinguished breeders, as Mr. Buckley, Mr. Ellman, Mr. Coke of Holkham, Lord Talbot, and others. Amongst the animals we see specimens of the short and long horned breeds of cattle, of the North Devon, of the Hereford, of the Suffolk-dun; and fine examples of our native breeds, the Ayrshire, the Galloway, and the West Highland. Of the sheep there is a vast variety from the wild races of Exmoor and Dartmoor, to the black-faced heath sheep of our own mountains. We observed the Merino, the Dor-

set, the Norfolk, the Wiltshire, the Romney Marsh, the Old Lincoln, and, amongst the more cultivated breeds, splendid examples of the Cheviot, the South-down, and the New Leicester. It is impossible for us to speak too highly of the manner in which these paintings have been executed. They have been all painted by one artist, Mr. Shiels of the Scottish Academy, who has been engaged for several years in this difficult task. They stand, beyond a question, in the first rank of this class of paintings. We are surprised with the variety of character which the figures present, and yet we see that they are all portraits rigidly faithful, representing, even to the smallest lock of wool, the external character of the animals. Upon this, indeed, was to depend all their value, as the subject of useful study, and the artist has wisely, and with good taste, chosen to abstain from everything which should interfere with the true end of the collection. So far are the paintings from suffering from this fidelity, that it constitutes their great charm, and affords a striking contrast to the caricatures of animals which we sometimes see, in which the painter, attempting to make the animals better than they are, destroys all individuality of character and harmony of parts. In the present case there are no mistaken attempts of this kind. The animals are represented without the least exaggeration as they were seen in the fields in their stalls, and on their native rocks and heath. Grouped together, they have all the pleasing variety of a splendid fancy picture, with the fidelity of representation of individual subjects of natural history. Looking to the interest of such a collection to agriculturists, its uses in illustrating the effects of art in modifying the characters of these valuable animals, and as affording the means of beneficial instruction in a primary branch of rural economy, we trust that nothing will interrupt the progress of this collection. We understand that it is not half completed, and that a yet greater number of paintings is required to complete the series of domestic animals of the country.—*Kelso Mail.*

## ON THE EPIDEMIC INFLUENZA OF 1836.

By MR. JOSEPH BEESON OF AMERSHAM.

(From the *Veterinarian.*)

This epidemic disorder has for several months past been very prevalent in this neighbourhood: I had however, eight cases of precisely the same nature occur to me from last November to January.

The principal features of the disease have been, inflammation and tumefaction about the eyes, with considerable effusion running down the cheeks. The head drooping, mouth hot and dry, the animal off his feed; in short there has been considerable fever. The flanks were tucked up, the pulse quickened more or less, the legs swelled, and in some cases very painful to the touch. A general stiffness of the whole muscular system prevailed, accompanied by extreme weakness; a great disinclination to turn in a stall, or go through a doorway, i. e. unless it was large and the threshold low. If relief was not obtained at the onset, every symptom rapidly assumed a more intense character. There was usually increased fever or inflammation of the membranes of the brain in particular; the nervous influence was more or less suspended; the animal quite staggered in his attempt to move, and now and then fell down.

With regard to treatment, I have found direct de-

pletive measures have generally done little or no good. I have, however, in some cases, where febrile symptoms have run high, or where there has been an evident determination to any particular organ, bled moderately. I have given the fever ball, consisting of half an ounce each of nitre and cream of tartar, and one drachm of emetic tartar twice or thrice a-day, varying the dose a little as circumstances might require. I have used setons or rowels, either behind the ears or in the breast. In cases of a milder form, I have considered it of consequence to keep the kidneys, at least alive to their natural function, and perhaps to exert them a little by combining with the fever ball a more direct diuretic. Purging in every instance that has occurred to me, so far from doing any good, has been productive of irreparable injury. The patient rapidly sinks under its operation, every symptom is aggravated, extreme prostration of strength ensues, the animal eats nothing, and, if the purgation is not immediately checked, the patient inevitably dies.

The horse should be kept in an airy but not a cold situation. Good hand-rubbing to his legs, or, at least, his usual dressing every day will be useful, and he should be well clothed up; cleanliness and the general comfort of the animal should be particularly attended to. His food should consist of bran mashes with some oats, green meat if it can be procured, or the best meadow hay. In desperate cases, I allow him to be indulged with any thing that he will eat, as I am quite sure that he will not take enough of any kind of food to hurt him, and in such cases I have given gruel, or linseed tea, or both; and in others bran tea instead of water.

I will give you the particulars of a few cases, which I trust may not be thought altogether uninteresting.

### CASE I.

On the 6th of November ult., I was sent for to attend a horse at strawyard, belonging to Mr. Jones of this town. I found him lying down in the yard, and those around me said I should never get him up again. With a little management we raised him, and put him into a loose box. His eyes were considerably swelled and discharging; his head hung down; the pulse was sixty and full; the respiration tolerably tranquil. It was, however, with the greatest difficulty that he could stand; he reeled about, and required several men to balance him while I was about him. Here was evident determination to the brain, and that to an intense degree. I bled him until a sensible effect was produced on the pulse: I then gave him a mild dose of physic, five drachms of aloes; inserted setons behind the ears, and ordered thick gruel to drink, as he refused his food.

7th.—His bowels mildly acted upon by the physic. He is not quite so well as yesterday. Rub in some blistering ointment behind the ears, in the course of the cervical vertebræ, and allow him plenty of gruel, and as thick as he can drink it, which if he refuses to drink must be carefully horned down while he is lying.

8th.—Purges briskly, every symptom aggravated; staggers more if possible; pulse seventy; sleeps a great deal. It is with difficulty he can get up, and as he cannot command himself it is dangerous to be very near him. He cannot stand many minutes, but reels backwards and forwards, and falls down. Give him gruel as yesterday—keep under him a good bed, in order that he may not bruise himself, &c.

9th.—Continues to purge; he is sinking fast: I begin to think he is purging too much, but which before had been my principal hope. I gave him two scruples of opium, half an ounce of gum myrrh, two

drachms of ginger, and one ounce of prepared chalk in some starch, twice a-day, and ordered him some starch in his gruel to-day.

10th.—Does not purge so much; in other respects he is about the same as yesterday. Continue medicine as yesterday, and give him his gruel as before.

11th.—Purging ceased, but my patient is no better; his respiration is more hurried; pulse accelerated. It is with extreme difficulty that he can get up, and does not stand many minutes;—he lies stretched out, and sleeps a great deal. If he is enticed to take a mouthful of food, he falls asleep with it in his mouth. No medicine to-day.

12th.—No better; I quite despair of his recovery. I gave him two drachms each of ginger and gentian, and half an ounce of gum myrrh in some gruel, and the nursing department was attended to as before. This plan of treatment was continued with very little deviation till the 15th, when he died.

*Examination after death.*—Extreme congestion of the membranes of the brain; about an ounce of blood had escaped and coagulated around the pineal gland, and which was intermingled with some small blood-vessels belonging to that part; the lungs were considerably inflamed, but the abdominal viscera were quite healthy.

#### CASE II.

A remarkably strong and round carcassed pony, the property of Mr. Cook, of Chenies, was observed to be ill on the 13th of December. His eyes were inflamed and closed, and discharged down his cheeks; pulse 70; very much tucked up, but his breathing not quickened; his head hanging down, but every now and then tossed up, and shaking. He quite reels as he moves, and does not feed; he had already been bled. I inserted a rowel in his breast, gave him two drachms each of aloes, nitre, and cream of tartar, and one drachm of emetic tartar in a ball; and prescribed for him three drachms each of nitre, cream of tartar, and one drachm of emetic tartar, to be given in a ball morning and evening.

14th.—He is about the same as yesterday; his dung quite pultaceous; eats nothing, but drinks his gruel well:—continue medicine; and give him his gruel.

15th.—Purges briskly; he is about the same as yesterday; pulse 70; breathing quiet; discontinue medicine until the purging has ceased: give him his gruel.

16th.—Continues to purge, does not eat, but drinks his thick gruel well. He appears rather more lively to-day but in other respects about the same.

17th.—Does not purge to-day, feeds a little and is better. The fever medicine was again resumed and continued until the 21st, by which time he was quite well, except that he was, of course, a little weak yet, from his illness.

Mr. Cook had two cart horses and two colts affected at the same time, of the same disorder; but they were milder cases; and all did well.

#### CASE III.

This was a horse, the property of Mr. Tallent, a surgeon of this town; it was lying at strawyard, at Mr. Cook's, the proprietor of the horses just spoken of.

On the 20th of January I was sent for, and found him in precisely the same state as the pony; I put him into a box and clothed him up, and gave him a fever ball, consisting of two oz. each nitre and cream of tartar, and one drachm of emetic tartar morning and evening.

21st.—Much the same, except that his breathing is a little quickened, and I heard him cough once while I was with him, the peculiar character of which plainly indicated that there was some mischief

about the chest. I inserted a rowel in his breast, and continued the fever medicine; the pulse was 70, and somewhat feeble; there was great prostration of strength, and the horse staggered at every motion; I therefore did not bleed him. At about ten o'clock at night a messenger came to say that the patient was much worse; that he was down and could not get up. I immediately went, and found the account to be too true; he was down and stretched out on his side; respiration was very slow and stertorous; his pulse was about the same; he started at the slightest touch or noise about him. I got him up, but it was with difficulty we could keep him on his legs; he reeled very much, and required several men to balance him. Here also is evident determination to the brain. I bled him, but he could not bear to lose more than seven pints. I gave him a purgative of five drachms of aloes, and inserted setons behind his ears. The moment I had completed this he fell down. I made him as comfortable as I could, and left him under the care of an attendant for the night.

22d.—His physic purges a little: his respiration is rather quicker; he cannot stand, and he is decidedly worse than when I left him last night. Horn down some thick gruel frequently to-day.

23d.—Purges briskly; every symptom aggravated, and he is sinking fast; pulse 84; respiration much disturbed; extremities cold, and perspiration breaking in patches: unless speedily relieved he must die. Give him immediately two scruples of opium, two drachms each of ginger and gentian, and half an ounce of gum myrrh; and repeat it every eight hours.

24th.—I was quite surprised this morning to see my patient up and looking out at a little window, and at the same time eating a bit of hay. I was informed by Mr. Cook that he began to amend after taking the medicine; and at ten o'clock last night, when Mr. C. went out to look at him before going to bed, the horse was up and feeding. He has eaten a tolerable quantity of hay in the night; continue his medicine morning and evening.

25.—Much better; has fed pretty well; can command himself, and turns about firm and well; give him his ball without the opium, morning and evening.

26th.—Still improving; give him daily three drachms each of ginger and gentian, and half an ounce of gum myrrh; and move the setons.

28th.—Going on well: continue his medicine; increase his allowance of oats.

Feb. 3d.—Quite well, except his loss of condition. Discontinue medicine; let him be led out every day. From this time nothing more was done, except that he was kept in for a few weeks, in order that his strength might be thoroughly established before turning him out again. From this time I have not given any kind of aperient in cases of influenza, but, on the contrary, if purging has come on from metastasis of the disorder, or any other cause, I have found the patient always worse, and I have immediately endeavoured to check the purging by giving the ball as in the last case: I have also found, that in protracted cases, after the febrile symptoms are abated, supposing the several functions of the lungs, bowels, kidneys, &c. are going on well, and although the pulse may yet continue high, that the vegetable tonics may not only be safely but very advantageously given. There often remains a staggering gait, from nervous weakness; an appetite, though much improved, yet not good; this condition of the patient is particularly and beneficially influenced by the invigorating system.

I am by no means an advocate for the general adoption of the cordial plan of treatment, after inflammatory disorders; but having put the several

animal functions right, I am satisfied that nature, under proper management, will restore strength, condition, &c. But influenza is, in my opinion, an exception to this rule.

I find that influenza is by no means peculiar to any age, condition, or situation; it has occurred in the straw-yard, at grass, and to stabled horses in good condition and bad, at rest and at work. That it arises from atmospheric influence there is no doubt.

In some cases I have found the skin much surfeited, either, I have imagined, from cold affusions or from the stormy state of the weather. Some cases presented little lumps on the skin from the size of the segment of a pea to that of a large nut; others having a thick scurf, which, together with the hair, peeled off as from the effect of a mild blister; this has happened to the saddle and collar places, &c., &c., and particularly the thighs.

This is the result of what has taken place in my practice of influenza. I have given you the several cases just as they occurred, good or bad, in order that they might be compared with the opinions of other practitioners, of which you may or will be in possession; and I shall be gratified if haply some useful inferences may be deduced therefrom. The first horse continued to purge a long time, and sunk under its operation; in the second case, although the patient did well at last, he purged too much, and would have been better without it: the third case is too striking to need any farther comment. I have had a great many cases of influenza, but have not lost a single case since the first.

## THE NEW POOR LAW.

EVIDENCE TAKEN BEFORE COMMITTEE OF THE HOUSE OF COMMONS ON AGRICULTURAL DISTRESS.

Mr. T. NEVE, Kent.—Is the amount of the poor rates the same now as it was three years ago?—No, they are lessened considerably.

Has the poor law amendment bill been carried into effect in your neighbourhood?—It has, a few months only.

Not a sufficient period to enable you to judge of the effect of it?—I have no doubt it will tend very much to lessen the rates.

Mr. J. CRAMP, Kent.—Has the poor law amendment bill been in operation in your neighbourhood?—It has just come into operation in the parish in which I reside; the other nine parishes have been united more than a twelvemonth, but in our parish we have only been united about a fortnight.

Can you state whether in those nine parishes there has been any considerable reduction in the rates?—There has been a considerable reduction in some of the parishes where the parish was very much neglected, but I think in other parishes there has been but little reduction, and I do not contemplate that there will be but a very trifling reduction indeed.

That is where the parish was previously well managed?—I think the old law was sufficient where it was well carried into execution; I speak from very positive knowledge, because I superintended the parish in which I live for many years, and created work of every description, and by doing so drove away the profligate and those who were imposing upon the parish, and by that means I think the rates were reduced to 4s. in the pound upon a moderate rental.

Then you had adopted in your parish very much the principles of the present law?—So much so that Sir Francis Head said that he could see no improvement to be made except in the bill of fare in the house.

Sir Francis Head was the assistant poor law commissioner?—He was.

C. C. PARKER, Esq., Essex.—Are the poor rates heavy in your part of Essex?—Not very.

Has the poor law amendment bill come into operation there?—It has, and very beneficially.

Has there been a considerable reduction of the rates in consequence?—We have not yet been long enough at work to create a considerable reduction of rates by the effect of the new poor law bill, but the poor rates have been decreasing by the better management of the farmers the last three or four years.

What has been the effect upon the character of the labourers of the introduction of this new system of poor laws?—I can hardly give a decided opinion upon that point, it has been so short a time in operation; but an increased attention to oblige their masters is now visible.

Mr. JAMES FISON, Norfolk.—What is the amount of poor rate in your neighbourhood?—It varies so much that I cannot give an answer to the question.

Has there been any reduction in it lately?—Yes, in many parishes, through the operation of the new poor law.

It has been brought into operation there?—Yes, partially; indeed the very idea of its coming into operation has operated very favourably, and produced a lowering in the rates.

Has the operation of the new poor law had any effect upon the character of the labourers?—Decidedly; a very excellent effect.

Has it improved the moral condition of the labourer, as well as his physical condition?—I have no doubt of it; I have a great deal to do with the lower orders; I have interested myself much in promoting emigration, and had very great difficulty in inducing them to stir for some time; they would not leave their parishes though there were several of them living, a man and his wife and eight children, upon 10s a week, but as soon as this poor law began to operate I had no difficulty; I and my brother have succeeded so that we have assisted upwards of 200 to remove from our neighbourhood into Yorkshire, where they are doing exceedingly well.

Have you had accounts of them lately?—Yes.

And they are satisfied with their circumstances?—Yes, they are very thankful that we interfered for them, and assisted them.

Mr. WILLIAM COX, Buckinghamshire.—Has the new poor law come into operation in your neighbourhood?—Yes.

Is your parish included in any union?—Yes.

How long has it been so?—Since Midsummer.

Has that had an advantageous effect upon the conduct of the labourers?—To a certain extent it has benefited the rate payer. I think it has worked well with the idle and the profligate.

The farmer now expects to get, and does get, a fair day's work from the labourer for the wages he gives him?—Yes.

Which he did not do before the new poor law came into operation?—No.

In your part of the country you were not very favourably disposed to the poor law?—I was not. Nevertheless you think it has done some good?—I think it has worked well where there has been

sympathy manifested by the guardians and by the employers. I know many parishes where indiscriminately they pay the man without a family and the man with a family the same wages; and I do the same, but I give all the men that have large families the best task-work, so that by working more hours in the day they can earn a little more money.

You are now of opinion that it is likely to lower the rates, and to have a good moral effect upon the lazy and indolent?—It will work well where there is a little sympathy manifested.

Do not you think that now there is every disposition to give aid to the new poor law bill, provided it is not pressed forward with precipitate haste?—I think there are many persons that were averse to it are now friendly to it. I think that, generally speaking, it is a favourite arrangement.

What should you say has been the case with respect to the treatment of the old people; have their allowances been diminished under the new system?—Yes, they have.

Is not that considered a matter of regret?—It is, by the rate payers themselves.

Supposing a rise of provisions to take place from unfavourable seasons, ought there not to be a greatly increased attention paid to that circumstance, to prevent the new poor law becoming a measure of great severity?—Yes.

Must not that severity apply particularly not only to the very old but to the very young?—Yes.

That is, it would be applied to the poorest and weakest part of the community?—Yes, but they have their remedy; they can go into the workhouse if they like: they will always give them an order, if they are dissatisfied with the pay, to go to the workhouse.

Are they not well clothed and well fed in the workhouse?—Yes, but they have a prejudice against it.

Do you know any persons that have been removed from a cottage of their own to a workhouse?—I know several that have petitioned their neighbours and friends to assist them to keep out of the workhouse.

Is there a great inclination in your neighbourhood to emigrate to America or to other countries?—I think that has a little subsided.

Sooner than go to the workhouse they will use every exertion to remain in their cottage?—Yes. The least allowance now is 4s 6d for a man and his wife out of the workhouse, for old persons.

That rests with the guardians?—Yes.

And the guardians are chosen out of the most respectable inhabitants of the parish?—Yes.

NOVEL AND IMPORTANT USE OF AMMONIA OR BRINE.—The thanks of the Society of Arts were lately voted to a Mr. Webster, of Ipswich, for a statement of the effect produced on potatoes by immersion in ammoniacal water, or in brine. If potatoes are immersed for four or five days in ammoniated water, containing an ounce of the common liquor ammonia to a pint of water, they will on removal, be found to have their vegetative principle greatly checked, or altogether destroyed, so that they may be preserved throughout the year without the least deterioration of their general qualities. The temporary action of the ammonia in no way affects the potatoe beyond that of destroying its power of growth; if, however, any change is produced, it is rather beneficial than

otherwise, somewhat improving the appearance and flavour of inferior potatoes, and giving them a meanness they did not possess. The transient nature of the application removes any suspicion of injury from the material employed, and it is all lost by evaporation, so that not a trace remains behind; nor could the most fastidious ever detect that the potatoes had been immersed in ammonia, so volatile is its nature, so perfect its escape. The exportation of potatoes to foreign climates, chiefly within the tropics, is an object of importance; and for the comfort of sailors, there is nothing in the way of diet greater than the luxury of a potatoe with their salt food. As a means of prolonging their enjoyments, and adding to the healthful diet of a sea life, this mode may be adopted with advantage. The expense of immersion is very trifling, and they subsequently require to be placed in an airy situation to dry. Potatoes so treated have been used after ten months' keeping in a warm kitchen closet, and were found to be perfectly good. If the potatoes, instead of being removed in five days, are continued in the ammoniacal water for three weeks, the potatoe becomes tough, and shrivelled, while in the liquor, and when dried by exposure to the air, assumes quite a new form; it appears consolidated, and its qualities are greatly lost, for on boiling it assumes the appearance of sage, or starch, yet still firm, and retaining its form; if used in its dry and uncooked state it has a mealy flavour, and the properties of corn. There is no chemical change effected on the potatoe, but merely a mechanical consolidation and extraction of moisture: for precisely the same effect may be produced by immersing potatoes in strong solution of salt and water, taking care to remove by subsequent ablution the whole of the salt, and this requires some time, and repeated changes of waters.

## ON THE USE OF BONE MANURE.

(FROM A CORRESPONDENT.)

With respect to bones, I am the occupier of about a thousand acres of land chiefly a lime-stone turnip soil, and our district, nearly the whole of which is arable, and farmed under a four or five field course of husbandry, that is, a fourth or fifth of the whole extent of country is prepared for turnips, and with a very few exceptions drilled with bones, varying in quantity from twelve to thirty bushels upon an acre. I have tried from fifteen to forty bushels: this I consider a great waste, as I have found from twenty to twenty-five bushels equally beneficial in effect; in a fair state of farming I think twenty bushels per acre is sufficient; and no farmer that knows his own interest will continue to use less. Our practise is to break up our one or two year old seeds for wheat, using about eight two-horse cart loads of manure per acre as long as it holds out, and if short, we apply five hundred weight of rape cake in lieu: we have some few farmers who use bones and manure mixed, that is, they apply six or seven cart loads of manure per acre for turnips, and drill in ten or twelve bushels of bones with the seed, but I hold the practice to be bad, as the means used are too light to keep the land up to the mark through its courses; by applying an additional ten bushels of bones, your land gets two dressings in every four or five years. I have other objections to the use of bones and manure together. I consider in very dry seasons the manure holds the land so open to the action of the sun and wind, that if the bones force

the seed to vegetate the plants frequently die under their influence. I hold the best practice in the use of bones for turnips is to work your land close with your harrows and rolls directly after the ploughs, not the next day, but the next hour, if possible; get your land fine and solid, or if I can convey my meaning by any stronger term, make it air tight, the nearer the bones are drilled to the surface, to be covered the better: after following these directions the greater chance you will have of being successful.

By pursuing this method I have been successful where others have failed, and I am convinced that every farmer who adopts the same plan will have reason to be satisfied with the result: this district thirty years ago was all waste or rabbit warrens; by the system of management I have laid down, I will fearlessly state it is not surpassed in its agricultural productions by any district of the same extent in the united kingdom.

## COMMUTATION OF TITHES.

(From the Bath Guardian.)

The importance of the new Act for the Commutation of Tithes, every person connected with agriculture will be willing to admit. It relieves farmers from the constant interference of the parson with their crops, and removes much of the harass, vexation, and annoyance, which the former mode of paying rectors and vicars produced. We are also glad that the tithe is to be commuted to a money payment, as it will greatly facilitate the reform of the administration of church revenues. A return was made to Parliament, through the Ecclesiastical Commissioners, of the value of church property, but we have every reason to know that it cannot be relied upon. A person who valued three livings for the incumbents has told us that he finds them returned greatly under the sum which he put on them. The commutation of the tithe will tell the real value. The actual amount of church revenues will be accurately ascertained, and this will, of course, much facilitate any future dealings with it that the Legislature may propose. Another advantage arising from the commutation of tithe will much benefit the farmer. At present he is the slave of the gentleman who occupies the parish sentry-box. He may have his tithe taken in kind: he may be harassed in its collection; or if justice is done to him, he is told to consider himself under obligations. In future he will be perfectly independent. The parson will have his dues ascertained; he will look upon them in the character of a chief rent; and if seasons require abatement in the farmer's payments, the farmer will be compelled to go to the landlord. The dependence on the parson of the parish is at an end. Again, the farmer will be able to take his premises upon an accurate knowledge of all the charges to which he will be subject. When, therefore, affairs go ill and prices fall so that he cannot make fair profits, he will know that it is to his landlord, and not to the Legislature, that he must look for relief. If the landlord is wise he will keep a good tenant; and if he refuses, the tenant must give up the property. But this power of making an accurate calculation of all charges will place the tenant in a more independent position with respect to the landlord than at present. He will know what to ask, and what he ought to have; and he will be able, if refused or if his request is complied with, to attribute the justice or injustice that is done to him to its right source.

## SUBSOIL PLOUGHING AND FREQUENT DRAINING.

Of late we have heard a good deal about "Steam Navigation applied to agriculture," nor has the power of steam been confined in an agricultural point of view to the ocean or the transit of fat cattle from one locality to another. The plough is now to be impelled by steam, and bogs are forthwith to be reclaimed by the scourings of ditches. In the meantime and until steam ploughing shall have become more common, we noticed with much pleasure a new feature in the agriculture of our country, reduced to practice on a limited scale near the Perth Depot, the Saturday after the grand cattle show. To those at all acquainted with the general principles of vegetation nothing need be said in favour of subsoil ploughing and frequent draining, as these advantages must be sufficiently obvious. On all tenacious soils of whatever quality, stirring by the subsoil plough must be of vast importance, in as much as that instrument opens the retentive mass and leaves a porous bed for the rich incumbent soil, through which the water will percolate, thus rendering the stirred subsoil liable to be fertilised from the descending rains and moisture, and forming a healthy and deeply extended range for the roots of plants. It is in the field a much safer process than the ordinary mode of spade trenching, whereby generally the subsoil (however injurious it may be in an unprepared state for vegetation,) is laid uppermost, this subsoil the plough only loosens, leaving future ploughings to take up and mix with the former fertilised soil, that upper portion of the loosened subsoil the farmer may judge proper to call into immediate service. The frequent draining plough supersedes the use of manual labour in cleaning out or cutting drains, and seems well adapted for that purpose. The resistance these instruments may meet with in the course of their operations, or the horse power that may be requisite, will vary according to the density or obduracy of subsoil and depth required. Suffice it to say, that each operation can be performed economically by the instruments exhibited by the justly celebrated Mr. Smith of Deanston, who, with genuine patriotism has put himself to much trouble and expense in forwarding an important point in agriculture. We saw his reaping machine also tried, a machine displaying much ingenuity—but the trial we saw of it, and the Clipping machine of Mr. Bell, near the Depot, was for both under favourable circumstances, and by no means calculated to bring out the merits of either, or to remove strong pre-existing prejudices. Those who wish to make a fair estimate of their merits should visit Deanston or Denboig, where they are at work. Reaping machines, when brought to the utmost perfection, will likely be inoperative where grain is completely lodged, and we consider that the true art of farming lies as much in striking the mean between the over-pampering and starving the soil, as any part of the profession, and should reaping machines become any thing like general, this point will be more attended to than it has been hitherto. The two ploughs, however, that we have noticed, are likely to advance the farmers interest to a much greater extent, than any improved mode of reaping—a process which, at the worst, only costs at an average about a half-sovereign per acre, while subsoil ploughing and frequent draining, either in the culture of grain or grass, will add twenty or more shillings to the annual value of each acre on many a farm.—Perth Courier.

Hops.—There is now exhibiting, at Norgate and Company's, a sample of hops grown by R. Crawshay, Esq. of Honingham Hall. We shall be rendering a service to Norfolk landowners, and to our intelligent farmers, by calling their attention to the very important fact, that this first attempt to cultivate hops in Norfolk has produced a quality unequalled by that of any county in the kingdom. We anticipate the period when the cultivation of hops will become general in Norfolk, and when the name of R. Crawshay, Esq., will be highly honoured as a benefactor to our agriculturists.—Norwich Mercury.

## REPLY TO MR. MILBURN.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—In your paper of Oct. 31st, I find a gentleman of the name of Milburn has thought proper not only to criticise my last Derbyshire Report, but also a letter from our old friend the "Lincolnshire Farmer," on whom I think he has been rather too severe. Now, the Farmer merely gave his opinion with regard to the destruction of the cabbage crop. He may be wrong—but it was quite natural when he found the plants covered with the cow-ladies, that he should suppose those animals were the cause of the destruction of those plants; as much so as others when they see the turnip plant covered with the smother-fly should state positively that it is the cause of the failure or destruction of the turnip crop. I do not suppose the "Lincolnshire Farmer" is so much acquainted with *entomology* as Mr. Milburn professes to be, for with regard to it he is evidently a paragon—he professes to be very well acquainted with the natural history of his "*doodly-cows*"—their mode of propagation—the number of "*doodly-calves*" they bring forth—as well as the form of the *calves*, which he states are *fat and lizard-like*—undoubtedly they are prevalent in Yorkshire, by his having paid so much attention to them. Again—he states—that the Lincolnshire Farmer has just as much right to *judge* that because he saw a couple of foxes in his meadow they were devouring his grass, as to say, that because he saw fifty lady-cows on a single cabbage, they were devouring his plant. Now, Sir, I think he had not as much right so to *judge*—he must have had ocular proof that the fox was a carnivorous animal by seeing him feast on his lambs; but he would not suppose that the *doodly-cows* were carnivorous animals from seeing them on his cabbage. No; he had a much greater *right to judge* that they were herbaceous animals from seeing them so situated. We certainly must thank Mr. Milburn for his information—for his perseverance—his industry—and also the minute attention he has paid to his *doodly-cows*—which by-the-bye many of us would rather pay to our *cow-ladies* or *lady-birds*.

Enough about *doodly cows* and their *calves*. I will now see how far Mr. Melburn's criticism of my statement (in the last Derbyshire report) of the failure of the turnip crop is correct. I fancy I shall prove to him that what I stated is not quite so erroneous as he supposes. First—I did not deny that the smotherfly fed on the turnip plants—but that those plants on which they did feed were unhealthy and that owing to their being so—to a want of vitality, incipient decomposition had taken place before the fly attacked them. He states that in Yorkshire, no decomposition in the plants could take place from the drought as the month of August was partly, and that of September entirely wet. Now I must inform Mr. Milburn that I stated that the drought with the *uncongeniality of the weather* was the cause of the unhealthy state of the plants. Every person is perfectly aware that the ground during the Summer was never perfectly saturated with moisture—there was not sufficient to support the turnip plant in a healthy state, consequently the cold winds, along with the cold rains promoted the decomposition of the plants—they were not sufficiently powerful—they had not sufficient vitality to prevent them from undergoing the laws of inorganic matter—that is decomposition. Dryness is not the most favourable state for decomposition—moisture with a certain degree of heat is required. The plants became unhealthy from a want of sufficient moisture, and when the rain did fall, the weakly plants, not having power

to resuscitate it rather tended to promote decomposition than otherwise.

He states that the flies commencing their ravages on any dry elevated situation is nothing new—but certainly does not prove my theory in the least. Now I say it does prove my theory, and that in the greatest degree. Why did the flies first attack the plants in such situations in preference to those on parts less elevated, and where the plants contain a greater quantity of juices? Evidently from this cause, that on the driest and most exposed situations there the plants first became diseased, even before they were attacked by the flies. If you examined the plants you found the leaves covered with a slimy mucus from incipient decomposition, and those plants so affected were invariably first attacked. Again—I stated that they the flies were not found on healthy plants. Mr. Milburn states that I should have said, "the plants which they have not attacked have had nothing to affect their growth, and are healthy and cover the ground *preventing the drought from penetrating*." Now a greater proof that the drought was the cause of the unhealthy state of the plants cannot be. Why were the isolated plants and those in the most elevated and exposed situations first attacked (which they invariably were)? Evidently, because they were so situated as to be most exposed to the drought and uncongenial weather, consequently they first became diseased, and then were attacked by the fly.

I stated that where the plants were thicker set so as to form a complete cover to the ground and exclude the rays of the sun—evaporation had gone on to a very small extent so that the plants had a sufficient degree of moisture to keep them in a healthy state, and there we found that the fly had done comparatively little damage. I would ask why did not the flies attack the plants situated in every part of the field without destruction which they undoubtedly would have done had they been the cause of the destruction. Why not attack the plants where they were thickly set as well as the isolated ones—why not attack those situated on the lower and more sheltered parts of the fields as well as those on the most elevated and most exposed situation? Evidently—because the plants in the latter situations were unhealthy, whilst those in the former were healthy not having been sufficiently affected by the drought and uncongenial weather. From my observations I have deduced the following inferences. That the drought with the uncongenial state of the weather has been the cause of the failure in the turnip crop. That the isolated plants and those on the most elevated and exposed situations being most affected by the drought, were the first which became unhealthy, and consequently were first attacked by the fly. That the flies attacked the unhealthy plants only. That the state of the weather which has been unfavourable to the turnip crop, has been favourable to the production of the flies. That, if the flies had not been more prevalent than in former years, we still should have had the same failure.

I remain Sir, your obedient servant,

S. P. G.

Mr. G. Spiak, of Aberdare, has favoured us with the following:—"To prevent Hares and Rabbits from barking trees, or topping young Scotch firs in plantations.—To one gallon of stale urine add one quart of powdered lime; one pint of foreign tar, warm the tar to mix with the above, then add as much fresh cow's dung as to bring it to the consistency of thin paint, and lay it on with a painter's brush.

## STABLE MANAGEMENT.

## BUSINESS OF THE GROOM.

The first object of consideration, under the present head, is the character of the groom; who should be a man of good sense, good temper, sober, honest, very industrious, and above all, proud of the appearance of the horses under his care. A material part of the business of a groom is very laborious—I allude to cleaning the horse; or what, in the phraseology of the professors of the art, is denominated *Strapping*. It is true, some have a more easy method of performing the operation in question, and yet they accomplish it equally well—generally better; and the same remark is applicable to all kinds of manual, (and indeed of mental) labour: one workman acquires a superior method to that which is seen in another. Yet, let it not be forgotten, that *strapping* a horse, in the hands of all is a laborious task; but its being well performed is as essential to the appearance of the horse as his food; nor can any horse, however fed, look well without it. Thorough good grooms are not always to be met with; and, indeed, whatever might be the abilities of the groom, I should frequently visit the stable. If all be correct—if the groom be worth keeping, he will be pleased with the visits of his master.

In the month of December, 1830, I happened to meet with an accident—I happened in fact to break my left collar bone, owing to a very sudden fall of my horse from placing his foot in a rabbit hole (hidden by long dead grass) when going very fast. In consequence I did not return home for a short period; during which my groom continued to purloin a considerable quantity of oats, carrots, and even hay; the illicit conveyance of a canal being very convenient, particularly when favoured by the length and darkness of the nights in the month of December.

The groom's first object should be to make himself acquainted with the temper, disposition, and constitution of the horses placed under his care, and vary his treatment accordingly.

The stable should be visited at six o'clock in the morning—in Summer rather earlier:—the first operation should be to rack and feed: after having, of course, ascertained that none of the horses is loose, cast, &c. The horse should have but little hay given him at a time, in order to induce him to eat it clean up—if a horse leaves or refuses good sweet hay, the cause of his refusal should be ascertained: it may have been fouled by cats or rats: and horses, particularly when well fed, are very nice in their food, and possess a very acute sense of smell. The hay may have been blown upon by other horses or cows: but if, upon examination, nothing of this appears, and the horse is in good health, it is tolerably evident he has been too freely supplied with hay, which should consequently be reduced.

The hay which is given him in the morning should be a quarter of his daily allowance; and, if a horse receives a proper quantity of oats,\* he will not eat more than ten pounds of hay per day; that is, generally speaking: horses must be varied in regard to hay, according to circumstances which will be pointed out as I proceed. If the hay be very dry, sprinkling it with water will make it more agreeable to the horse, and he will sooner eat it.

The horse should next be fed; that is, receive his corn, which should be one-fourth of a peck (supposing a peck to be his daily allowance). The oats should be of the best quality, should be sifted free from dust, and any extraneous substances (such as small stones, dirt, or rat's dung) carefully picked out. Clean the manger† well with a whisp of straw, and spread the oats in it, that the horse may not be able to gather too large a mouthful, and thus swallow them whole.

Horses should not be allowed to fill themselves in the morning, since they cannot go through severe or quick work with a distended stomach. When however the business of the day is over the horse may fill his belly, and he will rest better for it. All animals lie down to rest when they have completely satisfied the cravings of hunger.

As soon as the horses have received their corn, you should proceed to put the stable in order; for which purpose, you take the stable fork, (which must be used with great care, lest any of the horses should sustain injury), throw all dung off the litter, turning the driest of the litter under the manger; that part of the litter which has been too much stained for further use, you throw out with the dung. Every time you bring in fresh litter, let that which has been previously used be placed undermost.

Having turned up the litter, &c., clear away the dung and filth completely out of the stable as soon as possible; and could the elluvium which thence arises be dissipated at the same time, it could not be otherwise than beneficial to the health of the horses.

Proceed to unclot and clean the horses. The currycomb is the first instrument to be taken in hand, and it should be such a currycomb as is particularly applicable for the coat and skin of the horse. Some horses require very considerable application of the currycomb; others very little. Much of this will depend on the state of the horse, the time of the year, &c. Long coated horses and others just taken from grass, will require the free application of the currycomb, the teeth of which should be proportioned to the length,

\* The allowance of oats for horses must be governed by circumstances, such as the work the horse has to perform, his constitution, &c., all of which will be pointed out in the progress of this article.

† The manger should be well washed with soap and water once a week—cleanliness is conducive to the health of the horse in every respect; and he will eat his corn with a much better appetite if the manger be clean, and will derive more benefit from it also.

thickness, or foulness of the horse's coat. Horses that have been long in the stable, and which have been well groomed, will be generally found to have sleek, short, fine coats; and they will require little more use of the currycomb than merely to clean the brush.

Begin with the currycomb at the hind quarters on the near side. Proceed down the quarters, being careful to rub off all dried dung, but not to scratch the horse. The legs below the houghs should not be curried, unless there happen to be dried dung on the point of the hough, which may be loosened or removed with the currycomb: you will perceive that the comb will not operate properly on that part, and you must handle it very lightly. Proceed to the back, loins, flank, belly, shoulders, arms, neck, omitting no part to which the currycomb can be conveniently applied. You begin at the hind quarters and finish at the head—the latter, however, seldom requiring the application of the currycomb; nor indeed should spots thin of hair or tender be touched with it.

As soon as the near side is finished, you proceed to the other, where your left hand will be called into action; and after you have completed the off-side, wisp off the dust raised by the currycomb, and wisp those places in particular which were not touched by the currycomb. The wisp should be formed of hay or half worn straw—the former being preferable. Make the wisp about ten inches long, twisting it together till it is as thick as you can grasp. If the hay be harsh, sprinkle it with water, which will cause the dust to adhere to it, and it will also work more pleasantly. A good wisp will serve several times.

Taking the wisp in your right hand, place your left on the nose of the horse and begin to wisp his forehead above his eyes, the root of his ear, his cheek, and particularly his throat, rubbing rather hard if there be dried sweat and dust upon it. Change the wisp into the left hand, and resting your right against the most convenient part of the horse, begin at the top of the neck, and proceed to the shoulders, the under part of the neck, the bosom, especially between the fore legs, down the arms, knees, sinews, and fetlocks. Apply the wisp harder, where the use of the currycomb cannot be brought into operation; proceed to the withers, but do not fail to apply the wisp to every part of the horse. The flank, the sheath, under and between the thighs are ticklish parts, but must not be omitted. You must place yourself in such a manner as to run no risk of being struck by the horse; for which purpose, place your right hand on the hip of the horse; the animal will lean against you, but you will not be the less safe on that account. Proceed down the thigh, hough, leg, fetlock, &c. rubbing most, as I have before observed, where the currycomb could not be applied.

The brush comes the next in succession, which should, in the first place, be cleared of dirt and dust by rubbing it on the currycomb.

Proceed with the brush in the same manner as with the wisp, especially brushing those parts where the dust is most likely to lodge, such as the neck, next the head, down the scrag next the mane, applying the brush backward and forward, if necessary, taking care to finish the last three or four strokes the same way as the hair lies in order to render the coat smooth; also clearing the brush from the dust every two or three strokes by rubbing it on the currycomb. About the sheath, and places which produce no hair, need not be brushed.

As the operation of the brush causes much dust to fly about, the horse should be wiped with a piece of clean soft leather, hair cloth, flannel, or a piece of horse rug.

Let it be recollected that, in cleaning horses, we should be guided by circumstances: for instance, if the coat be long, foul, and full of dirt, the currycomb should be very freely applied; and it will be some time before the coat will become quite clean; nor should the currycomb be used too much at one time, lest injurious consequences should result from it—lest the coat should stare, or stand up; the pores of the skin would be opened, and the horse would catch cold: the insensible perspiration might become obstructed, and it is difficult to say where the evil might terminate.

Horses kept in warm stables will have fine coats if the animals are properly groomed; on the contrary, a cold stable will produce a long coat, in defiance of all possible grooming. In this, we may clearly perceive the operation of Nature; which thus furnishes a long coat to guard against the effect of cold. All animals, which live in the colder regions of the earth are remarkable for the manner in which they are provided to counteract the effect of the climate. A stable, in the heat of Summer, cannot be too cool. In cold weather, it should be warm—indeed, it can scarcely be too warm so long as it is properly ventilated. I have been in stables, particularly those of the Rev. Mr. Shakespear in Cheshire, which appeared almost suffocating. I could scarcely breathe in them. This would seem to be carrying stable heat beyond the bounds of reason: yet I must confess, that very few horses appeared in the field in condition equal to those of the gentleman I have just named. The same remark will apply to those of Sir John Kaye, as well as to several other studs which I have visited. I would have horses well clothed.

At first sight it would appear that horses kept in stables of the description just noticed, would be very susceptible of cold when exposed to the influence of the atmospheric air; but I could never perceive that they were more susceptible than others—if so much. If it be desirable for a horse to appear in prime condition, with a beautiful bloom upon his coat, it cannot be accomplished in a cold stable. Even in a stable tolerably warm, the hair upon the horse's fillets or thighs will, on the approach of Winter, become long; that

is, long hairs will be thrown up; which may be removed by pounded rosin held in the hand and rubbed upon the part in question.

After having finished cleaning the horse, his clothes are to be replaced; and this should be done with care and in a proper manner, since nothing can be more unsightly than the clothes appearing uneven, nor can they thus be comfortable and pleasant to the horse. Therefore in throwing the cloth over the horse, let it fall considerably forward, then placing yourself behind the horse, you can draw it back (which causes the hair to lie the right way) and adjust it evenly. Lay the pad of the roller on the horse's back, and buckle it moderately tight, so that the cloth and roller may keep their places, but not so as to render it uncomfortable to the horse. If a sheet be used, (instead of a rug) which is made to wrap over underneath, it should be laid smooth, so that when the roller comes to be buckled, it may not appear in wrinkles, nor gape—every part should be adjusted to lie close and free from wrinkles.

Then take off the horse's stall collar, turn him about in the stall, and give his head and ears a complete rubbing and brushing; wipe him well with your leather or cloth, and pull his ears through your hands, observing that they are soft, clean, and moderately cool. Comb out his fore top and mane; then with a water brush or sponge wet the top or roots of the mane, and pass a small rug or cloth over it, putting one end of it over on the near side at the top, pull it over to the off side, pressing the mane, and hair next the root of the mane, down, to make it lie smooth. Turn him about, buckle on his stall collar, and comb his tail, and wipe away any filth that may be lodged under his dock. His feet should next be picked and washed if necessary. Lastly, let the legs be rubbed with a clean loose wisp of straw in each hand, and the operation will be best performed kneeling, passing the wisp down the legs and sinews—finish with passing your hands down in like manner, to ascertain that no particles of straw or other substances adhere to them, but that they are quite smooth. These leg rubbings are of great use in quickening the languid circulation of the blood in parts remote from the heart, and will prevent the legs from becoming round; to which some horses are constitutionally predisposed; and to which others are very liable from over-exertion and inattention; and which when neglected, will be very likely to end in grease.

Give the horse his water, the quantity being governed by circumstances:—if the horse be inclined to have too much belly, his allowance of water must be shortened, and his allowance of hay also: if he be going out immediately, the same rule should be observed, as no horse can travel if blown out with hay and water. On a journey, a horse may be frequently indulged with a little water, which will much refresh him, particularly in hot weather; but he must not be allowed to drink

his fill till he has finished his day's work. I am speaking of a hackney, travelling at a moderate pace.

If the horse be not going out, he should take his exercise; and in this case, he may, while eating his corn, be merely brushed over and taken out as soon as he has finished his corn—if the morning be cold, the saddle may be placed on the rug. Where horses work two or three days in the week, airing exercise will be sufficient in the intervening days; but a horse should have either so much work or exercise twice in the week as will give him a good sweating, which will throw out through the pores of the skin what might otherwise cause humours; this sweating exercise likewise forces up the scurf, &c., and renders the coat clear and fine.

Exercise, though essential to the health of all horses, must be regulated according to circumstances, such as the constitution of the horse, his condition, &c., but, supposing the animal to be quite sound and a good feeder, two hours daily will not be too much: sometimes walking, sometimes trotting, &c. taking care to walk for some time at the latter end of the business, so that the horse may be perfectly cool, when he is watered on the way home, if convenient, and cleaned on his arrival at the stable after the manner already described.

The most open and airy places are the best calculated for exercising the horse—on turf, if possible—if on that species of elastic turf found upon the dry parts of moorlands, nothing can be better.

After the horse has been cleaned, give him another feed of corn. Shake down his litter and set the stable fair.

The groom's attention should next be directed to the horse furniture. The saddles and bridles must be cleaned with a sponge from all road dirt. The stirrups, buckles, and bits may be cleaned with Bristol brick or rotten stone, which, if applied dry with a piece of leather, will preserve the polish. When they are used, they should, the moment they are taken off, be wiped clean and rubbed with a bit of oiled flannel; neat's foot oil, or sheep's foot oil, is the best calculated for the purpose—no vegetable oil should be applied to iron and steel, as it soon becomes claggy and hard; animal oil, on the contrary, is naturally more soft, and will preserve the metals just mentioned much better from rust. Plated buckles may be rubbed with leather and whiting, care being taken not to smear the leather to which they are attached. Girths, when very dirty, should be well washed with soap and water. When all is cleaned, buckle the girths properly round the saddle, to keep the flaps down.

At noon give the horse a similar quantity of hay to that which he received in the morning, and another feed of corn; take away the dung, shake up the litter, and set the stable fair.

About four o'clock, let the horse have as

much water as he will drink, if he be not going out—unless he be a very greedy horse indeed for water, as he can scarcely at this period, drink more than will be beneficial. But brush him over first, which will put the blood in circulation, refresh the horse, and clear away that species of dust from his coat which is continually arising from insensible perspiration. The use of the currycomb and the wisp may be dispensed with, unless the coat of the horse is uncommonly thick and foul; finish, however, with rubbing the legs, combing the mane, tail, &c. Now give him his water, and leave him.

About eight o'clock, the business of the day should conclude. You must now give him another feed of corn and his remaining allowance of hay. In making up the bed, you should contrive to lay all the worst of the litter in the middle, where the horse is most likely to stain and spoil it; the cleanest and driest, should be placed on the top, the bed placed well up on the sides, and full towards the hind quarters. Sweep clean out, observe that all the stall collars are correct, and every thing else in order; when you may lock up.

When horses come in wet and dirty, they should not be left till they have been made thoroughly dry, clean and comfortable.

When a horse comes in remarkably wet or dirty, or both, the scraper should be applied, with which you remove as much of the dirt, sweat, or wet, as you are able, commencing at the top of the neck and proceeding to the shoulders, chest, back, ribs, flank, hind quarters, belly, inside the arms and thighs, down the legs, &c.: let this be done before you take the horse into a stall. Take off his bridle, and with clean wisps of straw rub his head well in every part; draw his ears through your hands for a minute or two, an operation very grateful and very refreshing to the horse. Tie his head to the rack, giving him a little hay, and wisp him well with clean straw all over, letting your wisps be rather loose, and let them also be frequently changed. In the first wising, you may rub both ways, by which means you will get more of the dirt out of his coat than by only using the wisp one way; finish however, by laying the coat as smooth as possible. The legs should be rubbed with wisps for the purpose of removing the principal part of the dirt. Wisp first one side and then the other several times, which will remove the principal part of the filth, taking plenty of clean dry straw, and wipe him for the purpose of getting him dry; which, if the horse be in good condition will soon be accomplished: and wiping the coat down smooth will greatly contribute to this object. If the horse be weak and faint, and breaks out again, the clean wisps should be applied with a lighter hand, that you may not occasion further perspiration; but you must not suspend your exertions till the horse is completely dry. Then proceed to brush him over, and clean him completely, after the manner already described; nor must he be

left till he is rendered as dry as when he went out in the morning, and as comfortable as possible.

There are horses, however, which, after undergoing more than ordinary exertion, require the labour of hours before they become dry. This arises from various causes:—it may be from want of condition, constitutional weakness, or a long coat: and horses of this description will, after being brought into the stable and rubbed nearly or quite dry, break out into a sweat again, and continue in this way for hours, or perhaps the greater part of the night. Good keep and proper grooming will remedy this defect in the first case; that is, want of condition: and also in the second to a certain extent; for the last, that of a long coat, clipping has been found to have the desired effect.

It was some years before I could be reconciled to this operation of clipping: I could not prevail upon myself to think otherwise than that it deprived the animal of a covering which Nature had intended should shield him from the inclemencies of the weather; and this reasoning would appear to be unanswerable: yet having witnessed the beneficial effects of clipping in a great number of instances, and of its injurious consequences in none, I am under the necessity of recommending it in cases of long-coated horses which, after more than ordinary exertion, are with difficulty got dry when they return to the stable.

A thorough-bred horse will seldom, if ever, stand in need of clipping: it is principally amongst horses of inferior blood that clipping is rendered necessary. Many of the Irish horses stand in need of clipping. It is true, that of late years a great improvement has taken place in the breed of Irish horses, yet many of the old sort are still to be met with, with long bristly coats, which cannot be got into good condition till the operation of clipping has been performed upon them. Clipping alters the colour of the horse, and gives him, in my estimation, no very prepossessing appearance: further, an opinion cannot be so well formed of his health, when he has been thus deprived of the greater part of his coat, since that part which remains upon him will not exhibit the sleek glossy bloom so indicative of good health; nor yet the *penny* stare, which is a sign of the reverse. But, beyond all question, it answers the intended purpose; the horse becomes dry after great exertion very rapidly, and breaks not out again into those never-ceasing faint sweats for which he before was so remarkable, which rendered it impossible to get him into condition, and incapacitated him for great and continued exertion. The horse should have an extra cloth for a day or two immediately after clipping, which seems to be all that is necessary to prevent his taking cold; for in a very short time afterwards, he is no more liable to take cold than those horses whose coats did not render clipping necessary. In

the best regulated stables *singeing* has been substituted for clipping, and is far preferable. Some have carried the matter so far as to *shave off the hair!* The lather and razor is applied, the horse is literally shaved: he is then well clothed with woollen or blankets, into which the hair soon grows: his clothing is gradually lessened, and a fine short coat is produced of its natural colour.

Horses which are very greedy drinkers are much inclined to sweat, but I seldom feel an inclination for shortening a horse's allowance of water, unless he far exceeds the ordinary bounds. If a horse does not drink freely, he seldom feeds well, and consequently it becomes a very difficult task to get him into condition: if, after endless trouble, a horse of this description acquires something like what is well understood by the word *condition*, he will go through one severe day's work, and that is all upon which you can calculate—his appetite fails, and nothing but vexation and disappointment results from horses of this description. There are persons who will tell you, that some of the best horses in England are shy or bad feeders; but expressions of this sort are calculated to convey a most erroneous impression, unless accompanied with the requisite qualification; for nothing can be more true than the old adage, that "if a horse won't feed he can't work." And therefore, when representing some of the best horses in England as shy feeders, it should be recollected that, if the expression is used in reference to a race horse, it amounts to this,—that the horse in question is remarkably fleet, and that, when with infinite pains and endless trouble, he has been got into the best possible condition of which he is susceptible, he will run *one* race well; but if this *one* race happen to be severely contested, it takes every thing out of the horse (that is, completely exhausts him) and he is not able to run again the next day, or in a few days (as a horse of a strong constitution would) or perhaps during the whole season!

In like manner, if a horse used for hunting be a bad feeder, he will perform well with harriers, at least if nothing severe take place, but one good run with a fox will most probably put him *hors de combat* for a considerable time—perhaps for the remainder of the season. I like to see a hunter in particular, with a good round carcass—a bad feeder presents the reverse—his carcass will be found tucked up; and I have often observed that shy feeders have frequently a peculiar staring starven expression of the eye. It often happens, however, that they are very free goers and very fleet also—the cause of which is, that they generally come out of the stable with their intestines and stomach by no means overloaded, from which they go freely, and as their carcass is tucked up, it enables them to bring up their hind legs and gives them speed: but as they may be said to have but little internal support, they soon become exhausted.

I have two horses (the one a bay and the other a brown,) both of them superior hunters: one of them is a good feeder, the other the reverse. The bad feeder will, for a short run, beat the other; but if the run becomes long and severe, the good feeder can overrate his competitor, and, what is more, he will come out again in two or three days, while the other, as he will not feed, cannot be expected to be able to endure severe exertion for some time.

Horses which do not feed well, require much nursing and attendance, and are liable to disease; their constitutions are delicate, and the animals are very much affected with the coldness of the atmosphere, unless they are protected from it, and properly managed.

In a state of nature some horses will be found that will eat more than others; and we find in the stable, that some are greedy feeders, others good feeders, and others again very delicate or bad feeders. To the greedy and the moderate feeders I feel no objection; the former will require more exercise than the latter, to prevent grease and humours which might otherwise arise from a gross and plethoric habit; and I am of opinion that no horses are bad feeders originally; but that this want of appetite arises from ill-treatment and disease. Inflammation of the lungs I have known to cause a horse to become a bad feeder, which, prior to that period, fed very well. I have known the farcy to produce the same effect. Horses of this description are ever after very delicate: they will shake under the influence of cold air, and even die, if not moved about and well clothed.

A horse now in my possession, a handsome fleet, good tempered horse, is a bad feeder. He is an Irish horse, and came into my hands when he was six years old. I am inclined to think that he has undergone very severe, and indeed violent exercise at an early period of his life, and in consequence of neglect has sustained a severe attack of inflammation of the lungs. If, after a run at grass, from the middle of May to the end of June, he be taken into the stable, with infinite trouble he may be got into tolerable condition by the latter end of October; but the first severe day after hounds seems to take his condition completely away, and he will not look well again during the winter, in defiance of every possible attention. And during this period, he will require alterative and diuretic balls; and though he is a pleasant horse to ride, not the least reliance can be placed upon the continuance of his exertion. A horse of this description cannot be otherwise than very troublesome, very expensive, and very unsatisfactory.

To horses labouring under a difficult discharge of urine, a diuretic ball administered occasionally will be found highly beneficial: it will give relief to the horse in a few hours, and may be given to him without the least preparation, and at any period of the day. It will prevent the heels swelling and becoming

greasy, which they would scarcely fail to do when the free discharge of the urine is interrupted. The diuretic ball may be thus prepared :—

Yellow rosin, half an ounce.  
Linseed powder, three drams.  
Sweet spirit of nitre, sufficient to make the ball.

The following will operate as a diuretic and increase the horse's appetite also. Horses which have difficulty in staling are often indifferently feeders :—

Best cantharides, in fine powder, three grains.  
Pimento in fine powder, two drams.  
Fine oatmeal, three drams.

Mix this powder in the horse's corn; if he will eat it so much the better, and horses do not often refuse it. If, however, the horse will not eat his corn thus mixed, a ball may be given him, prepared in the following manner :—

Cantharides, in powder, three grains.  
Powder of ginger, two drams.  
Powder of gentian, three drams.  
Treacle enough to form a ball.

Give one of these balls every other night.

Or, you may give the following :—

Nitre, sulphur, rosin, and linseed meal, a quarter of a pound each; mix them well together and add one ounce of Ethiop's mineral.

Give the horse a table spoonful in his corn every night.

Any of these may be given to bad feeding horses with advantage, and to those who have difficulty in ejecting their urine; and, as I have already observed, it will frequently happen that these two unfortunate qualities or maladies are united in the same horse. Horses vary very much in their disposition and temperament, and it may soon be discovered which of the three compositions is the most beneficial to the animal.

When the legs are inclined to swell, a diuretic ball will be found serviceable; but exercise, under such circumstances, must not be neglected.

No horse can continue in good health without exercise. Want of exercise will cause the legs to swell; in which case the circulation of the blood becomes sluggish in the extremities, and the parts far removed from the heart; the gross particles of this fluid, therefore, lodge or remain inactive in the finer arteries of the horse's limbs, and cause the legs to swell.

Legs will also swell from an impoverished state of the blood, when the system has become languid from a long continuance of in-nutritious food. This, though a different cause, produces a similar effect to that which I have already noticed, namely, a sluggish circulation in the extremities. But, although the same effect is produced in both instances, the remedy must be very different in each case. In the first case, unless the business be taken in time, physic, bleeding, &c., must be had recourse to in addition to exercise. In

the second case, gentle exercise, and good food should be administered; as the horse gains strength his exercise may be increased, and after some time a mild dose of physic (four or five drams of good aloes) may be given him. He will also receive benefit from his legs being bandaged at night.

It sometimes happens that the horse's legs swell from severe labour or fatigue; in which case fomentations of warm water should be applied, which, with rest and gentle exercise, will have the desired effect. Warm water, however paradoxical the expression may seem, is very cooling, and will not fail to dissipate the inflammation of the legs and feet.

Every animal is affected by the food which he eats; and hence we observe that, when a horse has subsisted for years in swamps, and such like places, and has consequently been feeding upon nothing but faint and foggy food, however well he may appear, he is no sooner taken into the stable, and put to a little work, than he exhibits unquestionable symptoms of weakness and debility; his legs swell, and he will fly to pieces (as the term is) if this be not prevented by proper attention and management. In this case I should prefer walking exercise, good food, and bandaging the legs at night, to the administration of physic. It is true, a dose of physic will reduce the swelling of the legs, but the operation reduces the horse also, already weak and debilitated, and therefore this makes bad worse, as in a few days the legs will swell again worse than they did prior to the administration of the physic.

In all cases of swelled legs, if proper treatment be not adopted they will break out into cracks and sores, will discharge a fetid fluid, which, if neglected, will rapidly spread, and become what is called grease.

In cases of swelled legs, to which horses in high condition are subject, there is nothing perhaps superior to a few balls made in the following manner:

One pound of nitre.  
Half a pound of sulphur.

Molasses sufficient to make the whole into balls of the common size: one to be given every day till the swelling has completely subsided. When horses fly at the heel, appear unkind in their coats, these nitre and sulphur balls will be found to answer the purpose much better than a course of physic, as the object will be thus effected equally well, if not better, while their operation is milder, and the horse consequently suffers less both in his constitution and condition.

When a horse contracts a cold, if it be but slight, warm clothing and exercise will effect a cure. If the cold be violent, bleeding, purging, sweating, and perhaps a diuretic ball may be necessary, by which inflammation is prevented, and the disease expelled: I do not recommend a horse to be nursed for a cold with warm mashes, cordials &c., as such means appear to me calculated to in-

crease the inflammation, with which colds are uniformly attended. When a cold first appears, warm clothing and moderate exercise in the open air (as I have already observed,) I mean such exercise as will keep the blood in free circulation without heating the horse. This is much more likely to effect the object in view, than the confined air of a stable, which can scarcely ever be pure, and which is frequently converted into an effluvia that cannot fail to irritate the lungs and increase the cough. Should, however, fever attend the cold, the horse should lose two, three or even four quarts of blood, which will greatly relieve him. Give a gentle dose of physic, and also gruel, and if he will not take the gruel, let his water be chilled; gentle exercise, warm clothing. This method is much superior to cordial balls, mashes, &c.

When horses are well fed, and not sufficiently worked or exercised, the economy of the whole system becomes deranged. The stomach is unable to perform its functions; the circulation of the blood is obstructed, the lungs are oppressed and incapable of the requisite expansion; and a train of very serious evils are likely to result from such a state of the animal organization, if, at least, relief be not immediately administered, and nature relieved from her overwhelming load, by bleeding, physic, and exercise. Yet I must observe, that if horses are well fed, well groomed, and properly exercised, bleeding and physic will seldom be necessary.

When the horse exhibits symptoms of approaching illness, such as refusing to eat, languor, heaviness of the eyes, heat in the mouth, breaking out, itching, swelling of the legs, &c., it will be highly advisable to apply the fleam or the lancet, in order to check the progress of the approaching disease. If the horse has been well kept, little worked, or exercised, and is full of flesh, it may reasonably be concluded the blood vessels are overcharged; and of course they must be relieved by evacuation, in the application of which a sound judgment should be exercised. If the horse has been kept at regular work or exercise, and by severe exertion is over worked, the loss of two or three quarts of blood and a day's rest will operate a cure.

If a horse, after being ridden till he is very hot, be suffered to cool too fast, he will contract a violent cold, attended by fever: he should be copiously bled, and have plenty of chilled water with a little oatmeal stirred in it, given to him. Mashes may be given in this case, followed by a mild dose of physic. If the horse does not dung as usual, immediate relief should be applied by the process of back-raking, followed by a glyster, made of thin gruel or any warm liquid and a little lard or grease in it. Should not the fever abate, bleeding and physic will be advisable, keeping the horse well clothed to promote perspiration as well as to prevent cold, leading the animal broad if the air be not severe. If no amendment be perceptible, call in the assist-

ance of a *skilful* veterinary surgeon, if such a person be within your reach. *Skilful* veterinary surgeons are seldom met with: you had better kill your horse by your own experiments than call in a man of no ability, who would finish the business in the same way, and make out a long bill into the bargain. A veterinary surgeon of acute perception and sound judgment, I regard as a valuable member of society; and whenever I have occasion to employ one of these professional gentlemen (which is not often) I make a point of having a little conversation with him before I trust so interesting and useful a creature as the horse to his direction.

When horses, either from inattention or other causes, have cracks, chaps, or running sores at the heels, they should be kept very clean by frequent washing with warm water, or the humour issuing from those sores will spread rapidly and cause the horse great pain. If the chaps are slight, unattended with inflammation, and small pustules issuing and ichor do not appear, they are most likely the result of neglect rather than the effect of disease; and therefore, after having been washed clean, and wiped dry, a little drying ointment may be applied, and a cure will soon be effected. If, however, they have originated from a vicious state of the blood, they should be poulticed repeatedly and kept clean; which will draw away the acrid fluid and assuage the pain: in a short time, you may dry them and heal them up in the manner just described.

All horses require much attention to the legs, particularly those which are highly fed.

The feet of the horse should be examined and picked out when he comes home; and if it be necessary to use stopping for the feet, there is nothing equal to the application of water. I am well aware that cow-dung, tar, or a mixture of these, tar and grease, and fifty other articles have been recommended for stopping horses' feet, each of which might enumerate its own most strenuous advocates; yet, after all, to what does it amount? Why, that, as in many other cases, persons hastily adopted the one or the other, without duly considering the subject, at least in a philosophical point of view. The intention of stopping the horse's foot is to soften it; and, as nothing will effect this purpose so speedily and so well as that simple fluid water, I therefore recommend it for the purpose in preference to every other substitute:—water not only softens the foot, but keeps it cool. There are patent pads for the purpose of stopping the feet of horses, but how far they answer the intended purpose I am not able to state, as I have never used them. Water may be applied for the purpose of softening the foot of the horse by means of flannel or toe soaked in it, applied to the foot, and fastened by means of small flat specks, fixed in the interior edge of the shoe. Where horses can take their exercise in the dewy grass, their feet will not want stopping; but this

is not always attainable, particularly in London.

When a horse becomes what is termed groggy, he is no longer fit for a hackney. A groggy hunter is not an uncommon sight, but they cannot be safe. Nor is there any cure for grogginess or founder, or which, in the phraseology of the lecturer Percival, is called the navicular disease. The operation of nerving may afford temporary relief, but no permanent cure can be expected.

When a horse comes in dirty, on no account allow him to be ridden into a pond for the purpose of washing off the dirt, nor yet allow the water brush to be applied much above the fetlock. Indolent grooms and stable men will, if not prevented, wash off the dirt with the brush from the arms and thighs, under the belly, the sides, &c. by which disease is produced that often ends in glanders. This horrible disorder mostly makes its appearance in stables where stage coach horses are kept, and generally arises from the practice of *washing the horses* with the brush, by which much labour is saved in cleaning; and to which most of these stage coach horse keepers will resort, if not well watched.

Horses are sometimes troubled with worms and bots, which are represented by Percival and other writers as not injurious to the health of the animal; an opinion to which I cannot subscribe. When a horse is troubled with worms he appears lean and jaded, his coat stares, and however well he may be fed, he never presents the appearance of anything like condition; since therefore, worms produce such indications of bad health, I cannot help thinking them injurious to the animal.

For the removal of worms and bots, veterinary surgeons generally employ calomel, which will, no doubt, destroy these vermin; but for that purpose the system must, in some degree, be poisoned; the horse must be affected with the calomel before the worms can be destroyed or removed. In preference to calomel I should recommend the use of linseed oil, which is as sure and as deadly a poison to the worm or the bot as calomel, but not injurious to the horse. Half a pint of linseed oil is a dose for the horse, which should be administered early in the morning upon an empty stomach, or as nearly so as possible; the dose should be repeated in three or four days; and the third dose administered after the lapse of a similar period. When a horse is troubled with worms, some of these vermin will have their noses buried, as it were, in the coats of the stomach or the intestines; and many of them will thus escape, in some degree, the effects of the oil; those which are loose will be killed. Hence may be easily perceived the reason for repeating the dose; and there is seldom occasion to administer more than three.

Incidental occurrences, such as pricks, bruises, kicks, &c. should be attended to immediately. The injuries the bottom of the feet sustain are generally from nails, sharp

flints, broken bottles, &c., and in these cases it will sometimes be requisite to remove the shoe, in order to be able to examine the wound in a proper manner. The wound should be cleaned, and if it be not serious, the application of a little of any of the spirituous balsams will be sufficient; otherwise procure the assistance of a skilful veterinary surgeon. Treads and bruises between hair and hoof, may become, if neglected, very serious injuries: they should be kept clean, and friar's balsam or some balsamic tincture applied to them. Bruises from blows and kicks, and the like, should be bathed with any kind of repellants, such as cold vinegar, goulard, or brandy; any of which will very much assist in dissipating the blood which rushes into the smaller arteries where the bruise takes place. All kinds of green wounds may be cured by the balsams already enumerated; these will be found preferable to unctuous applications, particularly where a bandage cannot be used.

When the roads are hard, horses with brittle hoofs are apt to exhibit sand cracks; or in other words, the horn of the hoof will crack or open from the coronet downwards, at first presenting perhaps, not more than an inch in length, but which, if neglected, would very soon proceed from the top to the bottom, which would render the horse unserviceable for a considerable length of time. As soon as the crack is discovered, apply a cauterising iron, and scar the hoof crosswise at the bottom of the crack tolerably deep, which will prevent the crack from proceeding further. In like manner, scar the top just above the hoof, for the purpose of preventing the continuance of the crack as the hoof grows, melt some Burgundy pitch, and fill the crack with it. After the horse has rested a day or two, he will be fit for moderate work.

---

PRESERVATION OF APPLES.—The following valuable observations, contained in a letter, have been published in the *Massachusetts Agricultural Repository*:—It is the practice of some persons to pick apples in October, and first spread them on the floor of an upper room. The practice is said to render apples more durable by drying them: but I can affirm this to be a mistake. Apples, after remaining so long on the trees as safety from the frost will admit, should be taken directly from the trees to close casks, and kept as dry and as cool as possible. If suffered to lie on the floor for weeks, they wither and lose their flavour, without acquiring any additional durability. The best mode of preserving apples for spring use I have found to be putting them in dry sand, and as soon as picked. For this purpose, I dry sand in the heat of summer, and late in October put down the apples in layers, with a covering of sand upon each layer. The singular advantages of this mode of treatment are these:—1. The sand keeps the apples from the air, which is essential to their preservation. The sand checks the evaporation of the apples, thus preserving their full flavour; at the same time any moisture yielded by apples (and some there will be) is absorbed by the sand, so that the apples are kept dry, and all mustiness is prevented. My pippins in May and June are as fresh as when first picked, even the ends of the stems look as if just separated from the twig."

GRAVESEND AND NORTHFLEET  
AGRICULTURAL ASSOCIATION,

We last month gave a list of the prizes awarded at this meeting, we now subjoin an interesting discussion, which took place after dinner: which we have extracted from the Maidstone Gazette.

T. BENTLEY, Esq., returned thanks, and assured them on behalf of himself and the other Vice-President, that their best exertions should never be wanting to promote the success of the institution. It appeared to him calculated to arouse a laudable ambition and excitement in their best labourers, in lieu of the debasing propensities which were too often found in some of them. He had no doubt but they felt gratitude for the advantages and liberal treatment which this institution extended to them. He (Mr. B.) believed, however, that this institution was calculated to produce much more important results, by the discussion of important agricultural questions. In order to promote discussion on one of these subjects, he had sent for three years a plough of an improved construction, drawn by two horses only, to each of their ploughing matches. He wished to have the question fairly discussed, whether or not the land in that neighbourhood required four horses to plough it? It was of very great importance that they should ascertain whether such was the case or not, because it depended on that fact whether they should continue to incur an expence of 25 per cent. more than was necessary in the culture of arable land? An increase of 25 per cent. in their rent would be considered a most heavy exaction, but they submitted to an unnecessary outlay of 25 per cent. in labour, because they had been used to do so. If they found upon inquiry that four horses were absolutely necessary, it would establish a most important exception to a general rule, namely, that whilst every thing around them was in a state of improvement, and in every department attempts were making to diminish the expense of labour, the turn-rist plough was an important exception, and, though of great age, was not capable of improvement. He took the opportunity of making these observations because he thought that the best course he could take to get this important question decided, was that of promoting discussion. (*Cheers.*)

R. H. BEAUMONT, Esq. said that it seemed to him that the question before them was whether it was absolutely necessary in the culture of the general lands of this county that four-horse ploughs should be used? It had been contended that it was impossible to turn the earth up deep enough to destroy weeds, &c., with a two-horse plough. Although he was inclined to that opinion, yet he would not say that it was impossible. At all events it could be put to the test. Such would, however, not be the case, unless some person came forward to propose to the committee that they should select two parcels of land, equal in every respect, in order to submit the matter to a trial for one, two, or three seasons. He did not think that one season was enough. (*Hear, hear.*) He had heard it said on that day that the two-horse plough did its work very foul, but that the next year the land would be very foul. He had also heard it remarked that wheat grown on the land so ploughed was not so good as wheat grown on land by the side of it, ploughed by the turn-rist plough. If the committee of this institution would select two pieces of land, say of eight or ten acres, in order to try the experiment, he him-

self would give ten guineas towards the expence. (*Long continued cheering.*) In this county they had always been called an old-fashioned people, but he did not see why they should continue to shut their eyes against improvement. (*Cheers.*) If the committee would try the experiment, there was no doubt but it might be productive of great good. (*Cheers.*)

Mr. RUSSELL said that he had tried both two-horse and four-horse ploughs, not only in Kent but in Essex. He should be exceedingly happy to see any improvement in the turn-rist plough. He had in his trials been assisted by Mr. Webley, an eminent mechanic, who had said that he never saw a plough that turned the land so completely over as the four-horse turn-rist plough. He (Mr. R.) had found that in Essex he was still obliged to keep the same number of horses per acre for other purposes, even if he ploughed with two horses, and on an average of five years that the land ploughed with the two-horse plough was much more deteriorated than the land in Kent, which was ploughed with four horses. He believed that one good ploughing with four horses was equal to three ploughings with two horses. (*Cries of "No, no," "Yes, yes," and cheers.*)

Mr. ELEY said that he had been farming for forty-two years on all sorts of land, from the best to the worst, and he had found that the wheat required the land to be closed upon it by the four horse plough on very light lands, in order to keep the wet from the roots. He had also found that the two-horse plough could not bury the grass and weeds at a sufficient depth. What had rendered Kent so famous for ploughing, if it were not the use of the turn-rist plough? He thought that the two-horse plough would never do on heavy lands, and that on light lands it would require more expence to keep it clean than the use of the turn-rist, and would not produce more corn. (*Hear, hear, and cheers.*)

Mr. BENTLEY said that his plough had that day ploughed half an acre of land in the field. If Mr. Solomon was agreeable, he would undertake to plough that same half-acre for five or any number of following years with the two-horse plough—that it should be in other respects treated the same as the other land—and if, at the end of five years, there was any deficiency or inferiority in the corn produced on that and the same quantity of land beside it, he would forfeit ten guineas to the society. He must admit that the proper test was, as Mr. Beaumont had proposed to the society, that of experiment. Still, if Messrs. Solomon would let him know when their field was to be ploughed, he would send his two-horse plough to plough the half-acre. (*Cheers.*)

The CHAIRMAN proposed "The Committee of Management," which was drank with due honours.

Mr. ELEY, in returning thanks, said that when he replied to Mr. Bentley as to four-horse ploughs being with some exceptions the best, he intended to have stated, in his opinion, two horses were certainly preferable for ploughing clover leys, for he had observed in such cases the shallower the ploughing the better the crops, and that, unless it was creased after the four-horse plough, Mr. Bentley's plough would produce more corn. (*Cheers.*)

The health of the Judges was then drank with the usual honours.

Mr. BARGROVE, in returning thanks, observed that Colonel Dalton had spared no trouble and expence in trying to introduce the two-horse ploughs, but he found that they would not do. He said that the men were prejudiced, and gave them five shillings each, to encourage them; but they said they did not understand how to use them—the farms run out—and the whole project fell to the ground.

## THE TITHE ACT.

TO THE EDITOR OF THE HEREFORD TIMES.

SIR,—In your paper of Saturday last there is a long letter on the subject of tithes, in which the respected writer expresses his regret that during the parliamentary discussions on the Tithe Bill, the landowners and farmers of England appeared to look on with supine indifference. And that a member for this county had told him, that among all his constituents he could not name two who had expressed any degree of dissatisfaction of the Bill. This may be true; for, alas! the landowners and tenants of Britain did appear to be asleep, or to have become chicken-hearted, and, like American birds under the fascination of the rattle-snake, wriggle, flutter, and cry, and finally, without an effort to escape, yield to their fate, and become the prey of the rapacious reptile. But, Sir, it will be found, I trust, that when injustice shall stalk abroad, the agriculturists and yeomen have not lost their native courage.

The true reasons for their hanging back appears to be that landowners, in very many instances, and especially those possessing large entailed estates, have their property so intertwined with tithes and church patronage that they think it is best for their pecuniary interests, leaving patriotism out of the question, to let things stop as they are, without the hazard of a change. And the tenants or tillers of the land are jealous of any new arrangement, from the fear that the landlords may be benefitted to their loss; and they prefer to chaffer with the clergyman or lay proprietor over whom they hold the expense and risk of taking tithe in kind, as a check on their demand, rather than chaffer with the landlord for the rent of the land tithe-free. I therefore hail with acclamation the present Tithe Act, as it will most thoroughly remove from the eyes of the parties spoken of, this "dog in a manger" cause of distrust and inaction; and so soon as the coercive clauses of the Act come into operation, they will find, to their cost, that they have been palsied by a shadow, and that they had better have co-operated in active endeavours to form a plan by which, by national justice, tithes might be abolished altogether.

If I rightly comprehend the Act, the commissioners are bound to compel commutation by the mode pointed out in the Act; and the choice to commute, or not to commute, no longer exists with the land or tithe owners. If this be the fact, is it not the interest of the tithe-payers to take time by the forelock, and to come forward and to form an association which might consider the question in all its bearings, and assist the legislature by its counsels, and its concentration of practical knowledge and experience? A letter containing this suggestion was inserted in your paper of the 17th of last month, and a part of which I now beg to copy:—"But before government can proceed with so great a work as the abolition of tithes, they must feel confident of support, or at least the favourable opinion of a large part of the population, and the active petitioning of those concerned, viz., the landowners and tithe-payers. But to obtain these suffrages it will be necessary that the attention of the people generally should be called to the subject, and information disseminated as to the deceptive means by which tithes were obtained in olden time, and by degrees rivetted on the necks of the British people; and the present inconvenient and strife-stirring course of the system. It would be much to the honour of any county were a society formed to inquire into the present state of tithe arrangements, and whether the agriculturist does or does not pay for the religious instruction of the whole population as well as for them-

selves. And it would reflect honour on the county of Hereford to be the first to institute a society for the purpose of inquiring into and pointing out a remedy for the crying national grievance of tithes, and ensuring an income to the pastors on a new, and honourable, and liberal basis. And it is suggested, that if the names of a few of those who think in unison with the writer, were to be left at the newspaper offices, directed to him, it might prove the means of collating ideas and opinions, and therefore lead to the formation of a society under whose sanction the question might be brought before the noble, religious, and high-minded British people." To this suggestion, one landowner has already written his approbation, and it is to be hoped that others may follow his example, and if the president of the Horticultural Society of London, should deem the plan worthy of attention and support, it might prove the means of effecting much good, and of affording an opportunity to the timid, and to those who are afflicted, to speak out, and to make their oppressions known.

ATETHESIAN.

Kingsland, October 17th, 1836.

EMBANKMENTS.—Mr. Johnstone in his Treatise on Draining, &c. gives the following instance of the value of agricultural improvements under the head of "Reclaiming Land from the Sea by Embankments:—"The tracts of salt marshy ground which have been reclaimed in Scotland are not very numerous; but it is hoped the profit which these have afforded, may tend to induce further exertions in this branch of improvement. Perhaps there is no place in which more valuable acquisitions have been made in this manner than in the Island ofIslay, under the direction of its intelligent proprietor, Mr. Campbell, of Shawfield. At the head of an arm of the sea called Loch Gruinart, an embankment has been executed, by which four hundred acres of land, which formerly composed an useless salt marsh, have been brought under the plough. In making this embankment it was found that a considerable stream which discharged itself into the head of the Loch, impeded the operation of the flood-gates; and as the only effectual method of removing this serious inconvenience, Mr. Campbell had recourse to the expensive and arduous expedient of totally reversing the course of the stream, by withdrawing it from its old channel, and leading it through the opposite side of the country into Lochindaal. The whole of this embankment was executed in one summer. The total expense was about 600*l*. The ground which was reclaimed was let at an additional rent of 255*l*, so that estimating this at thirty years purchase, the immediate gain by the embankment was 7,050*l* sterling. Mr. Campbell has finished a similar embankment against the sea at the head of Lochindaal."

NEW VARIETIES OF THE POTATO.—When the rot first made its appearance among the potatoes, we ventured to suggest, that gentlemen who had spare time on their hands, might occupy themselves to a worse purpose than in producing new varieties of the plant, from seed. We learn that our Mayor, Thomas Kennedy, Esq., has, for a long time, been engaged in the culture of such varieties; and has, at length, succeeded in producing four—all of them of a large size, and very prolific, and one of them of a dark colour, and peculiarly well adapted for the table. Mr. Kennedy has a great many other varieties in progress. He finds that it requires five years to perfect them, from the seed; and that degeneracy commences in the tenth year.—*Derry Journal*.

## "A LINCOLNSHIRE FARMER" AND THE LADY COWS.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR:—I observed in your paper, a letter signed "A Lincolnshire Farmer," in which the lady-cows are accused of destroying cabbages. He says "the cabbage is also in many instances very bad, the leaves being covered with a kind of filth, and where ever it happens they quite destroy the plant. I believe the filth to be bred by the lady-cow, as I have found many nearly all eaten away with these vermin, and upon examination I have found as many as fifty of these lady-cows, upon the leaves or stalks of one plant!" Now sir, it is needless to say, to any one at all acquainted with the natural history of these insects, that the Lincolnshire farmer is not only quite in error, but *the very reverse is the fact*. Doubtless the "filth" he alludes to is the cabbage plant-louse, (*aphis brassicae*) which are as distinct from the lady-cow, as the ox is from the tiger. That the lice in question destroy the plants there can be no doubt whatever, but that they are bred by the lady-cow is well known to be quite incorrect, for the latter insect is their natural enemy, and they have a very different method of propagation from it, and when in their perfect state are not so large by at least 19-20ths, and their long transparent wing, and midge-like bodies, remind us of any thing but the lady-cow. The latter deposits five or six yellow oblong eggs in a cluster, under some leaf, which hatch into a fat lizard-like grub, of a dim ash colour, and sometimes having a few indistinct spots of a light brown; these change into that beautiful beetle the lady-cow or lady-bird,—called in Yorkshire "doody-cow." He has just as much right to judge, that because he saw a couple of foxes in his meadow, they were devouring his grass, as to say, that because he sees fifty lady-cows on a single cabbage, they are devouring his plant. The fact is, the lady-cow has no apparatus for devouring the plant, and never do, but live entirely on these indistinct "filth" the plant-lice, whose long sucker (*haustellum*) enables them to kill the plants, by depriving them of their juices, and doubtless he was indebted to the fifty he saw, for the destruction of thousands of the real enemies.

When the aphid abounds, whether upon the turnip, bean, or hop, the lady-cows are sent by Providence to prevent their abundance, as the locust-thrush follows the locust, to thin their destructive ranks.

I observe also another error in the same paper, in your Derbyshire article, signed S. P. G., where the writer ascribes the failure of the turnips not to the smotherfly, (*aphis*) but to the drought, causing a decomposition of the gelatinous parts of the plant, which the flies he says, are sent to remove, in the way of the blow fly in consuming putrid flesh, and are not the cause of the evil, but are carrying off the effects of some other cause. This is also quite erroneous, for in Yorkshire where the flies abound, the month of August was partly, and that of September entirely wet, so that no decomposition from the drought could take place, though it is possible they may do more injury in a dry season, owing to their being no moisture to supply the juices of the plant which they suck. That the flies commence their ravages on any dry elevated situation is nothing new, but certainly does not prove his theory in the least. On healthy plants he says they are not found—it should have been, the plants which they have not attacked, have had nothing to affect their growth, and are healthy, and cover the ground, preventing

the drought from penetrating. The assemblage of flies at Mansfield, to which he alludes, was precisely similar to the swarms met with at York, Bradford, Wigan, Manchester, Malton, Thirsk, &c., about the same time, and which were leaving the turnip plants, either to propagate, or in consequence of the gross state of the juices of the plants, which rendered them unfit for their food. In this state, the geometric spider, whose beautiful webs are studated with them, are their greatest enemies, for the lady-cow cannot pursue them when on the wing, and sporting in their fanciful evolutions.

Yours obediently,  
Thorfield Oct 23.

M. M. MILBURN.

## USE OF CRUSHED BONES AS A MANURE.

(Continued.)

MODE, EFFECT, AND GENERAL DIRECTIONS.—Crushed bones have been invariably found more immediately beneficial as a fertilizer when suffered to remain previously for some weeks mixed with earth in heaps exposed to the action of the atmosphere; by being thus fermented and dissolved, they are necessarily more speedily serviceable as food to the plants to which they are applied, and this observation more especially relates to the oat, barley, and other spring corn, since these do not remain on the ground for so long a period as other agricultural crops. The proportion is 50 bushels of bones with five loads of earth or clay; or, 40 bushels to five loads of common dung. For wheat and pasture lands, the previous fermentation of the bones is, for this reason, not so essential to the production of immediate benefit. The mode of applying them is, either sowing by broad cast, or by the drill, either by themselves or previously mixed, as before described. On light dry soils they are employed to most advantage; the produce per acre is from 20 to 25 bushels. Their good effects have been acknowledged by many agriculturists to last for many years. A farmer in the neighbourhood of Watford, who dressed his land with whole bones, some twenty years since (at a period when you could obtain them from London for fetching,) declares, that to this day, to use his own expression, "the land has never forgotten them." The expense of bone dust is about 2s 3d per bushel; half-inch bones 2s; and one-inch 1s 9d. The turnip season is the time when bone manure shews itself to more advantage than any other, and on such crops it particularly excels. It is drilled with a drill made on purpose, with the turnip seed at a distance of 18 inches, and the turnips should be horse-hoed; the period is from May to July. Bone dust is also used with great advantage on grass lands sown broad cast. Since soil, situation, and climate, must all be taken into the farmer's consideration, it is almost impossible to give any general positive directions for the quantity of boned to be applied per acre. The following facts, however, have been ascertained by numerous experiments:—

1st.—That crushed bones remain in the soil for a length of time proportionate to the size of the pieces, the dust producing the most immediate effect, the larger pieces continuing to show the longest advantage. On arable land their good effects continue for four years; on pasture land for eight years.

2nd.—On turnips, oats, barley, and wheat, the quantity applied has been from 25 to 30 bushels per acre; on pasture land, from 25 to 40 bushels of bone dust early in the spring.

3rd.—The best mode of application is by the drill, with the seed corn.

4th.—The bones should, when first used, be always applied, for the sake of correct information, in varying quantities per acre, and on no account should the farmer omit to leave, by way of comparison, a fair portion of the field without any manure.

## STENT ON THE FAILURE OF THE POTATOE CROP.

SIMPKIN AND MARSHALL, LONDON.

The failure in the Potatoo crop, which has been productive of such serious loss in different parts of the country, renders every information upon the subject highly interesting to the Potatoo Grower. The author of this little work commences by animadverting upon the usual modes of preserving Potatoes through the Winter as well as of cutting and planting them, which he reprobates in the following terms:—"I would ask any reasonable man, if this course of treatment is not enough to destroy all the inherent powers of vegetation in the sets before they are planted?" We must observe that for many years we grew a considerable breadth of Potatoes, from 30 to 40 acres, and that we invariably pursued the system reprobated by Mr Stent, without ever experiencing a failure from decay of seed; and have raised from 80 to 100 sacks per acre, 240lbs to the sack, upon land not worth 15s per acre rent exclusive of manure. The following extract sets forth in detail the plan which our author recommends for our adoption, namely, that of selecting a "situation on the North side of a building, or high hedge," to make the pie, which, is decidedly at variance with our maturest experience.

"I shall now proceed to describe the course of treatment which ought to be pursued with the Potatoes which are intended for plants in the ensuing spring. And first of all I should say, that they ought to be picked out by hand from the bulk, at the time of taking up the crop, of a size weighing about four ounces.—These should be taken and laid thinly on a piece of clear ground, or on short grass, where they should remain at least three weeks, exposed to the action of the sun and air night and day, and longer should the weather permit, until they become quite green. If they there be any fear of frost, they must be covered over with a thin covering of straw to prevent the frost from injuring them, which should be taken off again as soon as a change of weather takes place. While they are thus lying on the ground, let them be watered over twice a week with a solution of saltpetre and water in the following proportions:—In ten gallons of spring or river water, dissolve half-a-pound of salt-petre, and let this be applied by a watering-pan with the rose on. When they have lain in this state about ten days, it would be advisable to turn them over; and after remaining the time before specified, a place should be prepared to pie them down for winter, which should be done, if possible, in a shady situation on the north side of a building or high hedge. A circular piece of ground must be cleared about eight feet in diameter, in the centre of which place the ventilator, as represented in the plate. This should be kept perfectly upright, and the Potatoes placed round it, the quantity not to exceed thirty or forty bushels. This being done, the next thing will be to cover the whole down neatly with straw, not more than two inches thick. In this state let them remain a week or ten days, or more, according to the mildness of the weather: then cover them about six inches thick with earth, keeping the ventilator continually open at the top, except in severe frost, when it can be easily closed by a whip of straw or hay. The whole of the sides of the pie might be covered down with litter, or Potatoo tops; in this state they may remain

until the weather becomes more severe, when the litter may be taken off and about six inches more of earth added, and the whole beaten well down with a spade. After this the litter may be replaced, every person exercising his own judgment whether this covering should be increased or diminished, according to the state of the weather; that is to say, in mild winters the covering might be diminished, whereas in very severe winters it will be necessary to increase it.

The advantages of the ventilator will be seen by its allowing the evaporation to pass off the whole depth of the pie; by this means the Potatoes will be kept in a cold, dormant, state, and will not grow until the time of planting; consequently the centre eye will be preserved, and which will always grow the first and the strongest, and therefore the Potatoo possessing all its inherent powers of vegetation, must of course make a much stronger shoot than those which have been previously exhausted as before described. From the base of this shoot immediately proceed the fibres or roots which support the ensuing plant in an horizontal direction. Above these proceed in the same direction, the laterals, or side shoots, which produce the tuber or Potatoo, and as soon as the fibres are sufficient to support the shoot, the original plant is of no further service, the fibres then become the support of the plant. Now, it is evident that the tuber, or Potatoo, receives its nourishment or support from the sap, which passes in the main stem from whence these laterals proceed. This operation is carried on by the ebbing and flowing of the sap, and is caused by attraction and repulsion, which depend upon the alternate action of heat and cold. Consequently, when the atmosphere which surrounds the plant, is at a higher degree of temperature than the soil in which the roots are, then of course the sap is ascending. Likewise, when the soil in which the roots are, is at a higher degree of temperature than the atmosphere which surrounds the plant, then the sap is in a descending motion. Now I am satisfied that it is from this descending current of the sap, that the tuber or Potatoo receives its nourishment, and not immediately from the fibres, or the soil. This is seen, for instance, by cutting off the tops of the Potatoes just below the surface; the consequence is, that the tubers will not grow any more; therefore no potatoes ought to be suffered to remain in the ground after the tops are decayed, or cut down by the frost.

Another very important advantage arising from this mode of treatment, in addition to its insuring the growing of the plants is, that they will be found to produce a crop one-fourth more on an average on the same land, and of a larger size than from the former mode of treatment. This I have proved by experiment to the greatest satisfaction, having had this season from a piece of Ash-leaved Kidneys, managed in the manner before described, such a crop as fully warrants my recommendation of the plan to others. They were planted on the 2nd day of April, and taken up on the 12th of July, the space between each row being twenty-four inches, and the distance from one plant to another in the rows, being ten inches. These rows twenty yards long, produced, besides small ones, four pecks of Potatoes heaped measure, fit for market, some of which weighed twelve ounces, and of the very best quality. The following is a statement of the above produce per acre, or 4,840 square yards of land, produce 1,452 pecks, heaped measure; price per peck at the time of taking up, 1s, the amount, 72l 12s 0d. But besides all this evidence in favour of the system, a friend of mine, a farmer, who has been in the habit of cultivating Potatoes

for the last twenty years, purchased in the spring of 1835, a thousand sacks of the Shaw Potatoe, of a neighbour for the Yorkshire Markets, out of which he collected at the time of delivery a sufficient quantity to plant two acres of land, of those that were green ended, and had become so by growing out of the ground the preceding year. These at the time of planting were put into the ground, adjoining others under the old system in the same field, with the same manure, and on the same day. They were treated in a similar manner in every respect, but from the commencement of their vegetation, (for every one grew,) they were decidedly superior to the others, and at the time of taking up were a much finer sample, and were found to produce twenty sacks per acre more than those adjoining them.

The above statements will I trust, carry with them sufficient proofs of the decided preference of this system to the old one. If the land has not been prepared and manured in autumn, it ought to be done as early in the spring as possible, and the manure should be spread regularly over the surface of the ground before the last time of ploughing, which will by that means become somewhat incorporated with the soil. As soon as the rows are prepared to receive the plants, the Potatoes should be taken from the pie, with as much care as possible, so as not to injure the buds, should they have begun to shoot, then planted in rows ten inches apart, and covered up as soon as possible, that the soil may not become too dry, should the weather be very fine at the time of planting; after which they may be treated in the usual way.

## AGRICULTURAL IMPROVEMENTS.

TO THE EDITOR OF THE YORK CHRONICLE.

SIR,—It has been by far too much the practice of nations rapidly advancing in civilization to consider every change, political or domestic, as an improvement. Now, while we would by no means follow the Medes and Persians in the unalterableness of their once declared laws,—or of Popery, in stamping every thing agreed upon by a certain body infallible,—we would make such changes as the circumstances of the times and the discoveries of knowledge demand or admit; but we would not countenance any alteration merely for the sake of change, where it was of doubtful utility, except it is on so small a scale as to render a failure no serious disadvantage or loss.

So far as agriculture is concerned, the improvement effected during the last thirty years is perfectly astonishing; it has, in fact, changed its first principles. Instead of the casual capricious cropping, rounds of exhaustion and idleness, and its consequences, straggling, stunted, and deficient crops, with weeds choking the corn and plants, we have a system of agriculture formed on some acknowledged principles, though perhaps not carried out to the extent they ultimately may be. We have a crop every year on most of the soils; instead of a naked and idle fallow, we have a produce from the soil alternately in corn and flesh; and the produce of some soils is absolutely doubled. The alternations of turnips,—of clover,—the system of under-draining (where care is taken that it is not *over-draining*),—and last, not least, the use of bone-manure, &c., have enabled the tenants to pay a fair rent for soils which, otherwise, would not be worth cultivation, of rent.—The silicious soils, which so soon decompose and absorb manure, could never be kept in

any degree of order, without the intervention of green crops, as it would be absolutely impossible otherwise to procure a sufficiency of extraneous manure. *These are improvements*; but can we call every new thing put in practice around us by that name, with any degree of accuracy? Can we call the consolidation of the small tenants' holdings, the ruin of his little family, and the destruction of his neat buildings, to make way for the erection of immense cattle-sheds, and splendid stables, an improvement? As well might we say, that the tyrannic and pompous sway of an Alexander, or a Napoleon, over the nations of the earth, was a blessing!

It is very desirable that the true principles of improvement should be distinctly understood, and a line of demarkation drawn, between the real melioration of the art of agriculture and speculative innovation. We may safely lay it down as a principle, that *every thing which increases the production, is an improvement*. Upon this principle, the four-course system is an improvement upon the naked fallow;—bone-manure, upon the incessant dunging;—and judicious draining, upon water-furrowing and ditching. Every increase in the production must increase the farmers' profits, as well as increase his manure, and thus add to his future capabilities: it will give more employment to labourers, in securing and bringing the produce to market, and thus increase his consumption in his family, and lessen the parish burdens; and in a national point of view, it renders us less dependent on foreign supply, and encourages our own trade. Besides, *great production increases future production*. When the crops are heavy, we say the soil is in a high state of cultivation, which is nothing more than being in a state of abundant productiveness—a state which it is easy to maintain, when once attained. The truth is, that the highest state of improvement is when the land is producing the largest amount of produce possible.

It is contended, that every diminution of labour is an improvement. Thus the flail is preferable to the "ox treading out the corn;" and the spade could never effect the turning of the soil which is requisite—we must have the plough to our aid. This is, however, manifestly unsound. The *only* object of decreasing labour is to lessen the price of raising the crops; otherwise, it is immaterial to the farmer. Now, suppose the introduction of *power* into agriculture should be adopted,—vast numbers of hands would be thrown out of employ, and eventually thrown upon the parish; the cost of supporting them in idleness, and its concomitant vices, would manifestly be *added to the expenses of his machinery*, and he thus increases the cost of production, and defeats the very object of his improvements! The folly and madness of agricultural machinery was strikingly exhibited some time ago, in Essex and some of the southern counties, by the introduction of thrashing-machines; the consequent want of employment produced excitement,—riots and destruction of odious machinery succeeded, and incendiary fires followed, to the consternation, alarm and horror of the large farmers, who shrunk horrified from the effects of their own system, which Mr. S. Lefevre recommends as a relief to Ireland!

There is, I admit, some difficulty in determining how far the introduction of machinery for facilitating labour may go, and how far it may not. Much will depend upon the circumstances of the case; when labour is scarce, and almost unattainable, machinery is admissible almost to an indefinite extent. In a country like this, where there is plenty of labour, *it should not go further than immediate necessity demands*. For instance, spade labour, valuable as it

is\*, could never get the whole of the land into a proper state of cultivation for the reception of the seed, from the want of hands.

But, Sir, scores, hundreds, and perhaps thousands, of farmers will read this:—many, perhaps, will feel it to be too true; but it is to be feared few, perhaps none, will adopt the principle, but be guided as interest or circumstances may dictate. "Why should I adopt it," he may say, "let others do it—let me alone;" not considering that if all acted upon this principle, it would never be done. Or some will urge, if they do not employ machinery, others will. Now, the fact is, we should *do our duty*, regardless of others, or we may possibly fall into their errors, and adopt their plans and views, until, like the Essex farmers, we have to repent of it, amidst confusion, desolation, and fire!

W. E. N.

## WEST KENT AGRICULTURAL ASSOCIATION.

### ANNUAL MEETING AND PLOUGHING MATCH.

The sixteenth anniversary of this Association, the parent stock from which several other societies in the county of Kent have sprung, took place on Wednesday, Oct. 26, at Kent House Farm, Beckenham, in the occupation of Mr. Mathews. The day was fine and the company numerous, consisting chiefly of the tenantry and labourers. We observed very few landlords on the ground, a circumstance which seemed to betoken an absence of that personal patronage which we consider it the duty and interest of the influential landowners to afford on such occasions. This deficiency in point of numbers was amply counterbalanced by the attendance of practical farmers and workmen.

The excellent arrangements made by the Committee of Management, by which the extraordinary number of 54 ploughs started and performed the work without the slightest confusion or difficulty, deserve especial notice, and the hospitality of Mr. and Mrs. Mathews, and their assiduous attentions to the comforts of their guests, for whom an excellent luncheon was provided, were universally spoken of in high terms.

The land was a strong loam on a clay subsoil, and turned up rather heavy. The two-horse ploughs were not exactly in their own element although many of them performed their work in a masterly manner, but it was evident that it laid too close to the collar to induce them to wish to make every day work of it. The judges were Messrs. Gladwin, Lewin, White, and Martin, members of the Surrey Agricultural Association.

The work being completed and the judges having determined upon the merits of the respective ploughmen, Thomas Parker, Esq., the Treasurer, assisted by the Committee of Management, and surrounded by a great number of visitors and a large body of workmen, who appeared to take a great interest in

the proceedings, proceeded to distribute the prizes as awarded. He stated that in order to avoid the possibility of partiality, the judges were selected from a considerable distance, and had not the slightest knowledge of any of the competitors and were therefore guided in their decision entirely by the merits of the work performed. This observation called forth a general expression of approbation from the assembled competitors.

CLASS 1.—Two Horse Ploughs: 9 competitors.—1st Premium to James Allen, servant to Mr. Burgh; Plough-maker, Mack and Butler; 3 guineas. 2nd Premium to Henry Winterman, servant to Sir Samuel Scott; Plough-maker, Jefferies; 2 guineas. 3rd Premium to Wm. Walker, servant to Mrs. Johnston; Plough-maker, Butler; 1 guinea.

CLASS 2.—Three-horse Ploughs.—26 competitors.—1st Premium to Jacob Harris, servant to Mr. A. Owen, Plough-maker, Mack; 3 guineas. 2nd Premium to John Hook, servant to Mr. Graham, Plough-maker, Butler; 2½ guineas. 3rd Premium to Wm. Searles, servant to Mr. Tyler, 2 guineas; Plough-maker, Patton. 4th Premium to Daniel Cooper, servant to Mr. Twort, 1½ guinea; Plough-maker, Jefferies. 5th Premium to George Olliffe, servant to Mr. Matthews, 1 guinea; Plough-maker, Mack.

CLASS 3.—No competitors.

CLASS 4.—Turn-wrest Ploughs; 5 competitors.—1st Premium to John Wilshire, servant to Mr. Noaks; Plough-maker, Tinker. 2nd Premium to James Brambleby, servant to Mr. Dowling; Plough-maker, Hartridge. 3rd Premium to Robert Berry, servant to Mr. Selby; Plough-maker, Hockley.—Prize, 1 guinea.

CLASS 5.—For Farmers' Sons; 2 Ploughs.—The judges decided the work of Mr. John Edgerton to be best; but as the rules required that there must be three ploughs entered for competition, no prize was awarded.

CLASS FOR THE CHAMPIONS.—12 competitors.—Premium of 3 guineas and a new hat to John Beckway, servant to Messrs. Wilmott and Co.; Plough-maker, Mack and Butler.

After the business of the day was over, the company repaired to the Bell Inn, Bromley, where an excellent dinner had been provided by the stewards, Messrs. Owen, Morris and Saunders. Upwards of 100 members and friends of the Society were present. John Wells, Esq., of Bickley, the president of the Association, in the chair, and Hugh Johnston, Esq., the vice-president, acting as croupier.

After the usual loyal toasts had been drank, the CHAIRMAN, in an able and appropriate address, gave "Success to the West Kent Agricultural Association."

The health of the worthy president was then drank in the most enthusiastic manner.

Song, "The Old English Gentleman."

Mr. WELLS, in returning thanks, adverted to the early formation of the Association, and commented upon the benefits resulting from meetings of this kind. He expressed in warm and feeling terms the deep interest he took, and ever should take, in promoting the welfare of the Association, and in furthering the interests of agriculture, which he considered to be the foundation of our national prosperity, and concluded by the toast, "Liberal landlords, prosperous tenants, and happy labourers."

Letters were read from Mr. Hodges and Sir W. Geary, the members for the county, excusing their absence both being called upon to preside at similar meetings which took place on the same day.

\* A poor man named James Scrbutt, with a broken leg, being an old pensioner, with an industrious foreign wife and three children has produced from thirty lugs of land, or the third part of a quarter of an acre, rented with upwards of 500 tenants of the Lord Bishop of Bath and Wells, the amazing quantity of eighteen bushels of cleaned excellent wheat, or at the rate of *eighty-six bushels per acre!* besides what the birds stole, and what was wasted in gathering. This is nearly three times the amount raised under plough culture.

The health of "the judges" was next drank.

Mr. GLADWIN, in returning thanks, dwelt with much force and effect on the advantages of an intimate intercourse, and well sustained confidence between the three classes, of landlords, tenants and labourers, as members of one family, having but one interest, that of the whole. He expressed much satisfaction, in which he was joined by the other gentlemen from Surrey present, at the friendly connexion which had been kept up of late between the Kent and Surrey Associations, and which the farmers of Surrey were desirous of maintaining. He spoke in high terms of the general character of the ploughing performed, which he had never seen excelled, and which made it exceedingly difficult to decide between the several competitors.

The health of "the vice-president" was drank, and Mr. JOHNSON returned thanks in an appropriate speech.

The health of the treasurer came next in order. Mr. PARKER returned thanks, and concluded by proposing the health of Lord Farnborough, from whom he had received a fourth donation of five pounds. (*Cheers.*)

At about ten o'clock the President retired, and was greeted with the most hearty cheers, every individual in the room rising at his departure; the vice-president, Mr. JOHNSON was then called to the chair, and Mr. Parker, the treasurer, took the vice-president's seat.

"The Committee of Management," was the next toast given, when Mr. OWEN returned thanks, at the same time taking occasion to observe that although as one of the stewards, he had exerted himself to provide good cheer for his friends, still he should have been much more in his element, had he been superintending the work in the field.

The health of Miss Thrail and the Ladies of Kent was then drank, with "three times three."

Mr. SKINNER stated that he was instructed by Miss Thrail not only to continue her subscription, but also an annual donation towards the funds of the Association.

The health of Mr. Thomas Watson Parker was given, and acknowledged by Mr. Parker, jun.

A great many excellent songs were sung by the professional gentlemen, and the evening was spent in the greatest harmony, all departing delighted with the proceedings of the day.

**SMUGGLED CORN.**—On Wednesday the cutter *St. Anne*, laden with corn, purporting to be the produce of this island, for importation into England, free of duty, and cleared as such for Plymouth, was seized by the officers of the Customs in the harbour of St. Helier, on suspicion that the said corn was partly, if not wholly, of foreign produce, by which the revenue of England would have been defrauded. It appears, that the shipper, Mr. Amy, of George Town, purchased the said wheat from a farmer named Anley, at St. John's parish, and upon information given, that the said Anley had thereby committed an infraction of the law, the constable of St. Helier presented a report against him yesterday to the Royal Court, upon which the Crown-office framed a prosecution; Anley was produced at the bar, but denied the charge, and by means of his counsel, Advocate Hammond, pleaded not guilty. He was admitted on bail in the sum of 200*l*. to appear when called upon. We believe the law passed some months since, provides that upon conviction, the corn shall be confiscated, a fine levied at per cabot, and the offender imprisoned at hard labour, for a term not less than six months.—*Jersey News.*

## SOUTH DERBYSHIRE AGRICULTURAL SOCIETY.

This Society had its first ploughing match and exhibition of agricultural roots, &c. on Thursday week, the 13th October, at Swarkstone. The field for the ploughing was one well adapted to the object, being two years turf, situated on the farm of Mr. Smith, at Swarkston Lows.

Eight ploughs entered for competition; they were drawn by two horses abreast and without a driver. Half an acre of land was staked out for each plough. All the competitors started at a given signal. The first man finished his half acre in two hours and twelve minutes, and all within two hours and a half. The work was performed by each in an excellent manner, and the successful competitors were declared to be as under:—

1st Prize of 3*l* to William Vallance, in the service of the Earl of Chesterfield.

2d Prize of 2*l* to John Sanders, in the employ of Sir George Crewe, Bart., M.P.

For farmer's sons not in business for themselves:—

1st Prize of 3*l* to William Higgin, son of Mr. Samuel Higgin, of Swarkston.

2d Prize of 2*l* to Joseph Steer, son of Mr. John Steer, of Chaddesden.

For farming boys under eighteen years of age:—

Joseph Smith, jun., in the service of the Earl of Chesterfield, seventeen years of age, was the only one entered, and he ploughed his half acre of land in two hours and twenty-nine minutes, in the most workmanlike manner, which excited the admiration of all present, and called forth the great commendation of the judges for his extraordinary skill as a ploughman. A prize of 2*l* was awarded to him.

The field was attended by a numerous company, who took great interest in the progress of the competitors, and the day passed off in a very satisfactory manner.

After the ploughing was finished, an exhibition of agricultural roots took place, and a sweepstakes of five shillings each was decided as under:—

To Mr. Cade, of Spondon, for the best five bulbs of mangel wurtzel.

To Mr. J. L. Hassall, of Packington, for the best five roots of Swedish turnips.

And to Mr. Smith, of Swarkston Lows, for the best five carrots.

Mr. Pearsall, of Foremark, exhibited some mangel wurtzel and Swedish turnips of a very superior kind, highly commended by the judges.

Mr. Cade, of Spondon, exhibited two bulbs of mangel wurtzel, the stems of which had been lopped off on their first showing a disposition to run to seed, and the bulbs had subsequently grown to a great substance.

Mr. Smith, of Swarkston Lows, exhibited eight apples, of the sort he calls *Pomme de Roy*, one of which weighed thirteen ounces fourteen drachms.

Mr. King, of Chellaston, exhibited an onion, grown at Chellaston, of the Portugal kind, which weighed one pound eleven ounces.

But what called forth the greatest admiration from the whole company and the commendation of the judges, were six cattle cabbages exhibited by Mr. J. L. Hassall, of Packington, against which unluckily for him there appeared no competitor. They were the real drum head species; their average weight was forty pounds each. Mr. Hassall liberally gave them to a gentleman who were present to set for seed.

### THE DINNER.

The society and friends dined together at the Crewe and Harpur Arms, Swarkston Bridge, at four o'clock. The dinner was excellent, and did great credit to Mr. and Mrs. Adams. The vension was supplied by Sir George Crewe, Bart., M.P., vice-president of the society, who presided as chairman. Amongst the company present were Sir F. Burdett, Bart., M.P.; H. S. Wilmot, Esq.; E. L. Crewe, Esq.; E. S. Chandos Pole Esq.; Cockslutt Heathcote, Esq.; Thomas Allsopp, Esq.; Roger Cox, Esq.; Henry Tillard, Esq.; J. L. Hassall, Esq. (who acted as vice-president); Mr. Smith, Swarkston Lows; Mr. Parkinson; Mr. Sale,

Barrow; Mr. Draper, and many other members and friends, about ninety in number. Mr. Stokes, of Kingston, and Mr. John Smith, of Donisthorpe, were the judges.

After the cloth was withdrawn, the usual toasts were given.

The CHAIRMAN then drew the attention of the company to the two subjects proposed for discussion, viz.

1st.—“Is the running to seed of mangel wurtzel and Swedish turnips much influenced by the time of sowing, and what are the best methods of cultivating those plants?”

Upon this subject the following letter addressed to the Chairman of the Derbyshire Agricultural Committee was read from Mr. J. L. Hassall, which we have pleasure in giving to our readers:—Mr. Hassall says, “I have grown mangel wurtzel for the last nine years, and have had good crops six years out of the nine; twice I had about half a crop, and once, owing to the weather being so dry that the seed could not vegetate, I had a total failure. I have invariably sown it the last week in April, or the first week in May, and my system has been to dibble it on ridges, about two feet interval, putting a seed in every three or four inches, about one inch deep, and leaving them when hoed from nine to twelve inches apart. I have always had some runners, but they have varied very much in number. This year I have only *forty* in two acres. Some years I have had ten times that number, and am inclined to think it depends more upon the land, the season, and the seed, than the time of sowing. Dry hot land I have found produces more runners than land of a more loamy description, and I have no doubt if transplanted seed was sown, there would be fewer runners, than if the seed was not transplanted, as in the latter, you are very likely to get a portion of seed from runners. I think this argument equally applies to Swedish turnips. I sowed some Swedes the last week in April, and some others the first week in June; the first sown are the best, and there is not one running plant in either of them; they were both sown with transplanted seed, and both crops grown upon rather cool and loamy soil. There is another question still undecided with regard to mangel wurtzel, viz., the propriety of pulling or lopping the tops before you take up the bulb; some persons hold it is injurious to the bulb, others, that this operation causes it to grow larger. With your permission, I will state what little experience I have had upon this part of the subject. The first year I grew mangel wurtzel, the latter end of the summer was very dry, and I had recourse to the above expedient, as food for my dairy cows; commencing about the first of September, I took all the under leaves, and merely left the *pea* in the *upright ones*, but it struck me forcibly that I was *thwarting nature*, and that this mutilation of the top would materially retard the growth of the root; to ascertain this fact, I left six rows completely untouched, the result was, they were decidedly larger than any others. In November, when they were taken up, I was fully convinced I had considerably lessened the weight of my crop, and robbed the bulb of much of its nutriment by taking away the leaves, and I have never had recourse to this practice since. About two months ago I had some conversation with an experienced gardener in the village where I live, upon mangel wurtzel, &c. He observed, “If you wish to have larger mangel than your neighbours, you must cut the tops off.” I asked him his reason; he said, the leaves took that nutriment which the bulb ought to have, and he strongly advised me to try the experiment, which I did in the following manner: I selected three rows, in which I could perceive no difference. The gardener said he thought he could; that the middle row was the best. I cut the tops off six yards of the middle row; this length produced nineteen bulbs, and to-day I have had them taken them up and weighed, and also nineteen bulbs of the two rows, directly opposite, and I find the respective weights to be—of the row with the tops cut off 31 lbs.—the others 40 lbs., and 37 lbs. I then weighed nineteen bulbs of each of the three rows, beginning where the middle row was cut off. The weights were—

the middle row 45 lbs., the other two 39 lbs. and 40 lbs. This is a trifling experiment, but it is quite conclusive in my mind, that if I had persevered in cutting off the tops, I should have had one-third less weight upon an acre than I shall, having let the tops remain.”

Mr. CADE, of Spondon, and other gentlemen, addressed the company upon this question, in appropriate and useful speeches. We have been favoured by the former gentleman with the substance of his remarks, which we incorporate in our report:—“My method,” says Mr. Cade, “of propagating mangel wurtzel is as follows: in the first place, I prepare my land in the same manner as usually done for Swede turnips, with good rotten manure; I plough and harrow it quite level, and don't ridge it; I make with a hoe trenches from half an inch to an inch deep, full two feet asunder, and sow my seed pretty thick and rake it in carefully. Before sowing the seed I steep it in tepid water until it gets soft, or if it is sprit a very little it will be all the better, for if you give it a start out of the hard husk it will go on, but if the weather should prove very dry and the plants do not come up regular, and those that are up do not come on, which was the case this last summer, I then give every row a good watering, almost to saturation, for it is of no use doing it in a slight way, and two men will do with a water cart and watering pans half an acre a day, and once watering, if sufficiently done, will be quite enough. I have before said sow your seed thick, for it is much easier to thin than transplant, for transplanted plants never make such good bottoms as those that are not removed, and leave the plants in the rows nine or ten inches asunder. I have generally sown my seed from the middle of April to the beginning of May, but this year by way of experiment I sowed some in the middle of March, but most of them run, and those that did not run I do not think made any better bulbs than those that were sown later, and those that were sown later not half a dozen in half an acre run. I also topped a few plants that were running by taking off the top about five or six inches above the bulb, and also the side sprouts but not the leaves, and I found they made nearly as good bottoms as those that had not run.”

2nd.—“What are the best means of supplying during the winter and spring, a deficiency of food occasioned by a dry season, or other accidental causes?”

The subject was introduced by a speech from Sir George Crewe, who discussed it at length, and concluded by recommending the strictest economy in the application of the very limited means the farmers had to get through the winter with. Mr. Smith, Mr. Sale, Mr. Hassall, Mr. Stokes, and Mr. R. Cox, also dwelt upon the question under discussion. Cutting and steaming straw was highly recommended as one strong hold of relief.

The Chairman's health, with three times three, was then proposed by E. S. Chandos Pole, Esq., who returned thanks in a very complimentary manner, and shortly after withdrew.

The company shortly afterwards separated, after an evening spent in the utmost harmony and good feeling.

EXTRAORDINARY PRODUCE. — A piece of land, measuring about 1A. 16P., in the occupation of Mrs. Townsend, at Watlingbury, was formerly a meadow, and broken up six years since. It was planted with hops, and the amount of produce within the last four years, has been as follows:—

	1833	1834	1835	1836
Hops .....	16 cwt.	16½ cwt	26¼ cwt	16cwt
Filberts .....	½ cwt	1½ cwt	1 cwt	25 lb.
Apples .....	5 bush	10 bush	20 bush	3 bus
Potatoes .....			20 bush	

This wonderful amount of produce is the more extraordinary, as the land has not been much manured since it has been broken up.—*Maidstone Gazette*.

## REPORT OF THE COMMITTEE OF THE HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND,

*To whose consideration was referred the subject of the General Shows of Live Stock, and the Arrangements and Regulations which it may be expedient for the Society hereafter to establish, with reference to these Meetings.*

The subjoined article from the "Quarterly Journal of Agriculture" states the reasons which influenced the Highland Society in offering premiums for particular breeds of cattle. It will be observed that the "Fife-shire" is excluded. The Society, however, afterwards reviewed its decision and offered prizes for "Fifeshire," cattle, one of which was awarded to the animal which forms the subject of our Plate.—ED. F. M.

The Committee would have been pleased that in the fulfilment of the duty devolved upon them, an opportunity for more frequent meeting and discussion had been afforded; but since it is deemed important that this Report should be presented previous to making the arrangements for the Perth Show in 1836, they will endeavour to submit to the Directors the opinions which their investigations on the subject submitted to them have led them to form.

These Shows have now become a powerful instrument in the hands of the Society, for effecting improvements on the live-stock of this country, and therefore it is peculiarly important that the Society, in the kind of encouragement it is to afford to breeders, should act upon a steady and well-matured system. It is not enough to give prizes for animals exhibited. These prizes should be directed to the end of inculcating sound principles of breeding, and of encouraging the rearing of the best classes of animals suited to the circumstances of the country. It is important that the basis upon which the Society means to found its system of premiums should be clearly explained, so that a unity of proceedings may be observed, and districts applying for General Shows may be at once apprised of the conditions on which the Society's patronage is to be offered. Under this system, steadily acted upon, will be avoided those sacrifices which it has been necessary to make to the prejudices of districts, and in some cases, it may be believed, to the wishes and interests of particular breeders.

A primary question, with relation to this object, is the particular classes of stock, or breeds, as they are called, which the Society will recognize and encourage in their pure state, by the offer of specific premiums.

A classification of this kind is obviously necessary. Premiums could not be offered merely for the best animals, because there could be no standard of comparison between the larger and more cultivated breeds and others, which, though inferior in size and feeding properties, are yet the only kinds which the natural circumstances of the country will permit to be reared. Thus there could be no principle of comparison between a short-horned and a West Highland ox, and yet the latter is the more important staple production of the country, and can be reared in circumstances under which the other could not subsist. In order

to encourage, therefore, the different kinds of stock, which different parts of the country are capable of producing, it is absolutely necessary to divide them into classes or breeds.

Of what are called breeds, the most highly cultivated in this island, and it is believed in Europe, appears to be the Short-horned. This breed, however, is only suited to parts of the country of a certain degree of natural or acquired fertility. But as the breed of the cultivated country, it is deserving of all the encouragement which the Society can bestow. A prominent object, therefore, in all offers of Premiums for the larger cattle, should be the short-horned in its purity.

The next breeds, are those of the more elevated parts of the country, where artificial food can be procured only in limited quantity. Of these breeds the best model, in the general estimation of breeders, is the West Highland. There may be equally good animals, indeed, reared by particular breeders in all other parts of the Highlands, and therefore it might seem that the term West Highland might be abandoned, and the general term Highland substituted. At the same time, the peculiar characters of the West Highland are so well understood, that it seems better, in the offer of Premiums, to retain the term. This breed merits the utmost encouragement that the Society can give.

The next classes of breeds, are those which are superior in size to the true West Highland, but inferior to the finer breeds of the lower country. These form a very mixed class of stock.

Of these breeds, one distinctly recognised by its numbers and the permanency of its characters is the Angus, now extended over the adjoining counties. This is a breed certainly well suited to a large tract of country, and having been cultivated with considerable care, deserves encouragement; and in this class of stock may likewise be placed what is called the Polled Aberdeenshire.

Of nearly similar characters is the Galloway, though it is the production of a different part of the country. In the offering of Premiums, there seems to be no reason for distinguishing these breeds from each other. They may be allowed to compete together, merely giving the Premiums to the best individuals of either breed. It is recommended, therefore, that these breeds be classed together, under the title of Galloway, Polled Angus, and Polled Aberdeenshire; and as thier may be supposed to be generally a considerable number of individuals brought forward, there may be an increase in the number of Premiums offered.

Another breed, distinguished from all the others, is the Ayrshire. In this breed, the attention of breeders has been in a peculiar degree directed to the character which indicate the property of producing milk. By this means, a breed, valuable for the Dairy, has been formed, on which account the Ayrshire will be properly recognised as a distinct breed, and the breeders of it encouraged by the offer of specific Premiums.

In this enumeration of breeds, neither the Fife-shire nor the Horned Aberdeenshire has been included. In the case of the Fife-shire breed, it has appeared to the Committee, that though very fine animals under this name are often reared by the care and skill of particular breeders, yet, that in its general character, the breed of Fife-shire is inferior to what the district is capable of producing; and that, with respect to the Horned

Aberdeenshire, as the interests of the breeders of the district are evidently leading them to rear the hornless in preference, it is not for the Society to attempt, by the offer of Premiums, to revive the cultivation of the other.

The Short-horned, therefore, the West Highland, the Ayrshire, and the Polled breeds of Galloway and the Northern districts, appear to the Committee to be those only which it is necessary for the Society to distinguish as separate classes of stock in their offer of Premiums. All the others, under whatever name, will receive Premiums solely as they are good individuals, without any distinction as to their peculiar designation, being comprehended under the general class of "any breed, pure or cross."

A mean of improving the live-stock of Scotland, may be supposed to be by crossing the native stock with superior males; and since the introduction of the short-horns into the north-eastern counties, this mean of improvement is in active progress. The only cases in which injury may possibly result from this species of crossing is, where a breed of established characters, and suited to the circumstances of the country, as the West Highland, already exists. In this case crossing may destroy the particular character for which the native breed is valued, without substituting another suited to the circumstances of the country where they are to be reared. But in the great majority of cases, comprehending innumerable animals of doubtful breeding, or defective form, there does not appear to be any reason to apprehend that the mixture of the blood of a better race will not produce beneficial results. There is not the slightest reason, therefore, why the Society should oppose itself in any way to a species of improvement, which has produced important effects, and which the interests of farmers are already leading them to adopt all over the country.

The great means of effecting this improvement of the defective stock of the country is the extension of the pure short-horns; and this affords further reason for the Society to devote especial attention to the introduction and diffusion of this breed in the lowlands of Scotland.

In offering premiums for cattle, an important object to be aimed at is encouraging the breeding of animals having a disposition to feed at an early age. Unless animals can be fattened at an early period, they do not fulfil an important condition of a good breed, nor merit especial encouragement by premiums. The committee, therefore, recommend to the Directors, in the strongest manner, to direct the attention of farmers to this essential property of breeding, by limiting in all cases the age at which fat animals shall be allowed to contend for premiums. No premium, it is conceived, should be given for any ox exhibited for symmetry, fat, and weight, exceeding the age of four years. The shows being supposed held in October, this will make the age of all the fat animals exhibited under four, which is conceived to be quite sufficient. The regulation may lessen the number of fat animals exhibited, but it will produce a far more than corresponding effect in causing the really good feeding animals to be brought forward. It may likewise create some disappointment amongst competitors; but it is for the the Society to look not to the wishes and prejudices of individuals, but to the ultimate object, a real improvement in the live stock of the country.

While the Committee express their opinion of the benefits calculated to result from an adherence on the part of the Society to the principle referred to,

yet it appears to be a general wish amongst the breeders who have been communicated with on the subject, that an exception shall be made in favour of breeds reared in districts where artificial food can be procured only in limited quantity, and in which, accordingly, the age of final feeding is retarded. It has been suggested that the age at which fat animals under these circumstances may be exhibited shall be limited to four off in place of three off, implying that the animals shall be under five at the time of the shows in autumn. It appears to the Committee than an exception may be made with perfect propriety to this effect in the case of the West Highland; and that in compliance with the wishes expressed, it may be extended, at least for the present, to the polled breeds of Galloway and the northern counties.

With respect to the particular rules of competition, these have in general been extremely well matured; and there are only two or three points with respect to them to which the Committee think it necessary to advert.

A regulation has existed in all the shows, with the exception of that of Kelso, excluding the stock of England from competition. For this there does not appear to the Committee to exist the slightest good reason. On the contrary this exclusion has an appearance of a want of that liberality which so much distinguishes the Society, and is, besides, attended with positive injury as regards the purposes of these shows. It lessens greatly their interest, and prevents valuable stock from being brought into Scotland. Had it not been for this regulation, it is understood that distinguished breeders in Northumberland and North Durham were prepared to bring forward stock both at Stirling and Aberdeen. Were there no other purpose served, therefore, than to produce to the farmers of Scotland examples of superior stock, there would be reason for rescinding this regulation. But, besides the purpose of useful example, the inviting the co-operation of English breeders in these shows is eminently calculated to excite emulation, and to lead to the introduction of good stock into the country.

There are two or three minor points in the regulations which the Committee may notice. Competitors are excluded from gaining more than one prize in the same class of stock. It appears to the Committee, that there does not seem to be any good purpose served by this regulation, and that it is attended with practical inconvenience, when the same individual has really the merit, as sometimes happens, of gaining two premiums in the same class.

Another point relates to a regulation which, it is believed, was adopted in consequence of a circumstance connected with the premium bull at Kelso, not at all likely to recur. Proof is required that the bull has previously got stock; now this limitation seems to be quite unnecessary. The chance of a young healthy bull not being able to get stock is not worth calculating upon, while the effect of the regulation may be to exclude from competition the finest and most promising young bulls than can be reared. It is thought that it will be sufficient in any case to allow the judges to make such enquiries with regard to the getting of stock by the bulls as they may think proper.

The Committee have referred to the particular breeds of cattle, which it seems necessary or expedient to distinguish. With respect to sheep, less difficulty presents itself than in the case of cattle.

There are three distinct breeds of sheep in Scotland, proved by experience to be well suited to the particular circumstances under which they are placed.

There are, for the low and cultivated country, the New Leicester, and for the elevated or highland parts, the Black-faced and Cheviot.

With respect to the New Leicester, the same remarks apply as to the short-horned cattle. They are as yet unrivalled as a breed for a low and cultivated country, where artificial food can be produced. The cultivation of superior sheep of this kind cannot fail to promote other improvements, by inducing proprietors to erect necessary inclosures, and the tenants to extend and improve their means of feeding. For which reason the Committee entertain no doubt that the attention of the Society will be directed to this valuable class of stock. There is, in this respect, ample scope for encouragement and improvement; for it cannot be concealed, that, over the greater part of Scotland, the management of the finer kinds of sheep is either unknown or extremely defective.

With respect to the Cheviot and Black-faced breeds, the interests of breeders will lead them to select the one or the other as they are most suited to the particular circumstances of the district or farm. The province of the Society appears to be, to award premiums, as hitherto, to the best individuals, male or female, of the respective breeds, and thus to encourage the maintaining of them in their purity. There appears to be little useful purpose served by holding out premiums for crossing these breeds with each other, and much less with the larger breed of the lower country. The latter species of crossing may be advantageous, with respect to a first cross to be fed off, but in rare cases as a general principle of breeding.

The South Down breed has not been included in this enumeration. Admirable as this breed is in the Downs of the southern counties, and in various districts of England, to which it had been carried, it appears to be very partially adapted to the circumstances of Scotland. Wherever the South Down could be cultivated in Scotland, the New Leicester could be reared; while for a mountainous country, it does not possess the hardy properties of the native breeds.

It has appeared to the Committee, with relation to the awarding of the premiums both of cattle and sheep, that a smaller number of judges might act for the different classes of stock. Two, it is conceived, with power to call a third as umpire, would be sufficient in any case.

The Committee have had their attention directed to the defective information which generally prevails among breeders of sheep in Scotland with respect to the relative qualities of wool. This may be mainly ascribed to the circumstance, that the wool-staplers of the great manufacturing districts of England purchase upon the large scale, often without thinking it necessary to vary their price in the case of particular parcels on account of the difference of quality; by which means a certain inattention is occasioned on the part of the producers to the quality of the material. This perhaps is an evil inseparable from the nature of the wool trade, as it is now established. But yet it is thought that the Society might beneficially direct the attention of farmers to the subject; and to this end it is recommended that premiums be offered at the different shows for samples of wool, divided into the following classes:—

1. Combing wool, the produce of the New Leicester.
2. Short Wool, the produce of the Cheviot breed.
3. Wool, the produce of the Black-faced breed.

The Committee have every confidence that a steady

adherence to the principles laid down will meet with the concurrence of intelligent breeders, and promote the efficiency of these important Stows.

*Highland Society Hall,  
Edinburgh, Jan. 30th, 1836.*

### SMITH'S SUB-SOIL PLOUGH.

The third Report of the Parliamentary Committee, on "the state of Agriculture," recently published, contains a description of the vast advantages derived by heavy clay soils from the use of a *New Plough*, used for piercing or guttering the under-crust or sub-soil, in addition to draining. Land which would not produce 20 bushels of wheat, has since produced 40 bushels per acre. The following evidence was given on the 8th of June last:—

#### MEMBERS PRESENT.

Mr. Shaw Lefevre.	Mr. Evans.
Mr. Attwood.	Mr. Sandford.
Lord Viscount Howick.	Mr. Wodehouse.
Mr. Cayley.	Mr. Bingham Baring.
Mr. Heathcote.	Mr. Clive.
Mr. Loch.	Mr. Miles.
Mr. Dunlop.	Sir Robert Peel.
Mr. Young.	

*James Loch, Esq.*, a Member of the Committee, called in, and examined:—

Have you received any communication from Scotland with reference to the system of sub-soil ploughing, which you think it advantageous to communicate to the Committee?—Yes, I have received a letter from Mr. Kennedy, who formerly sat for the Ayr Burghs, which I will lay before the Committee, detailing his own experiments on that point; it appears to me that it exemplifies very thoroughly the advantages of the sub-soil plough of Mr. Smith, of Deanston.

Memorandum by *T. F. Kennedy, Esq.*, of *Dunure*, respecting his experience of the system of DRAINING and SUB-SOIL PLOUGHING, recommended by *Mr. Smith, of Deanston*, in the County of *Stirling*.

May, 1836.

I have practised Mr. Smith's system of draining and sub-soil ploughing upon my farm, in the county of Ayr, during the last three years, and the result has fully justified every anticipation of benefit. It is applicable to all soils not rocky, which have not an *absolutely porous sub-soil*, the great object being, that the sub-soil should be rendered *artificially porous*, and that all rain water should sink on the spot on which it falls, and that no running of water should take place on the surface.

There was at the outset considerable difficulty in having the work executed; it was arduous, and those engaged in the superintendance and labour were adverse, because they did not see the principles of the system, or the advantages which were likely to arise. A little encouragement and a distinct intimation that there must be perseverance, overcame every difficulty. This observation applies to the sub-soil ploughing, while some difficulty attached to perfect execution of the drains, in having them made of the full depth of 30 inches, and filled neither too much nor too little, and with all due care in all particulars which must be attended to, to secure permanence in the effects. I have invariably made the drains twelve feet apart, in order to secure the effect being complete; and being much impressed with the folly of spending a considerable sum per acre in the operation, and still failing to obtain what I may term perfection in the system, I have also used

broken stones as the material, when they could be obtained within such a distance as to prevent the expense of cartage being excessive; in other cases, I have used tiles, with a layer of three or four inches of stones or gravel over them. When stones alone were used, the drains have been uniformly 30 inches deep, leaving 16 inches for the operation of the plough, and the sub-soil plough; where tiles have been used, the depth has been about 24 inches, the same depth for the ploughs being left as in the other cases. A crop of oats has generally been taken after the drains have been executed, and the land has been comparatively dry; but even the visible effect has been very imperfect until the *sub-soil plough has been applied*. By means of this plough the whole obdurate undercrust of the soil has been broken up, and all water has instantly escaped, and after six or eight months of the alternations of heat and cold, wet and dry, a most remarkable change has appeared in the condition of the soil; what was before obdurate and retentive, has become comparatively mellow and friable, and the longer the time since the operation has been performed, the greater has been the perceptible progressive effect. The operation of the sub-soil plough has produced cracks and crevices and interstices to the depth of 16 inches, through these the rain passes off with rapidity, and these crevices are immediately filled by the air of the atmosphere, and during dry and hot weather these cracks and crevices are multiplied to an indefinite extent, and in *clay soils* to an extent quite remarkable. Instead of resuming its original tenacity, there seems to be a decided change effected in the character of the component parts of the land to the depth the plough has reached. It is for the skilful farmer to apply manure judiciously according to the state of each field. Drilled green crop has followed a crop of oats, and the land which before was unfit to grow *turnips* has become fitted for that crop, although, perhaps, a little rough and cloddy during the *first year*. Next has come a crop of wheat, and in it has been seen the great and remarkable effects of the system in the condition of the soil and the quality of produce. Land which was before, in truth, unfit to carry wheat from extreme wetness, has become altogether the reverse, being sown with wheat without ridges and furrows, being perfectly porous; all rain disappearing as it falls, and being carried off by filtration to the many drains, and each drain having little more than a thread of water to carry off. Possibly the land of which I speak might have previously yielded a precarious produce of 20, or at the most 24 bushels of wheat per imperial acre, while in its improved state, the actual produce of the crop in 1835 has been 40 bushels thrashed out, a few bushels of which was not very good in quality, owing to what is now to be mentioned. The fault of the crop was, that it was too strong, and there being much rain while it ripened it was laid down. Had this not occurred, the quality of the whole would have been good, and there is no doubt that six or eight bushels more per acre would have been obtained. The facts, therefore, are most satisfactory, because the result in the first wheat crop may truly be said to be 20 bushels of wheat of *extra* produce, in return for an expense of 10l 10s per acre, which was the cost of the drainage and the extra expense of the subsoil ploughing. It ought to be stated, that with the turnips the land was well manured and subsequently limed abundantly. After the wheat was carried, and during the winter, the field was ploughed about nine inches deep with the ordinary plough, and remained rough until the month of March, the whole rains of winter, which were excessive, sinking as they fell,

Towards the end of March, the field was harrowed, drilled and sown with beans, without any manure. The crop is promising, and there can be no doubt that the powers of the soil which have now been brought into action, will render it abundant. The soil is so powerful, that it is intended to take a crop of wheat after the beans without any manure, but taking care to make the land perfectly clean, and there is little doubt that the wheat crop of 1837 so treated will be more productive than that of 1835, because it will be less superabundant in straw and incur less probable injury from being laid down.

I have selected one field, respecting which to state this progress; I might say the same of all the others which have been similarly treated so far as they have advanced in their progress. I have as yet no experience of grass, as the tillage has hitherto been carried on, and I am persuaded that beyond one year it would be injudicious immediately to introduce grass into the rotation upon land which was naturally so retentive, because it might have a tendency to revert to that condition. I am equally however of opinion, that a rotation of six or eight years would *totally alter the permanent character of the soil*, and after such a period of continued cultivation I have no doubt that very fine pasture might be established upon a soil which was before incapable of bearing any but the most worthless.

My experience on a moderate scale leads me to say, that the system is the greatest discovery which has been made in agriculture, (because it is applicable to soils hitherto almost intractable and most expensive to cultivate) provided it be applied only where the altitude justifies the undertaking, by securing a climate suitable to valuable crops. It, in truth, converts almost the *worst* into the best land, that is, the most powerful in respect of production, because the quality of land to which it is applicable, the heavy clays and retentive sub-soils, will yield heavier crops after such treatment than the lighter loams and many of those varieties of soil which hitherto have been so pleasant to the agriculturist to cultivate.

The reformation which the system effects on lands which previously were looked on as hopeless is quite surprising, and no one believes it until it is seen; but again I say, that the whole success depends on the *perfect and complete* manner in which the operations are executed, as any thing merely being an approximation to the system will end in disappointment. The expense of what is perfect must not be grudged, and as surely as it is liberally given will it be *abundantly repaid*. I would also say, that the effects of draining and sub-soil ploughing are dependent on each other; the one is comparatively worthless without the other; the ploughing would be thrown away without the previous draining, and the draining is a poor improvement compared to the combined effect with the sub-soil ploughing.

A remarkable effect is, that the harvest is considerably earlier on land so treated than on the same land in its previous state, and it is scarcely necessary to remark, that there will be a constant return for the same seed and labour and manure far greater than when they are applied to land in a naturally wet condition.

I do not think that any thing more useful could be done than that agricultural associations should offer premiums, such as to induce persons to make an experiment of this system; if such premiums were continued for a few years, they might speedily be discontinued, as the *ample repayment* which would arise from the system itself would be the best security for a continuance of the system throughout the kingdom.

## GENERAL AGRICULTURAL ASSOCIATION FOR AYRSHIRE.

The following is an extract from the Report of the Quarterly Meeting of the Directors of the Association, who met in the Court-House here on Friday, Nov. 11, for the purpose of determining as to the number and description of the premiums to be awarded at the next great show at Maybole in 1837;—to fix the premiums to be awarded for agricultural and other implements shown at the great exhibition in September last, and afterwards tried at Rozelle, in the presence of judges appointed by the Association, and to transact any other business connected with this useful Association:—

The Secretary read the report of the judges appointed to examine the implements exhibited at the September Show in 1836, and some of which were afterwards tried at Rozelle, in a field, the use of which was handsomely given by Mr. Hamilton. We make the following extracts from the judges' report:—

I. Subsoil Ploughs, on the model of Mr Smith's, of Deanston, Plough.

Nos. 1, 2, 3.—Exhibited by Mr. Hamilton of Rozelle, Mr. Kennedy of Dunure, and Mr. Ritchie of Cloncaird. These are all heavy ploughs, and very much of the same description. The judges admired their powerful operation, but cannot recommend them to the practical farmer on account of the great expense which they would cost him. Mr. Kennedy's plough was wrought with four horses, while the other two were drawn with six; but it was observed that Mr. Kennedy's four, although very strong animals, were considerably distressed.

No. 4.—Exhibited by Mr. Tennant, Shiells. This plough, which is of a lighter order, was wrought with two horses, and was considered a very great improvement in point of economy. The implement, however, did not keep steadily in the soil, and was considered not to be in good order. But the judges are, notwithstanding, of opinion, that if wrought with three horses it would keep the ground, and do its work well.

No. 6.—Made and exhibited by Mr. Begg, smith at Muirkirk. The judges are unanimously of opinion, that of the six ploughs exhibited, this is the one to which the premium falls to be awarded. It exhibits a very skilful improvement upon Mr. Smith's plough—the result being that, while much of the weight is taken away, the whole power of the implement is retained. Upon the occasion of the trial, it was worked with four horses, which did not appear to be in the least distressed, and the judges doubt not that, in some soils, three horses would be found sufficient. The judges consider that Mr. Begg has much credit by so excellent an improvement upon this valuable implement.

The judges cannot leave the subject of subsoil ploughs without expressing how deeply the people of this country are indebted to Mr. Smith, Deanston, as the inventor and prover of these most valuable implements.

No. 9.—Machine for sowing grass seeds and clover, exhibited by Mr. Tennant, in Shiells. It having been ascertained that this machine has been used with great advantage by Mr. Tennant, for the last twelve years, the judges now earnestly recommend it to the general notice of the members. The price is only 3*l.* or 4*l.* They beg leave further to remark, that in many counties in

England, no seed is sown with the hand, but all by machines; and the general opinion there is, that grain sown in this way springs much more regularly than when cast with the hand.

No. 10.—Presser, exhibited by Mr. Hamilton, Rozelle. For a proper description of this valuable implement, so little used in this part of the country, the judges cannot do better than refer to the following communication made to Mr. Hamilton, by Mr. Graham, sometime overseer to Captain Barclay, thereafter laudgrieve to the late Earl of Cassillis, and now residing at Yonderton, Dalrymple:—

“Yonderton, 3rd October, 1836.

“Sir,—In consequence of having seen your furrow presser tried on Saturday, and having for these last four years known its great usefulness to the farmer, I have taken the liberty of enclosing a note of a few of the advantages for your consideration—having often proved them myself. I shall have pleasure to lay them before any farmer, who has not yet had an opportunity of knowing them. I was so anxious some years ago to have the presser introduced in Ayrshire, that I took a plan of ours and forwarded it to Mr. McClymont, along with observations recommending it, but I suppose the want of the models for the castings, or the distance the farmers would have to send for one, has prevented the presser from being introduced until you have done so. Our joiner has the models, and he also has made many of them to the farmers in Aberdeenshire, &c. who are now reaping the benefit; and I believe he could send them to Glasgow for about 4*l.* each, so should any gentleman wish one, I could cause it to be forwarded.

“I did not mention in my observations, the effects of the presser on loose deep soils, which are apt to throw out the plants. By pressing such soils, while ploughing, and by rolling well after sowing, a good crop is generally insured. *Rolling well* is also of great advantage to the farmer.—I am, &c.

(Signed) “A. GRAHAM.”

The furrow presser is of the greatest advantage to the farmer, for the following reasons:—

“In all old grass land to be broken up, it is impossible for the plough to lay it so closely over as it ought to be, in consequence of the old foggage, and rough surface upon it; but by applying the presser, the furrow is so firmly pressed and closed up, and the rough fog and grass so completely covered in from air, &c. that instead of growing up among the crop, and causing the greatest foulness in the land, it rots away and acts as a manure to the crop, and leaves the land perfectly clear.

“Old rich pasture land, or even clover lea, ploughed up for cropping, is very apt to be destroyed by the grub and wire-worm; but when pressed, not a particle of turf is raised with harrowing, to harbour the eggs or insect under it (and it is always under the clod or turf in lea that these insects are found;) but never having seen a field that was pressed destroyed by wire-worm or grub, and having seen such destruction in unpressed fields by these insects, I am satisfied that the eggs must either be destroyed in pressing, or that by the land being so consolidated, they are allowed no shelter, and prevented from committing their ravages.

“In stiff clay and damp soils, lea land is never so closely ploughed as to prevent a quantity of the seed going down the back of the furrows, which either perishes, or comes up in an after-growth; but by applying the presser, this is completely obviated, and also a great quantity of seed saved.

“In giving the fallow land the seed furrow for

wheat, &c., where the dung has been applied, in such cases the dung is often rough (being made after the turnip dung), and cannot be so well ploughed in as it ought to be; but by applying the presser it is completely covered under, and neither exposed to the sun, nor torn up by the harrow while sowing. The presser will also have the same good effect where sea-ware is applied for a manure.

"When a field is to be sown down with grass seeds, by being pressed the grain is caused to braid so neatly in rows, that the grass seeds are sure to take well, as more air gives them a decided advantage.

"From the above hints, the experienced farmer will easily estimate the great advantages derived from pressing land. Captain Barclay of Ury, one of the most extensive, experienced, and enterprising gentleman farmers in Scotland, never allows a handful of grain to be sown without previously pressing the land. A single horse will draw a presser after two ploughs, and must be going along with them. Pressed land, and particularly lea, is so easily harrowed, that the farmer requires no extra strength, but, on the contrary, there is a great saving of labour. (Signed) A. GRAHAM."

The judges after fully considering the above observations, and having also seen the presser at work, and heard Mr. Hamilton's statement as to the successful use of it by him during the two last seasons, have no hesitation in recommending it as a most excellent and useful implement, and one which the farmers of this country ought generally to be possessed of.

No. 28.—A simple method of cutting straw into chaff by a common thrashing machine, exhibited by Mr. Alex. Reid, Bonshaw. The judges report that they consider this a very ingenious instrument, and its value is increased in consequence of being perfectly simple, and within the reach of every farmer. The cutters are placed diagonally across the drum of the thrashing machine. Specimens of oat and bean straw cut by this machine were exhibited to the meeting—the pieces of straw were from a quarter of an inch to three inches in length, but Mr. Reid said, "you can cut the straw as short as you like by feeding the mill slowly." The invention was commended; and Mr. R. explained that the straw was cut after the grain was thrashed, and that one horse was sufficient to work the mill while the straw was cutting.

CORN SCYTHES.—A good many remarks were made on the utility of the corn scythes, now pretty generally used, and that of Messrs. Drummond, of Stirling, and the American one, were highly spoken of. Some members thought scythes were susceptible of yet greater improvement. It was stated that the scythe was getting into favour with agriculturists, and an opinion was expressed that it would soon become a greater favourite. Mr. Hamilton mentioned, that in company with our agriculturists, he had lately seen five or six different kinds of them tried on Mr. Fulton's farm of Balig, and with Drummond's one the stubble was cut quite close, and smooth as a gentleman's lawn. Captain Dundas spoke in approving terms of the corn scythe, and stated that the whole of Colonel Kelso's crop had been cut by that scythe this year.

EXTRAORDINARY YIELD OF BARLEY.—Ninety-nine quarters of barley, weighing 16 stone with the sack, and which was sold at 2 guineas per quarter, has been obtained from ten acres of land on the Lincolnshire wolds, near Spilsby, the last harvest.

## FLINTSHIRE AGRICULTURAL SOCIETY.

To all those interested in or connected with the agricultural prospects of the spirited little county of Flint, a great treat was afforded on Wednesday Nov. 2, at the annual meeting and exhibition of stock. The day, considering the late period of the year, was very fine, and the attendance in the shev field at twelve o'clock, numerous. After viewing the stock, the committee and other influential members of this society retired to transact the general business of the institution; that being over, about eighty gentlemen sat down to dinner, at four o'clock, amongst whom were:—The President, C. B. T. Roper, Esq., Lord Kenyon, Lord Mostyn, the Hon. E. M. Ll. Mostyn, M.P., the Hon. Lloyd Kenyon, the Hon. Major Napier, Leeswood Hall, the Hon. Mr. Price Lloyd, Sir S. R. Glynne, Bart., Rev. C. B. Clough, Mold, Rev. Henry Jones, Northop, Rev. Henry Glynne, Rev. W. M. Williams, Flint, Rev. Mr. Hill, Broughton, J. W. Eytton, Esq., Leeswood, W. J. Bankes, Soughton, Wilson Jones, Esq., M.P. Hartsheath, Col. Phillips. Rhual, Edward Pemberton, Esq., Plas Isa, J. Taylor, Esq., Coed du, Edward Bate, Esq., Kelsterton, Thomas Lewis, Esq., Highfield, Doctor E. T. Hughes, Mold, John Dawson, Esq., Gronant, W. T. Ellis, Esq., Cornist, John Sisson, Esq., St. Asaph, S. Hancock, Esq., J. Hancock, Esq., Mold, Mr. Hughes, Abergele, Mr. James Kerfoot, Vaenol-bach, Mr. Bloor, Marsh, Mr. Jenkins, Mold, Mr. Williams, Mold, Mr. Thomas Jones, Northop, Mr. John Williams, Holywell, Mr. Vickers, Holywell, Mr. John Williams, Gwsany Hall, and several others. Mr. Robert Peters filled the office of Vice-President. M. Scotson of Toxteth Park, and Mr. Slingsley of Liverpool, were Judges of the stock. Mr. Palin, of Stapleford Hall, Judge of crops. Mr. Hugh Hughes, of Tyddyn, and Mr. T. Williams, of Celyn, were Judges of ploughing.

After the company had partaken of an excellent dinner, and the cloth was removed

The PRESIDENT gave from the chair, the following toasts in succession, which were drank with applause:

The King; the Queen; the Princess Victoria, and the rest of the Royal Family.

The CHAIRMAN then, in a neat speech proposed—"Success to the Flintshire Agricultural Society," which was drank with loud cheers.

The SECRETARY then read the different awards of the Society's premiums: several announcements in which elicited marked applause.

The following toasts were then proposed, the President introducing each with appropriate observations: "Lord Kenyon," received with cheers.

LORD KENYON returned thanks, and after some interesting observations, upon the utility of such societies, concluded by proposing—

"The health of Mr. Trevor Roper, the President."

The PRESIDENT briefly returned thanks, and proposed Lord Mostyn. His Lordship acknowledged the toast. The President then gave in succession—

"The Members for the county." The Member for the Borough, Sir S. R. Glynne, Bart.," both received with applause. "The Bishop and Clergy of the Diocese."

The Rev. C. B. CLOUGH, vicar of Mold, returned thanks on behalf of himself and the Clergy of the Diocese, and hoped the new Act for the Commutation of tithes would not make the clergy and the agriculturists worse friends.

"The health of W. J. Bankes, Esq., Soughton," followed.

Mr. BANKES briefly returned thanks. The next toast was "Wilson Jones, Esq., M. P." (Applause)

"The Judges of Stock" were next given.

Mr. SCOTSON, on behalf of himself, and Mr. Slingsley, begged to acknowledge the compliment,

"Mr. Palin, Judge of Crops," was then given.

Mr. PALIN returned thanks, and proposed the health of the

"Unsuccessful Candidates."

The toast that followed was—

“ Mr. Hughes and Mr. Williams, Judges of the main ploughing.

Mr. HUGHES returned thanks in an appropriate speech, after which was given—

The Secretary, Mr. Thomas Whitly.

Mr. WHITLEY spoke at some length, and assured the members of the Society, that so long as he had the honour of acting in their service as Secretary, he would do all in his power to further the interests of the Society, and to promote the regularity of its proceedings. He then stated that he had received several communications from the Doncaster Agricultural Association, upon the subject of gorse or furze, as fodder for horses and cattle. He said the Doncaster Society had issued a circular, containing a series of ten printed questions upon the subject, which, with the leave of the President, as it would occupy but very little of the time of the company, he would read. The questions are, 1st—How long have you used gorse or whins, as fodder for animals, and whether partially, or for your whole establishment? 2nd—What animals do you consider it to suit? 3rd—In what quantities, and whether alone or mixed with other fodder? 4th—By what machinery is it prepared for use? 5th—In what manner is it cultivated, and at what age, and in what manner cut for use, with the average produce? 6th—Is the plant you use the common whin or gorse, or any particular variety of it? 7th—On what soils do you grow it? 8th—What do you consider the peculiar advantages, and what the dangers, of using it? 9th—State the expense of cutting it in the field, and of bruising for use? 10th—State any general observations on the subject?

Mr. W. observed, the foregoing questions were put to agriculturists generally, with the view to ascertain, in the best manner possible, the properties and cultivation of gorse, as adapted to the barren and poorer soils in Yorkshire; and he had no doubt there were several influential and intelligent gentlemen then present who, he hoped, would further the intentions of the Doncaster Association by answering those questions, or by furnishing any other information upon the subject which they might possess, by addressing their communications to the worthy Secretary of the Society, Robert Baxter, Esq., of Doncaster.

“ The Vice-President, Mr. Peters,” was the next toast.

Mr. PETERS briefly returned thanks.

“ The President elect, Captain Morgan, of Golden Grove.” (*Cheers.*)—“ The Vice President elect, Mr. Hughes, of Tyddyn,”

was next proposed, and the company separated, after spending a most agreeable evening.

In the show field, Mr. Cartmel, of Liverpool, exhibited some agricultural implements of great utility, and of new invention. Mr. Dodd had on show two large ox cabbages, and Mr. Secretary Whitly some garden turnips of the white stone kind, one of which measured *thirty-eight inches* in circumference.

THE POTATOE HARVEST.

Severe as was the threatened loss on the potatoe crop, occasioned by the failure of the plants in the early part of the season, it was inconsiderable compared to the heavy damage arising from the recent frosts and storm. Since Tuesday afternoon the farmers have been engaged with the utmost activity in endeavouring to put the small remaider of their damaged crops beyond the reach of harm; and as we have instituted very minute and extensive inquiries on the subject throughout the greater part of the midlands of Perthshire, we may state the following as the results:—The spring failure appears to have diminished the weight of the crop over the whole county by somewhere about a third or fourth of what, under ordinary circumstances, it might have been expected to be; so that if it had been well got in, it would just have been about this proportion behind an average one. About one-sixth of the potatoes may be said to be taken up before the storm of the 26th, so that this is the state of that portion so secured. Of course these computations are a little vague, and must be taken in certain cases with some small latitude. We can state, we think, definitely and distinctly, from results obtained connected with that portion of the crop dug since the storm, that about one-third of the potatoes in the ground have been utterly destroyed by the frost, and that at present there is not over the country above one-half an average crop of sound potatoes. The Perthshire red, and one or two other varieties prevalent in this quarter, have a tendency to grow towards the surface, so that many of them at the top of the drill are washed quite naked by severe rains. Those so exposed have of course been completely destroyed. The snow on Friday evening fell so softly and gently, that it would have afforded considerable protection, but unfortunately the frost and wind of Saturday morning caused it to drift off the drills, where it was required, into the furrows and hollows where it was of no service. The natural anxiety felt by the farmer at this late period of the season to be as speedily as possible out of reach of further damage is itself productive of some evils. The eager haste with which the potatoe digging has been set about has in some cases not waited till the frost was out of the ground, and so exposed a part of the potatoes to an necessary risk, which might have been safe if left a little longer under the soil, and, at the same time, occasioned the confounding of those which were with those which might not be damaged. In any circumstances, it will be difficult to make a good gathering this season, whatever the weather may prove. No care, and no amount of supervision, will insure against many sound potatoes being left on the field where so many unsound ones, in aspect so little differing from those that are uninjured, must be thrown aside, and where a single frosty night will render the whole equally useless. In like manner, not a few of those which are damaged are apt to be stored, and must materially injure the whole heap. We find that our speculations of last week in reference to the convertibility of frosted or rotten potatoes into perfectly good and valuable starch have already been realised in the neighbourhood, and that the quantity of starch is but little diminished and its quality hardly injured by the decomposition occasioned by frost or rotting.\* There is a fact well

CONSUMPTION OF MALT BY THE PRINCIPAL BREWERS IN LONDON.

\* Since writing the above, the subjoined note has been sent us by a Doune correspondent. The statement it contains is not only a valuable practical corroboration of our views, but affords a proof of the length of

worthy of the attention of those who manufacture starch from sound potatoes which we have not observed in any scientific work, but which we have obtained from a gentleman of much experience in the manufacture, and the minuteness and accuracy of whose observations may be fully relied on. It is this, that newly dug potatoes will yield about twice as much starch as those which have been kept till far over in the season. On the latter of these the experiments of Thomson and Einhoff seem chiefly to have been made, and consequently, the results of their experiments seem to set the quantity of starch (about 15 per cent.) somewhat too low. The explanation of this diminution of the quantity of starch may be, that as this substance is easily decomposed and converted into sugar (a process on which the whole theory of malting depends,) this decomposition has taken place by the spring or summer—the sugar, which is soluble, is easily washed out, leaving behind it that sweetish taste by no means in general relished at table. The structure of the potato and its starch cells may be very easily observed by a microscope of the most ordinary magnifying powers and are equally beautiful. The fibrous matter is arranged in a reticulated form, in the little cells of which may be seen the flattened spherical portions of the starch shining like bright and half-formed seed pearl.—*Perth Constitutional.*

#### SCARCITY OF KEEP FOR HORSES AND CATTLE.

—The high prices of hay and the failure of the turnip crop in many districts will render the approaching winter and the early part of next spring trying periods to the farmer for the sustenance of his stock; it therefore may be useful for those who have plenty of furze or gorse growing on or near their farms, to learn that when gathered and properly prepared, it forms a most nutritive and excellent food for horses, cattle, and sheep; we know that in the early part of the winter of 1813, when the British army were in the Pyrenees, the horses of the light cavalry were subsisted

time which potato flour may be stored and kept without injury. Were any enterprising person to purchase the after-gatherings of the spoiled potatoes over a large tract of country for the purpose of manufacturing them into starch, he need entertain no fear of glutting the market, as the starch could be kept for any number of years, and sold out so as to meet the demands, and keep the prices remunerative:—

Sir,—In your agricultural report of the 1st November, I observe an excellent suggestion as to making potatoe flour from spoiled potatoes. On that subject I can give the following fact:—Exactly forty years ago, a potato field on the banks of Loch Lomond was flooded; the water having subsided, the potatoes were partially lifted, but found, as generally supposed utterly useless. An intelligent lady had a large quantity of the spoiled potatoes put into tubs full of water and mashed, when the usual proportioned quantity of flour, in every respect equal to that made in the common way, was found at the bottom. It was used in all the different culinary purposes to which that article is applied, and found perfectly wholesome. I have now in my possession a small packet of that flour quite perfect, presented by the lady under whose instructions it was made. It may have escaped general notice that the mode of separating the farinaceous from the fibrous part of the potato, in the usual process of making potato flour, is neither more or less than by rotting the fibrous part by the action of water.

Yours, AN OBSERVER.

for many weeks on gorse gathered by the men and chopped fine with their sabres; the animals got fat on the food, and continued in excellent condition for sere vice. The gorse should be gathered, and chopped find with a cleaver, or placed in a cider or other mill on ground, so that it may be bruised, and the prickles rendered innocuous, and then given to the stock, with a little salt added, or mixed with chopped straw, in the proportion of 100 lbs of bruised gorse to 8 or 10lbs of straw. In some parts of Wales there are mills (worked by small rills of water) for bruising the gorse.

LORD PALMERSTON AS A LANDLORD.—It is well known that Lord Palmerston, the noble and liberal Foreign Secretary, possesses a large estate in the county of Sligo. But it is not equally well known that he expends nearly the entire rental of that estate in improvements, and constantly employs his tenantry in the most useful works. He is consequently beloved by them, and considered, as he really is, one of the best landlords in Ireland.—*Sligo Champion.*

BLOOD STOCK.—Cumberland can now boast of having three of the best blood horses in the kingdom—viz., Grey Wiggantheorpe, bought by Rich. Ferguson, Esq., of Harker Lodge, at a very high price; Liverpool, the property of John Ramsay, Esq.; and last, though not the least valuable, Ben Ledi, purchased by Messrs. Shepherd and Weir. To farmers, breeders of stock, and sporting gentlemen, every facility is now offered to improve their breed of horses. It has long been a cause of complaint that no first-rate blood stallions travelled this district, and now when this source of complaint is made, we trust those interested will avail themselves of the spirited conduct shown by the owners of the horses we have just named.

SINGULAR OCCURRENCE.—On the 20th of March last, an ewe sheep, the property of Francis Clarke, of Stubton, Lincolnshire, brought forth two lambs, heder and shedder, and at the time it was his opinion, from symptoms, there was another, but after a lapse of about a week those symptoms disappeared, but again returned about three weeks since, and continued up to the 10th of November, when he had her slaughtered, and a fine heder lamb was taken from her, which appeared not to have been dead more than six or eight days.

COW CABBAGE.—There is now growing in a small garden belonging to Luke Frankland, adjoining Mr. T. Johnson's garden, at Pocklington, a plant of the Curled Cole or German Green-tribe, which is upwards of six feet two inches high, stem and foliage in proportion. Its foliage is beautifully curled, and it is at this time growing with great rapidity.

We beg to draw the attention of our agricultural readers in particular, to the remark of a celebrated traveller respecting the making of cheese in Norway. In speaking of Gamel Orse, or Norske, he says it is a cheese of such great celebrity in Norway, and of which the natives are so fond, that it is extremely difficult to purchase any of it.—That in making it they use *butter milk, mixed with yeast*. That it resembles the finest old Cheshire cheese, without the slightest rankness, and is sometimes kept ten years before it is brought to table. Perhaps this may furnish a hint for some good dairy woman to improve the produce of her dairy.—*Sussex Advertiser.*

As a proof of the superiority of Herefordshire cattle:—The Hereford steer, two years and seven months old, bred by Mr. Yeald, of the Broome, near Pembroke, and which won Mr. Hayton's prize at Hereford, was sold at Hereford fair for 35*l.* We understand this steer is by the celebrated Bull Tobias, now in the possession of Mr. Gough, of Gravel Hill, near Shrewsbury.—*Satopitan Journal.*

AGRICULTURAL REPORTS.

GENERAL AGRICULTURAL REPORT FOR NOVEMBER.

The field labours of this month simply consist of ploughing and stirring autumnal and winter fallows, cutting coppices, planting and felling timber trees, &c. on those farms of which they form a part: we have in this report, but little to offer, on practical farming, further than stating and re-stating, that these—which we consider to be of the greatest importance to those engaged in them—are all snugly in their place: notwithstanding that the fat, or rather fattening beasts, of both last summer and the present autumn, have been characterised, by the butchers generally as having come lighter to the scale, and carried less internal fat, both loose and over their kidneys, than the oldest amongst them recollect to have witnessed, at a corresponding season of any past year, there are no complaints of sheep rot, and the generality of live farm stock is represented as being healthy, and the depastured part of it for the most part, doing well, without the aid of any, or with but a very small proportion of dry fodder, which was given it during the heavy snow, in the in the early part of the month. The lingering foliage hanging on both fruit and forest trees, has assumed its deeply-tinged autumnal complexion, and is rapidly descending; but the most gratifying feature of the agricultural community is a daily improving "live and let live" understanding between landlords and their tenants. Hence, as we conceive we can say nothing more gratifying to our readers, than that there appears to be a rapidly increasing unanimity between landlords, tenants, and the clergy.

As it may not be uninteresting to a portion of our readers, to know how England's soils are disposed of, we, in the present dormant state of tillage, respectfully venture to impose upon them the following extract, from the second volume of "Young's Farmers' Tour," published in the year 1771. The author, on page 455, asserts—"There now only remains for me, to give a table of the state of the soils throughout England. This is an inquiry of more than amusement, for there is a use in proportioning the particulars of any considerable part of the kingdom to the whole,"—Subjoining—"It is not of consequence to know whether such parts of the kingdom that are included in farms make thirty-two millions of acres, but I shall take that supposition." Here he gives the following tabular statement.

"Acres in all .....	32,000,000
Arable land.....	13,518,716
Grass ditto.....	15,736,185
Wood, ditto.....	2,395,721
Allowing for gardens, yards, rivers, ponds, &c.....	349,378"

Now, as the author did not take into his statement, at least, 220,000 acres of bog and common lands that have been reclaimed and inclosed, since the year 1771—for the most part, since the passing of the Consolidating Act, of the 41st of George the Third—whence, possibly, the principle and predisposing causes of the ruinously low prices of wheat for so long a period before farmers were disposed to alter their courses, in sowing additional breadths of barley, oats, and beans,—at this time, by far their most remunerative crops. The Rev. A. Dickson, in his

"Husbandry of the Ancients," asserts,—"Inclosing lands is now a very common practice, in modern husbandry. It is reckoned a great improvement, and indeed, without it, lands cannot be brought to the highest degree of culture. The scheme in which land is changed ultimately from tillage into grass, is certainly most advantageous; but, unless lands are properly inclosed it cannot be properly executed. In this," the Rev. Author continues, "there seems to be a great difference between the ancient and modern husbandry, for, although the Romans had a great many different methods of inclosing, yet it does not appear, that in the time of either Columella, or even that of Pliny, there were any inclosures in Italy, for feeding of cattle. In Columella's account of the manner of feeding labouring cattle, no mention is made of their being put into inclosures."

As relates to the prices of farm produce since the date of our last report, those of corn have been singularly vacillating and anomalous, they having, as if by general impulse, suddenly advanced from 4s to 6s per quarter, owing to an alleged greatly increased demand and general scarcity, even from our poor complaining Sister Kingdom, but, unable to support their advanced position for even a single week, have gone toppling back. The prices of store sheep and beasts have been, in all our country fairs, with those of hops, game, and poultry, a little on the decline. Of each kind of fat stock, with hay, straw, good horses, and milch cows, about stationary.

The following is a retrospect of the supplies and prices of fat stock exhibited in Smithfield and Islington cattle markets, since that published in our last months' report.

Supply of preceding month.	891	13130	12	—	

By the foregoing retrospect of supplies, it appears that those of beasts, at Smithfield, have, since the date of our last months' report, decreased 3,441, of sheep 38,874, and of calves 422: whilst those of pigs have increased 34.

At Islington, there have been exhibited, in the same period, 275 beasts, 4,480 sheep, and 11 calves less than last month; whilst there were no pigs in the market. in either month; the beasts having consisted, for the most part, of short-horns, with a somewhat increased number of Scots and Herefords, with a few Welsh runts, Irish beasts, lusty cows, &c.; the sheep chiefly old Lincolns, old and new Leicesters, white-faced Gloucester sheep, South downs, Kents, Kentish half-breds, and horned Dorsets and Somersets.

About 11,360 of the beasts exhibited in both the above markets, a third of which were short-horns; the remainder, in not far from equal numbers of Herefords, Devons, and Welsh runts, with about 400 Scots and Norfolk home-breds, and not more than 500 Irish beasts have come from Lincolnshire, Leicestershire, Northamptonshire, and others of our northern and north-western districts; the numbers up the St. Alban's-road, having been 8,060; up the other northern and north-western roads, about 3,300; about 950, in about equal numbers of Devons, Herefords, Welsh runts, and Irish beasts, with a few, but not many, Scots, and Norfolk homebreds, from Norfolk, Suffolk, Essex, and Cambridgeshire: about 1,750, chiefly Scots, Devons, homebreds, and Welsh runts with some short-horns and Herefords, from our western and midland districts; about 225 horned and polled Scots, but chiefly the latter, by sea, from Scotland; about 180, mostly Devons and Welsh runts, with a few Sussex steers, cows, and heifers, from Kent, Sussex, and Surrey; and most of the remainder, comprising not an inconsiderable number of all the before-mentioned breeds, and about 190 lean and lusty towns-end cows, from the marshes, cattle lodgers, cow-keepers, stall-feeders, &c., in the vicinity of London. There has also, been a greatly increased number of store Devons and poor Irish steers and heifers offering, both on the Monday's and Friday's markets of this month; but the sellers of both, though more particularly the latter, when they sold, were compelled to submit to low prices.

PRICES.

	Oct. 28.			Nov. 25.

SUPPLIES.

Nov. 23, 1835, Nov. 21, 1836.

Beasts . . . . .	2,878	2,810
Sheep . . . . .	21,490	20,100
Calves . . . . .	335	200
Pigs . . . . .	412	420

By the above statement of prices, it appears, that each kind of fat stock, except pork, has been dearer this month than last, or in the latter end of November, 1835; whilst there were 68 beasts, 1390 sheep, and 135 calves less, and 8 pigs more, in the market on the 21st of November, 1836, than on the 23d of November, 1835.

This month's Smithfield supplies of sheep, like those of last month, have comprised not far from equal numbers of old and new Leicesters, Kents, and Kentish half-breds, old Lincolns, and South Downs; with a somewhat increasing number of Norfolk sheep, chiefly polled, as also of white-faced polled Gloucesters; a few pens of horned Dorsets and Somersets, horned and polled Scotch and Welsh sheep, &c. Not more than 130 sheep have arrived in the course of the month, by steamers, from Scotland.

This month's Smithfield supplies of sheep have been about equally derived from our northern districts, Kent, Sussex, Surrey, and our western and midland districts, with a few from the neighbourhood of London. Those at Islington chiefly from Lincolnshire, with a few from our other northern grazing districts.

The quantity of slaughtered meat sent from different parts of England to the London carcass markets during the month has been great; we ourselves, having witnessed the arrival, on Friday, the 25th of about 1,000 carcasses of slaughtered pigs and sheep from Hull by steam-vessels, consigned to Newgate and Leadenhall Markets; but, from Scotland, supplies have been very limited.

YORKSHIRE AGRICULTURAL REPORT FOR NOVEMBER.

Soon after our last report reached London, we had (for the season) an extraordinary visitation, frost, snow, and intense cold, which was more in quantity, and of longer duration, than occurred during the whole of last winter. Every one seemed amazed, and foddering immediately commenced, as it was judged to be the precursor of a severe winter, but it gave way, and since that period, though we have had incessant cold rains, we have had few or no frosts, and very seldom any snow, even upon the elevation of Black Hambleton Down, 1246 feet above the level of the sea at low water. The very uncongenial state of the weather last month, prevented three-fourths of the fallows intended for wheat from being sown, and it was only a little clover lea which could be broken up; and that in favoured and dry situations, and the seed was rather "daubed in," (a term well understood in Yorkshire) than sown. Even of this little, some has not yet appeared, and has only felt the effects of incessant rain, and some would sustain considerable damage from vegetating during the frost. The unsown fallows are generally unmanured, and some the ridging up would not be performed, and it must be exposed to the effects of the water standing upon it during winter, which will counteract much of the benefits of the fallow. Seed corn is exhibited very smutty, but the little that has been sown, has caused a demand for some soft samples, which otherwise would never have met a purchaser. The taking up of the potatoes has been equally impeded, and the greatest part of them remained in the ground and exposed to the action of the frosts at the latter part of last month; and where they were got up, they were in a very unfit state for preservation, and under almost

any circumstances, could scarcely be expected to keep over year. The reports of the produce are generally unfavourable, although few decided failures have taken place. There are certainly exceptions to this; Mr. James Craven, of Richmond, in the North Riding, took up a root to which sixty-one tubers were attached, and one of which weighed 2 lbs! Very general complaints are made, that they are watery, and very badly tasted. Those earliest put into the ground are certainly the best flavoured. Owing to the deficiency of turnips, cattle are beginning to be fed with them instead of reserving them for Spring, and owing to the high prices of the grinding qualities of barley, most of the labourers are feeding their hogs on potatoes. These are a root which takes very great trouble to obtain, and are a source of exhaustion to the soil, but when they are obtained, they are of great value, especially in the Spring, when other food is scarce. Turnips are beginning to show their deficiency very much. The bulbs are found small and wiry, and in some cases knotted by the continued attacks of grubs, and root weevils. The leaves are also poor, small, and shrivelled, and certainly we never saw the sheep trample them down, and refuse them so much; they seem to be deprived of some portion of their nutriment, which causes them to be rejected. Our stocks of sheep are heavy, but their condition, owing to the deficiency of pasturage through the summer, is only inferior. Cattle of every description are also rather short of condition, and prime fat is scarce. Fodder of every kind is dear, and dealt out with the utmost care. Ploughing is in a backward state, owing to the unfavourable state of the weather. The pastures were never eaten up so bare. Mangel wurzel turns up very small, and generally inferior, it has been unable to resist the effects of the extreme variations of the weather this season. Our markets have experienced the most remarkable fluctuations during the month. At one period the demand was such as the country were unable to supply, but the immense quantities which were hurried in, in order to take the advantage of the rise, and to enable the farmers to meet their Christmas rents, has caused the prices to flag, but a general impression prevails, that the prices will rally after Christmas. Servants' wages have been high, owing to this improvement in prices, and they are much hired up. We cannot say that the harvest is all gathered in; the remains of the bean and oat crops, are still exposed to the effects of the weather, very much barley of the grinding qualities comes into market stained, and soft, and fine samples are very scarce. It sells from 32s to 40s per qr. Oats are beginning to make their appearance, and the old are falling in price; the new however, in many instances are very soft, from 25s to 30s per qr must be our quotations. Wheat comes in too very fast, our old stacks are disappearing amazingly, and our stackyards generally are thinning. The thrashing machines are kept at work, and straw stacks are very generally making their appearance in the county. Wheat sells at 8s for white; red 7s 6d to 7s 9d per bush. Rye plentiful at 5s to 5s 6d per bush. Beef, 5s 9d to 6s; prime scarce, 6s 6d per stone. Mutton, 5½d to 6d per lb. The meeting of the Yorkshire Central Agricultural Association did not go off with its usual éclat, the attendance was not so great in past years, and the rise in prices, and selling of grain, seems to occupy the farmer's attention, more than political demonstrations. The Poor Law Commissioners are at present in Yorkshire, and have succeeded in forming unions at Beverley, Malton, Driffield, York, Easingwold, and at Osseburn, where they had united under the provisions of a previous act, and where fifty paupers are comfortably provided for, and rates light, they have unanimously resolved to reject the offer to come under the New Poor Law Act. Whatever may be the general working of it, the bastardy clause is certainly the most injudicious piece of legislation, ever stumbled upon.—Nov. 24.

#### REPORT FOR THE NEIGHBOURHOOD OF DEVIZES.

Seed time, an interesting and important period, is now nearly concluded, for which the weather has

been particularly favourable; indeed, this work has seldom been done under more desirable circumstances or in better manner; perhaps the early sowing on the hills was rather too dry, but the late heavy rains will be very beneficial to such in particular, and will much improve all. The breadth sown is a fair average, many pieces being sown with wheat when turnips had failed, which would otherwise have been left for spring corn. Winter vetches, rye, and winter oats, are sown very plentifully to meet the deficiency in the turnip crop, and small stock of hay. The harvest though hastily got in, was safely secured, and in threshing is found to be more productive than was anticipated; that on the hills and poor light soils which lost plant during the winter and spring, is a deficient crop, but the superior yield from the vallies will partly make up this deficiency, and the crop may prove nearly an average. Barley also yields well from the straw though light from the acre; quality not quite so good as last year. Chevalier decidedly the best. Oats the most deficient crop. Beans and peas not a good one. Potatoes good in quality though not an average crop, and some few are injured by the frost; the price at which they sell will prevent many from being given to pigs, generally the largest consumers.

#### NORTH RIDING, YORKSHIRE.

We have had all sorts of weather since our last report, but a great proportion of wet; however, as what is past cannot be altered, we think it does not benefit our brother farmers giving a particular account of it, except so far as it has affected the crops. Except on good forward soils we have had a most tedious harvest for Barley, Oats, &c., but by this time we hope the greatest part of each will be housed, though it is doubtful too much haste has been used. On high cold soils there may be some out yet, which will not be of much value when got in. Turnips are a partial crop; some fields are excellent, others worth little. In a field of 11 acres, a part of which was drilled with bones alone, at the rate of two and a half quarters per acre, another part with bones and quick ashes mixed, and a third with quick ashes alone, the first are excellent, second middling, and third very bad, and very much infested with insects. We merely state this, because we think every one ought to mention any effects different methods have on the crops, &c., although it may have been noticed before. With respect to the potatoe crop we cannot say much, as we have not seen many taken up as yet. It is with pleasure that we can state a general advance in prices, not that we are advocates for very high ones, but they have been long much too low; the general opinion is that they are likely to continue, or, however, not lower. In stock not much alteration.—Nov. 9.

#### SOMERSETSHIRE.

The extraordinary advance in the price of wheat has naturally drawn the attention of dealers to the quantity of corn on hand: as far as I can learn but few of the millers were prepared with large stock for advance—the bakers still less so: in the hands of speculators I may safely assert, that in the western and southern part of this county, 500 qrs would exceed the amount. Little of the new wheat (which, I think, from what I hear and see, is of much better quality than the average of the rest of the kingdom) has been brought to market, and of old wheat, although not so large a stock as last year, yet there is, I consider, more than the average of the last five years, and some of the farmers are holders to a large extent: in the yield of the new wheat I have heard but little complaint, and I know that nearly

40 bushels has been realized per acre. Up to last year the growth of wheat has been rapidly on the increase, and I think I may add the stock retained in the farmer's hands have been greater. I quite expect an abundant delivery before or about the end of the year. I think there has not been a shorter stock of old beans for many years: I have dealt in the article for many years; never knew less brought to market up to this time: there are a good many new in good condition, which we may expect shortly on the market: the price of new is 5s 6d to 5s 9d, old, 6s to 7s; I have heard of 7s 6d being given. Flaxseed is in great demand, and has advanced 2s per qr—6s 6d to 7s per bushel. Barley is very scarce; the best new is worth from 4s 9d to 5s 3d. Oats, 28s to 30s per qr. Boiling Peas, 6s to 7s. Old Wheat, top price, 8s to 8s 3d, 64lbs. per bushel, new, 7s 6d to 8s, 62 to 63lbs. Flour, 48s to 51s per sack.—Nov. 18.

## WILTS.

Winter has commenced much earlier than usual. Such an event as ploughs stopped by frost in October has seldom occurred, and though the frost has not been so hard since the beginning of this month, still we have a continuance of wintery weather. So far as food for cattle is concerned this circumstance is to be lamented, as the country was never in a state to suffer more from severe weather than at the present time. In some respects the autumn of 1835 was similar to the present. Then, we had a failing crop of turnips, and no grass on the downs or pastures, and so far it agrees with the present; but in 1835 we had secured a good crop of hay, with a very considerable quantity of old hay; and now, in 1836, we are beginning the winter with a bad crop of hay, and no old hay to help it out; so that any long frost, or such a peculiar season for the consumption of hay as we experienced last winter, will put all cattle masters to great inconvenience and loss. With the exception of some farms, where there are old wheat ricks (and these, considering the very low price wheat has yielded for some years past, are not many) the peculiar feature of the times is the small quantity and size of corn and hay ricks to be seen through the country. From this cause, coupled with our opinion of the new crop as stated in our report of August last, we do not wonder at the start the markets have lately taken, and the lesson to those who, from a command of capital were enabled to hold their wheat when it sold at 17s or 18s per 280lbs net, and did not avail themselves of the opportunity, may be a useful one; for though the wheat has been sinking in value since the year 1830 to the last year, yet it should be remembered that "it is a long lane that is without any turning." The low price of wheat in 1829, 1830, and 1831; the low price of hay in 1833 and 1834; and the late very low price of wheat, form historical truths of some value. These are commodities capable of being held over without any great deterioration of value. When the question arises with regard to keeping over cattle when the price is low (as in the case at present with sheep), then it is quite altered, on account of the great expense of keeping them. Hay may now be worth 5l per ton, and a good down ewe can be purchased at 20s. It is probable that at Lady-day next more poor sheep than usual will be seen, in consequence of the scarcity of hay and straw. The turnips sown on the wheat stubbles have this year no bulbs, so that the supply to the Salisbury, Bath, and other markets is wholly cut off. Carrots and parsnips are one-third dearer than of late years, and difficult to be procured. Potatoes are dearer at digging time than they have been since 1829, being now worth 4s per sack. The Poor

Law Amendment Bill is "carrying out" with as little individual suffering as any great and sudden change can be expected to produce. In one parish, not far from the centre of this county, 69 paupers were working in gangs, under the superintendence of a paid overseer, on roads and in stone pits at this time last year, at the present time there is not a man who is able to work who is on the parish. On the principle that "to be acquainted with particulars is the beginning of knowledge" it would be instructive to know the destiny of each of these 69 individuals.—Nov. 10.

## DEVONSHIRE.

As meetings are about to take place in several parts of this county, with a view to give efficiency to the Act for the Commutation of Tithes in England and Wales, we beg to call attention to the accompanying table. The prices opposite each year express the averages of the seven preceding years, and the column farthest on the right hand how much would have been paid in former years for every 20s rent charge, settled according to the average of 1835. If the compositions which have been agreed to during the seven years ending Christmas 1835, have been calculated on higher averages than the table exhibits, then the tithe payers will have good ground for signing a notice to the Commissioners, stating that the sums paid for tithes will exceed the amount of the rent charge, which should be fixed. We are the more disposed to press this observation on our brother farmers, as we know there has been a great reluctance on the part of the tithe owners, particularly the lay improprators, to consent to a fixed and permanent reduction, as if they had actually known years ago, the provisions of the present act, the only protection which it affords to the payers of tithes being the prevention of that iniquitous exaction which has been heretofore practised upon the most spirited and intelligent for the better culture and improvement of their lands.

Years.	Wheat per bus.		Barley per bush.		Oats per bush.		The value of 1l in 1835 estimated according to the prices of other years.	
	s.	d.	s.	d.	s.	d.	£	s. d.
1821	9	4 $\frac{1}{2}$	4	10 $\frac{1}{2}$	3	3 $\frac{1}{2}$	1	5 1
1822	9	0 $\frac{1}{2}$	4	8 $\frac{3}{4}$	3	2 $\frac{1}{4}$	1	4 3
1823	8	6 $\frac{3}{4}$	4	8 $\frac{1}{2}$	3	2	1	3 8 $\frac{1}{2}$
1824	7	11 $\frac{1}{4}$	4	5 $\frac{1}{2}$	3	0 $\frac{1}{4}$	1	2 5
1825	7	7 $\frac{3}{4}$	4	2 $\frac{1}{2}$	2	11	1	1 5
1826	7	4 $\frac{1}{2}$	4	0	2	10 $\frac{3}{4}$	1	0 9 $\frac{1}{2}$
1827	7	2	4	0 $\frac{3}{4}$	2	11 $\frac{1}{4}$	1	0 9
1828	7	3	4	2	3	0	1	1 2
1829	7	7 $\frac{3}{4}$	4	4 $\frac{1}{4}$	3	1	1	2 1
1830	7	10	4	4 $\frac{1}{2}$	3	1 $\frac{1}{4}$	1	2 4
1831	7	10 $\frac{1}{2}$	4	4 $\frac{1}{2}$	3	1 $\frac{1}{4}$	1	2 5
1832	7	8 $\frac{1}{4}$	4	3 $\frac{1}{4}$	3	0 $\frac{1}{4}$	1	1 10
1833	7	7 $\frac{1}{4}$	4	1 $\frac{1}{2}$	2	10 $\frac{1}{2}$	1	1 2
1834	7	4 $\frac{3}{4}$	4	0 $\frac{1}{2}$	2	9	1	0 6
1835	7	0 $\frac{1}{4}$	3	11 $\frac{3}{4}$	2	9	1	0 0

In the higher parts of the county the sowing of wheat is nearly finished, and many fields are quite green; but in the better lands little was sown except on the clover layers before the beginning of this month. In consequence of the many failures of the turnip crop, the wheat succeeding will be put in early. The principal feature of the last six week's has been the great rise in the corn markets, to which not only the state of the crops in Ireland, and the north of England and Scotland have contributed, but as we believe the slender produce of many English counties, and the great consumption of wheat during the last

twelve months. There is now a little check, but looking at facts which come within our own knowledge, we cannot believe the markets can materially recede. The Poor Law Unions in this part of the kingdom are working well: the idle and improvident have become more industrious and prudent; the dissolute and impudent more decent and civil; for the aged and helpless ample provision has been made, consistently with the rights of the independent labourer, and the vigilant supervision of the auditors is fast rooting out numerous parochial abuses. The consequence of all this is a great and general reduction in the poor rates.

#### SUFFOLK.

Since our last report the weather has continued unfavourable for agricultural pursuits, and although in this county the harvest was all secured (with the exception of part of the bean crop, and a chance piece of seed clover) when such report left us, yet a fine autumn is desirable for the various farm operations, which necessarily must be performed at this season. Carting manure for wheat and for wheat seeding, whether dibling, drilling, or sowing broadcast, also for carting off and securing mangel wurzel, and many other kinds of work almost innumerable. We again state the weather has during October been the most untoward we ever remember to have witnessed. At one time heavy falls of rain, at another the ground so hard from frost, that planting wheat could only be proceeded with during the latter part of the day; at another the ground covered by a deep snow for three or four days together, wheat sowing is therefore not yet completed. Of the probable produce of the various crops, we see no reason to alter our former opinion, although wheat rises well from a given quantity of straw; yet when we consider that that straw was the produce of a greater quantity of acres than have been required for the last several years, to make the same sized stack, or fill the same barn, we shall be surprised if many are not deceived as to the acreable rise of their wheat crop. The rise in the price of all kinds of grain have animated the minds of the farmers, and we hope will give a stimulus to an improved and compensating system of agriculture, and to the employment of the labouring population.—Nov. 12.

#### PERTSHIRE.

Winter has trodden closely on the heels of harvest and found many unprepared. A frost, unparalleled for intensity in October, set in on the 28th of that month, accompanied with a fall of snow. The preceding part of the week had been dry, and a very great part of the late crops was, during that period, carried in tolerable condition. Much, however, remained exposed in the higher districts, and even in the earlier parts of the county beans and oats were not all got in, nor even at this date are we able to report that in any district the operations of securing the crop are concluded. Although the storm in the end of October was of short duration, frosts have been frequent since, and rendered potatoes taking up an unpleasant and expensive process. In the early districts they are not yet all up. And we are sorry to be informed, that in some places bordering on the Highlands, the villagers refused to lend a helping hand in securing this valuable root, which a slight frost renders useless. In the Highland glens some patches of oats still remain uncut, and fields of barley are to be seen here and there in the stook, the lateness of which, exposed as it was to frost while in a green state, will render much of it useless to the maltster. The loss by frost sustained by potatoes is variously estimated, and they were variously affected on different soils; those varieties, too, which grow

deepest in the soil were most secure. Some estimate the loss at one-third, some at one-fourth, and some at one-eighth of the whole, but the loss will be easiest ascertained on an early turning and picking, which the frozen potatoes unavoidably mixed with the sound at taking up, renders necessary. We see no reason for departing from our previous estimate of the crop, only that as a great deal of beans were in a greenish state, although cut previous to the 28th ult. the frost which, on swampy grounds, indicated from twelve to fourteen degrees below the freezing point, will have rendered many of such useless even in feeding horses; to be used as seed is out of the question. The oats, notwithstanding many failures on highlands, will, in the cultivated districts, give a fair return, and the quality appears good. Sowing of wheat after potatoes and bean stubbles has been retarded till an unusually late period, and without dry and open weather, that operation cannot well be proceeded with. Early sown wheat on dry bottoms exhibits a healthy plant, but the breadth as yet above ground is inconsiderable. In the corn market prices have advanced considerably of late. Sound samples of barley are much in demand, and such are expected to command high prices. Oats are not likely to rise much in price, being, with the exception of late situations, a fair crop. Cattle, from the lightness of turnips, meet a dull sale.—Nov. 7.

#### DUMFRIES-SHIRE.—OCTOBER.

The first part of the month continued wet and very unfavourable for harvest work. This was succeeded by ten days of mild dry weather, during which much of the oat crop of this vicinity was secured; and the higher and later crops were better ripened than could have been anticipated. On the 27th and 28th, a high cold wind from the north was of great benefit in enabling the farmer to stack in fair order the late corns; and on the first of November, there does not remain out more than perhaps a twentieth part of the crop; of which, however, a part is yet to cut. The last four days of the month have been distinguished as the coldest at this season ever recollect. The eastern part of the county was covered with snow on the night of the 28th, which has remained for three days, with a severe frost, the thermometer, generally, in situations about 500 feet above sea level, falling to 20, on the 31st. This severe frost has of course completely destroyed the fields of unripened oats, which on moorish soils are to be seen in every quarter, although to no great extent. The produce of wheat falls under the lowest anticipated estimate of it. It probably will not average above 15 or 16 bushels per imperial acre, and the weight 57 or 58 lbs. Barley, too, is an inferior sample; and though bulky in straw, will be rather short in quantity per acre. The oat crop, on the whole, will be an average in produce of bushels, but certainly very deficient in meal. Potatoes, of which not above a third are yet taken up, are a very defective crop. On all light and weak soils, even though dry, they are (exclusive of the loss by failure of seed) one-third below an average; and on wet soils, generally more than a-half deficient. Where there is a depth of good dry soil, and no failure of seed, they are not much short of an average; and, what could not be anticipated in a cold year, in general, they are proportionably a better crop on the higher districts, than on those nearer the coast. In the town markets, they are at present selling at the unusual high price of 2s 6d per cwt; but as so great a proportion in this county is raised for feeding swine and other bestial, the consumption of which can be much abridged, any higher rate at least is not to be expected during the season.

## AGRICULTURAL INTELLIGENCE, FAIRS, &c.

**CHESTERFIELD FAIR.**—There was a tolerable supply of horned cattle: good new calved cows and those near calving, as well as prime barren cows, met with ready sale at rather advanced prices. All other descriptions of cattle were either disposed of at ruinously low prices or driven home unsold—arising, doubtless, from the extreme scarcity of fodder. The horse fair was more than usually well supplied: the few useful nags shewn met with ready sale at high prices, while all other sorts were scarcely noticed, and for which there were but few purchasers. There were a good many pigs in the fair; for those of a large size high prices were obtained, the smaller ones fetched less money. There was but a poor supply of cheese, and that but of middling quality, the average price was from 62s to 65s per cwt.

**YORK MARTINMAS FAIR.**—At this annual Beast fair there were a thin supply of fat beasts, which met a fair sale at from 5s 6d to 6s per stone; of all descriptions of lean beasts and going-on stock there was a great supply, but there only appeared to be a heavy market for them, at rather a depression in prices; there was also some Cheviot and Masham hogs and ewes shown, for which also the sale was heavy.—**THE HORSE SHOW.**—In the horse fair there was but a poor show of good ones, which were soon sold, at good prices; of inferior ones there were part shown, for which there was no demand.

At **ALRESFORD GREAT SHEEP MARKET** there was but a short supply of sheep, which met rather a dull sale, except for lambs, which experienced a ready sale, at about the same prices as at the late Andover Sheep Fair. Pigs were numerous, and sold at high prices.

At **BRECON NOVEMBER FAIR** fat cattle went off readily at brisk prices, but store cattle had but a very dull sale. Pigs, of which there was a very large supply, also went off slowly. Fat pigs, of which there were but very few, fetched about 8s per score. Cheese, 45s, 50s, and 54s per cwt. Butter in cask and tub, 1s per lb. Hops, a slow sale; best samples at from 5l to 5l 12s per cwt.

**WIRKSWORTH FAIR.**—There was an unusual number of cattle, chiefly store, and the few that changed hands were sold at low prices. Good beef kept up its price.

**EASTHOTHLY.—CROSS-IN-HAND FAIR.**—There was a middling exhibition of the different sorts of stock at this fair, but the business was extremely dull, and no great number of sales effected. The prices demanded by the Welchmen, may be quoted at about 2s per stone.

**EGTON FAIR.**—The stock shown was not so plentiful as might have been anticipated, nor of that prime quality for which this fair is noted; with the exception of fresh steers, which met a ready sale at high prices. It was considered a dull fair.

At **FROME FAIR** there was a large supply of horned cattle and sheep, but pigs were not in abundance. Cheese hung upon hand in the morning, but afterwards it sold more readily, and prices may be quoted at from 56s to 63s per cwt.; a large quantity was pitched. Fat beef fetched from 9s to 9s 6d per score; mutton, from 5d to 6d per lb; pigs, from 8s 9d to 9s 3d per score. Horses were plentiful, but of an inferior character, and, consequently, there was a dull sale. Articles, generally, were rather at a decline in prices than otherwise.

**CHESTER CHEESE FAIR.**—This fair took place on Wednesday last, and at no previous fair has there been such an extraordinary supply as appeared in the Halls this day. The buyers were numerous, but they were somewhat reluctant to give the prices asked. Good Cheshire Cheese sold at from 75s to 80s per cwt., whilst 50s to 65s was asked for middling. A good

quantity of the former was sold, but the latter, from its inferior quality and high price, went off but sparingly. The cheese fairs are held the day preceding the cattle fairs,—that is, on the day's preceding the following—last Thursday in February and April, July 5, 1st Thursday in September, October 10, and last Thursday in November.

**YEOVIL.**—The quantity of cattle at our fair was unusually small, and the quality of the beef very indifferent. The prices ranged from 8s to 9s 6d per 20 lbs, to sink the offal, but there were but few that were of the quality to realize the latter price; of half fat and poor stock there were a great number unsold. It was a full fair of sheep, mostly consisting of ewes and lambs, and but few good feeding wethers; there was a dull sale for the ewes, which were mostly inferior; the best lambs sold readily, particularly the Downs, which obtained a marked preference over the horned; the latter, likely to make the same weight, only fetching 18s to 20s, and the former 20s to 22s; there was some inquiry for hogs for grazing, and but very few for sale. Mutton is a dull sale, 5d to 6d per lb. There was a poor show of horses. A fine sample of old barley was sold at 44s; new, 39s to 40s. Flax at Yeovil market is worth from 5l 10s to 6l 10s per pack; the quality of the new is not so good as the old. The linen and sailcloth trade is brisk.

**BAWTRY MARTINMAS FAIR.**—This fair was numerously attended by purchasers. Fat stock which was scarce, experienced a great demand and fetched high prices. There was a good supply of lean stock, which also sold well.

The fair at Marlborough may be stated as the best since Weyhill. There was a large supply of sheep; and lambs sold briskly at an advance in price. For ewes the demand was not so great, but they supported the prices of former fairs. Good horses were in demand, and fetched high prices, especially cart colts.

At **DUNSE FAIR**, there were 650 head of cattle. There was a brisk demand for fat, but no advance in prices. Fat klyoes from 5s 6d to 6s, and fat cows 5s per stone. There was a number of lean cattle in the market, and a good deal sold, prices looking downwards. Year and a half olds sold at from 4l 10s to 6l 10s; small Highland do. 1l 10s a-head; farrow cows from 4l to 7l 10s. Blackfaced ewes, fat, 13s a-head; Cheviot Dimonts from 16s to 18s 6d. There was a middling show of horses, and sales were in general dull.

**KINCARDINESHIRE.**—We have received the following account of the state of the crops in the neighbourhood of Laurencekirk, in a letter dated the 12th of November:—"I have got my harvest concluded at last, it being the most tedious one we have had since 1817. Those who had patience, and did not take in too soon in the beginning, had the crop pretty well settled; but it is very different with those who had not. I happened to be one of the patient, which has proved fortunate to me. I had very little in until Monday fortnight. We began as 12 struck on Sunday night, and we only rested nine hours until 2 on Thursday morning, when we got it all into the stackyard. Snow came on about 6, accompanied with a very high wind, which damaged very much what was uncut. There is still a good deal to cut down in the late districts in our neighbourhood. Barley is below an average both in quantity and weight; oats an average in quantity, but not in quality; potatoes and turnips both very deficient. Our grain markets have started higher than last year, which will, in some measure, compensate our wants. Servants' wages have advanced greatly, owing to manufactures paying so well; that I should not grudge if our own trade would follow."—*Edinburgh Advertiser.*

**FAT STOCK.**—Two bullocks belonging to the Duke of Devonshire, which were exhibited at the late agricultural show at Bakewell, were sold by Mr. Swaffield,

baillif to his grace, at Bakewell fair, to Mr. Joseph Winsor, butcher, of that place, for one hundred guineas.

**PRICE OF HAY.**—The average price of good hay, in Sheffield, is 7/10s per ton. In addition to the supplies from Derbyshire, a considerable quantity has lately been brought up from Thorne.

**POTATOES.**—Mr. James Craven, of Richmond, took up a potato lately, which measured 18 inches round, and weighed 2lbs, there were 60 others of a smaller dimension attached to the same root.

**POTATOES.**—(Observations by Mr. John Johnston, Factor to the Earl of Glasgow.)—In this part of the country, where many fields of potatoes have been taken up since the late frost, I have observed that they are more or less frosted, which renders them not so pleasant a vegetable for the table. I have, however, ascertained that potatoes that have been frosted to such a degree as even to resemble pulp, will still yield, by proper treatment, a pure farina, without any unpleasant taste or smell. I ascertained this by trying a few of those that were frosted, which I lately gathered from a field for the purpose of making the experiment, and I and my family made, from the flour they produced, when mixed with boiled milk, a most excellent supper the same evening they were gathered. I was induced to make this experiment from my having on a former occasion observed in a pit where the potatoes were decayed a quantity of the farina in a pure state, white as snow, lying at the bottom; this I did not try at the time, but I have now ascertained, beyond all probability of doubt, that, even in the highest degree of frosting, the farina or flour of the potato, in which the nutriment exists, is not destroyed. I may observe that it is a common opinion that frosted potatoes are injurious to cattle; but this is by no means the case, and they will only prove hurtful by being given in too large quantity, which would be equally so had the potatoes been sound. In making potato flour therefore it will follow as a consequence that the process may be shortened by exposing the potatoes to a night's frost, when they may be mashed in place of grating them down.—Fairley Mill, 14th Nov.

The annual prize of five sovereigns, offered by E. Bouverie, Esq. to the tenant, occupier of land in the county, being a member of the Northamptonshire Farming and Grazing Society, who could show, about the first week in November, the cleanest and best crop, of not less than five acres, of Swedish turnips, on old tillage land which had the preceding year borne a crop of white grain, has been awarded to Mr. Richard Linnell, of Stove Nine Churches. The weight per acre, after the tops and roots were cut off, was 23 tons 7½ cwt.

The sweepstakes for the heaviest crop of mangel wurzel, of not less than three acres, on old tillage land, after a crop of white grain, average weight of the crop taken the latter end of October, was won by Earl Spencer.

And the sweepstakes for the heaviest crop, of not less than five acres, of Swedish turnips, on old tillage land, after a crop of white grain, the average weight of the whole crop ascertained about the first week in November, by the judges chosen at the annual meeting in September, was won by C. Hillyard, Esq.

Earl Spencer's prize of ten sovereigns to the hedge-cutter who should cut, lay, plash, and ditch eleven yards of hedge row in the best manner, was contended for at Earl Spencer's farm at Chapel Brampton, on Wednesday last, by twenty-one cutters. The judges awarded the prize to No. 9, which proved to be the work of John Whitehead, of Leckhamsted.

The excellent bull Pnam, which belonged to Mr. Denton, of Harraby, but was sold at the late sale to the steward of Lord Corhouse, was such a general object of admiration in Ireland that it was exhibited to the natives of the Emerald Isle at one shilling per head, and in the first day 30l. was paid for the sight.

**THE HARVEST.**—**DUMFRIES.**—So late as Tuesday, the 8th current, we were astonished to find acres

on acres of crop, not only uncarried, but actually uncut in the parish of Terregles, within three miles of the town of Dumfries. But for the evidence of our own eyes we could have hardly believed such a thing possible. Such, however, is the fact, and, perhaps, the remark we have just made applies with equal force to the higher districts of the parish of Irongray. On the Drumstichel and some other hills, not only stooks, but standing corn appeared; and, what is still more extraordinary, matters were nearly equally bad much lower down along the banks of the Cairn, particularly on the farm of Waterside. In Dunscore, we are told, the scene was quite frightful a few days ago; every stook, where a stook stood, was hooded with snow, and the prospect, altogether, as dreary and unpromising as can be well imagined. At the same date potato harvest was merely commencing—anxiety for the grain crops, and most uncertain weather, having for weeks absorbed every other feeling. When the soil is naturally damp and the climate cold, the damage done by frost is very great; say a *third* in extreme cases, and a *seventh* generally. The taint of itself was bad enough, and its new aide-de-camp, General Frost, has made, as may be supposed, terrible havoc in the poor man's greatest bread crop. The instances of failure that have fallen under our own observation, are almost innumerable, but what will the reader say to the following! A farmer in Carlawrock raised this year 11 cart load of potatoes from the same breadth of land which last year produced 130. This is a calamitous state of things, which, pinch as the farmer may by giving little beyond meadow-lay to the bestial, will occasion serious short-coming in a description of crop which Colquhoun estimated at the annual value of fourteen millions sterling: and, if the potatoes be bad, the turnips are so much worse that the opinion gains ground that the return will be under rather than above the fourth of an average. Here and there exceptions exist; but they are exceedingly rare, and, upon the whole, bear the same proportion to failure that the prizes did to the blanks in a state lottery. A friend, who was in Cumberland in the end of last week, observed at every little distance fields of grain to lead, and in a few instances patches of oats to cut, and even barley. Where the land was dry, the natives were busy raising their potatoes; but in all low situations, the water in the furrows and higher up the ridges, precluded the bare idea of such an operation. The turnips, in so far as he was able to judge, are no better than they are in Scotland, and yet, strange to say, the prices of cattle and sheep are rising.

## HOP INTELLIGENCE.

**BOROUGH, Nov. 28.**—Since the declaration of the Hop duty which took place early last week (for particulars we refer to the foot of this) the trade has experienced a decided alteration, and prices have fallen fully 15 per cent. In consequence of the declared amount being quite 15,000 above what was expected a short time back, at the present quotations much business will be done, as the holders must now meet the consumers if they mean to sell. The growth is quite equal to the consumption in *quantity*, if not in *quality*.

**WORCESTER, (Saturday last)**—It was generally expected our Hop market would be much depressed today, in consequence of the duty having turned out more than the late estimate; but we cannot quote more than 2s to 3s per cwt reduction from last week's prices, and very few could be met with even at that

trifling reduction; most of the planters still holding their stock back in expectation of realizing higher prices. It is calculated that full two-thirds of our growth have been disposed of,

G. A. COTTRELL, General Accountant.  
Excise Office, London, Nov. 21.

REVIEW OF THE HOP TRADE,

FOR THE MONTH OF NOVEMBER.

The above declaration of duty payable on this year's growth of hops, say 200,332l 12s 11 3/4d 15/20 old duty, being much above what was expected some time since, has produced a considerable fall in prices of all descriptions of hops, except for very fine parcels.

It being admitted that the consumption is equal to the present growth, particularly when hops are at moderate rates, it is expected that a considerable demand will immediately take place, as soon as the fall in prices become generally known.

The old duty paid in 1835 was upwards of 235,000l. The principle deficiency this year is in Kent about 35,030 and Sussex 13,000, but the considerable increase in Worcester, Farnham, and the

Clays, has tended to swell the duty to an amount not at all calculated upon by the trade.

HOP TRADE.

The actual duty appears to have been from 5000l to 8000l more than speculators had assigned as the probable value of the crops; 192,000l to 195,000l being the last bets made. The duty from Kent and Sussex is nearly one-fourth less than that of last year, as detailed below, the increase having been in Hampshire, Hereford, &c.:

	1835.	1836.
Canterbury .....	£ 98,975	£ 76,512
Rochester .....	144,681	106,993
Sussex .....	127,458	105,715
Hants .....	4,386	10,554
Hereford .....	22,704	26,670
Lincoln .....	350	2,970
Salisbury .....	2,464	6,289
Worcester .....	3,480	5,943
Derby .....	20	755

In the early part of the season, growers flattered themselves that the produce of the bines would be abundant, and the duty was estimated as high as 250,000l, the weather, however, proving ungenial, the bines did not thrive as favourably as was anticipated, and the duty receded to 175,000l; and though the Hops came down lighter than was expected, at the commencement of the picking, yet the estimated duty continued to advance until it attained the above sums, and approximated nearly the paid amount. The stock on hand of old is not estimated as large, the demand having been considerable throughout the year, owing to the increased consumption of malt liquor, which by the last official return of the malt duty was 5,664,625 qrs, showing an increase on the previous year of 581,750 qrs, which, taking the calculation of 1lb of Hops to a bushel of malt, which, averaging old and new quality is a fair estimate, is equal to 20,000l old duty, and making the annual consumption rather more than 200,000l exclusive of the quantity consumed by bakers for yeast, so that the produce this season is barely equivalent to the computed demand.

The declaration of the duty has not materially affected the trade; fine coloured Hops being scarce and forming a very small proportion of the bulk of the produce, have maintained their previous currencies, which they are likely to continue to do; but middling and inferior parcels which are pressing on the market, hang heavily on hand, and prices in some instances depending on the offers made; indeed the quality of some is so poor, that it is feared that they will not keep the beer brewed with them. But as consumers have refrained from purchasing, they are now likely to come forward, as the quotations are more settled, which will give the trade more animation, though a considerable disproportion is likely to prevail in the currencies throughout the year, and a wide range to exist between the maximum and minimum points. The following is the duty for the last seven years:

1830.	1831.	1832.	1833.	1834.	1835.	1836.
£ 88027	£ 174864	£ 139018	£ 156905	£ 189713	£ 235207	£ 200332

In 1736 the duty was only 46,482l., and during the last 100 years the minimum duty was in 1782, being only 14,895l. The maximum ranges having been—

1794.	1801.	1808.	1819.	1822.	1826.
£ 203063	£ 241227	£ 251089	£ 242076	£ 203724	£ 269331

## REVIEW OF THE CORN TRADE DURING THE MONTH OF NOVEMBER.

A striking instance of the vicissitudes of our climate, and the frustration of all preconceived operations of the farmer, occurred towards the commencement of the past month, the thermometer sinking below the freezing point, accompanied by one of the most general and heavy falls of snow ever experienced at such an early period of the season. All agricultural operations were suspended; but the frost in unison with snow proved less injurious than if the ground had been exposed to all the intensity of the cold. The unfavourable character of the weather enhanced the demands of holders of wheat, and during the first week in November, the quotations advanced 6s to 8s per qr., which communicated a fresh impetus to all the country markets, especially in the northern and western divisions of the kingdom, where the currencies were already in an excited state from the inclemency of the season. Liverpool vieing with the metropolis in commercial importance, and the merchants and speculators alive to any circumstances which were likely to give a favourable turn to the trade, entered freely into speculative purchases, founded on the weather, the falling off in the receipts from Ireland, and reported deficiency of the potatoe crop in the northern portions of that kingdom, in parts also of Scotland and England, especially Lancashire and Yorkshire, and transmitted large orders to London and its neighbouring counties for fine dry qualities of wheat. Ireland also in want of quality for immediate use, became a purchaser likewise in Mark Lane and on our eastern coast, prices having risen to 40s per barrel for red wheat, orders were being at the same time executed for Scotland; the new wheats being mostly unfit at the moment for millers' purposes, such a combination of circumstances naturally excited speculative spirit, which when once aroused in English markets is often carried beyond due bounds, rendering trade in a fevered and heated state, and advance rapidly succeeds advance; the excitement of one market infects another, which, as it were, inflames again the one from whence the exciting cause originated, until speculators eventually become alarmed at their own creations. The currencies, therefore, continued rising 3s to 4s per qr., until the following high rates had been attained at the leading markets.—In Mark Lane extra fine white wheat realized 76s, and red 68s to 70s per qr., making the rise from the top range of runs of wheat at the close of October 12s to 14s. per qr. At Liverpool English white wheat was worth 10s 6d, and white 10s 9d to 11s per 70lbs. Irish old red 9s to 9s 6d, prime brands of flour were worth 62s to 66s per sack; at Dublin white advanced as high as 45s, and red 42s per barrel. At Edinburgh red wheat attained 51s to 60s, and white 54s to 70s; many speculators confidently anticipated that foreign wheat would be liberated at a nominal duty, and high prices were paid for Bonded wheat; Danzig qualities found buyers at 50s to 56s; Elbe and Baltic reds at 46s, 48s, to 50s; stale old Odessa and Russian at 31s to 32s, and indeed the stalest parcels on hand of any description were not to be had under 30s. The

currencies both of the free and foreign exhibited during the middle of the month an extraordinary contrast with the rates prevailing at nearly a similar period last year, white English wheat being then quoted at 42s to 45s, red at 37s to 39s, showing a difference of 30s to 31s; Danzig at 20s to 26s, and red 17s to 20s. Owing to the extent of the speculative operations and anxiety to purchase foreign wheat, *estafettes* were dispatched to Danzig and other ports in the Baltic with considerable orders, and buyers at home considered themselves fortunate to obtain part of the local stocks, particularly at Liverpool, where Danzig wheat attained a quotation of 7s 9d, and red Baltic fine, 7s to 7s 6d per 70lbs. Towards the end of the third week in November the *mania* showed symptoms of subsiding and the aspirants for obtaining *fortunes* by possession of foreign corn, cooling their heated imaginations, a few began to reflect in something like the following strain:—If this chilly wet month instead of being November, were that of June, if the then forth-coming crops were unpromising, if the stocks of old corn were known to be exhausted, we should have *reason* to look forward to a permanent high range of currency, and to warrant our speculative enterprise; but we must not forget that the harvest in England, taking those counties in which wheat is chiefly cultivated, is an average produce on the common run of seasons; that though in Scotland the growth is deficient, especially in quality with less land sown, yet that the stocks in many districts are large, as well as throughout England; that in Ireland the crop of wheat is an average produce for the bulk of straw, and better in many instances than the yield and quality of last year; but a diminution in the amount of land cultivated and condition inferior, with nearly exhausted stocks; yet on the other hand, nearly the whole of this year's crops is now in the *barns* or *rick yards*; the consumption having been mainly dependent on old wheat, owing to the condition of the new growth;—taking these facts into mature consideration the probabilities are not in favour of the present range of currencies being maintained at this period of the year—to which we may add, that farmers, whose condition, we rejoice is improved, have not been compelled to force their ill-conditioned produce on the market, and through their own necessities to depress the prices against themselves; but now that the quotations have out-run their expectations, having exceeded the maximum point, which would have induced them to sell, they will thrash out freely, especially those parcels in condition, and with drying winds and cold weather an influx of corn will ultimately be pressed on the market, and a decline consequently ensue: such has been the case, and wheat in London has receded 8s to 10s per qr.; at Liverpool, 1s per 70lbs, and at Dublin 6s to 7s per barrel; but in Scotland, the want of fine quality of wheat has checked the decline of the top quotations to the same extent as experienced in England and Ireland. In conclusion, we may briefly remark, that allowing the state of the crops and the stocks of old wheat to be as we have above mentioned,

assuming that the consumption will not continue as lavish as has of late been experienced, the pressure on the money market having affected the manufacturing districts, causing a diminution in work and reduction of labour and wages, and therefore less capabilities to purchase bread at advanced rates, even though the regulations of the New Poor Law Bill may partially increase the consumption of flour, yet we are inclined to deduce the opinion, that the finer qualities of wheat are not unlikely to maintain a high proportionate range of quotation, but that the middling and inferior descriptions will realize much lower relative rates, not however to the extent to reduce the value of wheat below a remunerating point, nevertheless having the effect of checking the averages from obtaining a quotation, that at the prevailing currencies of wheat abroad will permit the entry of foreign corn, unless the appearance of the future crops should prove unfavourable. But, as we are likely to meet the ensuing harvest with exhausted stocks, we shall require a *superabundant* produce in 1837, to enable the consumption to proceed without eventually having recourse to foreign importation.

We regret this month to have to notice a fact connected with Ireland, which has been the cause of temporary inconvenience to the agricultural interests—we allude to the stoppage in the payments of the Agricultural Bank. At the commencement of the current year we drew particular attention to the Branch Banks of this establishment, the beneficial results attendant on the accommodation granted to farmers, enabling them to retain their stock and to avail themselves of a favourable turn of the trade, which was leading to an important revolution in the whole of the agricultural population, creating at the same time a vast change in the Irish grain and provision trade, and producing the anomaly of advancing the prices beyond the currencies of Liverpool and London; though stating that if any check was experienced in the *constant flow of accommodation*, the influx of grain upon the markets was likely to lead to a considerable depression. Though at present not the remotest doubt can exist of the eventual solidity of the Bank, yet that class of persons, the small farmers, depending on the Bank for credit, are likely, in many cases, to be compelled to convert their produce into money at some disadvantage to meet their more immediate engagements, and the belief that such would be the consequence, has not been without its influence on the trade in this country, especially at Liverpool. The occurrence is more particularly to be regretted as it will tend to throw a doubt upon the propriety of granting the same degree of credit to the small occupiers of land, though in the existing state of society in Ireland, it might be rendered of incalculable benefit, if judiciously applied.

The depression we have alluded to continued until towards the close of the month, when confidence having been partly restored in Ireland, and a few fresh orders transmitted from thence to Liverpool and London, with a few purchases for Staffordshire, &c., and also Scotland, the trade made strong efforts to rally, the London currencies improving 2s to 3s, Liverpool 6d per 70lbs, and many country markets slightly advancing. This re-action however, was to have been anticipated, and though slight fluctuations may take place until after Christmas, yet no material rise to the extent previously experienced is likely to ensue, though farmers, by a species of monopoly, will be enabled to keep the supplies down

and control the markets for a time; but this must eventually cease, and prices will equalize themselves. Bonded Wheat again found purchasers; a few fine fresh cargoes of Danzig at 48s, and an extra prime parcel at 52s, and Stettin, 42s.

The new samples of Wheat which have appeared have varied in quality, and been much affected in condition, owing to the prevailing damp weather, added to the soft, tender state in which many were housed, and while alluding to the quality generally, we are sorry to observe the prevalence of smut this season, which infects the samples more or less throughout the kingdom. No blight being so injurious to the miller as smut balls, it had therefore become a material desideratum in agricultural economy, that some method should be adopted of cleansing the grain from this evil attendant. We have lately inspected a REEING MACHINE, erected at the Mills of the Messrs. Pavitt, at Rotherhithe, invented by Mr. W. W. TUXFORD, of Boston, Lincolnshire, which seems to have most effectually attained the object in view; the construction of the machine being as remarkable for its simplicity as it is for the efficacy of its operation. One machine with half-horse power can clean nine quarters per hour, and as there is little friction in working, the machine is extremely durable. The cleansing properties are not confined to smut balls, but sprouted, mouldy, and perished grains, rat and mouse dirt, worms and weevils, are removed with equal facility, and while the loss in measure is trifling, the improvement of the sample in quality is, in many instances, from 3s to 4s per qr, and even more in some instances, where the wheat is previously much deteriorated with extraneous matter.

The millers have not been slow in taking advantage of the rise in wheat to enhance the price of flour, which advanced rapidly to 60s per sack, and some manufacturers naming at one time 65s, but not being enabled to establish this maximum quotation, the nominal price remained at 60s; the succeeding week it receded to 55s, owing to the reduction in the value of the raw article, at which rate it remains firm; but the short duration of the rates at 60s, is, in part, attributable to two influential parties, who, having made large sales at stated prices on delivery, were anxious to keep down the quotations as much as possible; and wheat continuing to decline the ensuing week, they succeeded in effecting their object, which, though beneficial to the public, was not at all in accordance with the views and wishes of the trade. The business latterly has, however, been languid; most of the country orders having been executed early in the week, and the bakers of the metropolis having, just previous to the rise, purchased largely from our town makers, have not been anxious buyers.

Little Bonded Wheat has been exported during the month, and shipments latterly, have entirely ceased to the United States, as well from England as the Baltic ports, owing to the high range of the currencies, and the speculative feeling afloat in this country, that the article will be required for our own consumption; it is therefore not unlikely that the anticipation on the other side of the Atlantic, of not receiving further supplies from these quarters of Europe, may have a considerable effect on the value of wheat in America, provided actual deficiency exists to the extent represented.

The averages are now exhibiting the effects of the advance in wheat and other grain. In the general averages of the kingdom, the quantities of wheat reported as sold, or rather, the different parcels which have changed hands, many of them several times

over, are considerably augmenting, having amounted in the two latter weeks together, to 267,000 qrs, at an aggregate average of 55s 6d to 60s 4d, making the average of the six weeks 51s to 52s. The duties on wheat during November have, however, only receded 4s, being 35s 8d; the reduction in the duty on Barley has been 3s, on oats, 3s, on rye the same amount, on beans, 1s 6d, and on Peas, 6s.

The supply of barley, as was to have been anticipated, has considerably increased the past month, having exceeded 53,000 qrs; and though at this season an active demand prevails usually for the article, yet the trade has continued languid and the currencies latterly receded 1s to 2s per qr on the finer descriptions, and 2s to 3s on inferior sorts. The principal cause of this heaviness has arisen from the high prices affixed to the finer malting parcels, checking the purchases of maltsters. The malt trade having remained dull and unrelieved by the purchases of the larger consumers, whose stock of old malt has kept them off the market, added to the expected import of several cargoes of good distilling and grinding barley from the Lower Baltic and Hamburg, and a few parcels of malting quality from Bohemia and the Saale, has effectually prevented any animation in the trade; and if the duty remains at 6s 4d, or should decline to 4s 10d, all the foreign in warehouse and afloat will be brought free on the market, and if the northern ports remain open longer than usual we may continue to receive shipments principally of secondary and inferior quality during most part of the winter.

The receipts of Oats from England and Ireland have been considerably larger than during October, and the trade having been influenced by the extensive purchases made of foreign Oats, which are likely to be admitted at a duty at the highest of 7s 9d, has prevented any extensive operations, more especially as the prices free on board in Ireland have ranged extremely high, say from 14s to 15s 6d per brl, and 16s to 16s 6d is demanded for the finer descriptions. The principal business, however, latterly transacting, has been the re-sale of purchases previously made for forward delivery by parties who had come in at lower figures. During the month the fine fresh parcels of English and Scotch Oats have advanced 6d to 1s per qr, and have come sparingly to hand, and the better samples of Irish have slightly fluctuated, having advanced 1s per qr, and being now about 6d per qr higher than at the close of October. Oats in Bond have advanced 2s to 3s per qr, good fresh feed being noted at 18s to 20s, and Brew 22s to 25s, and prices abroad have advanced in proportion to the reduction in the duties in this country.

The demand for Beans has continued unabated, and though the duties have receded and are likely to decline to 3s 6d per qr, yet the currencies have kept advancing, and are 4s per qr higher on old qualities and fine dry new; middling qualities also of new have improved about 2s, sales in bond have been made at from 40s to even 48s per qr.

The high price for all articles of feed has caused more demand to exist for Peas; good boiling qualities have been in limited supply, and the sale proving free, quotations rose 5s per qr, and Grey and Maple 5s to 6s. The duties, however, having declined during the month 6s per qr, and more samples coming forward, caused the article to give way fully 2s, making the improvement 3s to 4s per qr since October and the trade steady.

During the month of November the following quantities of Grain and Flour have arrived in the port of London:—

Foreign in Nov.	613	314	11,176	Iris. 4,073

In Canada the prices of wheat remained steady, Upper Canada white being worth 7s to 7s 6d per 60lbs, mixed 6s 6d to 6s 9d; superfine flour 45s, fine 42s 6d. The weather has been extremely unseasonable, snow succeeding rain with frost, which, though not severe, might, it was feared, prove injurious to the potato crop.

At Hobart Town, Van Diemen's Land, prices of wheat had receded, being noted at 7s to 8s 6d per bushel; Flour had declined 3s per 100lbs, being noted at 27s. The weather was remarkably fine for the operations of the plough and harrow, and a large extent of corn land had been sown under the most favourable circumstances. At Launceston, wheat was held at 9s to 9s 6d per bushel, owing to a few shipments still being made to Sydney, where, however, the currencies were ranging much lower, 10s per bushel being the average rate; at the same time that the weather was extremely favourable for the forthcoming crop.

At Odessa, as well as Taganrog, wheat had rather receded in value, and was noted at the latter port at 21s per qr for hard quality; soft quality at Odessa had obtained 21s to 24s 3d in retail, with little doing; but hard wheat in request at £2s 4d to 22s 11d, Indian corn very scarce. Vessels were extremely scarce, which checked the shipments from the Black Sea. At Odessa, there were in granary about 267,000 qrs of soft wheat, 25,200 qrs of hard, about 5,000 qrs of Oats, and 4,300 qrs of Barley, besides 14,000 qrs of Rye.

With the exception of a few of the Southern markets in France, most of the leading markets throughout the kingdom, having been more liberally supplied with wheat, are either on the decline or dull, and prices nominal; the raw material now feeling the decline which had already taken place in the manufactured article of flour, though there are, however, some important points where the demand continuing active, the previous rates are maintained: Soissons, for instance, is receiving various orders to purchase, some from the millers on the Oise, some from Ronen, some from Caen, and others from Bourdeaux; to the present period the large receipts of new wheat which are brought to market about this period assisted by old samples, the stocks of which are still considerable, have been fully sufficient to meet the current wants; but it is probable, that if the same demand continues, the supplies in certain districts may not prove equivalent, and then the currencies would rapidly improve: prices at Paris are from 36s 6d to 37s 6d per qr for the better descriptions. The advance in Mark Lane, and throughout the Baltic, had

had no effect on the Parisian currencies. At *Marseille*, though the supplies were sufficient to meet the demand, yet prices were supported, and the stocks much reduced; foreign wheat in *Bond* had experienced an improved demand, at rather better prices, considerable sales having been made on delivery, principally for the earlier months of the ensuing year.

At *St. Petersburg* an improved demand had been experienced for Rye, which has gradually advanced to 17s 10d per qr. for delivery in May and June, with 5 to 6 roubles in advance. The new linseed was favourably reported, both as to quantity and quality; *Morschansky* and the fine qualities were offering for delivery for July to the middle of August at 38s 5d to 39s 9d, with 10 roubles per tschetwert advance; fine *Moscow* was also to be had at the latter price. At *Riga*, *Courish* Wheat had been purchased for shipment to America at 27s 4d to 29s 1d. Oats obtained 12s 1d to 12s 10d, and barley, 16s 8d to 17s 7d both of *Courish* growth, which is particularly desirable, because it is of better quality than *Russian*, and is brought to the city during Winter, and can therefore be shipped first open water in the Spring. The crops not being abundant, there is not much probability of being able to purchase at lower rates. Some purchases have been made of *Russian* and *Courish* Rye at 17s 3d. At the commencement of the past month more or less activity had been observed in the trade at *Danzig* for all sorts of grain, and especially for the inferior and middling sorts of wheat considerably higher prices had been paid, and much higher relatively than for the finest runs; the ardour of buyers however had been checked, partly by the increased demands of the factors, partly by the lateness of the season, and the high granary rent equal to 1s 6d per month per last, and partly by the pressure on the money market, and difficulty of procuring discounts, and consequently holding stock. On the arrival however of advices from London of the 4th inst., announcing the rapid rise in our wheat trade, several hundred lasts were purchased, and more would have been taken had not holders withdrawn their samples; real fine highmixed wheat of 1834, was sold at 39s to 41s, and real fine of 1835, obtained the same rates; the common runs of fine highmixed realizing 36s, real good mixed 34s, being a rise of three to five shillings per qr., and when it is considered that in addition to the stocks available, on the market there were orders transmitted for resale of parcels in Warehouse held for British account, it could not have been anticipated that their enhancement would have been to a greater extent. Granary rent and expenses had advanced to 2s per last per month. Rye had only risen to 17s 9d and 18s per qr. At all the ports, as they approach the lower districts of the Baltic, where later accounts of the excited state of the English markets have been received, they have more or less participated in the improvement. At *Stettin*, the limited extent of the stocks checked the transaction of business, but purchases of superior quality of Polish mixed Wheat had been made at 33s, and *Silesian* at 31s 6d, and prices in the Spring were expected to rule at about 33s to 34s, unless the quotations from England materially advanced. Barley for Spring shipment was held at 16s 6d to 18s. Light Oats at 12s 6d to 12s 9d. At *Rostock*, the stocks of fine old Wheat are nearly exhausted, and owners were holding firm at 33s to 34s 6d, and even 36s was named. Stained and damp Barley, not free from smell, has obtained 20s 3d for English account. No new Oats were offering, but boiling Peas were held at 25s 6d. In *Holstein* the prices have ad-

vanced about 3s per qr., old Wheat, or old and new mixed, being held at 33s to 34s, weighing about 62 lbs. New Wheats for Spring shipment were quoted at 32s; fine Barley, secured before the rain, was not to be obtained under 20s, and common runs at 18s to 18s 6d per qr. Fine old Oats, 17s; old and new mixed, 16s to 17s, new, 15s per qr. White Peas, 26s to 26s 6d. At *Hamburg*, the trade is participating in the excitement of the English markets, fine old Polish Wheat having realized 44s 6d; and fine old Upland, 41s; new Upland, 39s to 39s 8d per qr. Before the departure, however, of the letters, the mail of the 11th had come to hand, reporting an additional advance of 4s to 5s, especially in Bonded Corn; and though time was not allowed for actual sales to be reported, yet the pretensions of holders were considerably elevated, as we have heard of offers being sent here, for Spring delivery, for fine old Upland Wheat, at 50s. Malting Barley was held at 27s 3d for immediate delivery, and 25s 11d for Spring shipment, and extensive contracts made for distillers and grinding qualities, for future delivery at the out-ports, at 18s 6d to 22s; considerable contracts had been also entered into for Oats at 14s to 15s 10d, according to quality, and place of shipment, from the *Jahde* oats were selling at 16s 4d. In *Holland* wheat had advanced 6s to 7s per qr during the last ten days, old *Rhenish* being held at 42s 4d to 43s 2d per qr. Oats had advanced, and heavy quality of 45lbs had brought 22s 7d; 43lbs 19s 1d to 19s 4d; old feed, 17s 4d. The trade has remained firm at *New York*, and *Western* canal flour free sale at 43s 4d to 43s 10d per barrel. The demand for Southern flour from new wheat, was very limited, the quality being indifferent. Foreign wheats were realizing 71s 6d to 73s 4d per qr, and a fine parcel of German in good condition, was held at two dollars 12½ cents or 77s 11d, being the only large parcel left on hand on the 30th of Oct., the market being reported steady. At *Philadelphia* the transactions in flour were considerable and prices had advanced to 42s 9d per bbl, and the receipts small. Wheat also met demand at improving prices, which ranged according to quality, fine old, at from 73s 4d to 77s, and new 58s 8d to 64s 2d; Rye 45s 10d to 46s 2d. At *Baltimore* flour was firm at 42s 9d, but the business on a moderate scale, wheat varying as in quality from 45s 10d to 73s 4d. Cloverseed in America is meeting improved demand owing to the failure in the Southern States; at *New York* 6d per lb was being paid, and at *Philadelphia* 24s 9d to 28s 1d per bushel. At *New Orleans* flour remained at nine dollars 25 to 50 cents, but at these rates purchasers refrained from buying beyond their immediate wants. The account showing the increased receipts from the interior at this city, and extensive capabilities of exporting, are of much interest at this particular period, being more considerable than many would have anticipated, though no doubt the augmenting demands of Cuba, &c., require a large proportion of the surplus supplies. The following are the imports of flour during the last ten years. A diminution has however occurred since the year 1834, which, except the prolific year of 1831, exhibits the largest amounts of arrivals. The periods are calculated from the 30th of Sept, in each year.

**PRICE OF SEEDS, Nov. 28.**

The foreign advices generally report a firmness in the prices of red Cloverseed; at Hamburg a demand continuing for English account, and the stocks being limited, prices were on the advance; old red Upland was noted at 46s to 54s; new, 49s to 55s 6d; and white, 46s to 57s per cwt. The deficiency in the Dutch crop, and request for export of red seed are having the effect of elevating the prices in Holland; new Upland being noted at 54s to 58s, and 49s to 53s for old; new Lowland varies much in quality, at from 44s to 54s per cwt. white is more plentiful and brisk at 48s to 54s. Prices noted from France are for the most part higher; at Paris good new seed is held at 52s to 54s, old meeting with little inquiry; at Rouen, new Cloverseed was held at from 52s to 56s; at Angers, all the seed offering at the *Fair* had been bought for England, Nantes, Caen, Honfleur, and Havre. The tone, however, of our trade has not been improved last week by some sales effected, free on board, in France, by a French house now here, at prices below the prevailing value in our market.

The Clover-seed trade closed dull and barely last Monday's rates maintained. The arrivals of foreign comprised 227 bags from ROTTERDAM, 159 casks and 59 bags from HAMBURG, and 200 bags from ANTWERP. White seed unaltered in value, but little doing. Trefoil participates in the dulness of Cloverseed. Linseed steady in price. In Rapeseed no variation; Hempseed is held at the rates noted last week. Caraway was heavy sale and rather cheaper; it being difficult to obtain more than 50s Coriander meets rather more attention at from 11s to 13s. The new Canary continues to come to hand inferior and much out of condition and hangs on hand at 44s to 47s; old is held at 49s to 50s. Mustard unaltered in value. Tares dull at 5s to 5s 6d. Linseed cakes saleable at full prices. The foreign supplies have been—

57 tons and 62,192 cakes of Linseed Cakes from AMSTERDAM; 13,400 cakes from ROTTERDAM; CALAIS, 15,000 ditto; BREMEN, 47 ton of ditto.

**WOOL MARKETS.**

**BRITISH.**

The English Wool trade continues in a most perplexing condition, prices nominal according to the nerve of the holder; as nearly all the year's produce have changed hands from the grower to the dealer, as manufacturers have been too wise generally this season to be over-burthened in a retreat, as in the present re-action the staplers and dealers have half the year's produce on hand, and to offer any part of it at the present time is indeed useless at any price. A reduction of 1d to 2d per lb. has been submitted to in many cases for sorts which have been inquired after, for only in such cases could sales be made, as in the present state of the money market no manufacturer will purchase only just such sorts, and in such quantities as is absolutely necessary for immediate use; many holders however have determined not to submit to general reduction until the Spring, well knowing that there were no old stocks on hand of English Wool at the last clip, and the clip of the current year being short (in some of the dry districts nearly a third in quantity,) that a moderate steady consumption will take off the last clip ere another can come in operation; so that in all probability late prices will be again realized in a very few months. At such times as the present when money is scarce, and several failures taking place, there are always to be found necessitous and timid persons to accept any price that may be offered; in a few cases this has been done, and yet some may be found to do so, yet the quantity so available is not considerable. Upon the whole English Wool was bought too high this last summer for dealer or manufacturer to realise any remuneration, even before any reaction took place, and the agriculturist may congratulate himself in obtaining 3s or 4s per tod more for this wool than the dealer could make, in consequence of the competition at the Wool Fairs, an evil to the wool trade which will work its own cure, or ruin the dealer on whose shoulders the present burthen rest heavily. Kent Wool seems to suffer most depression, which may be accounted for by the failure a French house, and another at Canterbury, and which wool was probably the most unnecessarily advanced to os high a price,—prices may be quoted as follow :

	Per lb.	NOVEMBER 1.		DECEMBER 1.

**LIVERPOOL.**

WEEK ENDING NOVEMBER 26.

**SCOTCH WOOL.**—There has been considerable more inquiry for Laid Highland wool this week, and although the transactions have not been numerous, our quotations have been fully supported. In cross and Cheviot wool the transactions have been limited, and barely support our quotation.

	per stone of 24 lbs.	
Laid Highland Wool, from 12s 3d to 12s 9d		
White do. ....	15s 6d	16s 6d
Laid Crossed do. ....	15s 0d	16s 0d
Washed do. do. ....	16s 0d	17s 0d
Laid Cheviot do. ....	18s 0d	20s 0d
Washed do. do. ....	26s 0d	28s 0d
White do. do. ....	32s 0d	36s 0d
Import for the week.....	414 bags.	
Previously this year.....	20399 do.	

**ENGLISH AND IRISH WOOLS** continue in the same dull, inactive state as formerly. A small lot of Irish hog wool has been sold as 1s 5d per lb., which may be said to constitute the entire business of the week.

**ENGLISH WOOL.**—Down ewes and wethers, 18d to 19d; Down tegs, 20½d to 21½d; combing fleece, 18d to 19d; combing skin, 17d to 19d; super. skin, 18d to 19d; head skin, 16d to 18d per lb.

**IRISH WOOL.**—Irish fleeces, mixed lots, 16½d to 17½d; Irish wethers, 16d to 16½d; Irish hogs, 17½d to 18½d; Irish combing skin, 15d to 16d; Irish short skin,

14d to 16d per lb. Import this week, 20 bags; this year, 5,246 bags.

**FOREIGN Wool** has been rather brisker since Monday last; the inquiry has been principally confined to Peruvian for which holders have gladly accepted the offers which have been made. The imports of the week amount to 680 bags. The stock on hand of foreign wool in this market is at present large, and far exceeds the demand. Holders, to effect sales, seem inclined to entertain any offers which may be made.

**Current Prices.**—Russian wool, 8½d to 9½d; Odessa, fine, 2s to 3s 6d; Buenos Ayres, 4d to 5½d; Mogadore and Barbary, 4½d to 6d; washed Peruvian, 14d to 16d; unwashed ditto, 11d to 12d; Portugal R., 1s 5d to 1s 7d; ditto, low marks, 1s 0½d to 1s 2½d; German fleeces, 2s 2d to 2s 6d; ditto assorted, 2s 6d to 2s 9d; ditto lambs, 2s 6d to 3s 6d; Spanish R., 2s 6d to 2s 9d; ditto F.S., 2s 2d to 2s 4d; New South Wales, 2s 0s to 2s 9d per lb. Imports this week, 680; imports this year, 44,040.

Nov. 28.

Electoral Saxony wool, from 4s 6d to 5s 6d; first Austrian, Bohemian, and other German wools, 2s 8d to 3s 8d; second do., 2s 0d to 2s 6d; inferior do. in locks and pieces, 1s 6d to 2s 0d; do. lamb's do., 2s 6d to 3s; Hungarian sheep's do., 2s to 2s 6d; Leonesa sheep's do., 2s 6d to 3s 4d; Segovia do., 2s 0d to 3s; Soria do., 2s to 3s; Caceres do., 2s 6d to 3s; Spanish lamb's wool, 1s 6d to 2s 6d; German and Spanish cross do., 2s to 3s 2d; Portugal sheep's do., 1s 6d to 2s 6d; do. lamb's do., 1s 4d to 2s 4d; Australian, fine crossed do., 2s 4d to 3s 4d; do. native sheep's do., 1s 8d to 2s 6d; Van Diemen's Land native sheep's do., 1s 6d to 2s 8d; Cape of Good Hope do., 1s 6d to 3s.

**POTATOE MARKET.**

**WATERSIDE, —SOUTHWARK, Nov. 28.**—The supply of potatoes coatways during the week has been limited, chiefly from Guernsey and Jersey, whence about eight vessels have arrived and the consumption is now becoming dependent on Guernsey, Jersey and Devonshire; from the latter county the potatoes come very superior and take the lead of the market. From Scotland during the season not more than eight cargoes have been received, and in consequence of the wet succeeded with frost, the article proves very inferior, so much so, that even the few parcels offering are heavy sale at declining prices. The very small portion of the crop in Scotland which was lifted before the inclement weather set in, proves of good quality, and is bearing higher proportionate rate; than are being paid in London. Notwithstanding the short supply, the sales continue heavy, which is to be attributed partly to the mildness of the weather checking consumption, and in part to the advancing tendency of the quotations, which induce dealers to refrain from purchasing in anticipation of increased arrivals. No Irish at market; subjoined are the prices paid this morning.

**THE BONE MARKET.**

LONDON, Nov. 26.

There has been a steady demand all the week for rough bones, and prices remain firm at 54s to 56s per chaldron.

In Hull no alteration to quote.

In the principal ports on the continent no change has taken place since last advices.

**BONES.**

Since our last there have passed the SOUND or ELSINORE, the GREAT BELT, and the HOLSTEIN CANAL, ships loaded with Bones, bound for Hull, 2; other parts of England, 1. For Aberdeen, 2; Newburgh, 1; other parts of Scotland, 2.

## TURF INTELLIGENCE.

The racing season closed (the Newmarket Houghton Meeting) under the frigid influence of a stern commencement of winter, attended by the unusual circumstance of a heavy fall of snow, which, our readers are very well aware, took place on the close of the month of October; in consequence, the amusement became very much neutralized, and much vexatious disappointment was experienced in consequence of the untoward and highly inauspicious state of the weather. Nothing occurred at the Houghton Meeting which demands particular notice, if we except, perhaps, the contest between Bay Middleton and Elis, which ended in the defeat of the latter; thus verifying our prediction. These nags had met in the previous Spring at the same place (Newmarket), where, after a struggle of extraordinary severity, Bay Middleton proved the winner by a head. The speed of these two superior nags was as nearly equal as possible; but their treatment during the Summer was widely different. Bay Middleton, after his success on Epson Downs for the Derby, which he won with the greatest ease, was carefully nursed and reserved for the close of the season; while Elis was subjected to a course of exertion, during that period, unusually severe, particularly on account of the extra weight placed on his back. How far it was wise in Lord Lichfield to force so good and so highly promising a colt through so much and such severe exertion, is a question which most concerns his lordship; but it can scarcely fail to produce the worst effects upon his system, and render his future running very problematical. Elis might be said to be made up earlier than usual, which circumstance, added to his conformation (being deep ribbed), enabled him to sustain or go through more work than ought to fall to the lot of any three-year-old. His future progress will be interesting, and we shall not fail to watch it. His successful opponent (Bay Middleton) is a splendid animal, but not so much made up as Elis, and therefore Lord Jersey evinced good judgment in not subjecting him to unreasonable exertion.

The Subscription Rooms at Tattersall's was but slenderly attended during the month of

November, nor has any very great or decisive alteration taken place in the odds since our last publication: however, it may be remarked, that Defender has crept up, and stands at precisely the same figure as Brother to Bay Middleton and Jereed; so that the list presents the extraordinary appearance of three equal favourites for the Derby. Flare-up is rising in public favour, and a similar remark may be applied to Wintonian. We scarcely heard the Oaks mentioned throughout the month.

On Monday, Nov. 21, Flare-up was in request, and something was adventured upon him at  $8\frac{1}{2}$  against him; so far he might then be said to have the call.

We last month received an account of Nottingham races from an eye witness and an inhabitant of the town, containing some remarks on the conduct of the judge, in his decision for the King's Hundred, which was given to Mundig, erroneously so, according to the statement of our correspondent; in justice to all parties, we insert the following letter:—

## THE LATE NOTTINGHAM RACES.

TO THE EDITOR OF THE MARK-LANE EXPRESS.

Sir,—Noticing in your valuable and extensively-circulated paper of the 31st of October last, a report and some remarks as to the race at Nottingham, for his Majesty's Plate of one hundred guineas, between Mundig, Sylvan, and Goldbeater, one of the finest contested exertions of animal power and speed between the two former horses ever witnessed, and of fairness of decision of the judge, Mr. Pyatt, that man could give, in justice to whose honourable conduct, I feel pleasure in communicating to you, that not a gentleman of respectability who had bet on the race, and who heard in whose favour it was given, had the least doubt of any unfairness of decision on the part or the judge of such race; and that every gentleman most honourably paid his losings, without the least scruple or doubt; thereby proving that they were perfectly

satisfied that Mundig had fairly won, and that the decision was honourable to the judgment of Mr. Pyatt, who never bets a shilling on the result of any race whatever; so that it cannot possibly be said of him, that he had any sinister view in giving other than a correct decision.

With regard to your correspondent, Mr. William North, of Nottingham, sub-reporter or collector of news for *The Nottingham Review*—besides being an excellent judge of a race—he has ventured to impugn the character of the judge, and to cast a most unnecessary and undeserving odium upon him, without even the slightest cause whatever. It is a maxim with you, I am happy to observe, "*audi alteram partem*," (to hear both sides), and therefore, through the medium of your valuable publication, I feel it a duty to bear honourable testimony to the character of Mr. Pyatt on this as on all other occasions. From the position in which Mr. William North stood during the race, amidst an anxious crowd of spectators, shouting, moving and restless, I defy him to say which horse absolutely won the race. I defy him, too, to impugn the character of the judge on that or any other occasion or transaction in life! and as little as that worthy and officious gentleman could do, would he be to apologize to Mr. Pyatt, and the public for the erroneous and wilful mis-statement he has been pleased to make on this occasion.

I remain, Sir, your most obedient servant,

AN OLD SPORTSMAN.

Nottingham, Nov. 10, 1836.

Guided by even-handed justice, we insert the following letter of Mr. Osbaldeston, and also the decision of the Jockey Club on the disputed event. Those unacquainted with the circumstance to which the following communications allude, we refer to our preceding number.

#### THE DISPUTE AT THE LATE YORK OCTOBER MEETING.

TO THE EDITOR OF THE YORK HERALD,

SIR.—Various reports having been circulated to my prejudice, relative to the Ladies' Tea Service, run for last week at York, I have to request the insertion of the following facts in your journal:—First, with regard to the charge of my riding against Captain Williams. In entering on my defence, I beg leave to disclaim any intention of impugning the decision of the Stewards, but as they decided on the evidence Capt. Williams submitted to them, without giving me an opportunity of producing mine, it is necessary I should trouble you with my statement.

In all cases of crossing or jostling, the jockies are invariably examined, and their evidence is generally conclusive. The four jockies nearest Capt. Williams when he fell, were Mr. Kent, Mr. Sirdefield, Mr. Robinson, and Mr. Whitworth, all of whom can prove that I was not near Zebetta when she fell, necessarily it is impossible I could be the cause of her falling. As I was next to Algiers (at the time of the accident) who was leading, I can only state Mr. Kent's and Mr. Sirdefield's account of the collision. Mr. Kent says—at the turn, Capt. Williams and he both ran for an opening, which Mr. Kent obtained inside, directly behind my horse, Zebetta being on his right, who ran into the heels of Mr. Sirdefield's horse, and fell outside of all. Mr. Sirdefield

thought that Zebetta clipped up, but be that as it may, all the four riders agree that I had nothing to do with Capt. Williams's fall. Capt Williams charged Mr. Sirdefield at the distance post with throwing him down, within the hearing of several gentlemen who can prove it.

Another most groundless and malignant report was in circulation, viz. that Patriot and Whitefoot both belonged to me, and that I ran against Zebetta, on purpose that Whitefoot should win. Mr. Dawson can prove whether I ever asked him the price of Patriot; and those persons who entertain such an erroneous opinion as my running against Zebetta on purpose, had better try the experiment among themselves, or endeavour to persuade the jockies to do so. Mr. Robinson was commissioned by me to back Zebetta and Patriot, which he did; and he can state I told him I thought Zebetta could not lose. I never backed Whitefoot for a shilling; and I had to pay Mr. Robinson for my losses on Zebetta.

It is also necessary to state why I rode Patriot and not Whitefoot. At Heaton Park I promised Mr. Dawson to ride for him at York, and I wrote to say that I did not think I should run Whitefoot at all. When I reached York, I agreed to ride Patriot for him, not intending to run Whitefoot.

On Monday night previous to the races, I told Mr. Kent and a party of friends I should not run, but they prevailed upon me to do so. I then said to Mr. Kent "You must ride him, as I have promised to ride for Dawson, but I would rather ride my own, as Dawson might think I would not try to beat Whitefoot." I named this to Dawson, and he said he had no such idea; but I told him the public might if Whitefoot won. He said if Mr. Kent would ride Patriot he would give me up; but Mr. Kent could not ride the weight, so I was obliged to ride Patriot. I mentioned this arrangement to Mr. William Scott, and my objections to riding Patriot; but he said as Mr. Kent could not ride the weight, he thought I was bound to ride for Mr. Dawson.

I am, your obedient servant,

GEORGE OSBALDESTON.

Ebberston Lodge, Oct. 27.

#### DECISION OF THE STEWARDS OF THE JOCKEY CLUB, ON THE RACE FOR THE LADIES' TEA SERVICE, AT YORK.—IN FAVOUR OF WHITEFOOT.

WE are of opinion that the Judge, upon finding that he could not see to judge the race from his Chair, ought to have made a representation to that effect to the Stewards, provided there was still time for him to do so; but as there appears to be no grounds for doubting that his final judgment was correct, and no suspicion attached of any intentional misconduct on his part, and as we think that if the Stewards had been appealed to, they must have sanctioned the course which was adopted by the Judge, we are of opinion that the decision ought to stand good.

(Signed)

## NOTICE.

---

The unavoidable absence from Town of the Editor of THE FARMER'S MAGAZINE, upon urgent business, has prevented him from completing the further Practical Directions on the TITHE COMMUTATION ACT, which he proposed to give in the present Number. They are, however, nearly ready, and will positively appear in the Number for November.

The COMMON FIELDS INCLOSURE ACT would not be complete without the two preceding Acts upon the same subject, which are "made part of this Act." These Acts will be given in the next Number of THE FARMER'S MAGAZINE, and will be accompanied with Index and Notes explanatory of the present state of the Law on the subject of Inclosures.

## ADVERTISEMENT.

---

As the recent Statute for **FACILITATING THE INCLOSURE OF ARABLE FIELDS, &c.** (the **6 & 7 W. IV.**, c. 115,) does not embrace the whole of the law upon this subject, it has been deemed best, for the purpose of ready reference, to add the three other Statutes, wherein the law will be found; and which, together, may be said to embrace all that is requisite to enable persons about to engage in inclosing any open fields, to inform themselves upon the necessary mode of procedure.

## ANALYSIS OF THE NEW INCLOSURE ACT.

This act, the 6 and 7 Will. 4, c. 115, is intitled "An act for facilitating the inclosure of open and arable fields in England and Wales." Its object is to authorize the inclosure of commons with the consent of a majority of the proprietors of rights of common, and without the trouble and expense of an act of parliament. The consent inclosures that it contemplates are of two kinds—inclosures with the assistance of commissioners, and inclosures without the assistance of commissioners. But the greater part of its provisions relate to the former kind of inclosures.

### 1. INCLOSURES CONDUCTED BY COMMISSIONERS.

*Preliminary Proceedings.*—A public meeting of the proprietors and parties interested is to be called, for the purpose of taking the proposed inclosure into consideration, by a notice signed by three proprietors, and affixed to the door of the parish church, and advertised in a newspaper of the county, fourteen days previous to the meeting.—s. 1.

*The parties whose consent is necessary, and the manner in which it is to be given.*—Two-thirds in number and value of the proprietors of rights of common, or other rights in the lands to be inclosed, must give their consent to the inclosure.—s. 1. The value is to be ascertained by the assessments of the poor-rates for the current year, if made according to the full annual value, but if not, or if the lands are extra-parochial, then according to the full annual value of the lands and rights to be affected by the inclosure.

The estates and interests in the rights over the common, which enable parties to consent to inclosures, are, an estate in fee-simple or fee-tail, or for life or lives, or by curtesy, or any other freehold, or for years determinable on a life or lives, or for a term of years whereof one hundred years are unexpired, or any analagous copyhold estate or interest.—s. 2. But the consent of a person having a less estate than a fee-simple or fee-tail is not good to make up the two-thirds, without the additional consent of the person entitled to the next vested estate in remainder or reversion, whether legal or equitable.—s. 2. And the consent of the incumbent, in respect of land held in right of a benefice is not good to make up the two-thirds, without the consent of the patron and ordinary. In the case of a crown living of above 20*l* a year, in the king's books, the consent of the first lord of the treasury, and in that of a

crown living under 20*l* a year, the consent of the lord chancellor, is requisite.—s. 2.

The consent of persons under a disability, as infants, idiots, lunatics, and femes covertes, may be given by their respective guardians, trustees, committees, and husbands—ss. 1 & 2.

The parties are to give their consent in writing under their hands; and persons may be consenting parties, who were not present at the meeting.—s. 1.

*Appointment of the Commissioners.*—After the necessary consents are obtained, the majority of the proprietors or their agents, are, at a meeting to be called for the purpose, to appoint one or more commissioners.—s. 3.

In case of death, resignation, &c., new commissioners are to be appointed by a majority of the proprietors, or their agents, at a public meeting called in like manner as the preliminary meeting. But, if no appointment of a new commissioner be made in this manner within two months, then a new commissioner may be appointed within another month by the remaining commissioner, by writing under his hand.—s. 3.

*Qualification oath, and payment of Commissioners.*—They must be persons who are not interested in the inclosure.—s. 3. The commissioners, umpire, and surveyors, are to take an oath in the form prescribed in the 6th section. The commissioners are to be paid three guineas a day, or by a gross sum by agreement with the proprietors.—s. 10.

*Powers and duties of Commissioners.*—They may appoint a clerk.—s. 4. Where there are two commissioners, they are to appoint an umpire, to decide in matters upon which there shall be a difference of opinion between them.—s. 5. They are to appoint the time and place of their attendance, and of meetings, and give notice thereof in the manner prescribed—ss. 7 & 8.; and, if necessary, adjourn meetings.—s. 7.

The commissioners are authorized to determine disputes between the parties concerning the rights or interests which they may respectively claim in the lands to be inclosed, or concerning any other matter relating to the inclosure; but not to determine the title to any estat

any right between the parties contrary to the possession, except in cases of encroachments made within twenty years previous.—s. 19. But they may determine disputes respecting encroachments within

twenty years—s. 20, and may ascertain and adjust the respective rights of the proprietors over the common in such manner as they shall think just and expedient, subject to the regulations of the act—s. 26. They are empowered to award costs against a party whose claim or objection is disallowed, and, upon refusal to pay them, to warrant the levying of such costs by distresses—s. 16.

*Proceedings in the Inclosure*—Four-fifths in numbers and value of the proprietors may agree upon the adoption of any previous plan, map, admeasurement, or valuation—s. 11, and upon the rules for the guidance of the commissioners or umpire—s. 12. But any proprietor may appeal against such agreements to the next quarter sessions, or, if they shall be held within one month after the agreement to the next following sessions, on giving notice to the commissioners of his intention to appeal, seven days previous to the sessions. And, if the decision be in favour of the appellant, any party may withdraw his consent, by giving notice in writing to the commissioners within twenty-one days after the decision: and, if the number of consenting parties be thereby reduced to less than the requisite two-thirds, the agreement for inclosure shall be at an end—s. 13.

Any of the parties may object to the account or claim of any other party, by a writing of which two parts are to be signed by the party objecting, and one of them to be served upon the other party or his agent—s. 14.

If a party be dissatisfied with any determination of the commissioners, the party dissatisfied may give notice thereof in writing to the commissioners and to the party in whose favour such determination was made, within thirty days after the determination shall have been notified to the parties interested, and, upon such notice in writing being given, bring an action upon a feigned issue against the person in whose favour the determination was made, at the then first or second assizes for the county: and the verdict in such action shall be final and conclusive upon the parties and the commissioners. But, if no such notice be given, or action brought or prosecuted, within the time limited, the determination of the commissioners shall be binding and conclusive—s. 17. Such actions are not to abate, or to be prevented from being brought by the death of the parties originally interested—ss. 17, 18.

No such difference, suit, or proceeding, nor any dispute respecting the title to any lands, is to impede or delay the commissioners in carrying on the inclosure—s. 17.

Land cultivated as an orchard or garden, or on which any building has been erected, or which has been inclosed by agreement with the commoners, is not to be allotted to any other person than the actual proprietor, without his consent in writing—s. 23.

Compensation is to be made to the owner or tenant of land to be allotted, by the allottee, in compliance with the commissioners' order in writing for growing crops, and the tillage and manuring of

lands, and the loss of any following or way-going crop; and, if such compensation be not duly paid, the commissioners may issue their warrant for levying the same by distress upon the goods of the person making default—s. 25.

The commissioners, immediately after their appointment are, by a writing under their hands affixed to the door of the church, or other conspicuous place, to publish orders respecting the course of husbandry to be pursued in the lands to be inclosed, and for preventing waste and destruction therein, and are empowered to enforce such orders by inflicting a penalty upon the offending party not exceeding 5l an acre—s. 24.

The commissioners are to allot the common lands unto and amongst the proprietors in proportion to their several rights, and the true value thereof, and in lieu and satisfaction of such rights—s. 26.

At the desire of several proprietors, the commissioners may set out their allotments together in one plot, distinguishing their several portions by metes and bounds, but not requiring them to make any subdivision fences—s. 27.

The commissioners are empowered to ascertain and set out the boundaries between the lands to be inclosed and adjoining lands—s. 28; and also to set out the rights of herbage in the private roads through the inclosure to such persons as they shall think best—s. 29.

Where one allottee has too great and another too small a proportion of boundary fences allotted to them, the commissioners shall direct a compensation to be paid by the latter to the former, in order to apportion the expense rateably—s. 32.

The commissioners are to avoid leases at rack rent of the lands to be allotted, so as satisfaction be made to the tenant by the landlords; and are empowered, with that view, to apportion the rent payable under such leases, either with respect to the time elapsed since the last rent-day, or in proportion to the part of the land as to which the lease is determined—s. 34.

The commissioners are empowered to improve the ditches, drains, watercourses, &c., or make new ones (the expenses to be raised and defrayed as part of the expenses of executing the act,) and to order by whom they shall be in future maintained, and to divert any streams or watercourses within the allotments—s. 38, and, if necessary to carry the drains through land not comprised in the inclosure, compensation being made for damage done to such land—s. 39.

The commissioners are to make and execute awards, with map annexed, which are to be deposited in the parish church—s. 51. The award is also to be enrolled, as required by the 41 Geo. 3., c. 109—s. 51, and the provisions of that act generally, and of the 1 and 2 Geo. 4. c. 23, where applicable, are adopted for effecting the purposes of the consent inclosure under the present act—s. 52.

*Allotments in respect of Church Property.*)—Rectors and vicars are empowered, with the consent of

the patron and ordinary, to erect buildings and make fences upon the allotments in right of their benefices (which buildings are to be insured in a London fire office,) and by deed or writing under their hand, attested by two witnesses, and with the consent of the bishop of the diocese, to charge their allotments, and the buildings erected thereon, with such sum of money, not exceeding two years' value of the allotments, as the commissioners shall think necessary for defraying the expenses of such building and fences, and of carrying this present provision into effect; and to raise such money by a mortgage for years of their allotments; and are required to pay off every year one-thirtieth part of the money so borrowed, and keep down the interest of the loan; and the persons lending the money are to have powers of distress and entry upon the premises for the recovery of the principal and interest—s. 30. Rectors and vicars are also empowered, with the consent of the bishop and patron, to lease their allotments for twenty-one years—s. 31.

*Exchanges, and communication of title.*—The act gives the commissioners ample powers for effecting exchanges of lands within the parish where the inclosure is made, for other lands in that or adjoining parish—s. 35., and defraying the expenses of such exchanges—s. 37, and contains clauses worded in the most comprehensive manner for communicating to the allotments and the lands taken in exchange the title—s. 33, and the tenure—s. 36, of the lands in respect of which such allotments and exchanges shall have been made.

*Sale before the award.*—The 45th section enables the allottee to mortgage, sell, demise, or dispose of his allotments before the execution of the award, and authorizes the commissioners to allot them to the purchaser; and declares, that, if not so allotted, the conveyance shall be valid and effectual *in law*, though made before the execution of the award. This clause, therefore, enables the allottee to transfer the legal estate in the allotment, by any kind of disposition, before the award.

*Expenses of the Inclosure.*—The general act of the 11 Geo. 3, enables tenants for life and other persons in possession, but not having the absolute interest to charge their allotments with the expenses of the inclosure to the amount of 5*l* per acre. The present act empowers the commissioners, at the request of such parties, to sell part of their allotments for the purpose of defraying the expenses, though part of the allotments are in one parish and part in another—s. 47; and to convey the part so sold to the purchaser in fee-simple—s. 46. But no sum shall be raised by sale, or partly by sale and partly by a charge under the 11 Geo. 3, exceeding the amount of 5*l* an acre in the allotments, the expenses whereof are thus sought to be defrayed—ss. 47, 46.

The expenses of the inclosure are to be paid by the proprietors in such proportions and at such times as the commissioners shall order, giving thirty days notice before the time of payment—s. 49. Persons whose respective allotments shall not exceed two

acres, and shall have been thrown together, are not to be liable to any part of the expenses. And four-fifths in number and value of the proprietors may agree at a general meeting that persons whose allotments shall not exceed five acres each, shall be exempt from any part of the expenses—s. 49.

*Commissioners' accounts.*—The accounts of the commissioners are to be annually laid before three justices of the peace for the county, to be examined and allowed by them; and the commissioners shall not retain out of monies received by them more than one third of the allowance to themselves or their clerk, till after six months from the delivery of the award—s. 50.

*Appeal.*—Parties aggrieved by any thing done under this act may appeal to the quarter sessions—s. 53.

*Lands that may be inclosed.*—Any open and common arable fields (including any untilled slips or balks therein), or any common meadow or pasture lands known by metes and bounds or occupied according to known and legal rights—s. 1, and lying in the parish where the inclosure is carried on, or in any adjoining parish within two miles—s. 3, may be inclosed. Encroachments within twenty years are to be included in the inclosure—s. 20, unless they have been taken or used for the site of a school-house, or for other charitable purpose—s. 21. But lands inclosed from the common for more than twenty years are to be deemed old inclosures—s. 22.

With a laudable care for the health and recreation of the inhabitants of densely peopled towns, it is provided that the act shall not authorize the inclosure of any commons within ten miles of London, or within one mile of any city or town of 5,000 inhabitants, or within one mile and a half of any city or town of 15,000 inhabitants, or within two miles of any city or town of 30,000 inhabitants, or within two miles and a half of any city or town of 70,000 inhabitants, or within three miles of any city or town of 100,000 inhabitants: the population, in each case, to be ascertained by the last parliamentary census, and the distance to be measured from the town-hall, or the cathedral, or the market-place of the town—s. 55.

## II. INCLOSURES WITHOUT THE INTERVENTION OF COMMISSIONERS.

Seven-eighths in number or value of the persons interested in the common, having such estates and interests as are required for the purpose of consenting to the other kind of inclosure, may, by themselves or their agents, or if under a disability, by their husbands, guardians, or committees, at a public meeting to be called for that purpose in the same manner as the preliminary meeting for the other inclosures, enter into an agreement for the inclosure of the common under the provisions of this act, but without the intervention of commissioners—s. 40.

A schedule of the land intended to be inclosed, containing a correct description thereof, and signed by the persons proposing and consenting to such inclosure, and, where any of the parties have a less estate than a fee-simple, then accompanied by a copy

of the settlement under which they are entitled, is to be deposited with the clerk of the parish and clerk of the peace of the county ; and a notice of the intended inclosure and of the schedule having been so deposited, is to be advertised in the county newspaper at three times in three successive months, and affixed on the church door, or in some conspicuous place for three successive Sundays after the schedule shall have been so deposited—s. 41.

Compensation is to be given for rights of common to all persons, whether consenting parties to the inclosure or not, who are possessed of such rights, and shall sign the schedule—s. 40. The compensation may be given in money or otherwise : and any person in possession of land in respect of which compensation is to be given, or having rights of common whether as tenants in fee-simple or fee-tail, or for life or lives, or any freehold estate, or for years determinable on lives, or having a personal right merely, may give their consent to the nature,

amount, and manner of the compensation—s. 42: the consent of parties under a disability or having a limited interest only, to be given in the same manner as with respect to the first kind of inclosures—s. 42.

Persons objecting to such inclosures may state their objections in writing, and deposit them with the clerk of the peace, within six months after the last notice of the deposit of the schedule—s. 43. And the objections shall be heard and determined by the justices at quarter sessions—s. 44.

Subject to such right of appeal, the inclosure, immediately after the expiration of the notices of the deposit of the schedule, is to be as valid and effectual in all respects as if it had been effected by means of commissioners—s. 40.

The 33rd section of the act communicates to lands assigned as a compensation under these inclosures, the title of the lands in respect of which such assignments shall be made.

E.

7

## ON DEFECTS IN TITLES UNDER INCLOSURE ACTS, AND THEIR PARTIAL REMEDY OR PREVENTION BY RECENT STATUTES.

The numerous and complicated difficulties that beset the deduction of titles to land allotted under commissions of inclosure, have originated in the first instance from certain material omissions in the general inclosure act of the 41 Geo. 3; but are attributable, in a still greater degree, to the partial and diversified manner in which the local acts of inclosure have attempted to remedy and supply those omissions. So that, besides the evils flowing from the original imperfections of the statute of Geo. 3, and arising inevitably, in such a proceeding as an inclosure, from the complexity of the interests and rights which it must affect, the titles derived under each inclosure take a new and particular colour from the manner in which the local act has been framed, and the comparative care or remissness with which it has happened to be drawn. And, instead of the judicial interpretations of a single statute, which might have gradually expanded and adapted its provisions to the exigencies of the case, or suggested from time to time the requisite legislative amendments, we are hampered with the inconsistent and defective clauses, and the doubtful construction of as many acts of parliament as there have been inclosures, which are stated to amount to as many as five thousand.

To illustrate this by an example:—The 7th section of the general act simply provides that the commissioners shall make the allotments “unto the person or persons who at the time of the inclosure shall have the actual seisin or possession of the lands in lieu or in right whereof such allotments shall be made,” without any provision respecting the title or quality of estate which the allotment shall assume. And it seems to have been contemplated, that, whatever were the nature of the interest which the allottee himself possessed, the allotment would enure according to the actual title of the land in respect of which it was made.

But it has been considered in practice, that, if the allotment be made to a person having a particular interest only, the legal estate in fee would vest in him: in trust, nevertheless, for the person or persons entitled to the reversion, according to their several and successive estates in the original land.

For the purpose of avoiding this inconvenience, most of the local acts contain a clause communicating to the allotments the title of the lands in respect of which they are allotted; and the effect of this clause, to whomsoever the allotment is made, is, to carry the legal estate according to the actual limitations of the original estate. Thus, where copyholds were granted for lives, an award making an allotment to one of the persons entitled for life, though not then in possession, gave the legal estate therein to the several persons entitled in succession to the copyhold tenement.—*Doe v. Hellard*, 4 M. & R. 736, 9 B. and C. 789.

This clause is worded in a very different manner, sometimes more and sometimes less comprehensively, in different acts. So that cases may frequently occur which the provisions of some acts are calculated to embrace, while those of others do not apply to them. In the case of *Doe d. Loues v. Davidson*, 2 M. and S. 175, the inclosure act contained a proviso, that the allotments should be held by the allottees to the same uses and for the same estates as the original lands. But it was nevertheless

held, that allotments to copyholders in respect of their copyhold tenements were of freehold and not copyhold tenure. And the same decision was made in the case of *Townley v. Gibson*, 2 T. R. 701, though there was a clause in the act providing that the inclosure should not “defeat the lord’s seignories incident to the manor.” In more modern acts, indeed, it is usually provided that allotments in respect of copyholds, shall be of copyhold tenure. But, where this provision is omitted, which not unfrequently happens, this strange anomaly and confusion results—that the allotments in respect of copyhold lands are freehold, yet subject to the seignorial rights of the lord of the manor, and to the uses and trusts of the old copyhold title.

Even where the clause in the local act, communicating the title of the original lands to the allotments in respect of them, is expressed in the most ample terms, it can of course only have the effect of clothing the allotments with the uses subsisting at the time, and not with any that shall arise under future conveyances. But it frequently happens, that, in conveyances made afterwards, and particularly in assignments of terms, the old description of the estate is retained, without any allusion to the new allotments. And therefore it may be doubtful whether they are comprised in such conveyances and assignments. And, though the ancient rights of common might well pass under the name of “appurtenances” to the land; yet it will be at least disputable whether the allotments are comprehended in that term, since land cannot be appurtenant to land; and, even in a will, a clear intention must be shown to extend the word “appurtenances” beyond its strict technical sense.”

But, if there are some difficulties which the clause in question fails of obviating, there are others that are even aggravated by the very potency of its operation. By the 6th section of the general act, it is required that all persons claiming rights of common in the lands to be inclosed, shall, previously to the inclosure, send in a written claim, particularizing such rights, and the lands in respect of which they claim, and “for what estates and interests they claim the same respectively, distinguishing the freehold from the copyhold or leasehold.” The statute goes on to say, that, in case of non-compliance with these requisitions, the party “shall be totally barred and excluded of and from all right and title in or upon such lands so to be divided, and of and from all benefit and advantage in or to any share or allotment thereof.” It would therefore seem, that, if the claimant omit thus to distinguish the titles and tenures of the lands in respect of which the claim is made, and an allotment be consequently made in respect of two or more estates held under different titles, there is ground for contending that the allotment is invalid. But, however this may be, the practice which is very frequent of making allotments to a proprietor without distinguishing the property in respect of which they are made, is productive of the utmost confusion and complication of titles. The estate in respect of which the allotments are made, may be composed of several portions, part freehold, part copyhold, and part leasehold, and derived under several titles: and, since it is not distinguishable which part is allotted in respect of which, the whole of the allotments will be subject to all those titles; and it will be impossible to show, to the satisfaction of a purchaser, of what tenure any particular part of the allotted land is, whether freehold, copyhold, or leasehold.

Similar difficulties arise with respect to exchanges of land under inclosure acts. Where the act does

not contain a clause communicating a reciprocity of title to the lands given and taken in exchange, it is at least questionable, whether, as between vendor and purchaser, both estates are not subject to both titles; and, since the general act contains no express provision on the subject, it seems to depend upon the manner in which the local act is worded, whether freeholds can be exchanged for copyholds; and, if they can, whether the freeholds become copyholds, and the copyholds are converted into freeholds. And it was not decided until very lately, that the commissioners may award land in exchange partly for other land and partly for money—*Doe d. Lord Suffield v. Preston*, 7 B. & C. 392, 1 M. and R. 713. But the exchange clause does not authorize the commissioners to make an allotment to a proprietor for his rights of common and an old inclosure to be given up and allotted in exchange: and therefore the title to an allotment made in such a manner would be defective—*Wingfield v. Tharp*, 10 B. and C. 785.

Under the provisions of the 35th section of the general act, the legal title to an allotment is not acquired until the execution and proclamation of the commissioners' award. And, even where the local act authorized the allottees to sell and convey their interests before the award, and the commissioners to allot to the purchasers, it was held that these provisions did not sufficiently countervail those of the general act, to vest the legal freehold in the allottee before the execution of the award—*Farrer v. Billing*, 2 B. & Ald. 171. The award, however, has such a relation back to the date of the act as to give effect to a conveyance of the land made between the passing of the act and the award—*Doe d. Dixon, v. Willis*, 3 M. and P. 24, 5 Bing. 441. But, if the act does not authorize a sale before the award, the allottee has not, until the award be made, a title which a purchaser can be compelled to take.

It is also extremely doubtful, in general, whether the allottee can devise his allotment by a will made between the passing of the act and the award; and it must always be a question, in the particular case, whether the local act is worded in a manner ample enough to give effect to such a disposition. It is evident that the clause communicating the original title to the allotments cannot help us here; as that applies only to wills subsisting and in force at the time of the passing of the act, and not to any future dispositions. Yet, independently of the aid which, in cases arising under modern inclosures, may be derivable from the clause now commonly inserted, enabling the allottee to charge or dispose of his allotment previously to the award, there seems to be ground for contending that the same relation of the award back to the time of the passing of the act, which effectuates a conveyance, would also give validity to a will made in the interval, if the will contain expressions applicable to the new acquisition. Or, if the doctrine of relation should not be thought applicable to the case, it might, we think, be maintained, that a devise of the equitable interest, which it is admitted the allottee has before the execution of the award (see *Cane v. Baldwin*, 1 Stark. 65), would not be revoked in equity by the mere accession of the legal estate under the award, as, from the nature of the case, it must be acquired in a shape exactly analogous to the previous equitable interest. But these are points which are still undecided, and therefore leave a title to allotted land, which depends upon a will thus circumstanced, liable in many cases to the doubts that they involve.

The general act requires that the award shall be enrolled within twelve months after the execution; and the strict observance of this formality is necessary to the validity of the award. It has, however, been decided, in the case of *Casamajor v. Storde*, 5 Sim. 57, 2 M. and K. 706, that the general inclosure act, so far as it enacts that the commissioners' oath, and the appointment of a new commissioner, shall be annexed to and enrolled with the award, is merely directory, and an omission in those particulars does not render the award void, or affect the title to the allotment.

There are also several other points, especially in reference to allotments in lieu of tithes, that, opening a door to mistake and controversy, have cast doubt and difficulty upon many titles. But our limits forbid us from entering at present into the consideration of them, and we must hasten to inquire what has been done by the legislature in the way of alleviating these evils.

By the 1 & 2 Geo. 4, c. 23, the owners of allotments are enabled to distrain for rent and to maintain an action of trespass or ejectment in respect of their allotments, before they have acquired the legal seisin by the execution of the award. And the 3 & 4 Will. 4, c. 87, supplies retrospectively the enrolment of awards which had not been enrolled, or which had not been enrolled within the time limited; and enables parties concerned to enrol such awards, notwithstanding that any commissioner shall be dead or incapable of acknowledging his award; and provides for the appointment of new commissioners in cases where it has been neglected or omitted to be made within the time limited by any previous act of inclosure.

The relief afforded by these acts is, it must be confessed, scanty enough. But the Legislature may have been justified in supplying omissions in mere matters of form, though not in repairing the consequences of a departure from its substantial requisitions and intentions; and to devise, if it were possible, a retrospective remedy for defects that had become interwoven with the very title and tenure of estates, would, perhaps, at the best, be only making "confusion worse confounded." Prevention for the future may in such a case be a more politic course, than cure for the past. And accordingly, we find, that, in the last session, an act, 6 & 7 Will. 4, c. 115, was passed, enabling inclosures of commons to be made by the mutual consent of the proprietors without the expense of an act of parliament. It authorizes such inclosures to be made with the consent of two thirds in number and value of the persons having rights of common, by commissioners appointed by the parties. It contains ample provisions for the management of such inclosures, and, as far as matters of title are concerned, clauses worded in the most comprehensive manner, for ascertaining the interests in respect of which the allotments shall be made; for authorizing exchanges of copyhold for freehold, and vice versa; for communicating to the lands allotted and exchanged the title and tenure of the original lands; and for disposing of the allotments before the execution of the award. It leaves the general inclosure acts of the 41 Geo. 3, and 1 & 2 Geo. 4, in full force as to inclosures under acts of parliament, and adopts and incorporates their provisions whenever they are available towards effecting these consent inclosures.—*The Jurist*.

# AN ACT

FOR

## FACILITATING THE INCLOSURE OF ARABLE FIELDS IN ENGLAND AND WALES.

6 & 7 WILL. IV.

[20th August, 1836.]

41. G. III. c. 109.—1 G. IV. c. 23.—*Open and Common Lands may be inclosed with the consent of Two Third parts in Number and Value of the Parties interested therein.*

I. Whereas there are in many parishes, townships, and places in *England* and *Wales* divers open and common arable, meadow, and pasture lands and fields, and the lands of the several proprietors of the same are frequently very much intermixed and dispersed, and it would tend to the improved cultivation and occupation of all the aforesaid lands within such parishes, townships, and places, and be otherwise advantageous to the proprietors thereof, and persons interested therein, if they were enabled by a general law to divide and inclose the same: And whereas an Act was passed in the forty-first year of the reign of his late Majesty King *George* the Third, intituled *An Act for consolidating in one Act certain provisions usually inserted in Acts of Inclosure, and for facilitating the mode of proving the several facts usually required on the passing of such Acts*: And whereas another Act was passed in the first year of his late Majesty King *George* the Fourth, intituled *An Act to amend the Law respecting the inclosing of Open Fields, Pastures, Moors, Commons, and Waste Lands in England*: Be it therefore enacted by the King's most excellent Majesty, by and with the advice and consent of the Lords spiritual and temporal, and Commons, in this present Parliament assembled, and by the authority of the same, That from and after the passing of this Act it shall be lawful for two-third parts in number and value (such value to be ascertained as hereinafter mentioned) of the several persons who shall be seised or possessed of, or entitled in possession to or interested in possession in any rights of common or other rights in any open and common arable fields (including any untilled slips or balks therein), or any open and common meadow or pasture lands or fields, in any parish, township, or place in *England* or *Wales*, known by metes and bounds, or occupied according to known and legal rights (except as hereinafter provided), as tenant in fee simple or in fee tail, general or special, or for life or lives,

or by the courtesy of *England*, or for any other estate of or as of freehold, or for years determinable on any life or lives, or for any term of years whereof one hundred years shall be unexpired, or as a holder of lands or rights of copyhold, customary, tenant right, or other tenure, or an estate or interest equal in quantity to the estates hereinbefore mentioned or any of them, and for the guardian, trustee, feoffee for charitable or other uses, husband or committeee of such person who at the time of any agreement for or on the making of any inclosure authorized by this Act shall be an infant, idiot, lunatic, feme covert, or under any other disability, in such manner and with such consent as is hereinafter mentioned, to inclose such open and common arable, meadow, and pasture lands and fields, or any of them, and to extinguish the right of inter-commonage which shall exist as well over as in respect of such land; provided that no such inclosure shall take place without the consent in writing under the hands of two-third parts in number and value of the persons so seised, possessed, entitled, or interested as aforesaid, or of the guardians, trustees, feoffees, husbands, or committeees aforesaid of such of the said persons who may be under disability as aforesaid, such value to be ascertained by the assessments of the poor rates of the respective parishes or townships for the then current year, which assessments of the poor rates, in case they shall not be made according to the full annual amount or value of the tenements and property thereby assessed, shall be increased or diminished so as to represent the full or true annual value of the several lands, fields, and rights liable to be affected by the intended inclosure, and where the lands are extra-parochial, or no poor rates shall exist in respect of any such lands, then by the full or true annual value thereof: Provided also that no such inclosure shall take place, nor shall any agreement for that purpose be binding, until a public meeting of the proprietors and persons interested in the lands intended to be inclosed shall have been previously called for the purpose of taking the expediency of such inclosure into consideration by notice under the hands of three or more of such

proprietors or persons interested, such notice to be affixed on the principal outer door of the church or chapel of the parishes, townships, or places wherein the lands intended to be inclosed shall lie, or in case there be no such church or chapel, then on the door of the church or chapel of some adjoining parish, township, or place, and also advertised in some newspaper circulating in the county wherein such lands lie, at least fourteen days before the said intended meeting; provided that such inclosure may after such meeting be proceeded with by and with the consent in writing of two-third parts in number and value of the proprietors and persons interested in the lands intended to be inclosed, notwithstanding some of the parties who may approve of and consent to such inclosure may not be present at such meeting, and may signify their consent thereto after the same shall have been holden.

*The Consent of the Tenant in Remainder necessary in certain Cases.*

II. And be it further enacted, That whenever any inclosure shall be proposed to be made or consented to under the authority of this Act, or any agreement for compensation in pursuance of the provisions in that respect hereinafter contained shall be entered into, by any person or persons who being necessary to make up, and without whom there shall not be consenting parties sufficient to make up, the proportion of two-third parts in number and value hereinbefore required, or other the proportion hereinafter required in the case of an inclosure without the assistance of commissioners, and who shall have a less estate or interest in the land to be inclosed, or the said rights therein, than a fee simple or an estate in tail, or be an holder of a copyhold or customaryhold tenant right or other tenure in such lands or rights for any less estate than an estate or interest in fee or in tail, or shall be under any disability, such consent shall not be available for the purposes of this Act unless the person to whom the next immediate vested estate of freehold or of copyhold or customaryhold tenant right or any other tenure of inheritance, in remainder or reversion, shall have been limited, (provided such person shall be of the full age of twenty-one years, and being a female shall be unmarried,) shall consent thereto in writing; and such consent shall be sufficient for the purposes of this Act, notwithstanding the person giving the same may have an equitable estate only in the land intended to be inclosed, or may have previously charged or incumbered his reversionary estate therein: Provided always, that if the person to whom such next immediate vested estate in remainder or reversion may have been limited shall at the time such inclosure is proposed to be made happen to be an infant, feme covert, idiot, or lunatic, it shall be lawful for the guardian or husband or committee of such infant, feme covert, idiot, or lunatic to consent to such inclosure in his or her stead: Provided always, that in respect to any land held in right of any benefice no consent of the incumbent thereof shall alone be available for the purposes of this Act, where such consent shall be necessary to make up the proportion of two-third parts in number and value hereinbefore required, or other the proportion hereinafter required in the case of an inclosure without the assistance of commissioners, without the concurrence of the patron of such benefice, and of the archbishop or bishop to whose ordinary or peculiar jurisdiction the said benefice shall be subject; and if the patron of such benefice shall

happen to be a minor, idiot, lunatic, or feme covert, it shall be lawful for the guardian, committee, or husband of such patron to consent to such inclosure in the stead of such patron, and on his or her behalf: Provided always, that if the patronage of such benefice shall happen to be in the crown, and the benefice shall exceed the yearly value of twenty pounds in the King's books, no consent of the incumbent thereof shall be available for the purposes of this Act, where such consent shall be necessary to make up either of the proportions aforesaid, without the concurrence of the Lord High Treasurer or the first Lord Commissioner of the Treasury for the time being, who are respectively hereby authorized so to concur; but if such benefice shall not exceed the yearly value of twenty pounds in the King's books, then no consent of the incumbent thereof shall be available for the purposes of this Act, where such consent shall be necessary to make up either of the proportions aforesaid, without the concurrence of the Lord High Chancellor, Lord Keeper, or Lords Commissioners of the Great Seal for the time being, who is and are hereby authorized to give such consent on behalf of the crown.

*Commissioners to be nominated by the Parties consenting to the Inclosure.*

III. And be it further enacted, That whenever the persons whose consents are hereby rendered necessary to any such inclosure shall have consented thereto in manner in that behalf herein authorized and required, it shall be lawful for the major part in number and value of the proprietors of and persons interested in the lands intended to be divided and inclosed, or their known agents, who may be present at a meeting to be called for that purpose, to nominate and appoint in writing under their hands one or more person or persons (not interested in the premises) to be a commissioner or commissioners for dividing, allotting and inclosing, and he or they is and are hereby empowered to divide, allot, and inclose, all or any of the open and common arable meadow or pasture lands or fields in any such parish, township, or place, or in any parishes, townships, or places adjoining or lying within two miles of the aforesaid parish, township, or place, which may have been agreed to be divided, allotted, and inclosed as aforesaid; and when and as often as any such commissioner or any commissioner to be from time to time appointed in his place shall die, neglect or refuse or become incapable to act, it shall be lawful for the major part in number and value of the proprietors of such open common arable fields, or other lands or fields as aforesaid so agreed to be divided, allotted, and inclosed, or of their agents assembled at a public meeting to be held in manner hereinbefore mentioned in respect to the meeting for taking such inclosure into consideration, to nominate and appoint any other person not interested in the premises to be a commissioner in the stead or place of the commissioner so dying, neglecting, refusing or becoming incapable to act as aforesaid; and in case the said proprietors or persons interested as aforesaid shall make default in appointing any new commissioner within two calendar months after any such death, neglect, refusal, or disability shall happen, and shall be known and signified to them or any two of them respectively as aforesaid, then the surviving or remaining commissioner (if any) shall and he is hereby required from time to time, by writing under his hand, within one calendar month next after the expiration of the said period

allowed to the proprietors or persons interested for naming such new commissioner to be appointed as aforesaid, to appoint one other commissioner, not interested in the said inclosure, in the place of such commissioners so dying, neglecting, refusing, or becoming disabled to act as aforesaid; and every such new commissioner so to be appointed shall have the like powers and authorities for carrying this Act into execution in all respects whatsoever as the commissioner in whose place he shall have been so appointed and chosen as aforesaid was invested with under and by virtue of this and the said hereinbefore recited Act.

*Commissioners to appoint a Clerk.*

IV. And be it further enacted, That the said commissioner or commissioners shall and they are hereby authorized and empowered to appoint a clerk to assist him or them in the execution of the said recited Act and this Act, and shall and may remove such clerk and appoint another in his room as to him or them shall seem meet; and in case of the death, incapacity, neglect, or declining to act of any such clerk, then and in any such case the said commissioner or commissioners shall and may appoint any other person to be clerk.

*Umpire to be appointed.—In case of difference of Opinion between the Commissioners, the Matter to be determined by the Umpire.*

V. And be it further enacted, That in all cases where two commissioners shall have been appointed for any such inclosure they shall, before they proceed upon the business of such inclosure, by writing under their hands appoint a fit and proper person (not interested in the said division and inclosure) to act as umpire between them, and from time to time afterwards renew such appointment in the event of the death, refusal, neglect, or incapacity to act of the person so appointed; and if any difference of opinion shall arise between them touching or concerning any matter or thing to be done by them by virtue or in the execution of the said recited Act or of this Act, the matter upon which such difference shall arise shall be settled and determined by such person so to be appointed umpire, whose determination therein shall be deemed and taken to be the determination of the said commissioners, and shall be reduced into writing, and shall be binding and conclusive upon all parties whomsoever (so far as the acts and determinations of the commissioners are by the said recited Act or this Act declared to be final and conclusive); and for the purposes aforesaid such umpire shall have and he is hereby invested with the same powers and authorities as by the said recited Act and this Act are given or vested in the said commissioners.

*Commissioners and Umpire to take an Oath.*

VI. Provided always, and be it further enacted, That no person shall be capable of acting as a commissioner or an umpire or a surveyor in the execution of this Act or the said recited Act until he shall have taken and subscribed an oath or made an affirmation in the form or to the effect following before one of his Majesty's Justices of the Peace for the county, riding, division, or place in which the lands intended to be inclosed, or some part thereof, are situate; which oath or affirmation the said Justice is hereby empowered to administer; (that is to say,)

*Form of Oath.*

“ I A. B. do swear, [or, being one of the people called Quakers, do solemnly affirm,] That I will

faithfully and impartially, and honestly, according to the best of my skill and judgment, execute and perform the several powers and authorities vested and reposed in me as a commissioner [or an umpire] or surveyor [as the case may be] by virtue of an Act passed in the year of the reign of King William the Fourth, entitled *An Act, &c. [here set forth the title of this Act]*, according to equity and good conscience, without favour or affection, prejudice or partiality, to any person or persons whomsoever.”

“ So help me GOD.”

[Or, being a Quaker, omit the words, “ So help me God.”]

*Commissioners to give Notice of Meetings, &c.—Adjournment of Meeting in case of failure of Attendance of Commissioners.—Place of Meeting.*

VII. And be it further enacted, That the said commissioner or commissioners or umpire shall and he or they is or are hereby required to cause notice in writing to be affixed to the respective church or chapel doors of the parish, township, or place wherein the lands intended to be inclosed are situate, or if there be no church or chapel, then in some conspicuous public place there, and also a like notice to be published in some newspaper circulating in the county wherein such lands lie, of the time and place of his or their attendance or meeting, and of all other subsequent attendances or meetings for executing the powers hereby or in and by the said recited Act vested in him or them, ten days before any such meeting (meetings by adjournment only excepted); and if there be two commissioners, and not more than one of them shall attend at the time and place appointed for any such meeting, it shall be lawful for the commissioner who shall attend such meeting, or the clerk of the said commissioners, or if notice shall have been given of such meeting by any umpire, and both the commissioners shall not attend the same, it shall be lawful for such umpire, to adjourn such meeting to any future day not exceeding fourteen days from the day of adjournment; and such clerk shall cause notice of such adjournment to be given to the said commissioners: Provided always, that all the meetings of the said commissioners, or umpire and commissioners, shall be holden in one of the parishes or townships wherein the lands to be inclosed are situate, or within seven miles of the boundaries of one of them.

*Mode in which other Notices are to be given.*

VIII. Provided always, and be it further enacted, That all other notices necessary or requisite to be given by the said commissioner or commissioners or umpire shall be so given by affixing the same on the respective church or chapel doors of the several parishes, townships, or places wherein the lands to be inclosed are situate, or if there be no church or chapel, in some conspicuous public place in such parishes, townships, or places, and by advertisement in a newspaper circulating in the county wherein such lands are situate

*Allowance to Commissioners, Umpire, and Surveyors.*

IX. And be it further enacted, That out of the money that shall arise for defraying the expences of executing this Act there shall be paid to each of the commissioners (if more than one) and to the umpire who shall act in the execution thereof, as a recompence for his pains and trouble, the sum of three guineas for each and every day they shall respectively be employed in travelling to, return-

ing from, and attending in the execution of this Act, and no more; and at all meetings to be held in pursuance of this Act the said commissioners and umpire shall, out of such allowance, defray their own expences; and there shall be paid to the surveyor or surveyors to be appointed for the purposes of this Act such allowances in respect of his or their services as the said commissioner or commissioners shall adjudge to be a full recompence and satisfaction for all his or their expences and charges whatsoever in attending the said commissioners, and in surveying and admeasuring the lands and grounds to be inclosed, and in planning and taking out the several allotments intended to be made, and in making such maps and plans as may be required respectively by virtue of this Act.

*Major part of Proprietors may agree for Payment of a Gross Sum to Commissioners, &c.*

X. Provided always, and be it enacted, That it shall be lawful for the major part in number and value of the proprietors and persons interested as aforesaid to make any agreement with any commissioner or commissioners or surveyor or surveyors to be appointed under this Act for the payment to them respectively of one sum for the whole duty or any part thereof to be performed by them or either of them.

*Four-fifths of Proprietors, &c. may agree to adopt any previous Plan, &c.*

XI. Provided further, and be it enacted, That it shall be lawful for four-fifths in number and value of such proprietors and persons interested as aforesaid to agree upon the adoption for the purposes of this Act of any plan, map, admeasurement, or valuation previously made, and such agreement shall be binding upon any commissioner or commissioners or umpire who may be appointed in pursuance of the provisions of this Act.

*Four-fifths in Number may agree upon Rules for guidance of Commissioners or Umpire.*

XII. Provided also, and be it enacted, That it shall be lawful for four-fifths in number and value of such proprietors and persons interested as aforesaid to agree upon the rules, conditions, and principles according to which any such commissioner or commissioners or umpire shall act in allotting the lands to be inclosed to the several persons interested therein, and such agreement shall be binding upon such commissioner or commissioners or umpire as aforesaid.

*Such several Agreements may be appealed against to the Quarter Sessions.—Notice of Appeal.—Proviso.*

XIII. Provided nevertheless, and be it further enacted, That it shall be lawful for any proprietor or person interested as aforesaid, who may deem himself aggrieved by any such agreement as hereinbefore mentioned for the payment of a commissioner or commissioners, surveyor, or surveyors, or for the adoption of any plan, map, admeasurement, or valuation, or for establishing any rules, conditions, and principles for the guidance of the commissioner or commissioners or umpire in making allotments, to appeal against the same to the first General Quarter Sessions of the Peace to be holden in and for the county, riding, or division wherein the lands, or the greater part thereof, in respect of which the matter of complaint may arise, shall be situate, or some adjournment thereof, or if such General Quarter Sessions shall be holden within one month from the making of such agreement, then to the General Quarter Sessions next following such first General Quarter Ses-

sions, or some adjournment thereof; and notice of such appeal shall in each case be given in writing to the commissioner or commissioners seven days at the least before the day on which such sessions respectively shall be holden: Provided always, That in the event of the decision upon any such appeal being in favour of the appellant it shall be lawful for any party who shall have consented to such agreement for inclosure as aforesaid to withdraw his consent from such agreement, by giving notice in writing to that effect to the commissioner or commissioners at any time within twenty-one days after the day on which the decision upon such appeal as aforesaid shall have been given; and if by reason of such withdrawal of consent the proportion of two-thirds in number and value of consenting parties shall not remain, the said agreement for inclosure shall thenceforth cease and determine.

*A Copy of the Objections to be left with the Party objected to, or given to his Agent.*

XIV. And be it further enacted, That if any of the parties interested in the premises shall have any objection or objections to any of the accounts or claims which shall be delivered to the said commissioner or commissioners by virtue of the said recited Act, or of this Act, such objection or objections shall be reduced into writing, and two parts thereof shall be signed by the party or parties making the same, or by some person or persons on his, her, or their behalf, and one part thereof shall be delivered to the party or parties whose claim or account shall be objected to, or to his, her, or their agent, or left at his, her, or their last and most usual place or places of abode, at such time or times as the said commissioner or commissioners shall appoint for that purpose.

*For settling Disputes between Parties interested.*

XV. And be it further enacted, That if any dispute or difference shall arise between any of the parties interested, or claiming to be interested in the said intended division, allotment, and inclosure, touching or concerning the respective rights or interests which they or any of them shall claim to have in, to, or out of the lands and fields hereby authorised to be divided, allotted, and inclosed, or touching or concerning any other matter or thing relating to the said division, allotment and inclosure, it shall be lawful for the said commissioner or commissioners, and they are hereby authorized and required, to examine into, hear, and determine the same respectively; provided that nothing in this Act contained shall authorize the said commissioner or commissioners to determine the title to any manors, messuages, cottages, lands, tenements, or hereditaments whatsoever.

*Commissioners may award Costs.*

XVI. And be it further enacted, That in case the said commissioner or commissioners shall, upon the hearing and determination of any claim or claims, or objections, to be delivered to them in pursuance of the said recited Act or this Act, see cause to award any costs, it shall be lawful for the said commissioners and they are respectively hereby empowered, upon application being made to them for that purpose, to settle, assess, and award such costs and charges as they shall think reasonable to be paid, either for the public account for or towards the expences occasioned in or relating to the investigation, settling, and determining of such claim or claims, if finally disallowed, or to the party or parties in whose favour any

determination of the said commissioner or commissioners shall be made, by the person or persons whose claim or objection shall be thereby disallowed or over-ruled, or against whom the said commissioner or commissioners shall have determined as aforesaid; and in case the person or persons who shall be liable to pay such costs shall neglect or refuse to pay the same, upon demand, it shall be lawful for the said commissioner or commissioners, and he and they are hereby authorized and required, by warrant under their hands and seals, directed to any person or persons whomsoever, to cause such costs to be levied by distress and sale of the goods and chattels of the person or persons so neglecting or refusing to pay the same, rendering the overplus (if any), upon demand, to such person or persons whose goods and chattels shall have been so distrained and sold, after deducting the costs and charges attending such distress and sale.

*Appeal allowed when Parties are dissatisfied with Decision of the Commissioners.*

XVII. Provided always, and be it further enacted, That in case any person or persons interested or claiming to be interested in the said intended division and inclosure shall be dissatisfied with any determination of the said commissioner or commissioners or umpire touching or concerning any claim or objection which shall be delivered to the said commissioners in pursuance of the said recited Act or this Act, or touching or concerning any property, right, or interest intended to be affected by such determination, and shall cause notice in writing of such dissatisfaction to be delivered to or left at the usual places of abode of the commissioner or commissioners or umpire making such determination, and of the party or parties in whose favour such determination shall have been made, if there be any party or parties specially interested in the same, or his, her, or their agent, within thirty days next after such determination shall have been notified in writing to the several parties or persons specially interested, if any such there be, it shall be lawful for such person or persons so dissatisfied, and giving such notice as aforesaid, to bring or cause to be brought an action or actions upon a feigned issue against the person or persons in whose favour such determination shall have been made, and to proceed to a trial at law of the matter so determined by the said commissioners or umpire at the then first or second Assizes to be holden for the county wherein the lands relating to which such dispute shall arise are situate; and the defendant or defendants in such action or actions shall, and he, she, and they is and are hereby required to name an attorney or attorneys, who shall appear thereto, and file common bail, and accept one or more issue or issues, whereby such claim or claims, rights in question, and the property, right, and interest thereby insisted upon, may be tried and determined; such issue or issues to be settled by the proper officer of the court in which the said action shall be commenced, in case the said parties shall differ about the same; and the verdict or verdicts which shall be given upon the trial of such action shall be binding, final, and conclusive, unless the court wherein such action shall be brought shall set aside such verdict or verdicts, and order a new trial to be had thereon, which it shall be lawful for the said court to do in case the said court shall think proper; and after such verdict or verdicts shall be obtained, and not set aside, the said commissioners shall and they are hereby required to act in conformity thereto,

and to allow or disallow the claim, property, right, or interest thereby determined according to the event of such trial or trials; and the costs and charges payable by the said commissioner or commissioners in or relating to such action or actions shall be paid and discharged out of the monies to be raised by him or them for the purposes of this Act: Provided always, that if no such notice shall be given, and such action or actions at law shall not be commenced as aforesaid, or if any such action shall be commenced, and the plaintiff or plaintiffs therein shall not proceed to trial within the time herein-before limited for that purpose, then the determination of the said commissioner or commissioners or umpire shall be final, binding, and conclusive to all intents and purposes whatsoever: Provided always, that if any of the parties in any such action to be commenced as aforesaid shall die before the determination thereof such action shall not abate by reason thereof, but shall be proceeded in as if no such event had happened; and that no difference, suit, or proceeding as aforesaid, nor any difference or dispute touching the title to any lands, tenements, or hereditaments, shall impede or delay the said commissioner or commissioners in the execution of the powers of this Act, but the division, allotment, and inclosure hereby authorized to be made shall be proceeded in notwithstanding any such difference or proceeding.

*Death of Parties not to abate Actions.*

XVIII. Provided always, and be it further enacted, That if any person or persons in whose favour such determination as aforesaid shall have been made, and against whom any such action or actions might have been brought if living, shall die before any such action or actions shall have been brought, and before the expiration of the time herein-before limited for bringing such action or actions, it shall be lawful for the person or persons who might have brought such action or actions against the person or persons so dying to bring the same within the time so limited as aforesaid against such person or persons as aforesaid as if actually living, and to serve the clerk of the said commissioner or commissioners with process for commencing such action or actions in the same manner as the party or parties so dying might have been served therewith if living; and it shall thereupon be incumbent upon the heir or heirs or other person or persons who shall claim benefit of such determination as aforesaid to appear and defend such action or actions in the name or names of the person or persons so dead; and proceedings shall be had therein in the same manner as if such person had been actually living, and the rights of all parties shall be equally bound and concluded by the event of such action or actions.

*Commissioners not to determine Rights between Parties except in Cases of Encroachments within 20 Years.*

XIX. Provided also, and be it further enacted, That nothing in this Act contained shall extend to enable the said commissioner or commissioners to determine any right between any parties contrary to the possession of any such parties, except in Cases of Encroachments made within the period of twenty years next preceding the passing of this Act; but in case the said commissioner or commissioners shall be of opinion against the right of the person or persons so in possession they shall forbear to make any determination thereupon until the possession shall have been given up by or

taken from such person or persons by ejection or other due course of law.

*Encroachments made within 20 Years to be deemed Part of the Land to be allotted.*

XX. And be it further enacted, that all Encroachments or Intakes which at any time within twenty years next preceding the date of the agreement for any such inclosure have been made upon the said lands and fields hereby authorized to be divided and inclosed shall be deemed and considered part and parcel of the lands and fields to be allotted and inclosed by virtue of this Act as if the same were actually lying open and uninclosed, and shall be divided and allotted accordingly; and in case any dispute or difference shall arise touching any such Encroachments or Intakes, or as to the extent thereof, such dispute or difference shall be determined by the said commissioner or commissioners.

*Lands used for charitable Purposes not to be deemed an Encroachment.*

XXI. Provided also, and be it further enacted, That in case any such lands shall have been taken or used at any time before the passing of this Act for the erection of a School-house or School-houses, or the appurtenances thereto, or for other charitable purposes, such lands so taken, or the erections made thereon, shall not be taken or deemed to be of the nature of an Encroachment within the meaning of this Act.

*Lands inclosed more than 20 Years deemed to be ancient Inclosures.*

XXII. Provided always nevertheless, and be it further enacted, That all lands which shall have been inclosed from the open fields, or any of them for more than twenty years next preceding the date of the agreement for such Inclosure, shall for the purposes of this Act be deemed and taken to be ancient inclosures.

*Cultivated Ground to be allotted to Proprietors only.*

XXIII. Provided always, and be it enacted, That it shall not be lawful for the said commissioner or commissioners or umpire to allot to any other person than the proprietor thereof any land which may be cultivated as orchard or garden, or on which any building may have been erected, or which may have been inclosed by virtue of any voluntary agreement between the proprietor thereof and the persons having right of common over the same, without the consent in writing of such actual proprietor.

*Compensation to be made for Standing Crops.*

XXIV. And be it further enacted, That the said commissioner or commissioners shall, by some writing or writings under their hands, ascertain, order, and appoint what recompence and satisfaction in money shall be made to the owner or owners of any crops growing at the time of the said intended division and allotment, for the said crops, by the person or persons to whom the lands on which such crops are growing shall be allotted, and also what recompence and satisfaction in money shall be paid, and by whom, to any tenant or tenants, occupier or occupiers of lands to be inclosed as aforesaid, as well for the ploughing, tilling, and manuring of any lands or fields which shall be allotted to some other person or persons, and for the profit or advantage which any such person or persons to whom the said lands and fields shall be allotted will obtain thereby, as for any loss or disadvantage which any such tenant or

tenants, occupier or occupiers, shall or may sustain by the loss of any following or way-going crop in any of the open and common lands or fields by this Act authorized to be divided, allotted, and inclosed, or by means of the said division, allotment, and inclosure; and if in any or either of the said cases last mentioned such recompence and satisfaction shall not be made at the time and in the manner to be appointed by the said commissioner or commissioners, then the said commissioner or commissioners shall and may, by any warrant or warrants under his or their hands and seals, directed to any person or persons whomsoever, (which warrant or warrants he or they are hereby authorized and empowered to grant accordingly,) cause the same to be levied by distress and sale of the goods and chattels of the person or persons required to make such recompence and satisfaction as aforesaid, together with the costs and charges of such distress and sale, rendering the overplus, if any, to the owner or owners of such goods and chattels.

*Commissioners to direct the Course of Husbandry to be followed.*

XXV. And be it further enacted, That the said commissioner or commissioners shall, as soon after his or their appointment as conveniently may be, by some writing or writings under his or their hands to be affixed on the principal outer doors of the several and respective churches or chapels of the parishes or townships in which the lands to be inclosed are situate, or if there be no church or chapel, then in some conspicuous place in the parish, township, or place where such lands shall be, order and direct the course of husbandry that shall be used in, over, and upon the open arable, meadow, or pasture lands or fields to be divided, allotted, and inclosed by virtue of this Act, until the time when he or they shall have made and completed the intended division and allotment thereof, as well with respect to breaking up and laying down, as the ploughing, sowing, fallowing, and tilling the same lands and fields; and by the same or any other writing or writings under his or their hands, to be affixed as aforesaid, shall and may make such orders and regulations touching the conduct of the owners and occupiers of the same lands and fields, for the preventing the committing of waste or destruction by any person or persons whomsoever upon any of the lands and fields to be divided and allotted by virtue of this Act, in the meantime and until the allotments and divisions thereof shall be effected, as to the said commissioner or commissioners shall seem expedient; all which orders and regulations of the said commissioners shall be binding and conclusive upon all parties interested therein, their farmers and tenants; and that the said commissioners shall set and impose such pecuniary penalties and forfeitures upon every person not conforming to such orders and regulations as they shall think necessary, not exceeding five pounds *per acre*; all which penalties and forfeitures shall be paid to such person or persons and for such uses and purposes as the said commissioner or commissioners shall by any such writing or writings as aforesaid, or any other writing or writings, direct or appoint; and the said commissioner or commissioners are hereby authorized and required to raise and levy the same, for the use of the person or persons he or they may consider entitled thereto, by such ways and means as the costs, charges, and expenses of carrying this Act and the said recited Act of the forty-first year of the reign of His late

Majesty King *George* the Third into execution may be raised and levied.

*Commissioners to allot the Lands to be inclosed.*

XXVI. And be it further enacted, That the said commissioner or commissioners shall apportion, divide, set out, and allot the said open or common arable, meadow, and pasture lands or fields authorized by this Act to be divided, allotted, and inclosed unto and amongst the several proprietors thereof and persons interested therein, in proportion to their respective shares, rights of common, and all other rights, property, and interests, and in proportion to the true and real value of their several shares, rights of common and all other rights, property and interests, and the same, when so apportioned, divided, set out, and allotted, shall be taken to be in lien and full satisfaction of and for such their said several shares, rights of common, and all other rights, property, and interests, to be ascertained and adjusted by such ways and means and in such manner as to the said commissioners shall seem just and expedient, but subject to the rules, orders, and regulations herein contained or referred to and authorized to be established concerning the same.

*At the Desire of the Parties several Allotments may be set out together, distinguished by Metes and Bounds, but not fenced from each other.*

XXVII. And be it further enacted, That in case any number of the proprietors or persons interested in the lands and fields agreed to be inclosed under the authority of this Act shall deem it expedient and desire to have their allotments thrown together and distinguished by metes and bounds, but not fenced from each other, and of such their desire shall give notice in writing to the said commissioner or commissioners, such commissioner or commissioners shall and he and they is and are hereby required to set out the several allotments of the said persons so giving notice as aforesaid in one plot or parcel of land, distinguishing the portion of such plot or parcel of land, allotted to each of such proprietors by metes and bounds, but not requiring them to make any subdivision fences or other fences, save such ring or outer fences as may be necessary and may be ordered by the said commissioner or commissioners to be made for dividing the said plot or parcel of land from the residue of the lands so to be inclosed.

*For ascertaining Boundaries.*

XXVIII. And be it further enacted, That for the purposes of shortening or rendering straight or otherwise improving any boundary fence or fences between the lands and fields hereby authorized to be divided, allotted, and inclosed, and the old or other lands thereunto adjoining, or between such allotments and inclosed or other lands, or any of them, and any adjoining lands and grounds, it shall be lawful for the said commissioner or commissioners (with the consent of the lord of any manor in which the lands are respectively situate, and of the owners of any such adjoining lands, testified by writing under their respective hands, or under the common seal of any of them being a corporation aggregate,) to set out, ascertain, and determine the boundaries between the lands hereby authorized to be divided, allotted, and inclosed, and any adjoining lands or grounds lying in the same or in any adjoining manor, parish, or place, as the said commissioner or commissioners shall judge proper for the purposes aforesaid; and after such boundaries shall be so set out, ascertained, and deter-

mined as aforesaid, the same shall be made, fenced, ditched, or mounded by such person, in such manner, and at such times as the said commissioner or commissioners shall direct, and shall for ever thereafter be deemed the boundaries between the said allotted and inclosed lands respectively, or (as the case may be) between the said allotments or inclosed or other lands and such adjoining manor, parish, or place; any law, usage, or custom to the contrary notwithstanding.

*Right of Herbage in Private Roads to be set out.*

XXIX. And be it further enacted, That the said commissioner or commissioners shall in and by his or their award order and appoint the grass and herbage growing and renewing upon all and every the private roads to be set out by him or them within the said lands and fields hereby authorized to be divided, allotted, and inclosed, to be and for ever hereafter remain to and for the use and benefit of such persons as the said commissioner or commissioners shall in his or their judgment think best entitled to the same.

*Empowering Rectors to erect Buildings on Lands allotted in right of Glebe, and charge Expences thereon.*

XXX. And whereas the allotments made to any rector or vicar who may be entitled to any glebe lands in such open and common arable, meadow, or pasture lands or fields, or some of such allotments, may probably require some additional buildings, by reason whereof, and in order to render the same of greater value to the said rectors and vicars respectively, and their respective successors, it may be necessary that some buildings should be erected thereon, and some necessary division as well as interior or subdivision fences may be necessary to be made, planted, and raised in and upon the said allotments or some of them: And whereas the erecting of such further buildings, and the making, planting, and raising such fences, will be attended with considerable expence, and as the same will probably be more beneficial to the successors of such rectors and vicars respectively than to the rector and vicar in whose incumbency such allotment and inclosure may take place; be it therefore further enacted, That it shall and may be lawful to and for the said rectors and vicars respectively, and their respective successors, by and with the consent in writing of the respective patrons of the said rectories and vicarages, and of the ordinary of the diocese for the time being, to erect or cause to be erected for agricultural purposes such further buildings upon the allotment or allotments (which buildings the said rectors and vicars respectively, and their respective successors, are hereby required to cause to be insured equal to the value thereof annually in some of the Offices in London established for Insurance against Fire,) so as aforesaid to be set out unto the said rectors and vicars and their respective successors as aforesaid, and also to make, plant, and raise such outer division as well as interior or subdivision fences in and upon the said allotment or allotments as the said commissioner or commissioners shall judge necessary and proper for the occupation of the lands so to be allotted to the said rectors and vicars respectively, and their respective successors, and by any deed or deeds, writing or writings, under the respective hand and seal of such rectors or vicars respectively, and their respective successors, and attested by two or more credible witnesses, by and with the consent in writing of the bishop of the diocese for the time being, to charge such allot-

ment or allotments so as aforesaid to be set out for the said rectors and vicars respectively, and their respective successors as aforesaid, and the buildings so to be erected thereon, with such sum or sums of money, not exceeding in the whole two years annual value of the respective allotments so to be set out to the said rectors and vicars respectively, as the said commissioners shall think necessary for the purposes of and in order to be applied to paying and defraying the charges and expences of erecting the said further buildings, and of making, planting, or raising such division or subdivision fences, or for either of the said purposes, and in applying for and obtaining the consent of the said bishop, and in exercise of the powers given to and vested in the said rectors and vicars respectively by virtue of this Act and the said recited Act; which sum or sums of money shall be paid to such person or persons as the said commissioners shall nominate and appoint, in order to be applied or disposed of accordingly; and for securing the repayment of such sum or sums of money, with interest for the same, to grant, mortgage, lease, or demise the allotments so as aforesaid to be set out unto and for the said rectors and vicars respectively, and their respective successors, as aforesaid, and the buildings so to be erected thereon, unto such person or persons who shall advance and lend the same, his, her, and their executors, administrators, or assigns, for any term or number of years, so that every such grant, mortgage, lease, or demise be made with a proviso to cease and be void, or with an express trust to be surrendered, when the sum or sums of money thereby to be secured, with the interest thereof, shall be respectively fully paid and satisfied; and such mortgagee or mortgagees advancing and lending the money so as to be borrowed shall not be obliged to see to the application or be in anywise answerable for the misapplication of such monies or any part thereof; and the said rectors and vicars respectively, and their respective successors for the time being, shall be and are hereby required and made liable, at the end of every year after the date of such mortgage, to pay to the person or persons to whom such grant, mortgage, lease, or demise shall be made, his, her, or their executors, administrators, or assigns, one-thirtieth part of the respective principal monies so to be borrowed, until the whole thereof shall by such annual payments be paid off and discharged, and also to pay and keep down the interest of the said respective monies so to be borrowed, so that the future rectors and vicars of the said respective parishes or townships becoming possessed of such respective lands and fields shall not be subject or liable (and they are hereby respectively discharged from being subject or liable) to pay any further or larger share of such monies than his or their proportion thereof according to such last-mentioned condition, or any interest for the same save only from the day of the death, resignation, or cession of the preceding incumbent of the said rectories or vicarages respectively; and that it shall and may be lawful to and for the person or persons who shall advance and lend such monies, his, her, or their heirs, executors, administrators, and assigns, for the more easily recovering the said one-thirtieth part of the said principal and the whole of the interest which is enacted annually to be paid, to have, use, exercise, and take such and the same powers and remedies, by entry and distress upon the premises so to be charged, mortgaged, and demised, and sale of such distress, as by the laws

now in force are provided for and given to landlords or as they can use and take for the recovery of rack rents in arrear.

*Rectors, with Consent of Bishop, may demise the Allotments.*

XXXI. And be it further enacted, That it shall and may be lawful for the rectors of the said rectories and the vicars of the said vicarages respectively for the time being, by indentures under their respective hands and seals, with the consent and approbation of the bishop of the diocese for the time being, and of the patron of the said rectories and vicarages, from time to time to lease and demise all or any part of the allotments to be set out and allotted to them respectively by virtue of this Act, to any person or persons whomsoever, for any term not exceeding twenty-one years, so that the rent or rents for the same shall be thereby reserved to such rectors and vicars for the time being by four equal quarterly payments in every year, and so that there be thereby reserved to such rectors and vicars the best and most improved rent or rents that can be reasonably gotten for the same, without taking any fine, foregift, premium, sum of money, or other consideration for granting any such lease, and so that no such lessee by any such lease or demise be made punishable for waste by any express words to be therein contained, and so that there be inserted in every such lease power of re-entry on non-payment of rent or rents to be thereby reserved within a reasonable time, to be therein limited, after the same shall become due, and so that a counterpart of such lease be duly executed by the lessee or lessees to whom such lease shall be made as aforesaid; and every such lease shall be valid and effectual, any law or usage to the contrary notwithstanding.

*Commissioners in certain Cases to apportion Expences of erecting Boundary Fences.*

XXXII. Provided always, and be it further enacted, That in case, through the necessity of situation or any other accident or circumstance, it shall happen that one or more of the said proprietors shall not have an equal or proportionable quantity of boundary mounds or fences allotted to him, her, or them on the said intended inclosure, it shall be lawful for the said commissioner or commissioners, when he or they shall judge it necessary and reasonable, to award, order, ascertain, and appoint what sum or sums of money such proprietor or proprietors shall respectively pay and contribute towards making the mounds and fences of the allotments of such other proprietor or proprietors who shall or may have too great a proportion of mounding or fencing allotted to him, her, or them by virtue of this Act, the same to be settled by the said commissioner or commissioners in such manner as he or they shall order, direct, or appoint; and the money so ordered, directed, or appointed to be paid shall be raised, levied, and recovered in such and the same manner as the other expences of this Act are herein or by the said recited Act ordered and directed to be levied and recovered.

*Act not to affect Settlements.*

XXXIII. Provided always, and be it further enacted, That nothing in this Act contained shall extend or be construed or adjudged to extend to revoke, make void, alter, or annul any settlement, deed, will, or lease, or to prejudice any person having any right or claim of dower, jointure, annuity, rent-charge, debt, or incumbrance whatsoever in, out of, upon, or affecting any of the lands, tenements, or hereditaments hereby autho-

rized to be divided and allotted, or which shall be exchanged or assigned in compensation for any other estate or right in pursuance of this Act; but as well the lands allotted as the tenements or other hereditaments which shall be assigned in exchange or as a compensation for any other estate or right shall, immediately after such allotment, exchange or assignment shall be made, be vested, remain, and enure, and the several persons to whom the same shall be allotted, assigned, or given in exchange as aforesaid shall thenceforth stand and be seised and possessed thereof respectively, to, for, and upon such and the same uses, estates, intents, trusts, and purposes respectively, and subject and liable to such and the same deeds, wills, settlements, limitations, and remainders, conditions, charges, tenures, rents, services, and incumbrances, as the several lands, tenements, and hereditaments in respect whereof such allotments, assignments, and exchanges shall have been made should or would have stood severally limited, settled, or subject or liable to, or been held by, in case the same had not been allotted, assigned, or exchanged, and this Act had not been made or acted upon; save and except such rents and services as shall have been compensated for and extinguished, and such leases and tenancies at rack rents as shall become void, by virtue of this Act, and subject nevertheless to all such mortgages and sales as shall be made by authority of this Act or of the said Act of the forty-first year of the reign of His late Majesty King George the Third.

*Leases at Rack Rent may be avoided.*

XXXIV. Provided also, and be it further enacted, That all leases, agreements, and tenancies at rack rent subsisting of any part or parts of the lands and grounds hereby authorized to be divided, allotted, and inclosed at the time of the first appointment of any commissioner or commissioners for the inclosure thereof, or which shall be exchanged in pursuance of this Act, shall, so far only as respects the lands hereby authorized to be divided and allotted or exchanged, cease and be void at such time or times as the said commissioner or commissioners shall by writing under his or their hands direct or appoint, so as the respective lessors or landlords of such lands or tenements do, before or at the respective times at which such leases or tenancies shall be directed to cease, make and pay such satisfaction to the respective lessees or tenants for the loss which shall be sustained by the determination of such leases respectively, so far as regards the said lands the tenancy and leases whereof are hereby authorized to be determined, as shall be mutually settled and agreed between them, or as the said commissioner or commissioners, being required by either of the parties, shall ascertain and direct; and the said commissioner or commissioners, being so required, are hereby empowered and directed to apportion a reasonable and proportionable part, according to the season of the year, of the rent, reserved on any such agreement for or in respect of the time which shall have elapsed between the last day on which any payment of the rent shall have become due and the determination of any such lease or agreement; and such part of the rent shall be recoverable by such ways and means as may by law be used for the recovery of rent in arrear; and the said commissioners are hereby empowered and directed in every case where such lands or other hereditaments shall be held by virtue of such lease or agreement, together with other lands or heredita-

ments, by one entire rent, to apportion and determine what part of such rent shall be deducted in respect of such of the lands or other hereditaments in such lease or agreement comprised as to which the same shall be determined as aforesaid, and from what time such deduction shall take place; and the rest of the rent reserved on any such lease or agreement shall, during the remainder of the term thereof, be the rent of and for the residue of such lands and hereditaments, and shall be payable and recoverable in like manner as the entire rent reserved by such lease or agreement shall immediately before such apportionment be payable and recoverable.

*Exchanges may be made.*

XXXV. And be it further enacted, That it shall be lawful for the said commissioner or commissioners to set out, allot, and award any lands, tenements, or hereditaments whatsoever, whether situate within the boundary of such open and common lands or fields as aforesaid, or adjoining thereto, within the parishes, townships, or places in which the lands to be allotted and inclosed are situated, or any of them, in lieu of and in exchange for any other lands, tenements, or hereditaments within the same parishes, townships, or places respectively, or any of them, or within any parish, township, or place adjoining to the said parishes, townships, or places respectively, or any of them; provided that all such exchanges shall be ascertained, specified, and declared in the award of the said commissioner or commissioners, and be made with the consent in writing of the proprietor or proprietors of the hereditaments and premises which shall be so exchanged, whether such proprietor or proprietors shall be a body or bodies politic, corporate, or collegiate, corporation aggregate or sole, rector, parson, vicar, or other ecclesiastical person or persons, or a tenant or tenants in fee simple, or for life, or in fee tail, special or general, or by the courtesy of *England*, or for years determinable on any life or lives, by and with the consent of the lessor or lessors, but not otherwise, or with the consent of the guardians, husbands, committees, or attorneys of or acting for any such proprietor or proprietors who at the time of making such exchange or exchanges shall be respectively infants, femes covert, idiots, lunatics, or under any other legal disability, or who shall be beyond the seas, or otherwise disabled to act for themselves, himself, or herself, or of the trustees or feoffees for charitable, parochial, or other uses, or of the person or persons having power to sell and dispose of the hereditaments and premises which shall be so exchanged (such consent to be testified in writing under the common seal of the body politic, corporate, or collegiate, and under the hands of the other consenting parties respectively); and all and every such exchange and exchanges so to be made respectively shall be good, valid, and effectual in the law to all intents and purposes whatsoever: Provided nevertheless, that no exchange shall be made of any lands, tenements, and hereditaments held in right of any church, chapel, or other ecclesiastical benefice, without the consent, testified as aforesaid, of the patron thereof, and of the bishop of the diocese in which such benefice shall be situate.

*Allotments to be under the same Tenure as the Lands in respect of which they are allotted.*

XXXVI. Provided always, and be it further enacted, that the lands, grounds, and heredita-

ments which shall be allotted or exchanged by virtue of this Act shall be held in like manner, under and by virtue of the same terms and rents, and shall be thereafter deemed to be of the same quality and tenure, as the lands, tenements, or hereditaments in respect of which such allotment or allotments or exchanges shall be made were held or deemed to be of immediately before the making of every such allotment or exchange respectively: Provided always, that when the tithes of any common lands or fields agreed to be allotted or inclosed under the provisions of this Act belong to different persons or do not extend over the whole of such common lands or fields it shall be lawful for the commissioners or commissioner to allot the tithes as well as the land, in order that all persons may have tithe-free allotments in lieu of lands which were before exempted from tithes.

*For defraying Expence of Exchanges.*

XXXVII. Provided also, and be it further enacted, that all costs, charges, and expences attending the making any exchanges and partitions shall be paid and borne by the several persons making such exchanges and partitions in such manner and in such proportions as the said commissioner or commissioners shall, by any writing under his or their hands, order and direct.

*Ditches, &c. may be cleaned, altered, or widened.*

XXXVIII. And be it further enacted, that the said commissioner or commissioners shall and may scour out, widen, and alter all such ancient ditches, drains, watercourses, tunnels, gates, and bridges in the respective open common arable, meadow, or pasture lands or fields (or any one of them) hereby authorized to be allotted and inclosed, and also shall and may set out, widen, and make any new ditches, drains, watercourses, tunnels, gates, and bridges in, through, and over the lands and grounds hereby authorized to be divided, allotted, and inclosed, (the expences thereof to be raised and defrayed, as the other expences of executing the powers of this Act are herein directed to be raised and defrayed,) and of such breadth, depth, and dimensions, and in such directions, as the said commissioners shall think proper; and the said commissioner or commissioners shall and may and they are hereby directed and required in and by their awards to order and determine by whom, and at whose expence, and at what time and in what manner, the said ditches, drains, watercourses, tunnels, gates, and bridges shall be afterwards cleansed, scoured, and maintained, and also shall and may direct, order, and award all or any of the streams, springs, and watercourses within the said lands and fields hereby authorized to be divided, allotted, and inclosed to be carried, diverted, and turned into such courses, and through, over, and across such parts of the lands and fields hereby authorized to be divided, allotted, and inclosed, as they the said commissioners shall in their discretion judge proper for the draining or watering the several allotments so to be made as aforesaid.

*Power to Commissioners to make Drains through Lands not proposed to be inclosed, due Compensation being made for Damage done.*

XXXIX. Provided always, and be it enacted, that if it shall be necessary, for the purpose of carrying off the water from such drains as may be made under the authority of this Act, to make

drains through any land not to be inclosed, divided, or allotted under the same, it shall be lawful for the said commissioners and their servants to enter upon such lands, and make such drains accordingly, due compensation being made for any damage done to such lands thereby; and it shall be lawful for such commissioners in their award to direct by which of the persons to whom any allotment shall be made in any field so divided and inclosed such drains shall be maintained, and the persons so directed to maintain such drains shall maintain the same accordingly, and have the same authority to enter upon such lands as herein-before described, for the purpose of maintaining the same, as is herein-before given to the said commissioners and their servants for the making of the same, making due compensation for any damage which may be done to such lands.

*Upon the Consent of Seven-Eighths in Number and Value, an Inclosure may take place without the Intervention of Commissioners.*

XL. And be it enacted, that in case seven-eighths in number and value of the persons being seised, possessed of, entitled to, or interested in any open and common arable fields, or open and common meadow or pasture lands or fields in *England or Wales*, and any rights of common or any other rights therein, being persons having such estates or interests in the said lands, fields, or rights as are herein-before required for the purpose of consenting to any such proposed inclosure as aforesaid, shall by themselves or their known agents, or if covert, infants, idiots, or lunatic then by their husbands, guardians, or committees, at a public meeting to be called for that purpose in the manner and after the notice herein-before provided for, or at some adjournment thereof, enter into an agreement for such inclosure under the provisions of this Act, but without the intervention of commissioners, and for the discharge of the lands to be inclosed from all rights of common, and for the granting of compensation to such persons as may be possessed of such rights, whether consenting parties to any such agreement or not, and shall sign or seal (as the case may require) the schedule herein-after mentioned, every such inclosure shall, from and immediately after the expiration of the notices of such schedule having been deposited as herein-after mentioned, be as valid and effectual to all intents and purposes (subject only to the right of appeal herein-after given) as if the same had been effected by means of commissioners to be appointed under this Act.

*Schedule of Land proposed to be inclosed to be deposited with the Clerk of the Parish and the Clerk of the Peace; and a Notice thereof affixed on the Church-Door, and published in some Newspaper circulating in the Country.*

XLI. And be it further enacted, that before any land shall be inclosed under the provisions herein contained for inclosure without the assistance of commissioners, a schedule of such land, containing a correct description thereof, and signed by the persons proposing to make such inclosure, and also by the persons whose consent to such inclosure is herein-before required to be given, and whenever the inclosure shall be proposed to be made by any person having a less estate than a fee-simple or under disability, then accompanied by a copy of the several limitations contained in the deed or will under which such person may be entitled, shall be deposited with the clerk of the parish, township, or chapelry, and also with the

clerk of the peace of the county in which the land proposed to be inclosed may be situated; and a notice of such schedule having been so deposited (such notice containing a description of the land intended to be inclosed) shall be published in some newspaper usually circulating in the county wherein such land is situated, at three several times in three successive months after such schedule shall have been so deposited, and a copy thereof shall be affixed on the principal outer-door of the church or chapel of the parish or township in which the land may be situated, before the commencement of divine service, or if there be no church or chapel then in some conspicuous place there, for three successive *Sundays* after such schedule shall have been so deposited: Provided always, that whenever such inclosure shall be proposed to be made by a corporation aggregate, or the consent of a corporation aggregate shall be necessary thereto, the affixing of the common seal of such corporation to such schedule shall be deemed a sufficient compliance with the provisions of this Act.

*Incapacitated Persons enabled to enter into an Agreement for Compensation.*

XLII. And be it further enacted, that it shall be lawful for any person who shall be seised or possessed of or entitled in possession to any land or tenement in respect of which compensation may be proposed or ought to be given, or to which any right of common may attach, or who, having no land in the common field in which an inclosure is proposed to be made, may nevertheless have a right of common therein, whether such person shall be tenant in fee simple, or fee tail, general or special, or for life or lives, or by the courtesy of England, or for any other estate of freehold, or for years determinable on any life or lives, and also for any person whose right of common may be merely personal, and for the guardian, trustee, feoffee for charitable or other uses, husband, or committee of such person who shall be an infant, idiot, lunatic, or feme covert, or under any other disability, to consent and agree to the compensation which may be offered or which ought to be given by the persons making such inclosure, not only as to the nature and amount of such compensation, but as to the manner in which the same shall be secured, and to sign the agreement for that purpose; but no such agreement shall be valid if entered into by any person having a limited interest only, or by any incumbent of a benefice, without the consent of the same persons and to be testified in the same manner as herein-before required in the case of such persons being respectively parties to any agreement for inclosure: Provided always, that in case such compensation or any part thereof shall be agreed to be paid in money, and such money shall belong to any persons who in the said first-recited Act are mentioned or described as persons incapacitated to receive the same, then such money shall be paid and applied in such and the same manner as money belonging to such persons is directed to be applied under the provisions of the said first-recited Act.

*Persons having objections to such Inclosure to deposit them with the Clerk of the Peace, within Six Months.—To be open to Inspection.*

XLIII. And be it further enacted, that whenever any agreement for compensation may or may not have been entered into, and notwithstanding any such agreement, if any person interested in any such inclosure, other than a person who may have signed such agreement or otherwise consented thereto, shall

object to such inclosure, or to the nature or amount of any compensation which may be offered, or to the manner in which such compensation may be proposed to be secured, or on account of there not having been any compensation offered, it shall be lawful for him to state such objection in writing, and to deposit the same with the clerk of the peace at any time within six calendar months from the expiration of the aforesaid notices of the deposit of such schedule; and such schedule and copy of limitations, and every statement and document annexed to such schedule, and every statement of objection which may be so deposited, shall be open to the inspection of any person interested, and the deposit of such statement of objections in manner aforesaid shall be deemed and taken to be a sufficient notice to all persons interested in such inclosure.

*Clerk of the Peace to lay the Schedule &c. before the Justices at Quarter Sessions, who shall hear and determine upon such objections.*

XLIV. And be it further enacted, that the clerk of the peace shall cause the schedule and statement of objections, and all other papers relating thereto, and which shall have been so deposited with him, to be laid before the justices at the General Quarter Sessions of the Peace, or at some adjourned meeting thereof, which shall be held not earlier than twenty-eight days next after the deposit of such objections, in and for the county, riding, or division wherein the lands proposed to be inclosed, or the greater part thereof, shall be situate; and all such objections shall be heard and determined by the said justices in manner hereinafter provided.

*Persons interested in Allotments may sell the same before the Award; and Commissioners may allot them to the Purchasers.*

XLV. And be it further enacted, that it shall and may be lawful for any person or persons interested in the said allotments at any time to mortgage, sell, demise, or dispose of all such estate, right, title, interest, and property which he, she, or they shall then have in or to the said open and common arable, meadow, or pasture lands or fields (or any one of them), and of the allotments set out in lieu thereof, before the execution of the award of the said commissioner or commissioners; and it shall be lawful for the said commissioner or commissioners, and he or they are hereby authorized and required, upon the conveyance or other instrument by which such sale or disposition is confirmed being produced to them, and the execution thereof proved to their satisfaction, to allot the same to the purchaser or purchasers thereof respectively; and if not so allotted such conveyance or other instrument shall be valid and effectual in law, notwithstanding it may have been so made before the execution of the said award.

*Tenants for Life empowered to Allotments to defray Expenses.*

XLVI. And be it further enacted, that it shall be lawful for the said commissioner or commissioners, in case he or they shall be requested by writing under the hand or hands of any person or persons being tenant for life, or other person being in possession of, but not having the absolute estate or interest in, any lands hereby authorized to be allotted and inclosed, to sell and dispose of any part or parts of the allotment or allotments belonging to such person or persons, for the purpose of defraying his, her, or their shares of the costs, charges, and expences of putting into execution this Act and the said recited Act of the forty-first year of the reign of His late Majesty King George the Third, and the

expences of fencing, ditching, subdividing, and inclosing such allotment or allotments; and the said commissioners shall accordingly sell such part or parts of such allotment or allotments, either by private contract or public auction, as they shall think proper, to such person or persons as shall be willing to purchase the same, and shall convey the same to such purchaser or purchasers by any deed under their hands and seals; and the receipt of the said commissioners for such money shall be a full and complete discharge to such purchaser or purchasers for such purchase money; and the said commissioners shall apply the purchase money in or towards the payment of such expences, and in fencing, ditching, subdividing, and inclosing the said allotment or allotments respectively, and not otherwise; but such purchaser or purchasers shall not be liable to see to the necessity or expediency of such sale, nor be answerable nor accountable for the misapplication of such purchase money; and upon the payment of such purchase money or purchase monies into the hands of the said commissioner or commissioners, the lands so to be sold as last aforesaid shall thereupon be vested in fee simple in possession (if such allotment or allotments is or are made in right of freehold) in the purchaser or purchasers thereof, and the same shall be thenceforth held in severalty by such purchaser or purchasers thereof respectively, as his, her, or their private property, and shall be allotted accordingly by the said commissioner or commissioners.

*When Allotments to a Tenant for Life are in different Parishes, Commissioners may sell the Land in one Parish to defray Expences attending the other Portion of the Allotment.—Proviso.*

XLVII. Provided always, and be it further enacted, that where any allotment or allotments so to be made to any person or persons being tenant for life or in tail, or other person being in possession, but not having the absolute estate or interest in any lands hereby authorized to be allotted and inclosed, which stand limited to the same uses, shall be situated partly in one and partly in another parish or township or place, it shall and may be lawful to and for the said commissioner or commissioners, in case they shall be requested as last herein-before mentioned, to sell and dispose of, and to convey and assure to the purchaser or purchasers thereof, any part or parts of the said allotments belonging to such person or persons in any one or more of the said parishes, townships, or places, in manner in that behalf herein-before mentioned, as well for the purpose of defraying his, her, or their share or shares of the costs, charges, and expences of putting into execution this Act and the said recited Act, and the expences of fencing, ditching, subdividing, and draining such allotment or allotments in respect of such of the said lands as are situated within the same parish wherein the said allotment or allotments so sold may be situated, as for and in respect of such of the said lands or other hereditaments or allotments as may be situated in any other township or place: Provided always, that it shall not be lawful to raise by such sale any further or greater sum of money than the person or persons part of whose allotment or allotments may be sold or disposed of would have been empowered and authorized to borrow or charge upon his, her, or their allotment or allotments under or by virtue of the said recited Act or this Act, reckoning five pounds for each and every acre of such allotment or allotments.

*Not to charge Lands with Expences unless the Sum to arise by the Sale shall be less than 5l per Acre.*

XLVIII. Provided always, and be it further en-

acted, that it shall not be lawful for the proprietor or person from whose allotments lands shall be as aforesaid deducted to charge his, her, or their lands or hereditaments, by virtue of the said recited Act or this Act, with any money towards payment of such expences, unless the money to arise by such sale shall be less than the sum of five pounds per acre: and then and in such case it shall be lawful for such person or persons to charge his, her, or their estate or estates with, or to raise by mortgage thereof, or other means or ways, as mentioned in the said recited Act or this Act, such further sum of money as may be necessary for the payment of the expences of executing this Act, and subdividing the said allotments, as, together with the value of the lands so deducted, shall not exceed the amount that might be borrowed and charged on the lands to be divided and allotted at the rate of five pounds for each and every acre.

*For Payment of Expences of measuring, dividing, allotting, and inclosing Open and Common Lands.*

XIX. And be it further enacted, that the charges and expences of surveying, valuing, planning, measuring, dividing, and allotting the said open and common arable, meadow, or pasture lands of fields hereby authorized to be divided, allotted, and inclosed, and of fencing the lands of the persons from whom a deduction of land shall be made as herein-before directed, and also the expences of preparing and enrolling the awards of and the allowances and payments to be made to the said commissioner or commissioners, umpire, and surveyors respectively, as herein-before directed, and all other charges and expences incident to or attending the carrying this Act into execution, shall be paid, borne, and defrayed by all the proprietors of the lands and hereditaments so authorized to be divided, allotted, and inclosed, or exchanged, in such proportions as the said commissioner or commissioners shall settle and adjust, and determine, to be paid at such time or times and to such person or persons as they the said commissioner or commissioners shall order and direct; notice thereof in writing under their hands being given thirty days before the time such payment shall be required: Provided always, that in case any number of persons whose allotments shall not exceed two acres respectively shall have required their allotments to be thrown together as aforesaid, such persons shall not be liable to pay, bear, or defray any part of the charges and expences as aforesaid: Provided also, that it shall be lawful for four-fifths in number and value of the proprietors and persons interested as aforesaid, at any meeting to be held as herein-before is mentioned, to agree that any persons whose allotments shall not exceed five acres respectively shall not be liable to pay, bear, or defray any part of the charges and expences aforesaid, and such persons shall by virtue of such agreement be exempt from all liability thereto.

*Commissioners to account.*

L. And be it further enacted, that once at least in every year, to be computed from the first appointment of such respective commissioner or commissioners, the accounts of the said commissioners, commissioner, or umpire, containing a true statement of all and every sum and sums of money by them received and expended, or due to them for their trouble and expence in the execution of this Act and the said recited Act of the forty-first year of the reign of his late Majesty King George the Third, until such account shall be finally settled, shall, together with the vouchers relating to the same, be by them laid before three of his Majesty's justices of the peace for

the county in which the lands to be inclosed, or the greater part of them, shall be situated, to be by them examined and balanced; and such balance shall be stated in the books of account to be kept in the office of the clerk of the said commissioners; and no charge or item in such account shall be binding on the parties concerned, or valid in law, unless the same shall be so allowed: Provided also, that it shall not be lawful for the commissioners to be appointed in pursuance of this Act, or any of them, to retain or pay to themselves or clerk, out of any monies to be received by them or over which they may have any control in the execution of any inclosure to be effected under this Act, any sum or sums of money on account of any allowance herein-before directed to be made to such commissioners and clerk respectively beyond one-third of such allowance as they shall respectively be entitled to as aforesaid, until after the expiration of six calendar months from the day of the delivery of the award hereby directed to be made in the church of the parish in which the lands inclosed may be situated.

*Awards.*

LI. And be it further enacted, That the said commissioner or commissioners shall make and execute awards, with maps or plans thereto annexed, and shall cause the same to be enrolled in manner as directed by the said recited Act; and such awards shall be deposited in the respective parish churches of the parishes wherein the lands so to be allotted and inclosed, or the greater part thereof, are situated.

*Provisions of Recited Acts, where not Altered or Repealed, extended to this Act.*

LII. And be it further enacted, That all and every the clauses, provisions, and enactments contained in the said Act of the forty-first year of the reign of King George the Third and of the first year of the reign of King George the Fourth, or such of them as are applicable to and consistent with the purposes and object of this Act, shall and may be in full force and effect for carrying into effect the allotments, divisions, inclosures, and exchanges hereby authorized to be made, as fully and effectually as if such clauses, provisions, and enactments had been herein repeated and re-enacted, and been made part of this Act, with such alterations and variations as would adapt them and render them applicable to the object and purposes of this Act.

*Appeal to Quarter Sessions where Parties think themselves aggrieved.*

LIII. And be it further enacted, That it shall be lawful for all persons who shall think themselves aggrieved by any thing done by virtue of this Act or the said recited Act (except in cases where the things so done are herein or by the said Act of the forty-first year of his late Majesty King George the Third declared to be final, binding, and conclusive,) to appeal to the General Quarter Sessions of the Peace which shall be held in and for the county, riding, or division wherein the lands, or the greater part thereof, in respect of which the matter of complaint may arise, shall be situated, or any adjournment thereof within six calendar months next after the cause of complaint shall have arisen, first giving or causing to be given twenty-eight days notice thereof in writing to the said commissioner or commissioners, or one of them, or to the parties intended to be appealed against: and the justices at their said Quarter Sessions, or any adjournment thereof, are hereby authorized and required to hear and determine the matter of every such appeal, and shall also hear and determine any appeal against the

sum agreed to be paid to any commissioner or surveyor, or against the adoption of any plan, map, admeasurement, or valuation, or against any rules, conditions, and principles which may have been agreed upon in manner aforesaid for the guidance of the commissioner or commissioners or umpire in making allotments, and shall also hear and determine all objections (if any) which may have been made in manner aforesaid to any inclosure without the assistance of commissioners, or to the nature or amount of the compensation which may have been offered, or to the manner in which the same may have been proposed to be secured, or on account of there not having been any compensation offered, and to make such order in every such case respectively, and to award such costs, as to them in their discretion shall seem meet, and by their warrant to levy the costs awarded by distress and sale of the goods and chattels of the parties respectively adjudged to pay the same, rendering the overplus (if any) to the respective owners of such goods and chattels, after deducting the reasonable charges of such distress and sale; and every determination of the said justices shall be final and conclusive on all parties concerned; and no such complaint, appeal, or proceeding shall be removed or removeable by certiorari or any other writ or proceeding whatsoever into any of his Majesty's Courts of Record at Westminster or elsewhere; but in case such appeal shall appear to the said justices to be frivolous, vexatious, or without foundation, then the said justices shall award such costs to be paid by the appellant or appellants as to them in their discretion shall seem reasonable, and to be levied in manner aforesaid.

*Act not to affect Rights of Lords of Manors.*

LIV. Provided always, and be it further enacted, That nothing in this Act contained shall in any case authorize the inclosure of any waste whatsoever, whether the soil thereof shall or shall not be vested in the Lord of any Manor, and whether with or without the assent of the Lord of such Manor; nor shall any thing in this Act contained prejudice, lessen, or defeat the right, title, or interest of the respective Lords for the time being of any such Manors in or to any of the royalties or seignories, fisheries, manorial and other rights, customs, and services incident or belonging to the said respective Manors or any of them; but that such respective Lords, and all and every person and persons claiming in trust for him or them as such respective Lords for the time being of the said several and respective Manors, shall and may at all times for ever hereafter have, hold, receive, take, and enjoy all rents, services, courts, perquisites and profits of courts, fines, goods and chattels of felons and fugitives, felons of themselves and put in exigent, deodands, waifs, estrays, and forfeitures, privileges and jurisdictions of their several and respective manors, to the respective Lords thereof, or any person or persons claiming under him or them, incident, belonging, or appertaining, except in respect of any land or estate for which compensation is herein-before authorized to be made, in as full, ample, and beneficial manner to all intents and purposes as the same might or ought to have been held and enjoyed in case this Act had not been passed.

*Act not to authorize the Inclosure of any Open or Common Fields within certain Distances of large Towns.*

LIV. Provided always, and be it further enacted, that nothing in this Act contained shall authorize the inclosure of any open or common arable fields, or of any open or common meadow or pasture lands or fields, situate, and being within ten miles of the city

of London, or of any open or common meadow or pasture lands or fields situate and being within one mile of any city or town of five thousand inhabitants, or within one mile and a half of any city or town of fifteen thousand inhabitants, or within two miles of any city or town of thirty thousand inhabitants, or within two miles and a half of any city or town of seventy thousand inhabitants, or within three miles of any city or town of one hundred thousand inhabitants, provided that in all cases the number of such inhabitants shall be ascertained by the then last Parliamentary census thereof, and that such distance shall be measured in a direct line from the town hall if there shall be any town hall, or if there shall be no such town hall, then from the cathedral or church, if there shall be only one church, or if there shall be more churches than one then from the principal market place of any such city or town.

*Meaning of certain Words in this Act.*

LVI. And be it further enacted, that the words and expressions herein-after mentioned, which in their ordinary signification have a more confined or a different meaning, shall in the construction of this Act, except when the nature of the provision or the context of the Act exclude such construction, be interpreted as follows; (that is to say,) the words "Proprietor" "owner," and "person," shall respectively extend as well to an individual as to a body politic, corporate or collegiate, and to a corporation as well aggregate as sole, whether such corporation be eleemosynary or civil, ecclesiastical or lay; the word "benefice" shall extend to and be taken to comprehend rectories, vicarages, donatives, perpetual curacies, parochial and consolidated chapelries and churches, and chapels having a district assigned thereto; the word "tithes" shall extend to any rent-charge or payment in lieu of tithes; the word "land" shall extend to every species of land, whether arable, meadow, or pasture, and whether freehold, copyhold, or customary, or held by any other tenure, and as well to one piece or parcel as to any number of pieces or parcels of land: the word "parish" shall be construed to include any parish, township, liberty, precinct, vill, village, hamlet, tithing, chapelry, or any other place or division or district of a place, whether parochial, or extra-parochial; and every word importing the singular number only shall extend and be applied to several persons or things as well as one person or thing.

*Saving the Rights of His Majesty in respect of the Duchy of Cornwall, or of the Duke of Cornwall for the time being.*

LVII. Provided further, and be it enacted, that nothing in this Act contained shall extend or be construed to extend to affect, prejudice, or derogate from the estate, right, title, interests, privileges, or

authority of the King's most Excellent Majesty, his heirs and successors, in right or in respect of his Duchy of Cornwall, or of the Duke of Cornwall for the time being, or to authorize, sanction, or permit the inclosure of any lands, grounds, tenements, or hereditaments whatsoever, or give any right or title whatsoever to any encroachment or intake heretofore made thereupon, or otherwise affect any lands, grounds, tenements, or hereditaments whatsoever belonging to or held of or being within and forming part and parcel of any manor, messuage, or tenement, open field, pasture, common, or other land or ground whatsoever, or any advowson, rectory, or vicarage, parcel of the possessions of the Duchy of Cornwall, or wherein or whereunto, or over, upon, or with reference whereto, His Majesty, in respect of his said Duchy of Cornwall, or the Duke of Cornwall for the time being, may have or claim to have any estate, right, title, or interest whatsoever, nor at any time or times be admitted in any court of law or equity or otherwise considered as evidence upon any occasion to affect in any manner his Majesty, his successors, in right or in respect of his said Duchy of Cornwall, or the Duke of Cornwall for the time being.

*Saving as to the Duchy of Lancaster.*

LVIII. Provided always, and be it further enacted, that nothing in this Act contained shall authorize the inclosure of any open land in, to, or over which his Majesty, in right of his Crown or of his Duchy of Lancaster has or may have or claim to be entitled to any estate, right, title, or interest whatsoever.

*General Saving.*

LIX. Saving always to the King's most Excellent Majesty, his heirs and successors, and to all and every other person and persons, bodies politic and corporate, ecclesiastical and civil, his, her, or their respective heirs, successors, executors, and administrators, (other than and except the persons to whom any allotment or compensation shall be made by virtue of this Act, in respect of the interest or property for which such allotment or compensation shall be made to them in respect of such right, and except such other rights and interests as the intents and purposes hereby authorized shall absolutely require to be barred, destroyed, or extinguished by this Act, and all persons respectively claiming under them or in remainder after them,) all such estate, right, title, interest, claim and demand as they, every or any of them, had or enjoyed of, in, to, or out of the said open and common arable, meadow, or pasture lands or fields hereby authorized to be divided, allotted, and inclosed, before the passing this Act, or the carrying the powers thereof into execution, or could or might have held or enjoyed in case this Act had not been made, or the powers thereof had not been carried into execution.

## N O T I C E.

The Introduction to the “COMMON FIELDS INCLOSURE ACTS” will be ready with the Number for January, so as to be bound up with the Acts at the end of the Fifth Volume of the FARMER’S MAGAZINE, and will make in the whole 49 pages.

---

### TO CORRESPONDENTS.

To “FAIR-PLAY.”—Mr. Cayley’s answer to Mr. Shaw Lefevre, shall appear in the FARMER’S MAGAZINE for January. It is omitted solely from press of other important matter.

## NOTICE.

---

The INTRODUCTION, NOTES, and INDEX to the “Common Fields Inclosure Act,” will appear in THE FARMER’S MAGAZINE for DECEMBER; so that the whole may bind up together at the end of the Volume which terminates the year.

# AN ACT

FOR

CONSOLIDATING IN ONE ACT CERTAIN PROVISIONS USUALLY INSERTED IN ACTS OF INCLOSURE, AND FOR FACILITATING THE MODE OF PROVING THE SEVERAL FACTS USUALLY REQUIRED ON THE PASSING OF SUCH ACTS.

41. GEORGE III.

[2nd July, 1801.]

*No Person shall act as a Commissioner under any future Act for inclosing Lands, except signing Notice of First Meeting, and administering an Oath, until he shall have taken the Oath herein mentioned.*

WHEREAS, in order to diminish the expence attending the passing of Acts of inclosure, it is expedient that certain clauses usually contained in such Acts should be comprised in one law, and certain regulations adopted for facilitating the mode of proving the several facts usually required by Parliament on the passing of such Acts: May it therefore please your Majesty that it may be enacted; and be it enacted by the King's most Excellent Majesty, by and with the advice and consent of the lords spiritual and temporal, and commons, in this present Parliament assembled, and by the authority of the same, that no person shall be capable of acting as a commissioner in the execution of any of the powers to be given by any Act hereafter to be passed for dividing, allotting, or inclosing any lands or grounds, except the power of signing and giving notice of the first meeting of the commissioner or commissioners for executing any such Act, and of administering the oath or affirmation herein-after directed, until he shall have taken and subscribed the oath or affirmation following:

'I A. B. do swear, [or, being one of the People called Quakers, do solemnly affirm,] that I will faithfully, impartially, and honestly, according to the best of my skill and ability, execute and perform the several trusts, powers, and authorities vested and reposed in me as a commissioner by virtue of an Act for [here insert the Title of the Act], according to equity and good conscience, and without favour or affection, prejudice or partiality, to any person or persons whomsoever. So help me God.'

*Oath and Appointment to be inrolled with the Award.*

Which oath or affirmation it shall be lawful for any one of the commissioners, where more than one shall be appointed by any such Act, or any one justice of the peace for the county within which the said lands or grounds shall be situated, where only one commissioner shall be so appointed, to administer, and they are hereby respectively required to administer the same; and the said oath or affirmation so to be taken and subscribed by each commissioner, and also the appointment of every new commissioner, shall be annexed to and inrolled with the award of any commissioner or commissioners, and a copy of the

inrolment thereof shall be admitted as legal evidence.

*Commissioners declining to act to give Notice of such Intention.—Commissioners not to be Purchasers for a limited Time.*

II. And be it further enacted, that every person appointed a commissioner in or by virtue of any such Act, who shall refuse or decline to act as such, shall forthwith give notice in writing to the other commissioner or commissioners of his intention to refuse or decline acting as a commissioner: Provided always, that no such commissioner shall be capable of being a purchaser of any part or parts of the lands, tenements, or hereditaments within any parish in which the lands and grounds intended to be inclosed are situate, either in his own name or in the name or names of any person or persons, until five years after the date and execution of the award to be made by any such commissioner or commissioners.

*Boundaries of Parishes to be ascertained.—Description of Boundaries to be delivered to one of the Churchwardens &c. of the respective Parishes, and the Lords of Manors, or their Stewards.—Appeal to Quarter Sessions.*

III. And whereas disputes or doubts may arise concerning the boundaries of parishes, manors, hamlets, or districts to be divided and inclosed, and of parishes, manors, hamlets, or districts adjoining thereto; be it therefore enacted, That the commissioner or commissioners appointed in or by virtue of any such Act shall and he or they is and are hereby authorized and required, by examination of witnesses upon oath or affirmation (which oath or affirmation any one of such commissioners is hereby empowered to administer), and by such other legal ways and means as he or they shall think proper, to inquire into the boundaries of such several parishes, manors, hamlets, or districts; and in case it shall appear to such commissioner or commissioners that the boundaries of the same respectively are not then sufficiently ascertained and distinguished, such commissioner or commissioners shall and he or they is and are hereby authorized and required to ascertain, set out, determine, and fix the same respectively; and after the said boundaries shall be so ascertained, set out, determined, and fixed, the same shall and are hereby declared to be the boundaries of such parishes, manors, hamlets, or districts: Provided always, that

such commissioner or commissioners (before he or they proceed to ascertain and set out the boundaries of such parishes, manors, hamlets, or districts,) shall, and he or they is and are hereby required to give public notice, by writing under his or their hands to be affixed on the most public doors of the churches of such parishes, and also by advertisement to be inserted in some newspaper to be named in such Act, and also by writing to be delivered to or left at the last or usual places of the abode of the respective lords or stewards of the lords of the manors in which the lands and grounds to be inclosed shall besituate, and of such adjoining manor or manors, ten days at least before the time of setting out such boundaries, of his or their intention to ascertain, set out, determine, and fix the same respectively; and such commissioner or commissioners shall, within one month after his or their ascertaining and setting out the same boundaries, cause a description thereof in writing to be delivered to or left at the places of abode of one of the churchwardens or overseers of the poor of the respective parishes, and also of such respective lords or stewards: Provided always, that if any person or persons interested in the determination of the said commissioner or commissioners respecting the said boundaries shall be dissatisfied with such determination, such person or persons may appeal to the justices of the peace acting in and for the county in which such lands or grounds shall be situate, at any general quarter session of the peace to be holden within four calendar months next after the aforesaid publication of the said boundaries, by delivering or leaving such description as aforesaid, the party or parties making such appeal giving eight days notice of such appeal, and of the matter thereof, in writing to the commissioners; and the decision of the said justices therein shall be final and conclusive, and shall not be removed or removable by certiorari, or any other writ or process whatsoever, into any of his Majesty's courts of record at Westminster or elsewhere.

*A Survey, Admeasurement, Plan, and Valuation of the Lands, &c. to be inclosed, shall be made.—Proprietors may inspect Admeasurements and Plans, and take Copies.*

IV. And be it further enacted, That a true, exact, and particular survey, admeasurement, plan, and valuation of all the lands and grounds to be divided, allotted, and inclosed by any such Act, and also of all the messuages, cottages, orchards, gardens, homesteads, ancient inclosed lands and grounds within any such parish or manor, shall be made and reduced into writing by such commissioner or commissioners, or by such other person or persons as he or they shall nominate and appoint, as soon as conveniently may be, for the purposes of such Act; and the number of acres and decimal parts of an acre in statute measure, contained in all the lands and grounds directed or authorized to be divided, allotted, and inclosed, and also in all the ancient inclosed lands, grounds, and homesteads aforesaid, and of each and every proprietor's distinct property in the same respectively at the time of making such survey and admeasurement, shall be therein set forth and specified; and that the said survey, admeasurement, plan, and valuation shall be kept by such commissioner or commissioners; and the person or persons who shall make such survey, admeasurement, plan, and valuation shall verify the same upon oath or affirmation at any meeting to be held after the making thereof (which oath or affirmation the commissioners, or any one of them, are and is hereby empowered and required to administer); and the proprietors and their

respective agents, and all persons interested therein, shall at all seasonable times have liberty to peruse and inspect such admeasurement and plan only, and to take copies thereof and extracts therefrom respectively.

*Lands may be entered upon to make Surveys, &c.—Maps made at the time of passing Act may be used without making new ones.*

V. And be it further enacted, That for surveying, admeasuring, and valuing all the said lands and grounds, and for other the purposes of such Act, it shall be lawful for such commissioner or commissioners, every or any of them, or the person or persons to be appointed by him or them to make such survey, admeasurement, plan, and valuation, together with their and every of their assistants and servants, at any time or times whatsoever, until such division shall be completed, to enter, view, and examine, survey, and admeasure, all and every part of the lands and grounds intended to be divided and allotted, and also all the ancient inclosed lands, grounds, and homesteads directed to be surveyed, and to do or cause to be done any Act or thing necessary for putting such Act into execution: Provided always, that any map or survey made at the time of passing any such Act, which shall be tendered to such commissioner or commissioners, and which shall be in his or their judgment and to his or their satisfaction a just and true map or survey proper for the purpose of carrying such Act into execution, may be used for that purpose, if the said commissioner or commissioners shall think fit, without any new map or survey being made of such part of the lands and grounds as shall be comprised in any such approved map or survey as aforesaid.

*Claimants of Rights in Lands to be inclosed to deliver to the Commissioners Schedules of Particulars, or shall be excluded, which Claims may be inspected, and Copies taken.—Objections to Claims to be delivered to the Commissioners at or before the Meeting for that Purpose, or shall not be received, except for special Cause.*

VI. And be it further enacted, That all persons and bodies corporate or politic, who shall have or claim any common or other right to or in any such lands so to be inclosed, shall deliver or cause to be delivered to such commissioner or commissioners, or one of them, at some one of such meetings as the said commissioner or commissioners shall appoint for the purpose, (or within such further time, if any, as the said commissioner or commissioners shall for some special reason think proper to allow for that purpose,) an account or schedule in writing, signed by them, or their respective husbands, guardians, trustees, committees, or agents, of such their respective rights or claims, and therein describe the lands and grounds, and the respective messuages, lands, tenements, and hereditaments in respect whereof they shall respectively claim to be entitled to any and which of such rights in and upon the same, or any part thereof, with the name or names of the person or persons then in the actual possession thereof, and the particular computed quantities of the same respectively, and of what nature and extent such right is, and also in what rights and for what estates and interests they claim the same respectively, distinguishing the freehold from the copyhold or leasehold; or on noncompliance therewith, every of them making default therein shall, as far only as respects any claim so neglected to be delivered, be totally barred and excluded of and from all right and title in or upon such lands so to be divided respectively, and of and from all benefit and advantage in or to

any share or allotment thereof; all which said claims or accounts shall, at all reasonable times until after the execution of the said award, be open to the inspection and perusal of all parties interested or claiming to be interested in the premises, their respective agents or attorneys, who may take copies thereof or extracts therefrom respectively; and if any person or persons, or bodies politic or corporate, interested or claiming to be interested in the premises, shall have any objection to offer to any such account or claim, the particulars of such objection shall be reduced into writing and signed by them, or their respective husbands, guardians, trustees, committees, or agents, and shall be delivered to the said commissioner or commissioners at or before some other meeting of such commissioner or commissioners, to be by him or them appointed for that purpose; and no such objection shall afterwards be received, unless for some legal disability or special cause to be allowed by the said commissioner or commissioners.

*Commissioners not hereby authorized to determine Disputes touching Rights; but they shall assign the Allotments to the Persons in actual Possession of the Lands in lieu whereof made.*

VII. Provided also, and be it further enacted, That nothing herein contained shall authorize such commissioner or commissioners to hear and determine any difference or dispute which may arise touching the right or title to any lands, tenements, or hereditaments; but such commissioner or commissioners shall assign and set out the several allotments directed to be made unto the person or persons who at the time of the division and inclosure shall have the actual seisin or possession of the lands, tenements, or hereditaments in lieu or in right whereof such allotment shall be respectively made: Provided also, that no difference or suit touching the title to any lands, tenements, or hereditaments shall impede or delay the commissioner or commissioners in the execution of the powers vested in him or them by virtue of any such Act, but the division or inclosure directed to be made shall be proceeded in, notwithstanding such difference or suit.

*Commissioners before making any Allotments, to appoint public Carriage Roads, and prepare a Map thereof, to be deposited with their Clerk, and give Notice thereof, and appoint a Meeting, at which, if any person shall object, the Commissioners, with a Justice of the Division, shall determine the Matter.—If the Commissioners by any Bill shall be empowered to stop up any old Road, it shall not be done without the Order of Two Justices, and which shall be subject to Appeal to the Quarter Sessions.*

VIII. And be it further enacted, That such commissioner or commissioners shall and he or they is and are hereby authorized and required, in the first place, before he or they proceed to make any of the divisions and allotments directed in and by any such Act, to set out and appoint the public carriage roads and highways through and over the lands and grounds intended to be divided, allotted, and inclosed, and to divert, turn, and stop up any of the roads and tracts upon and over all or any part of the said lands and grounds, as he or they shall judge necessary, so as such roads and highways shall be and remain thirty feet wide at the least, and so as the same shall be set out in such directions as shall, upon the whole, appear to him or them most commodious to the public; and he or they are hereby further required to ascertain the same by marks and bounds, and to prepare a map in which such intended roads

shall be accurately laid down and described, and to cause the same, being signed by such commissioner, if only one, or the major part of such commissioners, to be deposited with the clerk of the said commissioner or commissioners, for the inspection of all persons concerned, and as soon as may be after such carriage roads shall have been so set out and such map so deposited, to give notice in some newspaper to be named in such bill, and also by affixing the same upon the church door of the parish in which any of the lands so to be inclosed shall lie, of his or their having set out such roads and deposited such map, and also of the general lines of such intended carriage roads, and to appoint in and by the same notice a meeting to be held by the said commissioner or commissioners, at some convenient place in or near to the parish or township within which the said inclosure is to be made, and not sooner than three weeks from the date and publication of such notice, at which meeting it shall and may be lawful for any person who may be injured or aggrieved by the setting out of such roads to attend; and if any such person shall object to the setting out of the same, then such commissioner or commissioners, together with any justice or justices of peace acting in and for the division of the county in which such inclosure shall be made, and not being interested in the same, who may attend such meeting, shall hear and determine such objection, and the objections of any other such person, to any alteration that the said commissioner or commissioners, together with such justice or justices, may in consequence propose to make, and shall and he or they are hereby required, according to the best of their judgment upon the whole, to order and finally direct how such carriage roads shall be set out, and either to confirm the said map, or make such alterations therein as the case may require: Provided always, that in case such commissioner or commissioners shall by such bill be empowered to stop up any old or accustomed road passing or leading through any part of the old inclosures in such parish, township, or place, the same shall in no case be done without the concurrence and order of two justices of the peace acting in and for such division, and not interested in the repair of such roads; and which order shall be subject to an appeal to the quarter sessions, in like manner and under the same forms and restrictions as if the same had been originally made by such justice as aforesaid.

*The Carriage Roads shall be fenced on both Sides by such of the Land Owners as the Commissioners shall direct; and no Person shall erect any Gate across any Road, or plant any Trees on the Sides, at less than Fifty Yards Distance.—The Commissioners shall appoint Surveyors, and if with a Salary, such Salary and the Expence of making the Road, over and above the Statute Duty, shall be raised as other Expenses, and paid on or before Execution of the Award.—Surveyors to be subject to the Control of the Justices, and shall account to them for Monies received.—Justices may levy Rates.—If Surveyors neglect to complete Roads within a limited Time, they shall forfeit 20l. and the Inhabitants shall not be chargeable to them (except Statute Duty) till declared to be completed at a Special Sessions.*

IX. And be it further enacted, That such carriage roads so to be set out as aforesaid shall be well and sufficiently fenced on both sides by such of the owners and proprietors of the lands and grounds intended to be divided, allotted, and inclosed, and within such time, as such commissioner or commissioners shall by any writing under his or their hands direct or appoint; and that it shall not be lawful for any person

or persons to set up or erect any gate across any such carriage road, or to plant any trees in or near to the hedges on the sides thereof at a less distance from each other than fifty yards; and such commissioner or commissioners shall and he or they is and are hereby empowered and required, by writing under his or their hands, to nominate and appoint one or more surveyor or surveyors, with or without a salary, for the first forming and completing such parts of the said carriage roads as shall be newly made, and for putting into complete repair such part of the same as shall have been previously made; which salary (if any), and also the expence of forming, completing, and repairing such roads respectively, over and above a proportion of the statute duty on the roads so to be repaired, shall be raised in like manner as the charges and expences of obtaining and passing any such Act and of carrying the same into execution shall be thereby directed to be raised, and shall be paid to such surveyor or surveyors on or before the execution of the award of such commissioner or commissioners; and in case the same shall be thereby provided to be raised by sale of any part of the lands so to be divided and inclosed, that then such commissioner or commissioners shall make a conditional rate upon the owners and proprietors of the same, in case the produce of such sale shall prove insufficient for the purposes aforesaid; and such surveyor or surveyors shall and he or they is and are hereby directed to be in all respects subject to the jurisdiction and controul of the justices of the peace acting in and for the county in which such roads shall respectively lie, and shall account to such justices in like manner for all monies so to be by him or them received and expended, and for the repayment of any surplus which may remain in his or their hands to such persons as shall have been made liable to contribute thereto, according to the proportion so as above ascertained by such commissioner or commissioners; and such justices shall have the like powers of levying any such rate as may by them be thought necessary for the purposes aforesaid, according to the proportions previously ascertained by such commissioner or commissioners, as if such surveyor or surveyors had been appointed under or by virtue of the general highway Act passed in the thirteenth year of the reign of his present Majesty; and in case such surveyor or surveyors shall neglect to complete and repair such roads respectively within the space of two years after such award, unless a further time, not exceeding one year, shall for that purpose be allowed by such justices, and then within such further time, he or they shall forfeit the sum of twenty pounds: and the inhabitants at large of the parish, township, or place wherein such roads shall be respectively situate shall be in no wise charged or chargeable towards forming or repairing the said roads respectively, except such proportion of such statute duty as aforesaid, till such time as the same shall, by such justices in their special sessions, be declared to be fully and sufficiently formed, completed, and repaired; from which time, and for ever thereafter, the same shall be supported and kept in repair by such persons and in like manner as the other public roads within such parish, township, or place are by law to be amended and kept in repair.

*Commissioners shall appoint Private Roads, &c.*

X. And be it further enacted, That such commissioner or commissioners shall and he or they is and are hereby empowered and required to set out and appoint such private roads, bridleways, footways, ditches, drains, watercourses, watering places, quarries, bridges, gates, stiles, mounds, fences,

banks, bounds, and land marks in, over, upon, and through, or by the sides of the allotments to be made and set out in pursuance of such Act, as he or they shall think requisite, giving such notice and subject to such examination as to any private roads or paths as are above required in the case of public roads; and the same shall be made, and at all times for ever thereafter be supported and kept in repair, by and at the expense of the owners and proprietors for the time being of the lands and grounds directed to be divided and inclosed, in such shares and proportions as the commissioner or commissioners shall in and by his or their award order and direct.

*The Grass and Herbage on Roads shall belong to the Proprietors of the Lands adjoining on either side; and all Roads which shall not be set out shall be allotted and inclosed. No Turnpike Road shall be altered without the Consent of the Trustees.*

XI. And be it further enacted, That after such public and private roads and ways shall have been set out and made, the grass and herbage arising thereon shall for ever belong to and be the sole right of the proprietors of the lands and grounds which shall next adjoin the said roads and ways on either side thereof, as far as the crown of the road; and all roads, ways, and paths over, through, and upon such lands and grounds, which shall not be set out as aforesaid, shall be for ever stopped up and extinguished, and shall be deemed and taken as part of the lands and grounds to be divided, allotted, and inclosed, and shall be divided, allotted, and inclosed accordingly: Provided that nothing herein contained shall extend or be construed to extend to give such commissioner or commissioners any power or authority to divert, change, or alter any turnpike road that shall or may lead over any such lands and grounds, unless the consent of the majority of the trustees of such turnpike roads, assembled at some public meeting called for that purpose on ten days notice, be first had and obtained.

*Commissioners in making Allotments to have Regard to the Situation of Houses as well as the Quantity and Quality of Land, as far as may be consistent with general Convenience.*

XII. And be it further enacted, That such commissioner or commissioners, in making the several allotments directed by any such Act, shall have due regard as well to the situation of the respective houses or homesteads of the proprietors as to the quantity and quality of the lands and grounds to be allotted to them respectively, so far as may be consistent with the general convenience of the said proprietors; and that such commissioner or commissioners, in making the said allotments, shall have particular regard to the convenience of the owners or proprietors of the smallest estates in the lands and grounds directed to be allotted and exchanged.

*Commissioners may direct small Allotments to be laid together and ring-fenced, and stocked and depastured in common by the Proprietors.*

XIII. And whereas the proprietors and persons interested in open common fields, meadows, pastures, commons, and waste lands directed to be divided and allotted, whose allotments thereof will be small and expensive to inclose, may be desirous of stocking and depasturing their allotments in common, and of sharing such produce as may grow thereon, under proper regulations; be it therefore further enacted, That such commissioner or commissioners shall be and he or they is and are hereby fully authorized and empowered, on application of the

parties interested at their first or second meeting for receiving claims, and on an attentive view and full consideration of the premises, to award, order, and direct any such allotments to be laid together and ri.g-fenced, and to be stocked and depastured in common, and to make such orders and regulations for the equitable enjoyment thereof, and for the participation of any produce growing or to grow thereon, as such commissioner or commissioners may think beneficial and proper for the said several parties interested therein.

*Allotments to be in full Compensation for all Rights in the Lands, which shall cease on Notice from the Commissioners being affixed on the Door of the Parish Church.*

XIV. And be it further enacted, That the several shares of and in any lands or grounds which shall upon any division be assigned, set out, allotted, and applied unto and for the several persons who shall be entitled to the same, shall, when so allotted, be and be taken to be in full bar of and satisfaction and compensation for their several and respective lands, grounds, rights of common, and all other rights and properties whatsoever which they respectively had or were entitled to in and over the said lands and grounds immediately before the passing of any such Act; and that from and immediately after the making the said division and allotments, and the execution of the award of such commissioner or commissioners, or at any other time as such commissioner or commissioners shall, by writing under his or their hands to be affixed on the principal door of the church of the parish in which the lands and grounds shall be situate, direct or appoint, all rights of common, and all rights whatsoever by such Act intended to be extinguished, belonging to or claimed by any person or persons whomsoever, bodies politic or corporate, in, over, or upon such lands or grounds, shall cease, determine, and be for ever extinguished.

*Commissioners may exchange by Allotments, Messuages, Lands, &c. with the Consent of the Proprietors, or if belonging to Churches, &c., with the Consent of the Bishop and of the Patron.*

XV. And be it further enacted, That such commissioner or commissioners shall and he or they is and are hereby authorized to set out, allot, and award any messuages, buildings, lands, tenements, hereditaments, new allotments, or old inclosures, within such parish or manors, in lieu of or in exchange for any other messuages, buildings, lands, tenements, hereditaments, new allotments, or old inclosures, within the said parish or manors, or within any adjoining parish or place, so as that all such exchanges be made with the consent of the respective owners, proprietors, or other persons seised of the lands, hereditaments, and premises which shall respectively be so exchanged as aforesaid, or of the husbands, guardians, trustees, committees, or attorneys acting for or on behalf of such owners, proprietors, or other persons respectively who are under coverture, minors, lunatics, or beyond the seas, or under any other disability or incapacity of acting for themselves (such consent to be testified by writing under their respective hands,) and so that all such exchanges be ascertained, specified, and set forth in the award of such commissioner or commissioners; and so that all such exchanges of any lands, tenements, or hereditaments belonging to or held in right of any church, chapel, or ecclesiastical benefice, shall also be made with the like consent in writing of the bishop of the diocese, and of the patron of any church, chapel, or ecclesiastical benefice for the time being; and all such exchanges so made as

aforesaid shall be for ever good, valid, and effectual in the law to all intents and purposes whatsoever.

*Commissioners may make Allotments in Severalty to Joint Tenants or Tenants in Common.*

XVI. And whereas it may happen that some of the proprietors of messuages, cottages, tenements, or lands in any such parish or manor, and persons entitled to allotment or allotments to be made by virtue of any such Act, may be seised thereof or entitled thereto in joint tenancy, or as coparceners or tenants in common, and cannot, by reason of infancy, settlement, or absence beyond seas, make an effectual division thereof; be it therefore further enacted, That it shall be lawful for any such commissioner or commissioners, and he or they is and are hereby authorized and empowered, (upon the request in writing of such joint tenants, or coparceners, or tenants in common, or any or either of them, or of the husbands, guardians, trustees, committees, or attorneys of such as are under coverture, minors, lunatics, or under any other incapacity as aforesaid, or absence beyond seas,) to make partition and division of the messuages, cottages, tenements, lands, and allotment or allotments, to such of the said owners or proprietors who shall be entitled to the same as joint tenants, coparceners, or tenants in common, and to allot the same accordingly to such owners and proprietors in severalty; and from and immediately after the said allotments shall be so made and declared, the same shall be holden and enjoyed by the person or persons to whom the same shall be allotted in severalty in such and the same manner, and subject to such and the same uses, as the undivided parts or shares of such estates would have been held in case such partition and division had not been made.

*Persons to accept t' eir Allotments in a limited Time, or to forfeit their Rights.*

XVII. And be it further enacted, That all and every person or persons to whom any allotment or allotments shall be made by virtue of any such Act shall and he, she, or they is and are hereby required to accept his, her, and their respective allotments within the space of two calendar months next after the execution of the award directed to be made in and by such Act; and in case any person or persons shall neglect or refuse to accept of his, her, or their share or allotment within the time before mentioned, such person or persons so neglecting or refusing shall be totally excluded from having or receiving any estate or interest, or right of common whatsoever, in any part of the lands and grounds to be divided and inclosed by virtue of any such Act.

*Guardians, &c., may accept for incapacitated Persons, and Tenants for Life shall accept of Allotments. Nonacceptance of Guardians, &c., shall not prejudice the Rights of incapacitated Persons who shall accept in a limited Time after enabled so to do.*

XVIII. Provided always, and be it further enacted, That it shall and may be lawful for the respective guardians, husbands, trustees, committees, or attorneys of any person or persons being minors, femes covert, lunatics, beyond the seas, or otherwise incapable by law, to accept any such allotments as shall be made by virtue of any such Act to and for the use of such person or persons so incapacitated as aforesaid, and also that any person or persons entitled to any allotment or allotments as tenant or tenants for life or lives shall be, and he, she, and they is and are hereby respectively enabled and required to accept of and take such allotment or allotments respectively; and every such acceptance re-

spectively shall be and is hereby declared to be valid and effectual to all intents and purposes whatsoever: Provided further, That the nonclaim or nonacceptance of any such guardian, husband, trustee, committee, or attorney shall not exclude or in any way prejudice the right of any infant, feme covert, lunatic, or other person or persons being under any disability or incapacity as aforesaid, or absent beyond the seas, who shall claim or accept such share or allotment within twelve calendar months next after such disability or incapacity shall be removed, or of any person entitled as heir in remainder after the death of any person dying during such incapacity or disability who shall claim or accept the same within one year next after his, her, or their right, title, or interest shall have accrued, descended, or vested, or be known so to be.

*Before Execution of the Award, Allotments may be ditched and inclosed, with the Consent of the Commissioners.*

XIX. And be it further enacted, That after the allotments shall be set out by such commissioner or commissioners, and at any time before the execution of his or their award, it shall be lawful for any person or persons to whom any allotment or allotments shall be so made and staked or marked out, by and with the consent of such commissioner or commissioners in writing under his or their hands, to ditch, fence off, and inclose their respective allotments in such manner as such commissioner or commissioners shall so direct and appoint.

*Trees, &c., to be allotted with the Lands whereon they stand, the Parties paying to the Owners such Sums as the Commissioners shall direct; but in case of Neglect the Owners may cut them down and take them away.*

XX. And be it further enacted, That the timber trees and other trees, thorns, and bushes standing and growing upon any waste lands or other lands to be allotted by such act shall be allotted and go along with the lands whereon they respectively stand, and shall be deemed the property of the several persons to whom the same lands shall be respectively allotted, such persons paying to the owner or respective owners of the same trees such sums of money for the same, and at such time or times and place or places, as the said commissioner or commissioners shall by writing under his or their hand or hands direct; but if the said parties who are to make such respective payments shall neglect or refuse to make the same accordingly, then it shall be lawful to and for the respective parties who shall be entitled to have and receive such payments, to enter on the said lands, and cut down, take, and carry away to their own use the said trees, thorns, or bushes in respect of which the said payments were respectively to be made to them, at any reasonable time or times within one year next after such neglect or default, they doing as little damage on the said lands as may be.

*Where Money is to be paid for Lands, &c., and which ought to be laid out in other Purchases to be settled to the same Uses, the Commissioners may thereout defray a Proportion of the Expenses of passing the Act, and putting it in execution, &c., and of the Surplus amount to 200l. it shall, as soon as may be, be laid out in other Purchases, and in the meantime be paid into the Bank, and applied under the Direction of the Court of Chancery.*

XXI. And be it further enacted, That whenever any sum of money is, under the provision of this Act, or any such Bill, to be paid for the purchase or exchange of any lands, tenements, or hereditaments,

or of any timber or wood growing thereon, and which sum of money ought to be laid out in the purchase of other lands, tenements, or hereditaments, to be settled to the same uses, it shall and may be lawful to and for such commissioner or commissioners out of such sum to defray such proportion of the expense of passing such Act, and of carrying the same into execution, as shall, if any, be charged upon any of the lands, tenements, or hereditaments of the person or persons, body politic or corporate, trustees, or feoffees in possession of the lands, tenements, or hereditaments so sold or exchanged, or on which such timber or wood actually grew, and also the expense of any permanent improvement, such as building, subdividing, draining, or planting, and the like, which shall in the judgment of such commissioner or commissioners be proper to be made, and shall be made under his or their direction, upon any lands to be by virtue of such Act allotted to such person or persons, body politic or corporate, trustees or feoffees respectively; and in case the surplus of such money shall amount to the sum of two hundred pounds, then the same shall, with all convenient speed, be invested in the purchase of any lands or hereditaments, which shall be conveyed and settled upon and subject to the like uses, trusts, and limitations as such lands so sold or exchanged, or the lands on which such timber grew, were settled, limited, or assured; and in the meantime, and until such purchase can be made, such money shall be paid into the Bank of England in the name and with the privity of the accountant general of the high court of chancery, to be placed to his account there *ex parte* the said commissioner or commissioners, without fee or reward; to the intent that such money shall be applied, under the direction and with the approbation of the said court, to be signified by an order made upon a petition to be preferred in a summary way by the person or persons who would have been entitled to such lands, tenements, and hereditaments, or timber respectively, either in or towards the redemption or purchase of land tax, or towards the discharge of any debts or incumbrances, affecting the lands or hereditaments so purchased or exchanged, or on which such timber grew; or until the same shall, upon the like application, in a summary way, be laid out by order of the said court in the purchase of other lands or hereditaments, to be settled to the like uses; and in the meantime, and until order can be made, such money may, by order of the said court, be laid out in some of the public funds, or on government or real securities, and the dividends or interest arising therefrom shall, by order of the said court, be paid to such person or persons as would for the time being be entitled to the rents and profits of such lands, tenements, and hereditaments so to be purchased, conveyed, and settled.

*If such Money be less than 200l. and upwards of 20l. it shall, at the Option of the Person entitled to the Rents of the Lands, be paid into the Bank, or to Two Trustees to be approved of by the Commissioners, to be applied as before directed;*

XXII. Provided always, and be it further enacted, That if any such money shall be less than the sum of two hundred pounds, and shall exceed the sum of twenty pounds, then and in such case the same shall, at the option of the person or persons for the time being entitled to the rents and profits of the lands or hereditaments so purchased, or of his, her, or their guardian or guardians, committee, or committees, in case of infancy or lunacy, to be signified in writing under their respective hands, to

be paid into the bank in the name and with the privy of the said accountant general of the high court of chancery, and be placed to his account as aforesaid, in order to be applied in the manner before directed; or otherwise the same shall be paid at the like option to two trustees, to be nominated by the person or persons making such option, and approved of by the commissioner or commissioners (such nomination and approbation to be signified in writing under the hands of the nominating and approving parties), in order that such principal money and the dividends arising thereon may be applied in manner herein-before directed, so far as the case be applicable, without obtaining or being required to obtain the direction or approbation of the said court of chancery.

*And if less than 20l. it shall be applied to the Use of the Person entitled to the Rents of the Lands, as the Commissioners shall think fit.*

XXIII. Provided also, and be it further enacted, That where such money shall be less than twenty pounds, then and in such case the same shall be applied to the use of the person or persons who would for the time being have been entitled to the rents and profits of the lands or hereditaments so purchased, in such manner as the said commissioner or commissioners shall think fit, or in case of infancy or lunacy, then to his, her, or their guardian or guardians, committee or committees, to and for the use and benefit of such person or persons so entitled respectively.

*If any person does not accept, inclose, and fence his Allotment as the Commissioners shall direct, they may cause it to be inclosed and fenced and let, and receive the Rents until the expenses are satisfied, or they may charge them upon the Proprietor.*

XXIV. And be it further enacted, That if any person to whom any allotment or allotments shall be made, or any guardian, husband, trustees, feoffees, committees, or attorney of any infant, feme covert, charity or charities, lunatic, idiot, person or persons beyond the seas, or otherwise incapable of acting respectively, or any tenant in tail or for life, or trustee or trustees for any settlement, or any mortgagee or mortgagees, or other creditor in possession, shall neglect or refuse to accept, inclose, and fence his, her, or their allotment or allotments within such time or times as such commissioner or commissioners, by any writing as aforesaid, or by his or their award, shall order or direct, it shall be lawful for such commissioner or commissioners to cause such allotment or allotments to be inclosed and fenced, and to let the same to any person or persons he or they may think proper, and to receive the rents and profits thereof until the expenses attending the inclosure and fencing thereof are paid and satisfied, or to charge such expenses upon the proprietor or proprietors of the same allotment or allotments, and by any such writing as aforesaid, or by his or their said award, to appoint to whom and at what time or times the same shall be paid, subject to the same mode, and with the like powers of recovery thereof, as may be provided respecting the other expenses of passing any such Act, and carrying the same into execution, or otherwise directed by any such Act.

*Within Seven Years after fencing of Allotments, Fences may be erected on the outside of the Ditches, and the Materials carried away by the Proprietors.*

XXV. And be it further enacted, that it shall be lawful for the several proprietors of the allotments

to be made in pursuance of any such Act, their agents or workmen, at any seasonable time or times, within the space of seven years next after the fencing of any allotment or allotments, to set up and erect posts and rails, or other dead fences, on the outside of the ditches bounding their respective allotments, not exceeding three feet from such ditches, for the preservation of their quickest hedges, and at any seasonable time or times before the expiration of the said term to take and carry away the materials of such outside fences when they shall think proper.

*No Fences or Hedges standing when any Act is passed shall be destroyed till the Execution of the Award, without Consent of the Commissioners, and if assigned by them as a Boundary or Division Fence, they shall be left uncut, the Persons to whom the Allotments shall belong making Compensation to the former Owners.*

XXVI. And be it further enacted, that no fences or hedges which at the time of the passing of any such Act shall be standing or growing in or upon any of the lands directed to be divided and inclosed shall be cut down or destroyed by the owners and proprietors thereof, after the passing of such Act, until the execution of the award, without the consent of such commissioner or commissioners first had and obtained in writing for that purpose; and if any such fences or hedges shall be assigned or approved by such commissioner or commissioners as and for a boundary fence, or as and for a subdivision fence to and for any of the allotments to be made in pursuance of such Act, all such fences and hedges shall be left uncut for the benefit of the person or persons to whom such allotment or allotments shall belong; and he, she, or they shall make such compensation in money to the former owners and proprietors thereof as such commissioner or commissioners shall, by writing under his or their hand or hands, in that behalf order and appoint; subject to the same mode, and with the like powers of recovery thereof, as may in such Act be provided respecting the other expenses of passing any such Act, and carrying the same into execution.

*Where the Boundary of any Common Fields or inclosed Grounds shall be fenced by any Mound, &c., the Proprietors of the adjoining Allotments shall not be compelled to fence them next such Common Fields and inclosed Grounds, and such Boundaries shall be maintained by the respective Proprietors; the Expenses of which the Commissioners may apportion.*

XXVII. Provided always, and be it further enacted, that no proprietors whose allotments or shares shall, upon any such inclosure, lie and be situated next and adjoining to any common fields or inclosed grounds the boundary of which shall be fenced by any mound, fence, brook, or rivulet, shall be compelled to make or erect any hedges, ditches, or fences next adjoining to any such common fields or inclosed grounds, for inclosing such their allotments or shares; but that the whole mound, fence, brook, or rivulet, or other sufficient fences which divide any such common fields or inclosed grounds from such allotments, shall for ever be and remain a boundary fence for the purpose of such division, and shall from time to time be maintained, kept, cleansed, scoured, and repaired by the respective proprietors thereof in the same manner as before the passing of this Act, or in such other manner as such commissioner or commissioners shall order and direct: Provided nevertheless, that in case it shall happen that some of the proprietors shall have a greater proportion of fences to make and maintain upon any of the lands directed to be divided and inclosed, than in

the judgment of such commissioner or commissioners the allotments of such proprietors ought to be charged with, it shall be lawful for such commissioner or commissioners, where he or they shall judge it proper, to ascertain and appoint such sum of money to be paid to every such proprietor towards making and maintaining such fences, by such other of the proprietors who may have a less proportion of fencing, according to the value and quantity of the lands to be allotted to them, and to grant such other relief in respect thereof, out of the money to be raised for defraying the expences of carrying such Act into execution, as he or they shall think reasonable, and in case any such money shall be so directed to be raised, in order that the said boundary fences may be brought as near as may be to a just and equal proportion.

*If any Person shall destroy or damage any Fence, &c. put up under the Authority of any Act, he shall forfeit 5*l.*, and the Proprietor of the Lands, &c. may give Evidence.*

XXVIII. And be it further enacted, That in case any person or persons shall wilfully and unlawfully break down, destroy, carry away, or damage any fence, stile, post, rail, gate, bridge, or tunnel which may be put up or placed under the authority and for the purposes of any such Act, every person so offending and being thereof convicted before any justice of the peace for the county in which the lands or grounds to be inclosed shall be situate, on confession or on proof of the offence by oath of one or more credible witness or witnesses (which oath the said justice is hereby authorized to administer), shall for every such offence forfeit and pay any sum not exceeding five pounds; and every person shall be allowed to give evidence of such offence, notwithstanding he may be a proprietor or occupier of lands within or an inhabitant of such parish, and notwithstanding he may be the owner of any such fence, stile, post, rail, gate, bridge, or tunnel: to be recovered as hereinafter provided.

*If it shall be provided by any Act that the Expenses of obtaining and carrying it into execution shall be paid by the Proprietors, and they neglect so to do, the Commissioners may cause the same to be levied by Distress, or may take Possession of the Allotments, and receive the Rents till satisfied.*

XXIX. And whereas it may often be provided by such Act that the expences of obtaining the same, and also the expences of carrying the same into execution, shall be paid in proportion by the proprietors of lands or grounds to whom any allotments shall be made; be it further enacted, that in such case, when and so often as any such person or persons, except the persons thereby exempted from payment of any such charges and expences, shall refuse or neglect to pay his, her, or their proportion of the charges and expences, or shall refuse or neglect to pay the expences attending the inclosing and fencing of any such allotments as upon the neglect or refusal of the proprietors shall be inclosed and fenced by such commissioner or commissioners as hereinafter mentioned, at the respective days and times to be appointed for payment of such charges and expences, it shall be lawful for such commissioner or commissioners, by any warrant or warrants under his or their hands and seals, directed to any person or persons whomsoever, to cause the said costs, charges, and expences, and sum or sums of money respectively, to be levied by distress and sale of the goods and chattels of the person or persons so making default in payment as aforesaid, his, her, or their husbands, guardians,

trustees, committees, or attornies, wheresoever the same shall be found, rendering the overplus (if any) on demand, to the owner or owners of such goods and chattels, the reasonable charges of such warrant, distress, and sale being first deducted, together with the interest, after the rate of five pounds *per centum per annum*, to be computed on such share or shares, proportion or proportions, from the time the same shall be directed to be paid by such commissioner or commissioners as aforesaid; or otherwise it shall be lawful for such commissioner or commissioners, or any person or persons authorized by him or them, to enter upon and take possession of the premises so to be allotted to such person or persons refusing or neglecting to pay as aforesaid, and to receive and take the rents and profits thereof, until thereby, therewith, or otherwise, the share or shares, proportion or proportions, and the said costs and charges so ordered and directed by such commissioner or commissioners to be paid by such person or persons as aforesaid, and all interest on such share or shares, proportion or proportions, to be computed from the time the same shall by such commissioner or commissioners be directed to be paid as aforesaid, and also all costs, charges, and expences occasioned by or attending such entry upon and perception of the rents and profits of the said premises, shall be fully paid and satisfied.

*Husbands, &c. may charge Allotments with such Sums as the Commissioners shall adjudge necessary for defraying the aforesaid Expences; and if Persons in Possession liable to a Share thereof, or enabled to charge the Lands with the same, shall advance the Money, the Commissioners may mortgage the Lands to them for Reimbursement.*

XXX. And be it further enacted, That in such case as last aforesaid, it shall be lawful for the husbands, guardians, trustees, committees, or attornies of any of the owners or proprietors of such allotment or exchanged lands, being under coverture, minors, lunatics, beyond the seas, or under any other disability, and for any of the said owners or proprietors being tenants in tail, or for life of lives, or years determinable on a life or lives, or on any other contingency, or otherwise interested as aforesaid (except the rector or vicar of such parish), to charge such allotments or exchanged lands and premises with such sum or sums of money as such commissioner or commissioners shall by his or their award, or by writing under his or their hands, either before or after the execution of such award, adjudge necessary to pay and defray the said respective shares of the charges and expences incident to and attending the obtaining of such Act, and carrying the same into execution, and of charging the said lands as aforesaid, so that the same shall not exceed five pounds for every acre of such allotments or exchanged lands, and to grant, mortgage, surrender, lease, or demise, or otherwise subject the lands, tenements, and hereditaments so to be charged, unto such person or persons who shall advance and lend the same respectively, his, her, or their executors, administrators, and assigns, for any term or number of years; or in case any person in possession, who shall or may be liable to and charged with a share of the expences as aforesaid, or enabled by this or any such Act to charge such lands and grounds with the same, shall choose to advance, pay, and discharge such sum or sums of money, then it shall be lawful for the said commissioner or commissioners, by any deed or writing under his or their hands and seals, to be attested by two or more credible witnesses, in like manner to grant, mortgage, surrender, lease,

demise, or otherwise subject the said lands, tenements, and hereditaments to such person or persons respectively paying and discharging the same, his, her, or their executors, administrators, and assigns, for any term or number of years, to and for the payment of such sum and sums of money so advanced, paid, and discharged by him or them, with interest for the same, to commence on the termination of his, her, or their right in the premises, so that every such grant, mortgage, surrender, lease, or demise be made with a proviso or condition to cease and be void, or with an express trust to be surrendered or re-assigned, when such sum or sums of money thereby to be secured shall be fully paid and satisfied, and also with a covenant to pay and keep down the interest, so that no person or persons afterwards becoming possessed or entitled to any such lands, tenements, or hereditaments, shall be liable to pay any further or larger arrear of interest than for six calendar months preceding the time when the title to such possession shall have commenced; and that every such charge, grant, mortgage, surrender, lease, or demise shall be good, valid, and effectual in the law for the purposes thereby intended.

*Commissioners may deduct from Allotments for Charity or School Lands what shall be deemed equal to the proportionable Share of the Expenses of passing and executing any Act, and allot the same to such Persons as will undertake to pay it.*

XXXI. And whereas in such cases as aforesaid, where provision may be made in any such act for charging the expences of passing such Act, or of executing the powers therein contained, or of fencing the respective allotments on the several proprietors thereof, it may be more convenient for the feoffees or trustees of any charity lands or school lands to have lands deducted from the respective allotments to be made for such charity lands or school lands, for paying the proportionable share in respect of such allotments of such expences respectively, than to raise money on mortgage for those purposes; be it therefore further enacted, That it shall be lawful for any such commissioner or commissioners, if he or they shall judge it right or expedient, to deduct from the respective allotments to be made to such feoffees or trustees as aforesaid so much land as shall in the judgment of such commissioner or commissioners be equal in value to their respective proportions of the said expences, and to allot, assign, and award the same to such person or persons as such commissioner or commissioners shall think proper, and who will undertake to pay and defray, and shall pay and defray, all such expences.

*If it shall be provided by any Act that the Expenses of obtaining and carrying it into Execution shall be paid by Sale of Part of the Lands, the Commissioners shall set out and sell such Part as they think will raise a sufficient Sum, and the Purchasers shall immediately deposit a Part of the Purchase-Money, which shall be forfeited if the Remainder be not duly paid.*

XXXII. And be it further enacted, That in case it shall be provided by any such Act that the expences attending the same shall be paid by sale of any part of the land so to be inclosed, the said commissioner or commissioners shall mark and set out such part or parts of the said waste or commonable lands as in his or their opinion will by sale thereof raise a sum of money sufficient to pay and discharge all such charges and expences as may by any such Act be directed to be paid and discharged out of the same; and the said commissioner or commissioners shall sell such part or parts of the said lands to any

person or persons, for the best price or prices that can be gotten for the same, by private contract, or by public auction or auctions to be holden for that purpose, of which six weeks previous notice shall be given in such manner as shall by any such Act be directed with respect to the other notices thereby required; and the person or persons so purchasing the same shall immediately pay (by way of deposit) into the hands of the said commissioner or commissioners, or such person or persons as he or they shall direct and appoint, one-tenth part of his, her, or their purchase-money, and pay the remainder thereof within three calendar months next after, or at such other time as the said commissioner or commissioners shall appoint, and in default thereof the money so deposited shall be forfeited, and shall be applied in carrying such Act into execution; and the said allotment or allotments for which the whole of such purchase-money shall not have been so paid, or for which there shall be no bidding at such auction, shall be again put up to sale, and sold in manner aforesaid for the best price or prices that can be gotten for the same, or be sold by the said commissioner or commissioners by private contract for any sum or sums not less than the remaining nine-tenths of the price or respective prices for which the same was or were respectively before sold, or the amount of one bidding above the sum or respective sums at which the same was or were respectively put up in the said former auction; and every allotment for which the full purchase-money shall be paid shall immediately thereupon be absolutely discharged of and from all common and other right thereon or therein, and be vested in fee-simple in, and be inclosed and thenceforth held in severalty by, such purchaser or purchasers thereof respectively, as his, her, or their private and absolute property, and shall be allotted accordingly by the said commissioner or commissioners; and the said purchase-money shall be applied in defraying such charges and expences as may be in any such Act directed to be paid and discharged by the sale of such land.

*Commissioners may summon Witnesses, who shall be subject to Penalty for Neglect.*

XXXIII. And for the better enabling such commissioner or commissioners to determine the several matters and things by this or any other such Act referred to his or their determination, be it enacted, That it shall be lawful to and for the said commissioner or commissioners from time to time, as he or they shall see occasion, by any writing or writings under his or their hand or hands, to summon and require any person or persons to appear before them, at any time and place in such writing to be appointed, to testify the truth touching the matter in dispute between any proprietors or interested persons, or otherwise relating to the execution of the powers given by this or any such Act, and to cause a copy of such writing to be served on such person or persons required to give evidence, or to be left at his, her, or their usual or last place of abode; and every person or persons so summoned, who shall not appear before the said commissioner or commissioners pursuant to such summons (without assigning some reasonable excuse for not appearing,) or appearing shall refuse to be sworn or examined on oath or affirmation, which oath or affirmation the said commissioner or commissioners is and are hereby empowered and required to administer, (such person or persons having been paid or tendered to him, her, or them the reasonable charges of his, her, or their attendance,) and being

thereof convicted before one of his Majesty's justices of the peace of the county or district in which such lands are situated, upon information thereof upon oath made before any such justice, shall for every such neglect or refusal forfeit and pay such sum of money, not exceeding ten pounds nor less than five pounds, as such justice or justices shall think fit and order.

*No Witness shall be obliged to travel beyond a certain Distance.*

XXXIV. Provided always, and be it further enacted, that no witness summoned to attend such commissioner or commissioners shall be obliged to travel above eight miles from the boundary of the parish, manor, or district by any such Act intended to be inclosed.

*Commissioners shall draw up an Award, containing sundry Particulars, which shall be read and executed at a Meeting of the Proprietors, and proclaimed the next Sunday in the Parish Church, and then considered as complete.—Award to be enrolled in a Court of Record at Westminster, or with the Clerk of the Peace of the County, and may be inspected, and Copies obtained for a certain Sum.—Award and Copies to be legal Evidence, and Award to be binding on all Parties interested.—Commissioners may form Maps of the Grounds, which shall be annexed to the Award, and deemed Part thereof.*

XXXV. And be it further enacted, that as soon as conveniently may be after the division and allotment of the said lands and grounds shall be finished, pursuant to the purport and directions of this or any such Act, the said commissioner or commissioners shall form and draw up, or cause to be formed and drawn up, an award in writing, which shall express the quantity of acres, roods, and perches, in statute measure, contained in the said lands and grounds, and the quantity of each and every part and parcel thereof which shall be so allotted, assigned, or exchanged, and the situations and descriptions of the same respectively, and shall also contain a description of the roads, ways, footpaths, watercourses, watering places, quarries, bridges, fences and land marks set out and appointed by the said commissioner or commissioners respectively as aforesaid, and all such other rules, orders, agreements, regulations, directions, and determinations as the said commissioner or commissioners shall think necessary, proper, or beneficial to the parties; which said award shall be fairly engrossed or written on parchment, and shall be read and executed by the commissioner or commissioners in the presence of the proprietors who may attend at a special general meeting called for that purpose, of which ten days notice at least shall be given in some paper to be named in such Act, and circulating in the county; which execution of such award shall be proclaimed the next Sunday in the church of the parish in which such lands shall be, from the time of which proclamation only, and not before, such award shall be considered as complete; and shall, within twelve calendar months after the same shall be so signed and sealed, or so soon as conveniently may be, be enrolled in one of his Majesty's courts of record at Westminster, or with the clerk of the peace for the county in which such lands shall be situated, to the end that recourse may be had thereto by any person or persons interested therein, for the inspection and perusal whereof no more than one shilling shall be paid; and a copy of the said award, or any part thereof, signed by the proper officer of the court wherein the same shall

be enrolled, or by the clerk of the peace for such county, or his deputy, purporting the same to be a true copy, shall from time to time be made and delivered by such officer or clerk of the peace for the time being as aforesaid to any person requesting the same, for which no more shall be paid than two-pence for every sheet of seventy-two words; and the said award, and each copy of the same, or of any part thereof, signed as aforesaid, shall at all times be admitted and allowed in all courts whatever as legal evidence; and the said award or instrument, and the several allotments, partitions, regulations, agreements, exchanges, orders, directions, determinations, and all other matters and things therein mentioned and contained, shall to all intents and purposes be binding and conclusive, except where some provision to the contrary is herein or shall be by any such Act contained, unto and upon the said proprietors, and all parties and persons concerned or interested in the same, or in any of the lands, grounds, or premises aforesaid; and also that the said respective commissioners, if they think it necessary, shall form or draw, or cause to be formed and drawn, on parchment or vellum, such maps or plans of the said lands and grounds, the better to describe the several new allotments or divisions to be made, and premises that shall be exchanged by virtue of this Act, and which shall express the quantity of each allotment in acres, roods, and perches, together with the names of the respective proprietors at the time of such division and allotment; which said maps and plans shall be annexed to and enrolled with the said respective award, and shall be deemed and construed in every respect as and for part of the said award.

*Commissioners shall keep an Account of all Monies received and disbursed, which may be inspected at their Clerk's Office, gratis.—Penalty for not keeping such Account, or for refusing the Inspection thereof.*

XXXVI. And be it further enacted, that such commissioner or commissioners shall, and he or they is and are hereby required to enter in a book to be provided for that purpose, a particular account of all sums of money whatever received from the proprietors or others during the progress of the inclosure, and also of all the charges, expences, and disbursements which shall accrue or be made by virtue of any such Act, and in carrying the same into execution; which book of accounts shall be kept at the office of the clerk, open at all reasonable times during the progress of the inclosure, and till all the accounts are finally settled, for the inspection of any of the proprietors, without fee or reward; and in case any such commissioner or commissioner, or his or their clerk, shall neglect to provide and keep such book of accounts as aforesaid, or refuse the inspection thereof to any of the proprietors at reasonable times in manner before mentioned, and shall be convicted thereof, upon the oath of one or more credible witness or witnesses not interested in the intended division and inclosure, before any justice of the peace of the county in which the lands or grounds to be inclosed shall be situate, or of such other county or place where such commissioner or clerk so offending shall be or reside, every such commissioner or clerk so causing such neglect or refusal, and convicted as aforesaid, shall forfeit and pay for every such offence any sum not exceeding ten pounds nor less than five pounds, to be levied, recovered, and applied in the same manner as other penalties are by this Act directed to be levied, recovered, and applied.

*Monies raised under any Act shall be deposited as may be approved by a Majority in value of the Proprietors, and not issued without an Order from the Commissioners.*

XXXVII. And be it further enacted, that all monies to be raised under and by virtue of the powers contained in any such Act shall from time to time, as often as the same shall amount to the sum of fifty pounds, be paid to and deposited in the hands of some banker, or such person or persons as shall be approved by a majority in value of the proprietors who may be present at the first meeting of such commissioner or commissioners, and in the notice of which meeting shall be expressed the intention of then appointing such banker, or such other person or persons; and no such monies deposited or paid into the hands of such banker or other person or persons to be appointed as aforesaid, shall be issued or paid by him or them without an order in writing under the hands of such commissioner or commissioners, specifying the person or persons to whom the same are respectively payable, and the service or consideration for which the same are due; and the balance, if any, upon the final settlement of accounts, shall be immediately repaid to the land owners, in proportion to the sums respectively paid by them.

*The Rector or Vicar, with the Consent of the Bishop of the Diocese and of the Patron of the Living, may lease Allotments for 21 Years, upon certain Conditions.*

XXXVIII. And be it further enacted, that it shall be lawful for the rector or vicar for the time being of any parish wherein the lands and grounds intended to be inclosed shall be situate, by indenture or indentures under his hand and seal, with the consent and approbation of the bishop of the diocese, and of the patron of the said rectory or vicarage, to lease or demise all or any part or parts of the allotment or allotments to be set out and allotted to any such rector or vicar by virtue of any such Act, to any person or persons whomsoever, for any term not exceeding twenty-one years, to commence within twelve calendar months next after the executing the award; so that the rent or rents for the same shall be thereby reserved to the rector or vicar for the time being by four equal quarterly payments in every year; and so that there be thereby also reserved and made payable to such rector or vicar the best and most improved rent or rents that can be reasonably had or gotten for the same, without taking any fine, foregift, premium, sum of money, or other consideration, for the making or granting any such lease or demise; and so that no such lessee by any such lease or demise be made disposable for waste by any express words to be therein contained; and so that there be inserted in every such lease power of re-entry on nonpayment of the rent or rents to be thereby reserved within a reasonable time, to be therein limited, after the same shall become due; and so that a counterpart of such lease be duly executed by the lessee or lessees to whom such lease shall be so made as aforesaid; and every such lease shall be valid and effectual, any law or usage to the contrary notwithstanding.

*Recovery and Application of Penalties.*

XXXIX. And be it further enacted, that all penalties and forfeitures imposed by this or any such Act, or which shall be imposed by such commissioner or commissioners under or by virtue of the authority of this or any such Act, shall be levied

and recovered before any one justice of the peace for the county in which the lands or grounds to be inclosed shall be situate, and residing near any such parish, and not interested in the matter in question; for which purpose it shall be lawful for any such justice of the peace, upon complaint made to him, to summon the party accused and the witnesses on both sides, and upon the appearance or contempt of the party accused, to examine such witnesses upon oath (which oath any such justice is hereby empowered to administer,) and upon such evidence to give judgment accordingly, and to condemn the party accused (proof of the accusation being made by one or more witness or witnesses as aforesaid), in such penalties and forfeitures as the offenders shall have incurred, and to levy such penalties and forfeitures by distress and sale of the offender's goods and chattels, together with reasonable costs; all which penalties and forfeitures, the application whereof is not particularly directed by any such Act or this Act, shall, when and so soon as the same shall be levied, be paid and applied to and for such uses, intents, or purposes as such commissioner or commissioners, in and by any writing or writings under his or their hands, or in and by his or their award, shall order, direct, or appoint.

*Saving of the Rights of Lords of Manors.*

XL. And be it further enacted and declared, that nothing in such Act contained shall lessen, prejudice, or defeat the right, title, or interest of any lord or lady of any manor or lordship, or reputed manor or lordship, within the jurisdiction or limits whereof the lands and grounds thereby directed to be divided and allotted are situate, lying, and being, of, in, or to the seigniories, rights, and royalties incident or belonging to such manor or lordship, or reputed manor or lordship, or to the lord or lady thereof, or to any person or persons claiming under him or her; but the same (other than and except the interest and other property as is or are meant or intended to be barred by such Act) shall remain in as full, ample, and beneficial manner, to all intents and purposes, as he or she might or ought to have held or enjoyed such rights before the passing of such Act, or in case the same had never been made.

*General saving.*

XLI. Saving always to the King's most Excellent Majesty, his heirs and successors, and to all and every other person and persons, bodies politic and corporate, and his, her, and their heirs, successors, executors, and administrators, all such estate, right, title, and interest (other than and except such as are hereby intended to be barred, destroyed, or extinguished,) as they, every or any of them, had or enjoyed of, in, to, or out of, or in respect of the said lands, grounds, and premises so directed to be divided, allotted, and inclosed, or exchanged as aforesaid, before the passing of such Act, or could or might have had or enjoyed in case the same had never been made.

*Two Justices may take Affidavits of the Notices required having been given, &c., in the Forms in the Schedule, without Stamps.*

XLII. And be it further enacted, That it shall and may be lawful for any two or more justices of the peace to take affidavits on oath or affirmation (which oath or affirmation such justices are hereby authorized and empowered to administer) of the notices required for such bills having been given, of the consents of the parties interested therein, of the allegations contained in the preambles of such bills,

and of the quantity of the land to be inclosed ; and that such affidavits shall respectively be in the forms contained in the schedule hereunto annexed, as near as the circumstances of the case will admit ; and that such affidavits shall not be subject or liable to any stamp duties whatsoever.

*Persons forswearing themselves to be deemed guilty of Perjury.*

XLIII. And be it further enacted, That if any person or persons shall in any examination, affidavit, deposition, or affirmation to be had or taken in pursuance of this Act before such justice or justices, or such commissioner or commissioners, knowingly and wilfully swear or affirm any matter or thing which shall be false or untrue, every such person so offending shall on conviction thereof be deemed guilty of perjury, and shall suffer the like pains and penalties as persons guilty of wilful and corrupt perjury are now subject and liable to.

*Powers of this Act to be binding only as far as not otherwise provided in any future Act.*

XLIV. Provided always, and be it enacted, That all and every the powers, authorities, directions, and provisions in this Act contained shall be only so far effective and binding in each particular case as they or any of them shall not be otherwise provided and enacted in any such Act hereafter to be passed as aforesaid.

SCHEDULE TO WHICH THE ACT REFERS.

(A.)

FORM OF AFFIDAVIT OF NOTICES.

A. B. of maketh oath and saith [or, being one of the People called Quakers, upon his solemn affirmation saith], that he did see a copy of the notice hereunto annexed affixed on the church door of the parish of in the County of [or on the several church doors of the respective parishes of in the County of or in the several counties of and

] on the several Sundays hereinafter mentioned ; *videlicet*, [specifying the days on which the notices were affixed.]

Signed A. B.

Sworn [or solemnly affirmed] before us, two of his Majesty's justices of the peace acting in and for the and subscribed in our presence, by the above-named A. B. this day of in the year As witness our hands and seals.

(B.)

FORM OF AFFIDAVIT OF CONSENT.

A. B. of maketh oath and saith, [or, being one of the People called Quakers, upon his or her solemn affirmation saith,] that he [or she] believes himself [or herself] to be interested in the proposed inclosure of the in the [here describe the Place, whether Parish, Hamlet, or Place.] in the county of by virtue of [here set forth the Interest of the Deponent]; [or

that he [or she] believes that C. D. of

for whom he [or she] is guardian [et cetera, as the case may be] is interested, et cetera ; and that he [or she] hath seen a copy of an Act [here set forth the title of this Act], and also a copy of the bill intended to be presented to Parliament, and hath subscribed his [or her] name, or hath set his [or her] mark to the same respectively, and doth consent to the said bill being passed into a law.

Signed or marked A. B.

Sworn [or solemnly affirmed] before us, two of his majesty's justices of the peace acting in and for the

and subscribed in our presence, by the above-mentioned A. B. this

day of in the year As witness our hands and seals.

The same form may be applied, *mutatis mutandis*, to the case of several persons whose interests are joint, or whose interests, though distinct, are of a similar nature.

(C.)

FORM OF AFFIDAVIT OF ALLEGATIONS OF THE BILL.

A. B. of maketh oath and saith, [or, being one of the People called Quakers, upon his or her solemn affirmation saith,] that [here set forth such of the several facts alleged in the preamble of the Bill as are within the knowledge of the witness,] or, that he [or she] is informed and verily believes that [here set forth such of the said facts as are within the belief of witness.]

Signed A. B.

Sworn [or solemnly affirmed] before us, two of his Majesty's justices of the peace acting in and for the

and subscribed in our presence, by the above-named A. B. this

day of in the year As witness our hands and seals.

(D.)

FORM OF AFFIDAVIT OF ADMEASUREMENT.

A. B. of maketh oath and saith, [or, being one of the People called Quakers, upon his solemn affirmation saith,] that he has surveyed and admeasured the several lands in the parish or hamlet of in the county of [or counties of ] described in the bill intended to be presented to Parliament, and signed by the deponent, by the name [or names] of and that the quantity of such lands amounts to and no more, according to such admeasurement, and the best of this deponent's judgment.

A. B.

Sworn [or solemnly affirmed] before us, two of his Majesty's justices of the peace acting in and for the

and subscribed in our presence, by the above-named A. B. this

day of in the year As witness our hands and seals.

# AN ACT

TO

## AMEND THE LAW RESPECTING THE INCLOSING OF OPEN FIELDS, PASTURES, MOORS, COMMONS, AND WASTE LANDS IN ENGLAND.

1 & 2 GEO. IV.

[19th April, 1821.]

*Landlords or persons acting under their Orders, may enter upon Land allotted, and seize and distrain for Rent, notwithstanding the Commissioners Award shall not be executed.*

Whereas great inconveniences have arisen to landlords and other persons, owners of allotments allotted and set out to them by the commissioner or commissioners under or by virtue of several Acts, already passed, for dividing, allotting, and inclosing of open and uninclosed fields, pastures, moors, commons, and waste lands in *England*, by reason that such landlords and other persons, owners of allotments as aforesaid, cannot, before the execution and perfecting of the award or awards by such Acts directed to be made by such commissioner or commissioners, distrain for the rent in arrear or unpaid for or in respect of such allotment or allotments, or support an action of trespass for any damage or injury done to such allotment or allotments, or an action of ejectment to recover the possession of such allotment or allotments, in consequence of the freehold or legal seisin thereof respectively not being vested in such landlords and other persons, owners of such allotment or allotments, by the award or awards of such commissioner or commissioners as aforesaid: for remedy whereof be it enacted by the King's most Excellent Majesty, by and with the advice and consent of the Lords spiritual and temporal, and Commons, in this present Parliament assembled, and by the authority of the same, That from and after the passing of this Act it shall and may be lawful to and for all and every person and persons to whom any allotment or allotments of land has or have been set out or allotted, or which shall or may hereafter be set out or allotted, and to whom the possession of such allotment or allotments hath been already given by virtue of any order or direction, orders or directions, or to whom the possession thereof shall hereafter be given by virtue of any order or direction, orders or directions in writing, in the form and specified in the schedule hereto annexed, and signed by the commissioner or commissioners acting under or by virtue of any Act or Acts of Parliament now or hereafter to be passed for dividing, allotting, and inclosing any open fields, pastures, commons, moors, and waste lands in *England*, and who shall have demised the same or any part thereof, to any tenant

or servant, or for their, his, or her bailiff or agent, bailiffs or agents, or any person or persons by them, him, or her authorized and employed for that purpose, to enter into and upon any such allotment or allotments, and to seize and distrain any goods, chattels, or effects which may be in or upon such allotment or allotments, or in or upon any other lands, tenements, or hereditaments held, occupied, or enjoyed by the tenant or occupier of such allotment or allotments along and together with any such allotment or allotments, for any rent that may be in arrear and unpaid for all or any part of such allotment or allotments, and either alone or together with any such allotment or allotments, and any other lands, tenements, and hereditaments, held, occupied, or enjoyed therewith, notwithstanding the award or awards of the commissioner or commissioners appointed in or named by or by virtue of any such Act or Acts so made and passed, or to be hereafter made and passed, shall not be executed and perfected by such commissioner or commissioners by virtue or in pursuance of any such Act or Acts of Parliament.

*Actions at Law may also be brought.*

II. And be it further enacted, that it shall and may be lawful to and for all and every person or persons to whom any such allotment or allotments is or are already set out or allotted, or which shall or may be hereafter set out or allotted; and to whom such possession as aforesaid hath been already given, by virtue of any order or direction, orders or directions, or the possession whereof shall hereafter be given to such person or persons by virtue of any order or direction, orders or directions in writing, in the form specified in the said schedule as aforesaid, and signed by such commissioner or commissioners as aforesaid, and to his, her, or their tenants, stewards, bailiffs, agents, or servants, to commence, prosecute, and maintain any action or suit at law for any injury or damage that may be done or committed by any person or persons whomsoever to the ground soil, or herbage of any of such allotment or allotments, or to the walls, hedges, fences, ditches, gates, posts, rails, stiles, cloughs, bridges, or tunnels already erected or to be erected in or upon any such allotment or allotment or allotments, and to bring, maintain,

and prosecute any action or actions of ejectment for recovering the possession of any such allotment or allotments, or any part or parts thereof, from any person or persons whomsoever, notwithstanding the award or awards of the commissioner or commissioners appointed in or named by or by virtue of any such Act or Acts now made and passed, or to be hereafter made and passed, shall not be executed and perfected by such commissioner or commissioners by virtue or in pursuance of any such Act or Acts of Parliament; any thing in any Act or Acts, or any construction of or implication from any Act or Acts, or any law, usage, or custom, to the contrary in anywise notwithstanding.

*Act not to affect Right of Persons to appeal against Award of Commissioners.*

III. Provided always, that nothing in this Act contained shall prevent or be construed to prevent or take away the right of any person or persons, bodies politic or corporate, and his, her, and their heirs, successors, and assigns, to appeal against the award or awards, order or directions of any such commissioner or commissioners, when made and executed, or the right of possession to any such allotment or allotments which may be affected by the judgement of the court or such appeal; or to prevent or obstruct, or in anywise lessen or prejudice, any alteration or alterations to be made, ordered, or directed by any such commissioner or commissioners as aforesaid for or in respect of any such allotment or allotments, in and by his or their award or awards, to be made and executed by virtue or in pursuance of any such Act or Acts of Parliament as aforesaid.

*Where Leases granted under 41 G. 3. c. 109. become void before the expiration of their Term, Incumbents may grant new Leases.*

IV. Provided always, and be it further enacted that whenever any lease or leases to be granted by any rector, vicar, or other incumbent, under the powers or provisions of an Act passed in the forty-first year of the reign of his late Majesty King George the Third, intituled *An Act for consolidating in one Act certain provisions usually inserted in Acts of Inclosure, and for facilitating the mode of proving the several facts usually required on the passing of such Acts*, shall by any means become forfeited or void, or be surrendered before the expiration, by effluxion of time, of the term or terms thereby granted, then and in such case, and as often as the same shall so happen, it shall and

may be lawful for the rector, vicar, or other incumbent for the time being of the same rectory, vicarage, or parish, by and with the previous consent of the ordinary and patron, to grant a new lease of the lands so demised for such term or terms of years as shall, at the time or times of such avoidance, be then to come and unexpired of the original term or terms granted by such original lease or leases, subject nevertheless to the provisions and conditions contained in such original lease or leases, and then remaining unperformed and capable of having effect.

*Powers of this Act only binding in Cases where not otherwise provided.*

V. Provided always, and be it enacted, that the powers, authorities, and provisions in this Act contained shall be only so far effective and binding in each particular case as they or any of them shall not be otherwise provided and enacted in any Act hereafter to be passed for dividing, allotting and inclosing any open fields, pastures, commons, moors, or waste lands in *England*.

#### SCHEDULE TO WHICH THE ACT REFERS.

I A. B. [or, in case of two or more commissioners, we, A. B., C. D., &c] the commissioner [or commissioners] named and appointed in and by an Act of Parliament lately made and passed, intituled *An Act [here insert the title of the Act by which the commissioner or commissioners is or are appointed,]* do hereby order and direct, permit and authorize T. F. or his [her or their] bailiff or agent, to take possession of all that allotment [here describe the allotment or allotments by metes and bounds] by me [or us] set out or allotted, and staked or marked out to and for him [or her or their, as the case may be] under and by virtue of the said Act, and to cultivate and manage, or to let and demise the same allotment, [or allotments] to any tenant or tenants as he [or as she or they, as the case may be,] shall think proper; but nevertheless subject and without prejudice to any such order or orders, direction or directions, as I [or we] may think proper and expedient to make in and by the award or awards to be hereafter executed by me [or us] so far as respects such allotment [or allotments] so set out and allotted, and staked or marked out to and for the said T. F. As witness my hand [or our hands,] this Day of

Witness, (Signed) A. B.

# AN ACT

TO

REMEDY CERTAIN DEFECTS AS TO THE RECOVERY OF RATES AND ASSESSMENTS MADE BY COMMISSIONERS AND OTHER PERSONS UNDER DIVERS INCLOSURE AND DRAINAGE ACTS AFTER THE EXECUTION OF THE FINAL AWARDS OF THE SAID COMMISSIONERS.

3 & 4 WILLIAM IV.

[24th July, 1833.]

*Mode of proceeding for Recovery of Rates or Assessments in Arrear where no Remedy hath been already given.—Limiting the Recovery to Six Years from Period of Rate becoming due.*

Whereas divers Acts of Parliament have from time to time been passed for the inclosure, drainage, and improvement of divers lands, commons, and waste grounds, wherein commissioners are empowered to set out and make private roads and drains, banks, bridges, sluices, and other works: And whereas it hath been discovered since the passing of the said Acts, that there are no powers therein for the recovery of the rates or assessments from time to time after the making of the respective final awards of the commissioners acting in execution of the said Acts, under or by virtue of the said Acts or the said awards, or under or by virtue of powers, authorities, or directions given or contained in the said Acts or Awards, for defraying the expences of repairing, superintending, or renewing the said roads, drains, banks, bridges, sluices, and other works, whereby great inconvenience and losses have been sustained for want of such powers: And whereas it is expedient that a summary mode of proceeding should be granted for the purpose of recovering and enforcing the payment of such rates or assessments; for remedy whereof, may it please your Majesty that it may be enacted; and be it enacted by the King's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, That in all cases where no such remedy shall have been given, and where any such rate or assessment, rates or assessments, already made or hereafter to be made, or any part thereof, and whether made at one time or at several times, shall have been or shall be in arrear and unpaid for the space of twenty-one days after a notice in writing requiring payment thereof shall have been personally served on or left at the place of abode of the person or persons, or one of the persons, by whom the said rate or assessment, rates or assessments, ought to be paid, or at the place of abode of the tenant or occupier of the lands or grounds in re-

spect of which the said rate or assessment, rates or assessments, is or are made, it shall and may be lawful for any two or more of his Majesty's justices of the peace acting for any county, riding, or division, in petty sessions assembled, (not interested in the matter in question,) and who are hereby required, upon complaint made to them by the person or persons, or any one of the persons, to whom for the time being the said rate or assessment or rates or assessments ought to be paid, or by the person or persons, or any one of the persons, who for the time being shall be duly appointed to make or collect such rate or assessment or rates or assessments, to summon the person or persons from whom any rate or assessment, rates or assessments shall be due, and the witnesses on both sides, and upon the appearance or contempt of the party or parties accused, or any of them, to examine such party or parties and witness or witnesses as may be then present, upon oath (which oath such justices as are hereby authorized and empowered to administer), and to give judgment accordingly upon the matters and things brought before them, and by warrant or warrants under the hands and seals of such justices to levy the amount of all and every such rate or assessment, rates or assessments, so in arrear and unpaid, by distress and sale of the goods and chattels of the person or persons so making default in payment of such rate or assessment, rates or assessments, where-soever the same can or may be found, or of the occupier or occupiers of any lands or grounds belonging to such person or persons in respect of which such rate or assessment, rates or assessments, is or are made, which may be found on such lands or grounds, together with the reasonable costs and charges of such proceeding, rendering the overplus arising by such sale (if any), after deducting the sum or sums to be levied by such distress and sale, and the charges of taking, keeping, appraising, and selling the said distress, to the owner thereof (on demand); and the respective tenants of all the lands on which such distress shall be taken are hereby authorized and required to pay any sum of money for which such distress shall be made, and to deduct the same

out of his, her, or their rent; and every tenant making such payment shall be acquitted, exonerated, and discharged for so much money as shall be by him or her so paid: Provided always, that no such levy by distress and sale shall be made in respect of any such rate or assessment when more than six years shall have elapsed from the time when such rate or assessment first became due, unless a promise in writing to pay the said rate or assessment shall have been given by the person or persons liable to the payment thereof to some person duly authorized to receive the same; and when such promise has been given no such levy by distress or sale shall take place when more than six years shall have elapsed from the time that such promise was given: Provided also, that no such levy by distress and sale shall in any case exceed the amount of the rent due.

*Form of Warrant of Distress*

II. And be it further enacted, that the justices by whom any such warrant of distress shall be issued may cause such warrant to be drawn up in the following form of words, or in any other form to the same effect; (that is to say.)

“ To the constable of the                    in the county of  
 “                    } Whereas in and by a certain rate or assess-  
 [to wit.            ] ment, dated the                    and made for  
 [here in substance describe the purposes of the rate] A.  
 B. of                    in the parish of                    in the county  
 of                    was duly rated and assessed in the sum  
 of                    [if more than one rate or assesment, recite the  
 others in the same manner:] And whereas it appeareth  
 unto us, two (or more) of His Majesty's justices of  
 the peace for the said (county, riding, or division, as  
 the case may be,) upon the complaint of C. D. of  
 the person to whom the said rate or assessment  
 ought to be paid, (or otherwise, as the case may be,)  
 that a notice in writing, requiring payment of the  
 said sum (or said several sums,) was personally  
 served on the said A. B., (or left at the place of  
 abode of the said A. B., or of the tenant or occupier  
 of the lands or grounds,) to wit on the                    day  
 of                    last, and that default has been made in  
 payment thereof for the space of twenty-one days  
 next after such notice so served (or left,) and that  
 the same sum (or several sums, or a certain part of  
 such sum or sums, as the case may be,) is (or are) still  
 due and unpaid: and whereas it having been duly  
 proved to us, upon oath, that the said A. B. hath  
 been duly summoned to appear before us, the said  
 justices, to show cause why the said rate or assess-  
 ment (rates or assessments) should not be paid; and  
 he the said A. B. having appeared before us (or and  
 he the said A. B. having neglected to appear accord-  
 ingly before us, as the case may be,) according to  
 such summons, and not having shown to us any  
 sufficient cause why the said sum so as aforesaid due  
 and unpaid should not be paid: these are therefore  
 to require you forthwith to make distress of the

goods and chattels of him the said A. B. wheresoever they may be found, or of the occupier or occupiers of the lands or grounds or some part thereof belonging to the said A. B. in respect of which the said rate or assessment, (rates or assessments) is (or are) made, which may be found in and upon such lands or grounds; and if within the space of five days next after such distress by you taken, the sum of                    and also the further sum of                    being the costs already incurred in the premises, making together the sum of                    together with the reasonable charges of taking and keeping the said distress, shall not be paid, that then you do sell the said goods and chattels so by you distrained, and out of the money arising by such sale that you detain the said sum of                    and also your reasonable charges of taking, keeping, appraising and selling the said distress, rendering to him the said A. B. the overplus, on demand. Given under our hands and seals this                    day of                    one thousand eight hundred and thirty.

*Appeal*

III. And be it further enacted, that if any person or persons shall think himself, herself, or themselves aggrieved by any thing done in pursuance of this Act, then and in every such case, he, she, or they may appeal to the next court of general quarter sessions of the peace which shall be holden not less than ten days after the cause of such complaint for the county, riding, division, or place wherein the cause of complaint shall have arisen: provided that such person shall give to the complainant a notice in writing of such appeal, and of the cause and matter thereof, within eight days after such cause of complaint, and six clear days at the least before such sessions, and shall also enter into a recognizance within such six days, with sufficient surety, before a justice of the peace for the same county, riding, division, or place, conditioned to appear at the said sessions, and to try such appeal, and to abide the judgment of the court thereupon, and to pay such costs as shall be awarded by the court; and the court at such sessions shall hear and determine the matter of such appeal, and shall make such order therein, with or without costs to either party, as to the court shall seem meet.

*Warrant not to be quashed for want of Form.*

IV. And be it further enacted, that no such warrant of distress or adjudication made on appeal therefrom shall be quashed for want of form.

*Rated Persons not to be disqualified from giving Evidence.*

V. Provided always, and be it further enacted that at the hearing of the said complaint and appeal, or either of them, no person shall be an incompetent witness by reason of his or her being rated or liable to be rated to the said rate or assessment, rates or assessments.

# AN ACT

FOR

REMEDYING A DEFECT IN TITLES TO MESSUAGES, LANDS, TENEMENTS, AND HEREDITAMENTS, ALLOTTED, SOLD, DIVIDED, OR EXCHANGED UNDER ACTS OF INCLOSURE, IN CONSEQUENCE OF THE AWARD NOT HAVING BEEN INROLLED, OR NOT HAVING BEEN INROLLED WITHIN THE TIME LIMITED BY THE SEVERAL ACTS; AND FOR AUTHORIZING THE APPOINTMENT OF NEW COMMISSIONERS IN CERTAIN CASES WHERE THE SAME SHALL HAVE BEEN OMITTED.

3. & 4. WILLIAM IV.

(28th August, 1833.)

*All Awards already made but not inrolled shall, from the Execution thereof be as valid as if inrolled within the Time limited by the Act.*

WHEREAS by divers Acts of Inclosure the awards or instruments in writing, thereby directed to be formed and drawn up or made by the commissioner or commissioners appointed by or by virtue of such Acts for executing the powers and authorities thereof respectively, are directed or required to be inrolled by or with the clerk of the peace of the county, riding, division, soke, or place in which the lands to which such Acts respectively relate are situated, or in one of his Majesty's courts of record at *Westminster*, or in some other court, and, in certain of the said Acts, within certain times mentioned in such Acts next after the execution of such awards or instruments in writing respectively; and in certain of the said Acts new commissioners are directed to be appointed within certain times thereby respectively limited: And whereas in a great number of instances such awards or instruments in writing have not been inrolled, or have not been inrolled within the time directed or required by the several Acts; and by reason of such omission the title to the messuages, lands, tenements, hereditaments allotted, sold, divided, or exchanged under such Acts respectively may be considered defective; and in many instances new commissioners have not been appointed within the time directed by the several Acts: And whereas it is expedient that provision should be made for remedying such defects: May it therefore please your Majesty that it may be enacted; and be it enacted by the King's most Excellent Majesty, by and with the advice and consent of the lord's spiritual and temporal, and commons, in this present Parliament assembled, and by the authority of the same, That every award already made and executed under or in pursuance of any Act of Inclosure, and which has not been inrolled, or which has not been inrolled within the time limited by the Act under or in pursuance of which such award shall have been made, shall from the time of the execution of such

award be as good and valid and of the same effect in all respects as if such award had been inrolled in the manner, and within the time, if any, appointed and limited for that purpose in the Act under or in pursuance of which the same has been made.

*Proprietors of Lands may cause Awards to be inrolled. Copy of any Award so inrolled and signed by the proper Officer to be delivered to any Person requiring the same.*

II. And be it further enacted, That where any award already made and executed under or in pursuance of any Act of Inclosure has not been inrolled, it shall be lawful for any person or persons having or deriving title to any messuages, lands, tenements, and hereditaments under such award, at his, her, or their expense, to require and cause such award, with any maps or plans annexed or relating thereto, to be inrolled in any one of his Majesty's courts of record at *Westminster*, or by the clerk of the peace of the county, riding, division, soke, or place in which the lands to which such award shall relate are situated, to the end that recourse may be had thereto by any person or persons interested therein, for the inspection and perusal whereof no more than one shilling shall be paid; and a copy of such award when so inrolled, or of any part thereof, signed by the proper officer of the court wherein the same shall be inrolled, or by the clerk of the peace for such county, riding, division, soke, or place, or his deputy, purporting the same to be a true copy, shall from time to time be made and delivered by such officer or clerk of the peace for the time being, or his deputy, to any person or persons requesting the same, for which no more shall be paid than three-pence for every sheet of seventy-two words; and every award already made, whether inrolled or not, and every copy of such award when inrolled as aforesaid, or of any part thereof, signed as aforesaid, shall at all times be admitted and allowed in all courts whatsoever as legal evidence.

*As to Practice requiring Acknowledgement of Deeds.*

III. And be it further enacted, That if any commissioner shall be dead or incapable of acknowledging his award before such award shall be inrolled, the same award may be inrolled without the acknowledgement of such commissioner, on due proof being given that such award is the deed or instrument of such commissioner.

*As to the Possession of Awards when deposited.*

IV. And be it further enacted, That where any award already made and executed under or in pursuance of any Act of Inclosure shall be deposited in any parish church, it shall be considered as in the custody of the officiating minister and churchwardens for the time being of such parish church; and where any such award shall be in the possession of the lord of any manor to or for whom, or to or for any preceding lord of which manor, any allotment shall have been made under such award, or in the possession of the steward of such manor, it shall be considered as in the custody of the lord of such manor for the time being; and the steward shall, when required, deliver up the same accordingly; and the said minister and churchwardens, or lord, as the case may be, shall from time to time, upon the request of any person or persons interested in any allotment or allotments, or otherwise, under such award, cause the same to be produced for the inspection of such person or persons on being paid by him, her, or them a just and reasonable compensation for such production, and shall also cause the same to be produced for the purpose of being inrolled, or in any court of law or equity, or on any other occasion, for the purpose of being given in evidence, on being paid all just expenses.

*Proprietors may require Awards to be deposited in the Church or with the Lord of the Manor.*

V. And be it further enacted, That where any such award as aforesaid shall not be deposited in the parish church of the parish in which the lands to which such award shall relate are situated, and shall not be in the possession of the lord or steward of any manor to or for the present or any preceding lord of which manor an allotment shall have been made under such award, but shall be in the possession of any other person, it shall be lawful for any person or persons interested in any allotment or allotments, or otherwise, under such award, to require the same to be deposited in the parish church of the parish in which the lands to which such award shall relate are situated, and the person in whose possession the same shall be, shall on such request, deliver up the same to the minister and churchwardens for the time being of such parish church, for the purpose of being so deposited.

*Providing for Appointment of Commissioners in Cases where they have been neglected or omitted to be made.*

VI. And be it further enacted, That in all cases where in or by virtue of any Act or Acts of Inclosure heretofore passed provision hath been made for the election, nomination, or appointment, within a time therein limited or directed, of a new commissioner or commissioners in the event of the death, refusal, or neglect to act of the commissioner

or commissioners appointed by or by virtue of such Act or Acts, or of his or their becoming, by reason of absence beyond the seas, or otherwise, incapable of acting in the execution of the powers, authorities, and trusts in such commissioner or commissioners vested and reposed, before the same and every of them shall have been fully executed and performed, and where any such election, nomination, or appointment, as aforesaid, or any of them, shall have been neglected or omitted to have been made, pursuant to such Act or Acts within the time or times thereby limited or directed, then and in every such case it shall and may be lawful to and for the person or persons by any such Act or Acts of Inclosure authorized or empowered for that purpose, and on such notice or notices, and at such meeting or meetings (if any) as required or directed by any such Act or Acts of Inclosure, to proceed at any time after the passing of this Act to the election, nomination, and appointment of, and to elect, nominate, and appoint in such manner as by such Act or Acts of Inclosure is or are directed, one or more fit and proper person or persons (as the case may require), not interested in the division, allotment, or inclosure by such Act or Acts of Inclosure directed or authorized to be made, and not otherwise disqualified by such Act or Acts respectively, as a commissioner or commissioners in the room, place, or stead of the commissioner or commissioners so dying, refusing, or neglecting, or becoming incapable of acting as aforesaid, and to do all other acts, matters, and things which shall be requisite or necessary for effecting the purposes aforesaid, notwithstanding the time so limited or appointed as aforesaid for doing or performing the same shall then have elapsed, and so from time to time as often as any commissioner so to be elected, nominated, or appointed as aforesaid shall die, refuse, neglect, or become incapable of acting as aforesaid; and the several writings appointing such new commissioner or commissioners, and all other documents (if any) relative thereto, shall be deposited or disposed of as by such Act or Acts of Inclosure is or are directed; and every commissioner to be elected, nominated, or appointed by virtue of this Act to execute the powers, authorities, and trusts of any Act or Acts of Inclosure as aforesaid, having first taken the oath or oaths, and complied with the other terms or conditions (if any) prescribed in and by such Act or Acts of Inclosure, shall have the same powers and authorities, and no others, for putting or carrying into execution such Act or Acts, as if he had been duly elected, nominated, and appointed for those purposes, within the time limited or directed by such Act or Acts of Inclosure.

*Act not to give greater Validity to Awards than as respects the Defects.*

VII. Provided always, and be it further enacted, That nothing herein contained shall extend to affect any public right, or otherwise to give any greater force or validity to any award already made and executed under or in pursuance of any Act of Inclosure, than such award would have had if this Act had not been made, except so far as respects the several defects herein-before respectively specified and provided for.

## NOTICE.

---

A plan for the Commutation of Tithes having been sanctioned by the Legislature, and which, by the co-operation of men of all shades of political opinion, has been rendered as perfect as any general measure applicable to a question so complicated and difficult could be, the Editor thought it desirable that the Act should be in the hands of the parties interested as early as possible. This seemed to be more necessary as the period in which a VOLUNTARY Commutation may be effected is limited to something more than two years, the Commissioners being invested with full power to make a COMPULSORY Commutation after the 1st Oct. 1838. The important point disputed in settling this question was, whether the Commutation should be VOLUNTARY or COMPULSORY. The Act just passed gets rid of the difficulty by first facilitating a VOLUNTARY Commutation, and if by a given day no arrangement shall have been effected, then by enforcing a COMPULSORY settlement. The Editor has both before and since the question has been agitated in Parliament given considerable attention to the subject, and the result of his most mature reflection is, that in by far the majority of cases a VOLUNTARY Commutation will be found most satisfactory. It cannot be doubted that impracticable persons will occasionally be met with upon whom reason and argument will produce no effect; in such cases a COMPULSORY mode becomes absolutely requisite: these, however, are the exceptions. The payers and receivers of tithes in each parish being the parties interested are likely to be best acquainted with the minute circumstances attendant upon the quality and production of the soil—the system of farming—the outlay which has been made in improvements—and a thousand other details necessary to be taken into consideration. Let them but meet, with a determination to be reasonable, and the difficulties which seem to impede their progress will in the main be removed. The Commissioners are necessarily clothed with large discretionary powers, without which it would be impossible for them to embrace all cases, many of which differ so widely from each other. The landed interest, however, has ample earnest that that discretion will not be abused in the appointment of the Commissioners, W. Blamire, Esq., the late member for Cumberland, I. W. Buller, Esq., and the Rev. R. Jones, M.A. of King's College, London. Independent of being a considerable landed proprietor Mr. Blamire the Chief Commissioner, is well known to be a sound practical agriculturist, a qualification which if not altogether essential in a Commissioner will aid

him much in the performance of his duties, and will be absolutely requisite in an Assistant-Commissioner. Many valuable improvements were made in the Tithe Bill upon the suggestion of Mr. Blamire, and for which Lord John Russell expressed his obligations in the House of Commons. The Rev. R. Jones has also devoted much time and attention to the tithe question, and materially contributed to the satisfactory arrangement of the present system of Commutation. Up to the 1st October, 1838, the duties of the Commissioners will be rather to advise and co-operate with those parties who may wish to effect a VOLUNTARY Commutation. After that day they are directed by the Act to take immediate steps for effecting a COMPULSORY Commutation of Tithes in every parish. The Editor being desirous of rendering this edition of the Act practically useful to general readers has, for the purpose of facilitating reference, given a very copious index preferring to be guilty of repetition rather than that difficulty shall be experienced in finding any subject to which it may be requisite to refer. The very short space of time which has elapsed since the Act received the Royal Assent, (13th August) combined with the circumstance of its being published in a magazine, which required that it should be completed early (26th August) have rendered it impossible to make this edition as perfect as the Editor could wish: he trusts, however, that it will be found sufficiently useful for ordinary practical purposes.

WM. SHAW.

## VOLUNTARY COMMUTATION.

A hope was entertained that there would have been sufficient time before the Magazine went to Press to prepare a statement in detail of the proceedings to be taken in effecting a VOLUNTARY and a COMPULSORY Commutation of Tithes under this Act. That being found impracticable it is necessarily postponed until the next Number, to be published on the 1st October, when such practical directions will be given as will very much simplify the course of proceeding. For the present it must suffice to observe that persons having it in contemplation, to take steps for effecting a voluntary Commutation of Tithes, will find that an acquaintance with the following points will not only enable them to provide against difficulties which, by presenting themselves at a parochial meeting, may occasion delay, but also that a previous knowledge of them will tend very much to facilitate the business of the Meeting.

The meaning of the following terms, as explained in s. 12:—

“ Person,”		“ Parochial,”
“ Lands,”		“ Land-owner” or “ Owner of land,”
“ Tithes,”		“ Tithe-owner” or “ Owner of tithes.”

Forms of notices, agreements, &c. will be supplied by the commissioners to churchwardens and overseers, upon application, s. 22.

If it be expedient, for the purposes of commutation, that a parish should be divided, commissioners have power to direct a division. See “ Parish,” s. 12.

Correspondence with commissioners is exempt from postage, s. 92.

Advertisements, contracts, agreements, awards, and powers of attorney, &c., not liable to stamp-duty, s. 91.

By whom the ownership of lands and patronage belonging to the crown is to be exercised, s. 13.

An owner of lands, being also owner of tithes and patron, may be treated, and may act and vote in each separate character, s. 14.

Land-owner, tithe-owner, or patron, or any person interested, being a minor, idiot, &c., or labouring under other legal disability, may act by his legal representative, and in default of such, commissioners may name a person to represent him, s. 15.

All acts may be done by agent duly appointed, s. 16.

Leases of tithes commuted may be surrendered, with consent of commissioners, s. 88.

The interest of land-owners and tithe-owners to be calculated by reference to the poor-rate, if no poor-rate, then according to the rule by which property is rated, to the relief of the poor, s. 19.

The tithe of mills may be included in parochial agreement, but Easter offerings, surplice fees, mineral tithes, personal tithes, &c. &c. cannot be included without special provision and consent of commissioners, s. 90.

### MEETING.

Land-owners having an interest in one-fourth of the value of the titheable lands, or tithe-owners having an interest in one-fourth of the value of the tithes, may summon a parochial meeting, giving 21 days notice, s. 17.

The notice must be signed by the parties, affixed upon the church-door, or in some other conspicuous place within the parish, and inserted twice during the 21 days in some one of the county papers, s. 17.

Commissioners or assistant-commissioners may attend meeting to advise on terms of agreement, s. 23.

First business of meeting to elect a chairman, s. 18.

Chairman to ascertain the interest of land and tithe-owners present, s. 18.

Correct minutes should be kept.

Meeting may be adjourned; notice of adjournment, signed by chairman, being put up outside the building where the last meeting took place. Business transacted at adjourned meetings as valid as if done at original meeting, s. 20.

If there be present land-owners interested in two-thirds of the titheable lands, tithe-owners interested in two-thirds of the great tithes, and also in two-thirds of the small tithes, an agreement for commutation by the payment of an annual sum in lieu of tithes, may be made and executed, s. 17.

This sum must be the total sum to be paid by the parish, the apportionment of the proportional amount upon the respective lands will be made afterwards.

If there be not present the above-required number of land and tithe-owners, then those who are present, whatever the number, may make a provisional agreement, which if signed

- within six months of the date of the first signature by two-thirds of the owners of land, two-thirds of the owners of great, and two-thirds of the owners of small tithes, respectively, will be as valid as if made at a full meeting, s. 18.
- Consent of patron must be obtained to every agreement for commutation of ecclesiastical tithes, s. 26.
- Twenty acres of land may be given to the owner of *ecclesiastical* tithes in lieu of rent-charge, or an equivalent part of it, s. 29.
- The agreement should strictly follow the form prescribed, and contain all the particulars therein required.
- The agreement, when properly executed, to be sent to the office of the commissioners, who will examine into its fairness and correctness, and call for proof if they deem it necessary, s. 27.
- If the agreement refer to ecclesiastical tithes, commissioners will give notice to the Bishop of the diocese before confirmation, s. 28.
- If land be given to ecclesiastical tith-owner, in lieu of rent-charge, commissioners will satisfy themselves as to the title at the expense of the land-owners, s. 30.
- Suits and differences pending at the time, or arising during the making of a parochial agreement, may be referred to arbitration, and the decision will be final, s. 24.
- Reversioners, &c. will not be bound by decision of arbitrator, without the consent of the commissioners, who may direct that other persons interested be made parties to the reference, s. 24.
- Expenses of advertising and attending parochial meetings, must be borne by the parties, s. 17.

#### Particulars to be set out in Parochial Agreement.

- The date of the first signature.
- Particulars of all the lands subject to tithes
- The true or estimated statute measure.
- The nature of the land, as arable, meadow, pasture, wood land, common land, &c. &c.
- Whether any and *what* lands subject to moduses, composition real, prescriptive or customary payments, &c. &c.
- What tithes so covered by moduses, &c. &c.
- The number of tithe-owners, their respective rights, to what tithes entitled, and upon what lands.
- Whether any and what lands, and how exempt from tithes.
- The amount of the sum or sums agreed to be paid by way of rent-charge, in words at length.
- And such other particulars as the commissioners may require.

#### “C O R N.

RETURN to an Order of the Honourable the House of Commons, dated 19th February, 1836;—for,  
AN ACCOUNT of the Average Prices of BRITISH WHEAT, BARLEY, and OATS, in *England* and *Wales*, for the Seven Years preceding 31st December, 1835, computed from the Weekly Averages of the CORN RETURNS.

YEARS ENDED.	WHEAT.		BARLEY.		OATS.	
	Per Quarter.		Per Quarter.		Per Quarter.	
	<i>s.</i>	<i>d.</i>	<i>s.</i>	<i>d.</i>	<i>s.</i>	<i>d.</i>
1829 .....	66	3	32	6	22	9
1830 .....	64	5	32	7	24	5
1831 .....	66	1	38	0	25	4
1832 .....	58	3	33	1	20	5
1833 .....	52	11	27	6	18	5
1834 .....	46	2	29	0	20	11
1835 .....	39	4	29	11	22	0
Average of the Seven Years.	56	3	31	9	22	0*

Corn Department, }  
Board of Trade. }

WILLIAM JACOB,  
Comptroller of Corn Returns.\*

\* Hence the price of the bushel is,—Wheat, 7*s.* 0½*d.*; Barley, 3*s.* 11½*d.*; Oats, 2*s.* 9*d.*

This average when taken as the basis for commutting 300*l.* of tithes, would produce the following result :—

	Qrs.
100 <i>l.</i> laid out in wheat, at 56 <i>s.</i> 3 <i>d.</i> per quarter, would produce .....	35·56
100 <i>l.</i> laid out in barley, at 31 <i>s.</i> 9 <i>d.</i> per quarter, would produce .....	62·98
100 <i>l.</i> laid out in oats, at 2 <i>s.</i> per quarter, would produce .....	90·9

Suppose that in 1837 the average prices of the seven preceding years, ending Christmas 1836, should prove to be—

Wheat .....	60 <i>s.</i>
Barley .....	40 <i>s.</i>
Oats .....	20 <i>s.</i>

Then, a corn rent-charge rendering the number of quarters above specified, and which are this year worth 300*l.* would produce in 1837, as follows :—

	£	<i>s.</i>	<i>d.</i>
35·56 quarters of wheat, at 60 <i>s.</i> .....	106	13	6
62·98 — of barley, at 40 <i>s.</i> .....	125	19	2
90·9 — of oats, at 20 <i>s.</i> .....	90	18	0
Total value of rent-charge for 1837 .....	323	10	8

Such is the kind of variation which will take place under the Act.

### RENT-CHARGE.

The following rule has been communicated by Mr. DRINKWATER, the Parliamentary Counsel to the Home Office and published, by which the variations in the value of any rent-charge may be readily calculated. It will always give less than the true value, but the error will never amount to half a farthing per £1.

**RULE.** Add together the price of a bushel of wheat, barley, and oats, (as published in the Gazette, according to the Act,) and subtract one-twentieth part of the sum. Call the remainder (*A*).

Add together the price of a bushel of barley, and of two bushels of oats; subtract one-fourth part of the sum, and one-fiftieth part of the remainder. Call the last remainder (*B*).

The sum of (*A*) and (*B*) is the value in any year of that which was £1 at the time of commutation.

**Ex. 1.** Let the price of wheat be 7*s.* 0¼*d.*, barley 3*s.* 11½*d.*, and oats 2*s.* 9*d.* per bushel.

<table style="width: 100%; border-collapse: collapse;"> <tr> <td style="text-align: right;"><i>s.</i></td> <td style="text-align: right;"><i>d.</i></td> <td></td> </tr> <tr> <td style="text-align: right;">Wheat 7</td> <td style="text-align: right;">0¼</td> <td></td> </tr> <tr> <td style="text-align: right;">Barley 3</td> <td style="text-align: right;">11½</td> <td></td> </tr> <tr> <td style="text-align: right;">Oats . 2</td> <td style="text-align: right;">9</td> <td></td> </tr> <tr> <td colspan="2" style="border-top: 1px solid black;"></td> <td style="text-align: right;"><i>s.</i></td> </tr> <tr> <td style="text-align: right;">13</td> <td style="text-align: right;">8¼</td> <td style="text-align: right;">or 13·729</td> </tr> <tr> <td></td> <td></td> <td style="text-align: right;">·68645 = <math>\frac{1}{20}</math></td> </tr> <tr> <td colspan="2" style="border-top: 1px solid black;"></td> <td style="text-align: right;">13·04255 = (<i>A</i>)</td> </tr> <tr> <td></td> <td></td> <td style="text-align: right;">6·95494 = (<i>B</i>)</td> </tr> <tr> <td colspan="2" style="border-top: 1px solid black;"></td> <td style="text-align: right;">19·99749</td> </tr> <tr> <td colspan="2" style="border-top: 1px solid black;">Answer .....</td> <td style="text-align: right;">19·99749</td> </tr> <tr> <td colspan="2" style="border-top: 1px solid black;">Accurate value .. 20</td> <td style="text-align: right;">Error ¼ of a farthing.</td> </tr> </table>	<i>s.</i>	<i>d.</i>		Wheat 7	0¼		Barley 3	11½		Oats . 2	9				<i>s.</i>	13	8¼	or 13·729			·68645 = $\frac{1}{20}$			13·04255 = ( <i>A</i> )			6·95494 = ( <i>B</i> )			19·99749	Answer .....		19·99749	Accurate value .. 20		Error ¼ of a farthing.	<table style="width: 100%; border-collapse: collapse;"> <tr> <td style="text-align: right;"><i>s.</i></td> <td style="text-align: right;"><i>d.</i></td> <td></td> </tr> <tr> <td style="text-align: right;">Barley 3</td> <td style="text-align: right;">11½</td> <td></td> </tr> <tr> <td style="text-align: right;">2. 		6·375																																																														
		1275 = $\frac{1}{50}$																																																														
		6·2475 = ( <i>B</i> )																																																														

The investigation of this rule is very simple.

The present prices, as deduced from the return made to the House of Commons, from the Corn Office, and which will govern the conversions, are those assumed in the first example;—viz. Wheat 7*s.* 0¼*d.* Barley 3*s.* 11½*d.* Oats 2*s.* 9*d.*

Let the prices in any following year be, Wheat X, Barley Y, Oats Z.  
Then the value of £1 converted at the present prices, and reconverted at the supposed prices, X, Y, Z.

$$= \frac{s. d.}{6 \ 8} .X + \frac{s. d.}{6 \ 8} Y + \frac{s. d.}{6 \ 8} .Z$$

$$= \frac{320}{7 \ 0\frac{1}{4}} .X + \frac{320}{3 \ 11\frac{1}{2}} .Y + \frac{320}{132} .Z$$

$$= \frac{320}{337} .X + \frac{320}{190} .Y + \frac{320}{132} .Z$$

$$\frac{320}{337} = .94955 = .95 - .00046$$

$$\frac{320}{190} = 1.6842 = .95 + .7342 = .95 + .735 - .0008$$

$$\frac{320}{132} = 2.4242 = .95 + 1.4742 = .95 + 2 + .735 + .0042$$

Therefore the value of £1 becomes .95 (X+Y+Z) + .735 (Y+2Z)  
+ .0042 Z - (.00046 X + .0008 Y)

The first line contains the result of the rule for ..... .95 =  $\frac{19}{20}$   
and .... .735 =  $\frac{3}{4} - \frac{1}{20}$

The error of the rule is therefore contained in the second line.

A table is subjoined, showing the average price of seven years preceding every year since 1820.

It may be assumed that the average price of wheat will never be more than three times the average price of oats, nor barley more than twice the average price of oats.

With those extreme values the error is still in defect, and amounts to .00122 Z.

It may also be assumed, that the average price of wheat will never be less than twice the average price of oats, nor barley less than oats.

With those extreme values the error is at its greatest, and amounts to .0025 Z, which is less than half a farthing, so long as Z is less than 4s., i. e. whenever oats are less than 32s.

AVERAGE PRICE OF CORN DURING SEVEN YEARS ENDING AT THE CHRISTMAS PRECEDING EACH YEAR.

YEARS.	WHEAT.		BARLEY.		OATS.	
	s.	d.	s.	d.	s.	d.

# AN ACT

## FOR THE COMMUTATION OF TITHES IN ENGLAND AND WALES.

6 & 7 WILL. IV.

[13th August, 1836.]

APPOINTMENT AND GENERAL POWERS  
OF COMMISSIONERS AND ASSISTANT  
COMMISSIONERS.

### *Appointment of Commissioners.*

I. Whereas it is expedient to amend the laws relating to Tithes (*a*) in *England* and *Wales*, and to provide the means for an adequate compensation for tithes, and for the commutation thereof; be it therefore enacted, by the King's most excellent Majesty, by and with the advice and consent of the Lords spiritual and temporal, and Commons, in this present Parliament assembled, and by the authority of the same, that it shall be lawful for one of his Majesty's principal Secretaries of State to appoint two fit persons to be commissioners to carry this act into execution, and for the Archbishop of *Canterbury*, under his hand and archiepiscopal seal, to appoint one fit person to be a commissioner to carry this act into execution, (*b*) and for the said Archbishop and Secretary of State at their joint pleasure to remove any one or more of the commissioners so appointed; and upon every vacancy in the office of commissioner some other fit person shall be appointed to the said office in the same manner and by the same authority as the commissioner whose vacancy is thereby supplied; and until such appointment it shall be lawful for the continuing commissioners or commissioner to act as if no such vacancy had occurred (*c*).

(*a*) By the interpretation clause, s. 12, p. 11, the word "TITHES" "shall mean and include all uncommuted tithes, and portions and parcels of tithes, and all moduses, compositions real and prescriptive, and customary payments."

(*b*) This appointment is to continue in force five years, and from thence to the end of the next session of Parliament, after which so much of this Act as authorises any such appointment to cease, see s. 6, p. 10.

(*c*) As to oath to be taken by commissioners, see s. 9, p. 10.

*Style of Commissioners.*—To have a Common Seal.—Awards, &c. purporting to be sealed with such Seal, to be received as evidence.

II. And be it enacted, that the said commissioners shall be styled "The Tithe Commissioners for *England* and *Wales*," and shall have their office in *London* or *Westminster*, and they, or any two of them, may sit from time to time, as they deem expedient, as a board of commissioners for carrying this act into execution; and the said commissioners shall cause to be made a seal of the said board, and shall cause to be sealed or stamped therewith all agreements and awards confirmed by the said commissioners in pursuance of this act; and all such agreements and awards, and other instruments proceeding from the said board, or copies thereof, purporting to be sealed or stamped with the seal of the said board, shall be received in evidence, without any further proof thereof; and no agreement or award shall be of any force, unless the same shall be sealed or stamped as aforesaid.

*Commissioners to Report to Secretary of State.*

—Annual Report to be laid before Parliament.

III. And be it enacted, that the said commissioners shall from time to time give to any one of his Majesty's principal secretaries of state such information respecting their proceedings, or any part thereof, as the said principal secretary of state shall require, and shall once in every year send to one of the principal secretaries of state a general report of their proceedings; and every year such general report shall be laid before both Houses of Parliament within six weeks after the receipt of the same by such principal secretary of state, if Parliament be sitting, or if Parliament be not sitting, then within six weeks after the next meeting thereof.

*Power to appoint Assistant Commissioners, Secretary, Assistant Secretary. &c.—Limiting the number of Appointments.*

IV. And be it enacted, that it shall be lawful for the commissioners from time to time to appoint a sufficient number of persons to be assistant commissioners (*d*), and also a secretary and assistant secretary, and all such clerks, messengers and officers as they shall deem necessary, and to remove such assistant commissioners, secretary or assistant secretary, clerks, messengers or officers, or any of them, and on any vacancy in any of the said offices to appoint some other person to the vacant office; and the persons so appointed shall assist in carrying this act into execution at such places and in such manner as the said commissioners may direct: provided always, that the said commissioners shall not appoint more than twelve such assistant commissioners to act at any one time, unless the Lord High Treasurer, or any three or more of the commissioners of his Majesty's treasury, shall in the case of each such appointment consent thereto: provided further, that the number of such clerks, messengers and officers shall be subject to the like consent.

*Commissioners not to sit in the House of Commons.*

V. And be it enacted, that no commissioner or assistant commissioner appointed as aforesaid shall during his continuance in such office be capable of being elected or of sitting as a member of the House of Commons.

*Operation of Act as to appointment of Commissioner, &c. limited to five years.*

VI. And be it enacted, that no commissioner or assistant commissioner, secretary, assistant secretary, or other officer or person so to be appointed, shall hold his office for a longer period than five years next after the day of the passing of this act, and thenceforth until the end of the then next session of Parliament; and after the expiration of the said period of five years and of the then next session of Parliament so much of this act as authorizes any such appointment shall cease.

*Salaries of, and Allowances to, Commissioners and Assistant Commissioners, Secretary and other Officers.*

VII. And be it enacted, that the salaries of the commissioners, the allowance to the

assistant-commissioners, and the salaries of the secretary, assistant-secretary, clerks, messengers, and other officers to be appointed under this act, shall be from time to time regulated by the Lord Treasurer or the Lords Commissioners of his Majesty's treasury, or any three of them: provided always, that the salary of a commissioner shall not exceed the sum of one thousand five hundred pounds a year, nor the allowance to an assistant-commissioner the sum of three pounds for every day that he shall be actually employed or travelling in the performance of the duties of his office, nor the salaries of the secretary or assistant-secretary the sum of eight hundred pounds a year; and that the salaries of the clerks, messengers and other officers shall be in fit proportion: provided also, that the said lord treasurer or lords commissioners may allow to any commissioner, assistant-commissioner, secretary, assistant-secretary, clerk, messenger, or other officer, any such reasonable travelling and other expenses as may have been incurred by him in the performance of his duties under this act, in addition to his salary or allowance respectively.

*Such Salaries, Allowances, and other Expenses, how to be paid.*

VIII. And be it enacted, that the salaries, allowances and travelling and other expenses of the commissioners, assistant-commissioners, secretary, assistant-secretary, clerks, messengers and officers as aforesaid, and all other incidental expenses of carrying this act into execution, not herein otherwise provided for, shall be paid by the lord treasurer or the lords commissioners of his Majesty's treasury out of the Consolidated Fund.

*Commissioners and Assistant-Commissioners to take an Oath.—Form of Oath.—Notification of Appointment to be published in the Gazette.*

IX. And be it enacted, that every such commissioner and assistant-commissioner shall, before he shall enter upon the execution of his office, take the following oath before one of the Judges of his Majesty's Courts of King's Bench or Common Pleas, or one of the Barons of the Court of Exchequer; (that is to say)

“ I, A. B., do swear, that I will faithfully, impartially and honestly, according to the best of my skill and judgment, fulfil all the powers and duties of a commissioner (or assistant-commissioner, as the case may be,) under an act passed in the seventh

(*d*) As to oath to be taken by assistant commissioners, see s. 9, p. 10; and as to the powers of assistant commissioners, see s. 11, p. 11.

year of the reign of King *William* the Fourth, intituled [*here set forth the title of this act.*]

And the appointment of every such commissioner and assistant-commissioner, with the time when and the name of the judge or baron before whom he shall have taken the oath aforesaid, shall be forthwith published in the *London Gazette*.

*Commissioners or Assistant-Commissioner may summon and examine Witnesses.*

X. And be it enacted, that the said commissioners, or any assistant-commissioner, may, by summons under their or his hand, require the attendance (*e*) of all such persons as they or he may think fit to examine upon any matter brought before them or him as hereinafter mentioned relating to the Commutation of Tithes, and also make any inquiries and call for any answer or return as to any such matter, and also administer oaths, and examine all such persons upon oath, and cause to be produced before them or him upon oath, all books, deeds, contracts, agreements, accounts and writings, terriers, maps, plans and surveys, or copies thereof respectively, in anywise relating to any such matter: provided always, that no such person shall be required, in obedience to any such summons, to travel more than ten miles from the place of his abode, or to produce any deeds, papers or writings relating to the title of any lands or tithes (*f*).

*Commissioners may delegate Powers to Assistant-Commissioners, except the Powers to be exercised under their Seal.*

XI. And be it enacted, that the said commissioners may delegate to their assistant-commissioners, or to any one or more of them, such of the powers hereby given to the said commissioners as the said commissioners shall think fit, (except the power to confirm agreements and awards, or to frame forms of agreements and other instruments, as hereinafter provided, or to do any act herein required to be done under the seal of the said commissioners), and the powers so delegated shall be exercised under such regulations as the said commissioners shall direct; and the said commissioners may at any time recall or alter all or any of the powers delegated as aforesaid, and, notwithstanding the delegation thereof, may act as if no such delegation

had been made; and all acts done by any such assistant-commissioner in pursuance of such delegated powers, shall be obeyed by all persons (*g*) as if they had proceeded from the said commissioners, and the non-observance thereof shall be punishable in like manner.

INTERPRETATION CLAUSES (*h*).

*Meaning of the words "Person," "Lands," "Tithes," "Parish," "Parochial," "Land Owner," "Tithe Owner," as used in this Act.—13 & 14 Car. 2, c. 12.—Where Parties to be deemed Joint Owners.*

XII. And be it enacted, that in the construction and for the purposes of this act, unless there be something in the subject or context repugnant to such construction, the word "person" shall mean and include the King's Majesty, and any body corporate, aggregate or sole, as well as an individual; and any word importing the singular number only, shall mean and include several persons or parties as well as one person or party, and several things as well as one thing respectively, and the converse; and any word importing the masculine gender only, shall mean and include a female as well as a male; and the word "lands" shall mean and include all messuages, lands, tenements, and hereditaments; and the word "tithes" shall mean and include all uncommuted tithes, portions and parcels of tithes, and all moduses, compositions real, and prescriptive and customary payments; and the words "parish" and "parochial" shall mean and include and extend to every parish and every extra-parochial place, and every township (*i*) or village, within which overseers of the poor are separately appointed under the provisions of an act passed in the thirteenth and fourteenth years of the reign of his late Majesty King *Charles* the Second, intituled *An Act for the better Relief of the Poor of this Kingdom*, and every district of which the tithes are payable under a separate impropriation or appropriation, or in a separate portion or parcel, or which the commissioners shall by any order direct to be considered as a separate

(*g*) By s. 12, p. 11, the word "PERSON" shall mean and include the King's Majesty, and every body corporate, aggregate, or sole, as well as an individual.

(*h*) Particular attention should be given to this and the three following sections, as a perfect knowledge of them will very much facilitate a ready apprehension of all the cases to which the Act applies.

(*i*) The townships to which the 13 and 14 Car. 2, applies, are most common in the North of England.

(*e*) See s. 93, p. 36, by which a party giving false evidence shall be deemed guilty of perjury, and any person refusing to give, or withholding evidence guilty of a misdemeanour.

(*f*) As to witnesses' expenses, see s. 73, p. 31.

district for the commutation of tithes (*j*) ; and the words "land owner" or "tithe owner," or "owner of lands" or "owner of tithes," shall mean and include every person who shall be in the actual possession or receipt of the rents or profits of any lands or tithes (except any tenant (*k*) for life or lives, or for years, holding under a lease or agreement for a lease on which a rent of not less than two-thirds of the clear yearly value of the premises comprised therein shall have been reserved, and except any tenant for years whatsoever holding under a lease or agreement for a lease for a term which shall not have exceeded fourteen years from the commencement thereof) and that without regard to the real amount of interest of such person ; and in every case (*l*) in which any tithes or lands shall have been leased or agreed to be leased to any person for life or lives, or for years, by any lease or agreement for a lease on which a rent less than two-thirds of the clear yearly value of the premises comprised therein shall have been reserved, and of which the term shall have exceeded fourteen years from the commencement thereof, the person who shall for the time being be in the actual receipt of the rent reserved upon such lease or agreement for a lease shall, jointly with the person who shall be liable to the payment of such rent of such tithes or lands, be deemed for the purposes of this act to be the owner of such tithes or lands : and in every case in which any person shall be in possession or receipt of the rents or profits of any tithes or lands under any sequestration, extent, elegit, or other writ of execution, or as a receiver under any order of a court of equity, the person against whom such writ shall have issued, or who but for such order would have been in possession, shall, jointly with the person in possession by virtue of such writ or order, be deemed for the purposes of this act to be the owner of such tithes or lands.

(*j*) This is a very useful provision, as it will enable the commissioners upon application being made to them, to direct that any part of a parish subject to any peculiarities which might impede a commutation, be taken separately.

(*k*) Tenants at a rent of two-thirds of the clear yearly value, and tenants for a less term than fourteen years, are generally considered to be "tenants at rack-rent."

(*l*) Instances may occur in which there may be many tenants intervening, between the original lessor and the tenant at rack-rent, in such cases the consent of the whole will be necessary.

*When the Ownership of Lands or Tithes or Patronage is vested in the Crown, who shall be deemed the Owner or Patron.*

XIII. And be it enacted, that whenever the ownership of any lands (*m*) or tithes to which the provisions of this act are intended to apply shall be vested in his Majesty, the first commissioner of his Majesty's woods, forests, and land revenues for the time being, or in case such lands or tithes shall be vested in his Majesty in right of the Duchy of *Lancaster* or of the Duchy of *Cornwall*, the Chancellor of the Duchy of *Lancaster*, or the Officers of the Duchy of *Cornwall* entitled to grant leases of lands parcel of the Duchy of *Cornwall* (*n*), shall for the purposes of this act be substituted instead of the owner of such lands or tithes respectively ; and whenever the patronage of any benefice to which the provisions of this act are intended to apply shall be vested in his Majesty, the Lord High Treasurer or First Lord Commissioner of the Treasury for the time being where the value of such benefice is above the yearly value of twenty pounds in the King's books, and where such value is of or below the yearly value of twenty pounds in the King's books, the Lord Chancellor or Lord Keeper or First Lord Commissioner of the Great Seal for the time being, shall for the purposes of this act be substituted instead of the patron : Provided nevertheless, that if such patronage is vested in his Majesty in right of the Duchy of *Lancaster*, the Chancellor for the time being of such Duchy shall for the purposes of this act be substituted instead of the patron.

*When the same Person is Owner of Lands and Owner of Tithes, he may be dealt with in both characters.*

XIV. And be it enacted, that whenever any person shall be at the same time owner (*o*) of any lands and owner of any tithes comprised within any agreement to be executed pursuant to the provisions of this act, or besides being owner of any lands or of any tithes shall also be patron of the benefice to which the tithes in question may belong, such person, in relation to such agreement, may act and be

(*m*) By s. 12, p. 11, the word "LANDS" "shall mean and include all messuages, lands, tenements, and hereditaments."

(*n*) 1 and 2 W. 4, c. 5.

(*o*) As to the meaning of the terms "OWNER OF LANDS," and "OWNER OF TITHES," see s. 12, p. 11.

dealt with in each of the several characters so borne by him as aforesaid. (p)

*In case the Patron or Owner is under legal Disability, who to act.*

XV. And be it enacted, that whenever the patron of any benefice or the owner of any lands or tithes to which the provisions of this act are intended to apply, or any person interested in any question as to any tithes, shall be a minor, idiot, lunatic, feme covert, beyond the seas, or under any other legal disability, the guardian, trustee, committee of the estate, husband, or attorney respectively, or in default thereof such person as may be nominated for that purpose by the commissioners after due inquiry shall have been made by them as to the fitness of such person, and whom they are hereby empowered to nominate under their hands and seal, shall for the purposes of this act be substituted in the place of such patron, owner, or person so interested.

*Acts may be done by Agents duly authorized.*

XVI. And be it enacted, that it shall be lawful for any land owner or tithe owner, by a power of attorney (q) given in writing under his hand, to appoint an agent to act for him in carrying into execution the provisions of this act; and all things which by this act are directed to be done by or with relation to any person may be lawfully done by or with relation to the agent so duly authorized of such person: and every such agent shall have full power, in the name and on behalf of his principal, to concur in and execute any agreement, and to vote on any question arising out of the execution of this act; and every person shall be bound by the acts of any such agent, according to the authority committed to him, as fully as if the principal of such agent had so acted; and the power of attorney under which the agent shall have acted, or a copy thereof authenticated by the signature of two credible witnesses, (r) shall be appended to every agreement executed by any such agent, and shall be sent with it to the office of the commissioners as hereinafter provided; and any such power of attorney may be in the form following:—

(p) That is, the same person may act and vote as land-owner, tithe-owner, and patron, if he be owner of land, owner of tithes, and patron.

(q) Power of attorney is exempt from stamp duty, see s. 91, p. 35.

(r) It will be most convenient for the agent to keep the original, and append an attested copy to the agreement.

*Power of Attorney.*

“I, A. B., of, [&c.] do hereby appoint C. D. of, [&c.] to be my lawful attorney to act for me in all respects as if I myself were present and acting in the execution of an act passed in the sixth and seventh years of his present Majesty, intitled [here insert the title of this Act].”

(Signed) ‘A. B.’

VOLUNTARY AGREEMENT FOR COMMUTATION BETWEEN LAND-OWNERS AND TITHE-OWNERS.

*Parochial Meetings may be called, at which Owners of Two-thirds in Value may agree on the sum to be paid to the Tithe Owners, which Agreement shall bind the whole Parish.*

XVII. And be it enacted, that any one or more of the land owners or tithe owners, whose interest respectively shall not be less than one-fourth part of the whole value of the lands subject to tithes, or one-fourth part of the whole value of the tithes of any parish (s) in *England* or *Wales*, may call a parochial meeting of land owners and tithe owners within the limits of the parish, by notice thereof in writing under his or their hand, to be affixed at least twenty-one days before such meeting on the principal outer door of the church, or in some public and conspicuous place within the limits of the parish, and to be twice at least during such twenty-one days inserted in some newspaper (t) generally circulated within the county in which such parish is situated, for the purpose of making an agreement (u) for the general commutation of tithes within the limits of such parish; and every land owner and tithe owner attending such meeting shall bear his own expenses of attendance; and the land owners and tithe owners who shall be present at any such meeting called as aforesaid, and whose interest in the lands and tithes of the parish respectively shall not be less than two-thirds of the lands subject to tithes, two-

(s) By s. 12, p. 11, the words “PARISH,” and “PAROCHIAL,” shall mean, and include, and extend to every parish, and every extra parochial place, and every township or village within which overseers of the poor are separately appointed under the provisions of the 13 and 14 Car. 2, c. 12, intituled *An Act for the better relief of the poor of this kingdom*, and every district in which the tithes are payable under a separate impropriation, or appropriation, or in a separate portion, or parcel, or which the commissioners shall by any order direct to be considered, as a separate district for the commutation of tithes.”

(t) Advertisements are exempt from duty, see s. 91, p. 35.

(u) In respect to agreements pending at the time of the passing of this act, see s. 25, p. 16.

thirds of the great tithes, and two-thirds of the small tithes of the parish, may proceed to make and execute a parochial agreement for the payment of an annual sum by way of rent-charge (*v*), variable as hereinafter provided, instead of the great and small tithes (*w*) of the parish collectively, or instead of the great tithes and small tithes severally, to the respective owners thereof in the said parish; and every agreement so made and executed, and confirmed (*x*) in manner hereinafter mentioned, shall be binding on all persons (*y*) interested in the tithes or lands subject to tithes of the said parish (*z*).

*Provisional Agreements may be made at the Parochial Meetings.*

XVIII. And be it enacted, that the majority of such land owners and tithe owners present at every such meeting shall elect a chairman, who shall forthwith proceed to ascertain (*a*) the interest (*b*) of the land owners and tithe owners then present in person or by their agents (*c*); and in case it shall thereupon appear that the persons present at such meeting have not a sufficient interest in the premises as aforesaid to make and execute such an agreement which shall be binding on all persons interested therein, it shall be lawful notwithstanding for any number of the persons then present to make and execute a provisional agreement for the commutation of tithes of the like form and tenor; and every such provisional agreement which shall be executed within six calendar months from the day (*d*) of the first making thereof by the land owners and tithe owners whose interest in the lands

and tithes of the parish shall not be less than two-thirds of the lands subject to tithes, two-thirds of the great tithes, and two-thirds of the small tithes of the parish respectively, shall be as binding as if executed by all the parties thereto at the meeting at which the agreement was first made.

*Proportional interest in Lands and Tithes, how to be estimated for the purposes of this Act.*

XIX. Provided always, and be it enacted, that the proportional interest (*e*) of the owners of such lands or tithes, so far as relates to their power to make any such agreement or provisional agreement, or to give any notice to the commissioners or assistant commissioners as hereinafter provided, shall be estimated according to the proportional sum at which such lands or tithes shall be rated (*f*) to the relief of the poor, or if there shall be no such rate, according to the rules by which property of the same kind is by law rateable to the relief of the poor.

*Meeting may be adjourned.*

XX. And be it enacted, that in case an adjournment of the said meeting for any cause shall be desired by a majority of the persons attending such meeting, the chairman shall adjourn the meeting to any time (*g*) and place then by him to be declared, and so from time to time in case the same shall be in like manner desired by a majority of the persons attending such meeting; and notice of every adjourned meeting shall be given under the hand of the chairman, and shall be affixed in a conspicuous place on the outside of the building in which such meeting or the last adjournment thereof shall have been holden; and the like order of proceeding shall be observed at any such adjourned meeting, and everything done at any such adjourned meeting shall be as valid as if done at the original meeting.

*Form of Parochial Agreement.*

XXI. And be it enacted, that every such agreement (*h*) shall bear date on the day

(*v*) Land not exceeding twenty acres may be given to any ecclesiastical owner as commutation of tithe, see s. 29; for appointment of valuers to appraise rent-charge, see s. 32, 33, 34, and 35.

(*w*) As to Easter offerings, mortuaries, surplice fees, tithes of fish or fishing, personal tithes, mineral tithes, payments in lieu of tithes by custom, or private Act of Parliament, and tithes already commuted and extinguished, see s. 90, p. 35.

(*x*) For confirmation of agreement by commissioners, see s. 27, p. 16.

(*y*) Consent of patron must be given to any agreement for commutation of ecclesiastical tithe, see s. 13 and 26.

(*z*) Tithes due before commutation not to be affected, see s. 89, p. 35.

(*a*) Correct minutes of the proceedings should be kept.

(*b*) See s. 19, p. 14, as to the mode of ascertaining the proportional interest of owners of land or tithes.

(*c*) See s. 16, p. 13, as to the appointment of agent, and what acts may be done by him when duly authorized.

(*d*) The day on which the first signature is attached thereto, see s. 21, p. 15.

(*e*) As to the mode of settling suits, and differences touching liability to the payment of tithes, the boundary of lands, &c., see s. 24, p. 15.

(*f*) It will be desirable to have the poor-rate books at the meeting, and to enter the assessment of each person who attends on the minutes.

(*g*) The twenty-one day's notice is only requisite on calling the first meeting.

(*h*) Forms of agreement will be supplied by the commissioners, but especial care must be taken that the provisions contained in this clause of the Act be strictly complied with.

on which the first signature is attached thereto, and every such agreement or some Schedule thereunto annexed shall set forth all the lands of the said parish which are subject to the payment of any kind of tithes, and also the true or estimated quantity in statute measure of land subject to tithes within the parish which shall be then cultivated as arable, meadow, or pasture land, or as wood land, common land, or howsoever otherwise, and shall also set forth whether any modus or composition real, or prescriptive or customary payment, shall be payable instead of all or any of the tithes of the said parish, and which lands or tithes respectively are covered thereby, and shall also set forth which of the said tithes, moduses, compositions or payments are payable to the tithe owner, or if there is more than one tithe owner to each of the several tithe owners in the said parish, distinguishing in what right every such tithe owner is entitled to such tithes, and shall also set forth whether any and which of the lands of the said parish are or have been under any and what circumstances (*i*) exempt from the payment of any and what tithes; and such agreement shall also state in words at length the amount of the sum or sums agreed to be paid (subject to variation as hereinafter provided) instead of the tithes of the lands comprised in the said agreement, and instead of all moduses and compositions real, prescriptive, and customary payments (if any), payable in respect of such lands, or the produce of such lands or any of them, distinguishing, if there is more than one tithe owner, the sum payable to every such tithe owner, and where the tithes of different lands in the same parish are payable to different tithe owners, or to the same tithe owner in different rights, distinguishing the sum payable in respect of such different lands; and every such agreement shall also state all such other particulars as the commissioners shall by any order from time to time require to be inserted in such agreements.

*Commissioners to frame and circulate Forms of Agreements, &c.*

XXII. And be it enacted, that the commissioners shall frame and cause to be printed, as soon as conveniently may be after their appointment, forms of notices

(*i*) A statement of the circumstances under which the lands are exempt is essential, as it may be that they are only exempt whilst in the hands of the present occupier.

and agreements and such other instruments as in their judgment will further the purposes of this act, and supply all or any of such forms to the churchwardens and overseers of any parish who may require (*j*) the same, or to whom the commissioners may think fit to send the same, for the use of any land owner or tithe owner desirous of putting this act in execution.

*Commissioner or Assistant Commissioner may attend to advise Terms of Agreement.*

XXIII. And be it enacted, that any commissioner, or assistant commissioner, if the commissioners shall think fit, may attend any such meeting for the purpose of taking part in the discussion and advising on the terms of agreement; but no commissioner or assistant commissioner, during the time that he is actually attending such meeting for that purpose, shall have any of the powers herein given to the commissioners in case of an award or apportionment by the commissioners as hereinafter provided.

*Suits and Differences may be referred to Arbitration.*

XXIV. And be it enacted, that if any suit shall be pending (*k*) touching the right to any tithes, or if there shall be any question as to the existence of any modus or composition real, or prescriptive or customary payment, or any claim of exemption from or non-liability to tithes, under any circumstances in respect of any lands or any kind of produce, or touching the situation or boundary of any lands, or if any difference shall arise whereby the making and executing of any such agreement shall be hindered, it shall be lawful for the owners, or if there shall be no owner actually in possession, for the persons claiming to be the owners of the lands and tithes respectively, being parties to such suit or difference, to submit the same to reference by any writing under their respective hands, containing an agreement that such submission shall be made a rule of any of his Majesty's courts of record, upon such terms of reference as the parties may agree upon; and the decision of the arbitrator

(*j*) Applications for these forms must be made to the churchwardens and overseers, who may themselves apply to the commissioners. Letters addressed to "the Tithe Commissioners for England and Wales, London," will go and be answered free of postage, see s. 92, p. 35.

(*k*) It should be observed that this section applies to disputes of any kind respecting tithes existing at the time of the passing of this act, as well as those which may arise hereafter.

or arbitrators named in the said reference shall for the purposes of this act be final and conclusive on all persons : Provided nevertheless, that no person being owner of an estate in land or tithes, less in the whole than an immediate estate of fee simple or fee tail, shall be empowered to submit to any such reference so as to bind any person in remainder, reversion, or expectancy, without the consent of the commissioners ; and that it shall be lawful for the commissioners, if they shall think fit so to do, but not otherwise necessary, to direct that any person in remainder, reversion, or expectancy of an estate of inheritance in the said lands or tithes, or any other person whom they shall deem to be interested therein, shall be made a party to such reference.

*Agreements pending at the time of the passing of this Act, if completed and confirmed by the Commissioners, to be as valid as Parochial Agreements.*

XXV. And be it enacted, that every agreement for the commutation of a rent-charge of the tithes of any lands which shall be pending (*l*) at the time of the passing of this act, and which shall be executed before or within six calendar months after the passing of this act by the land owners and tithe owners, or persons claiming to be such owners, whose interest in the said lands and tithes shall not be less than two-thirds of the said lands, two-thirds of the great tithes, and two-thirds of the small tithes of the said lands, and which shall be confirmed (*m*) by the commissioners, under their hands and seal, in the manner hereinafter provided for the confirmation of any parochial agreement, shall be as valid, and the rent-charge agreed to be paid by any such agreement shall be apportioned and charged, as hereinafter provided, among and upon the said lands, as if the agreement had been made and executed at a parochial meeting.

*Consent of Patron to be given to every Agreement for Commutation of Ecclesiastical Tithes.*

XXVI. Provided always, and be it enacted, that in every case in which any tithes shall belong to any ecclesiastical person in right of any spiritual dignity or benefice, no agreement for the commutation

of such tithes made and executed under this act shall be deemed to be executed by the owner of such tithes unless such consent (*n*) thereto be given as is hereinafter mentioned ; (that is to say), in the case of an archbishop or bishop, the consent of the crown signified by the Lord High Treasurer or First Lord Commissioner of the Treasury ; and in case of the incumbent of any other benefice or ecclesiastical dignity, the consent of the patron or person entitled to present to such benefice or dignity in case the same were then vacant ; and every such consent shall be given under the hand of the person giving the same, and shall be annexed to the agreement, and taken to be part of the execution thereof.

*Agreement to be confirmed by the Commissioners.*

XXVII. And be it enacted, that every such agreement, as soon as may be after it shall have been executed by a sufficient number of land owners and tithe owners whose interest in the lands and tithes of the parish respectively shall not be less than two-thirds of the lands subject to tithes, two-thirds of the great tithes, and two-thirds of the small tithes, shall be sent by the chairman of the meeting, or by the person in whose custody it shall then be, to the office of the commissioners (*o*), and the commissioners, by themselves, or by some of the assistant commissioners, shall cause inquiry to be made and shall require such proof as will be satisfactory to them, whether or not the agreement has been made without fraud or collusion, and whether or not it ought to be confirmed ; and if they shall be satisfied that it ought to be confirmed, the commissioners shall confirm (*p*) the agreement (*q*) under their hands and seal, and shall add to such agreement the date of the confirmation, and shall publish the fact

(*n*) The object of this enactment is to guard against any agreements by persons now in the enjoyment of tithes which might prejudice their successors.

(*o*) As a considerable period of time must necessarily be occupied by the commissioners in making inquiry into the regularity, as well as the proper terms of the agreement, as also in making the valuation and apportionment, it is desirable that the agreement should be forwarded with as little delay as possible after it is properly signed.

(*p*) Every agreement relating to tithes belonging to any ecclesiastical person in right of any spiritual dignity, or benefice, must be communicated to the bishop of the diocese before it is confirmed, see s. 28, p. 17.

(*q*) Commissioners may before confirming it require notice of any agreement to be given to rever- sioner, &c., see s. 65, p. 28.

(*l*) By this section pending agreements are put upon the same footing with provisional parochial agreements.

(*m*) See s. 27, p. 16.

of such confirmation and the date thereof within the parish in such manner as to them shall seem fit : and every such confirmed agreement shall be binding on all persons interested in the said lands or tithes (*r*).

*Agreement to be communicated to Bishop of the Diocese previous to its being confirmed.*

XXVIII. Provided always, and be it enacted, that before the commissioners shall confirm any such agreement relating to tithes belonging to any ecclesiastical person in right of any spiritual dignity or benefice, they shall communicate the same to the Bishop of the Diocese for his observations and opinion ; and no such agreement shall be confirmed by such commissioners until four weeks shall have elapsed from the date of the transmission of such agreement to such bishop, unless the said bishop shall sooner signify his approbation of such agreement to the said commissioners.

*Land not exceeding 20 acres, may be given as Commutation for Tithes, &c.*

XXIX. And be it enacted, that any such parochial agreement may be made in manner and form aforesaid for giving to any ecclesiastical owner (*s*), in right of any spiritual benefice or dignity, of any tithes or of any rent-charge for which such tithes shall have been commuted, any quantity not exceeding in the whole twenty (*t*) imperial acres of land by way of commutation for the whole or an equivalent part of the great or small tithes of the parish, or in discharge of or exchange for the whole or an equivalent part of any rent-charge agreed to be paid instead of such tithes, but subject in every case to the provisions hereinafter contained ; and every such agreement shall be made in such form and contain such particulars as the commissioners shall in that behalf direct, specifying the land whereof the tithes or rent-charge for which such tithes shall have been commuted shall be the subject of such agreement, and giving full and sufficient descriptions of the quantity, state of culture, and annual value of the land proposed to be given in exchange for such tithes or rent-charge : Provided, always, that the same consent and confirmation (*u*)

shall be necessary to any such agreement as in the case of an agreement for a rent-charge ; and that in case the said agreement shall not extend to the whole of the tithes of the parish, an agreement or award as hereinafter provided may and shall be made for the payment of a rent-charge in satisfaction of the residue of the said tithes ; and such rent-charge when agreed upon or awarded, or the residue thereof, shall be apportioned in manner hereinafter provided upon all the lands of the parish subject to the payment of tithes, unless otherwise agreed upon by the parties to the said parochial agreement, except the land so given by way of commutation, in like manner as if no agreement for giving land had been made : Provided also, that the land so given shall be free from incumbrances, except leases at improved rent, land tax, or other usual outgoings, and shall not be of tenure, nor of copyhold or customary tenure, subject to arbitrary fine or the render of heriots.

*Commissioners to satisfy themselves of the Title of such Land, &c.*

XXX. And be it enacted, that in every case in which any such agreement for giving land shall be so entered into, the commissioners shall satisfy themselves, in such way and by such evidence as they shall see fit, of the title to the land proposed thereby to be given in exchange for such tithes or rent-charge, and that the same are of the description and value set forth in such agreement, and that such agreement is conformable in every respect to the provisions hereinbefore contained respecting the same ; and the expense attending every such agreement for giving land, and the confirmation thereof, and of investigating the title to the land, shall be borne by the owners of land liable to the payment of tithes within the parish, in such proportions as they may agree, or, in default of agreement, as the commissioners may direct.

*Agreements for giving Land to operate as Conveyances.*

XXXI. And be it enacted, that such agreement for giving land, confirmed by the said commissioners, shall operate as a conveyance of such land to the owner of such tithes or rent-charge, and the land so conveyed shall thereupon vest in and be deemed to be holden by such person or persons, and upon the like uses and trusts

(*r*) Commissioners may require notice to be given to reversioners, remaindermen, or such other persons interested, as they may see fit.

(*s*) Lay-impropriators are not included.

(*t*) This section will enable any incumbent to increase the extent of his glebe by 20 acres.

(*u*) Not only is the consent and confirmation of the commissioners requisite, but they are required

to examine into and approve of the title, see s. 3, p. 17.

in every respect as the tithes or rent-charge in commutation or exchange for which the same shall have been given shall be vested and holden; and for the purpose of making and completing any such agreement the provisions of this act respecting persons under legal disability (*v*) shall apply to every person party to such agreement or in whom any such land shall be vested, and whose concurrence or consent may be necessary to the perfecting thereof, or of the title to such land, as fully as if the same had been here repealed and re-enacted.

**APPORTIONMENT UPON THE RESPECTIVE LANDS OF THE SUM AGREED TO BE PAID BY WAY OF RENT-CHARGE.**

*Appointment of Valuers.*

XXXII. And be it enacted, that at the said meeting or at some adjournment thereof, or at some other parochial meeting to be called in like manner, either before or after the confirmation of the agreement, the owners of land subject to tithes in the said parish, or their agents, present at the meeting, may appoint a valuer or valuers (*w*); and in case the majority in respect of number and the majority in respect of interest shall not agree upon the appointment, then they shall appoint two or such other even number of valuers as shall be then agreed on by such land owners, half of such number to be chosen by a majority in respect of number, and the other half by a majority in respect of interest, of such land owners then present.

*Valuers to apportion the Rent-Charge.*

XXXIII. And be it enacted, that as soon as may be after the chusing of such valuer or valuers, and after the confirmation of the said agreement, the valuer or valuers (*x*) so chosen (*y*) shall apportion (*z*) the total sum agreed to be paid by way of rent-charge instead of tithes, and the expenses of the apportionment, amongst the several lands in the said parish, according to such principles of apportionment as shall be agreed upon at the meeting at which the valuer or valuers shall be chosen, or if no principles shall be then agreed upon for the guidance

of the valuer or valuers, then, having regard to the average titheable produce and productive quality of the lands, according to his or their discretion and judgment, but subject in each case to the provisions hereinafter contained, and so that in each case the several lands shall have the full benefit of every modus (*a*) and composition real, prescriptive and customary payment, and of every exemption from or non-liability to tithes relating to the said lands respectively, and having regard to the several tithes to which the said lands are severally liable; provided that it shall be lawful for the said valuers, when an even number is chosen, by any writing under their hands, to appoint an umpire (*b*) before they proceed upon the business of such apportionment, and the decision of the umpire on the questions in difference between the valuers shall be binding on them, and shall be adopted by them in the apportionment.

*Valuers may enter on Lands for the purpose of valuing Tithes.*

XXXIV. And be it enacted, that the said valuers and umpire (if it shall become necessary for him to act), and their agents or servants, at all reasonable times, may enter upon any of the lands to be included in the apportionment, and make an admeasurement, plan, and valuation of the same, without being subject to any action or molestation for so doing: Provided always, that no valuer or umpire shall be capable of acting until he shall have made and subscribed before the said commissioners, or some assistant commissioner or justice of the peace, a solemn declaration to the same purport and effect as the oath hereinbefore directed to be made by the said commissioners, substituting only the proper description of such person instead of the word commissioner, and adding to his signature the usual place of his residence, which declaration it shall be lawful for the said commissioners, or any assistant commissioner or justice, to administer; and every such declaration so made and subscribed shall be countersigned by the person before whom the same shall have been

(*v*) See s. 15, p. 13.

(*w*) Who may appoint an umpire, see s. 33, p. 13.

(*x*) Valuers and umpire must make and subscribe a declaration, see s. 34, p. 13; may enter on lands to make valuations, &c., see s. 34, p. 18.

(*y*) The apportionment must be made either by valuers so appointed or by the commissioners.

(*z*) If apportionment not made within six months commissioners to apportion, see s. 54, p. 25.

(*a*) The amount of rent-charge apportioned on lands having the benefit of a modus must be estimated on the money value of the modus. Some difficulty may arise where lands pay a modus only whilst in pasture, but become liable to tithes when under the plough. See also s. 44, p. 22.

(*b*) The umpire must be appointed before the valuers proceed to the performance of their duties, he need not act unless the valuers disagree.

made, and shall be sent by him to the office of the commissioners.

*Old Plans and Surveys may be used if the Valuers think proper.*

XXXV. And be it enacted, that the valuer or valuers or umpire may (c), if they think fit, use for the purposes of this act any admeasurement, plan, or valuation previously made of the lands or tithes in question of the accuracy of which they shall be satisfied; and that it shall be lawful for the meeting at which such valuer or valuers shall be chosen to agree upon the adoption for the purposes aforesaid of any such admeasurement, plan, or valuation, and such agreement shall be binding upon the valuer or valuers; Provided always, that three-fourths of the land owners in number and value shall concur therein.

#### COMPULSORY AWARD BY THE COMMISSIONERS IN DEFAULT OF VOLUNTARY AGREEMENTS.

*After 1st. October 1838, Commissioners may ascertain total Value of Tithes in any Parish in which no previous Agreement has been made.*

XXXVI. And be it enacted, that after the first day of *October* one thousand eight hundred and thirty-eight the commissioners shall proceed (d) in manner herein-after mentioned, at such time and in such order as to them shall seem fit, either by themselves or by some assistant commissioner, to ascertain and award the total sum to be paid by way of rent-charge instead of the tithes of every parish in *England* and *Wales* in which no such agreement binding upon the whole parish as aforesaid shall have been made and confirmed as aforesaid: Provided nevertheless, that if any proceeding shall be had towards making and executing any such agreement after the commissioners shall have given or caused to be given notice of their intention to act as aforesaid in such parish, the commissioners may refrain from acting upon such notice, if they shall think fit, until the result of such proceeding shall appear.

(c) The valuers or umpire will only be compelled to use old plans and valuations if three-fourths of the land-owners in number and value present at the meeting at which the valuers were appointed shall concur in requiring them so to do.

(d) By this and the sixteen following sections the commissioners are invested with full powers to effect a compulsory commutation of the tithes in every parish in which the land owners and tithe owners have not embraced the opportunity afforded them of making a voluntary agreement before the 1st October, 1838.

*Value of Tithes to be calculated upon an Average of Seven Years.—Tithes to be valued without Deduction on account of Parochial and County Rates, &c.*

XXXVII. And be it enacted (e), that in every case in which the commissioners shall intend making such award (f), notice thereof shall be given in such manner as to them shall seem fit; and after the expiration of twenty-one days after such notice shall have been given the commissioners or some assistant commissioner shall, except in the cases for which provision is hereinafter made (g), proceed to ascertain (h) the clear average value (after making all just deductions on account of the expenses of collecting, preparing for sale, and marketing, where such tithes have been taken in kind,) of the tithes (i) of the said parish, according to the average of seven years preceding *Christmas* in the year one thousand eight hundred and thirty-five: Provided that if during the said period of seven years, or any part thereof, the said tithes or any part thereof shall have been compounded for or demised to the owner or occupier of any of the said lands in consideration of any rent or payment instead of tithes, the amount of such composition, or rent or sum agreed to be paid instead of tithes, shall be taken as the clear value of the tithes included in such composition, demise, or agreement during the time for which the same shall have been made; and the commissioners or assistant commissioner shall award the average annual value of the said seven years so ascertained as the sum to be taken for calculating the rent-charge to be paid as a permanent commutation of the said tithes: Provided also, that whenever it shall appear

(e) Having now come to that part of the act wherein the mode of calculating the value of tithes to be adopted by the commissioners in cases of compulsory commutation is set out, it becomes material to observe, that the tithe-payers and tithe-owners neglecting to make a voluntary agreement, lose the advantage of fixing the amount to be paid, and also of apportioning it in that way which they might think best. The commissioners are bound by the rules here laid down, and can only deviate in certain special cases.

(f) Expenses of award to be paid by land owners, see s. 74, p. 31.

(g) How to modify extreme cases, see s. 38, p. 20.

(h) How the tithe of hops, fruit, and garden produce to be valued, see s. 40, p. 21; how the tithe of coppice wood to be valued, see s. 41, p. 21; as to land exempt by reason of having been converted from barren heath, or waste land, and as to glebe, see s. 43, p. 22; as to moduses &c., see s. 44, p. 22.

(i) Commissioners may hear and determine disputes touching the right to tithes, moduses, &c., see s. 45, p. 22.

to the commissioners that the party entitled to any such rent or composition shall in any one or more of the said seven years have allowed and made any abatement from the amount of such rent or composition on the ground of the same having in any such year or years been higher than the sum fairly payable by way of composition for the tithe, but not otherwise, then and in every such case such diminished amount, after making such abatement as aforesaid, shall be deemed and taken to have been the sum agreed to be paid for any such year or years: Provided also, that in estimating the value of the said tithes the commissioners or assistant commissioner shall estimate the same without making any deduction therefrom on account of any Parliamentary, parochial, county, and other rates, charges, and assessments to which the said tithes are liable; and whenever the said tithes shall have been demised or compounded for on the principle of the rent or composition being paid free from all such rates, charges, and assessments, or any part thereof, the said commissioners or assistant commissioner shall have regard to that circumstance, and shall make such an addition on account thereof as shall be an equivalent (*j*).

*Commissioners in certain Cases may increase or diminish the Sum to be paid for Commutation.*

XXXVIII. Provided always, and be it enacted, that in case notice in writing under the hand of any patron, or the hands of any land owners or title owners whose interest in the lands or tithes of the parish shall not be less than one-half of the lands subject to tithes, one-half of the great tithes or one-half of the small tithes of the parish shall be given to the commissioners or assistant commissioner acting in that behalf, within one calendar month next after the notice of the intention to make an award shall have been given as aforesaid, that the average value to be ascertained as aforesaid will not fairly represent the sum which ought to be taken for calculating a permanent commutation of the great or small tithes of the said parish, the commissioners shall have power (*k*) to diminish or increase the sum to be so taken by a sum amounting to not more than

one-fifth part of the average value ascertained as aforesaid: Provided always, that every case which shall appear to the commissioners to be fraudulent or collusive, or which, by reason of the length of time which shall have elapsed since the making of any composition then in force, or which, by reason of the peculiar interest in the lands or tithes of either of the parties to any composition, or by reason of any other special circumstances, ought in the judgment of the commissioners to be separately adjudicated upon, shall be reserved for separate adjudication as hereinafter provided; and the commissioners shall certify and report to one of his Majesty's principal secretaries of state, under their hands and seals, before the first day of May in the year one thousand eight hundred and thirty-eight, in what manner the discretion hereby vested in them ought in their judgment to be exercised, and shall in the said report lay down such rules for the guidance of the assistant commissioners as may to them seem expedient, and such report shall be laid before Parliament within six weeks after the same shall have been received, or after the meeting of Parliament; and, unless Parliament shall otherwise provide, such rules shall be observed by the said commissioners and assistant commissioners in the exercise of the discretion hereby vested in the commissioners.

*Special Adjudications, how to be made.*

XXXIX. And be it enacted, that the commissioners shall from time to time report to one of his Majesty's principal secretaries of state, under their hands and seals, all the cases which under the power hereinbefore reserved to them in that behalf shall have been reserved for separate adjudication, and shall state in every such report the reasons for so reserving every case mentioned therein, and the commissioners shall in every such case award the rent-charge to be paid as a permanent commutation for tithes, having regard to the average rate which shall be awarded in respect of lands of the like description and similarly situated in the neighbouring parishes: Provided always, that a draft of such intended award, with a copy of so much of the said report as is applicable to such award, shall be deposited in the parish, and the commissioners, or an assistant commissioner to be specially appointed by the commissioners for that purpose, shall hear and determine all objections to the award in the like manner as is herein provided in an ordinary

(*j*) The real value of the title must of course include the amount of all rates, charges, &c.

(*k*) The discretionary powers given in this and the following section can only be exercised by the commissioners in case of compulsory commutations.

case of award, and the commissioners shall have power thereupon to amend the draft of the said award accordingly.

*How the Tithe of Hops, Fruit, and Garden Produce is to be valued.*

XL. And be it enacted, that in case any of the lands in the parish shall be hop-grounds (*l*), orchards or gardens, and notice shall be given by the owner thereof to the commissioners or assistant commissioner acting in that behalf, that the tithes thereof should be separately valued, the commissioners or assistant commissioner shall estimate the value of the tithes thereof according to the average rate of composition for the tithes of hops, fruit and garden produce respectively, during seven years preceding *Christmas* in the year one thousand eight hundred and thirty-five, within a district to be assigned in each case by the commissioners or assistant commissioner, and estimating the same as chargeable to all Parliamentary, parochial, county, and other rates, charges and assessments to which the said tithes are liable, and shall add the value so estimated to the value of the other tithes of the parish ascertained as aforesaid.

*How the Tithe of Coppice Wood is to be valued.*

XLI. And be it enacted, that in case any of the lands in the parish shall be coppices, and notice (*m*) shall be given by the owner thereof, or by the owner of the tithes thereof, to the commissioners or assistant commissioner acting in that behalf that the tithes thereof should be separately valued, the commissioners or assistant commissioner shall estimate the value of the tithes thereof with a due regard to the average value, estimated according to the best of their judgment, of coppice wood of the same kind cut during the said period of seven years in that parish and the neighbouring parishes, estimating the same as chargeable to all Parliamentary, parochial, county, and other rates, charges, and assessments to which the said tithes are liable, and shall add the clear value of the tithes so estimated to the value of the other tithes of the parish

ascertained as aforesaid; and the commissioners shall, in the report which they are herein-before required to make to one of his Majesty's principal secretaries of state before the first day of *May* in the year one thousand eight hundred and thirty-eight, lay down rules for the guidance of the assistant commissioners in estimating the value of the tithes of coppice wood, and, unless parliament shall otherwise provide, such rules shall be observed by the said commissioners and assistant commissioners.

*Provision for the Change of Culture of Hop Grounds and Market Gardens.*

XLII. And be it enacted, that the amount which shall be charged by any such apportionment as herein-after provided upon any hop grounds or market gardens in any district so to be assigned shall be distinguished into two parts, which shall be called the ordinary charge and the extraordinary charge (*n*), and the extraordinary charge shall be a rate *per* imperial acre, and so in proportion for less quantities of ground, according to the discretion of the valuers or commissioners or assistant commissioner by whom the apportionment shall be made as aforesaid; and lands whereof the tithes shall have been commuted under this act, and which shall cease to be cultivated as hop grounds or market gardens at any time after such commutation, shall be charged after the thirty-first day of *December* next following such change of cultivation only with the ordinary charge upon such lands; and all lands in any such district the tithes whereof shall have been commuted under this act, and which shall be newly cultivated as hop grounds or market gardens at any time after such commutation, shall be charged with an additional amount of rent-charge *per* imperial acre, equal to the extraordinary charge *per* acre upon hop grounds or market gardens respectively in that district; Provided always, that no such additional amount shall be charged or payable during the first year, and half only of such additional amount during the se-

(*l*) The owner of hop-grounds or market gardens should not omit to give notice to the commissioners to have the tithes separately valued, in order that he may avail himself of the provision with respect to change of cultivation, s. 42, p. 21.

(*m*) In almost every case of coppice wood a separate valuation will be called for either by the tithe owner or tithe payer, as a calculation upon the average of seven years could only be fair where the cutting takes place regularly once during that period.

(*n*) It is much to be regretted that there should be a necessity for making an enactment so completely at variance with the principle upon which a commutation of tithes has been sought. The subject was one excessively difficult to be dealt with, and is now fixed upon a basis perhaps as satisfactory as the circumstances admit. The legislature should have long since interfered in the case of hop grounds and market gardens, it never was intended that a tenth of the produce arising from the investment of such immense capital as is requisite in this species of cultivation, should be taken.

cond year, of such new cultivation; and an additional rent-charge by way of extraordinary charge upon hop grounds and market gardens, newly cultivated as such beyond the limits of every district in which any extraordinary charge for hop grounds or market gardens respectively shall have been distinguished as aforesaid at the time of the commutation, shall be charged by the commissioners at the time of such new cultivation, upon the request of any person interested therein, if such new cultivation shall have taken place during the continuance of the commission of the said commissioners, and after the expiration of the commission shall be charged in such manner and by such authority as parliament shall direct, and shall be payable and recoverable in like manner and subject to the same incidents in all respects as an extraordinary charge charged upon any hop grounds or market gardens at the time of commutation.

*Provision for valuing Tithes of Lands to which the Average of Seven Years cannot apply.*

XLIII. And be it enacted, that in case any of the lands in the parish shall, during any part of the said period of seven years preceding *Christmas* in the year one thousand eight hundred and thirty-five, have been exempted from payment of tithes by reason of having been inclosed under any Act of Parliament or converted from barren heath (*o*) or waste ground, or by reason of being glebe (*p*) lands or of having been heretofore parcel of the possessions of any privileged order (*q*), and notices shall have been given as last aforesaid to the commissioners or assistant commissioner acting in that behalf that the tithes thereof should be separately valued, the commissioners or assistant commissioner shall estimate the value of the tithes thereof according to the average value which shall be ascertained as aforesaid in respect of lands of the like description and quality in that parish and the neighbouring parishes, or as near thereto as the circumstances of each case may in their judgment require, and estimating the same as chargeable to all Parliamentary, parochial, county, and other rates, charges, and assessments to which the said tithes

(*o*) By 2 & 3 Ed. 6, c. 13.

(*p*) And therefore exempt from tithes whilst in the occupation of the incumbent.

(*q*) There are many estates which formerly belonged to privileged orders which are still exempt from tithes whilst in the occupation of the owner, but become liable when let to a tenant.

are liable, and shall add the value so estimated to the value of the other tithes of the parish ascertained as aforesaid.

*Moduses, &c. how to be allowed for in the Award.*

XLIV. (*r*). And be it enacted, that if any modus or composition real, or prescriptive or customary payment, shall be payable instead of the tithes of any of the lands or produce thereof in the said parish, the commissioners or assistant commissioner shall in such case estimate the amount of such modus, composition, or payment as the value of the tithes payable in respect of such lands or produce respectively, and shall add the amount thereof to the value of the other tithes of the parish ascertained as aforesaid, and shall also make due allowance for all exemptions from or non-liability to tithes of any lands or any part of the produce of such lands: Provided also, that if it shall appear to the said commissioners or assistant commissioner that any question concerning any modus or composition real, prescriptive or customary payment, or claim of exemption from or non-liability to the payment of tithes relating to the lands in question, shall have been decided by competent authority before the making of the said award, the commissioners or assistant commissioner shall act on the principle established by such decision, and shall make their award as if such decision had been made at the beginning of the said period of seven years (*s*).

*Commissioners may hear and determine Disputes;*

XLV. And be it enacted, that if any suit (*t*) shall be pending touching the right to any tithes, or if there shall be any question as to the existence of any modus or composition real, or prescriptive or customary payment, or any claim of exemption from or non-liability under any circumstances to the payment of any tithes in respect of any lands or any kind of produce, or touching the situation or boundary of

(*r*) A similar provision in the case of parochial agreements is made in sections 21 and 33.

(*s*) That is, if a modus has been established in the last year of the seven it will be taken as extending over the whole of the seven years, if on the other hand the liability to tithes has been established, the land will be taken as having been subject to tithes during the whole period.

(*t*) Disputes pending before the passing of this act, or arising before the 1st of October, 1838, may be settled by a reference to arbitrators; such as occur after the commissioners interfere, or remain unsettled on the 1st October, 1838, are to be decided by them or by an assistant-commissioner.

any lands, or if any difference shall arise whereby the making of any such award by the commissioners or assistant commissioner shall be hindered, it shall be lawful for the commissioners or assistant commissioner to appoint a time and place in or near the parish for hearing and determining the same ; and the decision (*u*) of the commissioners or assistant commissioner shall be final and conclusive on all persons, subject to the provisions (*v*) hereinafter contained.

*Subject to Appeal by an Issue at Law ;—or by taking the Opinion of a Court of Law thereon.*

XLVI. Provided always, and be it enacted, that any person claiming to be interested in any lands or in the tithes thereof who shall be dissatisfied with any such decision of the commissioners or assistant commissioner may, if the yearly value of the payment to be made or withholden according to such decision shall exceed the sum of twenty pounds, cause an action (*w*) to be brought in any of his Majesty's courts of law at *Westminster* against the person in whose favour such decision shall have been made, within three calendar months next after such decision shall have been notified in writing, in such manner as the commissioners or assistant commissioner shall direct, to the parties interested therein or to their known agents, in which action the plaintiff shall deliver a feigned issue, whereby such disputed right may be tried, and shall proceed to a trial at law of such issue at the sittings after the term or at the assizes then next or next but one after such action shall have been commenced to be holden for the county within which such lands or the greater part thereof are situated, with liberty nevertheless for the court in which the same shall have been commenced or any judge of his Majesty's courts of law at *Westminster* to extend the time for going to trial therein, or to direct the trial to be in another county if it shall seem fit to such court or judge so to do ; and every defendant in any such action shall enter an appearance thereto, and accept such issue ; but in case the parties shall differ as to the form of such issue, or in case the defendant shall fail to enter such appearance or accept such issue, then the same shall be settled

under the direction of the court in which the action shall be brought, or by any judge of his Majesty's courts of law at *Westminster*, and the plaintiff may proceed thereon in like manner as if the defendant had appeared and accepted such issue ; and the parties in such action shall produce to each other and their respective attorneys or counsel, at such time and place as any judge may order before trial, and also to the court and jury upon the trial of any such issue, all books, deeds, papers, and writings, terriers, maps, plans, and surveys relating to the matters in issue in their respective custody or power ; and it shall be lawful for the judge by whom any such action shall be tried, if he shall think fit, to direct the jury to find a verdict, subject to the opinion of the court upon a special case ; and the verdict which shall be given in any such action, or the judgment of the court upon the case subject to which the same may be given, shall be final and binding upon all parties thereto, unless the court wherein such action shall be brought shall set aside such verdict and order a new trial to be had therein, which it shall be lawful for the said court to do, if it shall see fit : Provided also, that in case any such decision shall involve a question of law only, and the parties in difference shall be agreed upon the facts relating thereto, and whereon such decision shall have been founded, the said commissioners or assistant commissioner, at the request of the person dissatisfied, (such request to be made in writing within three calendar months after such decision, and at least fourteen days previous notice in writing of such request to be given in like manner to the other parties in difference or to their known agents,) shall direct a case to be stated for the opinion of such one of his Majesty's courts of law at *Westminster* as the commissioners or assistant commissioner shall think fit, which case shall be settled by them or him or under their or his direction in case the parties differ about the same, and may be set down for argument and be brought before the court in like manner as other cases are brought before the court ; and the decision of such court upon every case so brought before it shall be binding upon all parties concerned therein : Provided always, that after such verdict given and not set aside by the court, or after such decision of the court, the said commissioners or assistant commissioner shall be bound by such verdict or decision ;

(*u*) Subject to an appeal to a court of law, where the sum in dispute exceeds 20*l*. See s. 46, p. 23.

(*v*) Proceedings not to abate by the death of parties, see s. 47, p. 24.

(*w*) If a party die after the decision of commissioners, and before action brought, the action nevertheless to be carried on in the name of the party, see s. 48, p. 24.

and the costs of every such action, or of stating such case and obtaining a decision thereon, shall be in the discretion of the court in or by which the same shall be decided, which may order the same to be taxed by the proper officer of the court, and the like execution may be had for the same as if such costs had been recovered upon a judgment of record of the said court.

*Proceedings not to abate by Death of Parties.*

XLVII. And be it enacted, that no proceeding (*x*) of or before the commissioners or any assistant commissioner, or in any action, or in any case stated, or reference in pursuance of this act, shall abate or cease by reason of the death of any person interested therein.

*In case of Deaths of Parties before Actions brought, &c. the same to be carried on and defended in their Names.*

XLVIII. And be it enacted, that if any person in whose favour any such decision of the commissioners or any assistant commissioner shall have been made shall die before any such action shall have been brought or case stated, and before the expiration of the time herein-before limited for that purpose, it shall be lawful for every person who might have brought such action, or have had such case stated, against the person so dying, to bring or have the same, within the time so limited as aforesaid, nominally against such person as if living, and to serve the said commissioners or assistant commissioner with process and notices relating thereto in the same manner as the person deceased might have been served therewith if living; and it shall be lawful for every person entitled to the benefit of such decision as aforesaid, or, in case of any such person being a minor, idiot, lunatic, feme covert, beyond the seas, or under any other legal disability, the guardian, trustee, committee of the estate, husband, or attorney respectively, or in default thereof such person as may be nominated for that purpose by the commissioners, and whom they are hereby empowered to nominate under their hands and seal, to appear and defend such action or argue such case; and proceedings shall be had therein in the same manner, and the rights of all persons shall be equally bound and concluded by the

(*x*) This clause extends to all proceedings, whether arising out of voluntary agreements and references, or after the compulsory interference of the commissioners.

event of such action or the decision upon such case, as if such person had been living; and the costs of every such action or case shall be in the discretion of the court as aforesaid.

*Statutes of Limitation not to be affected.*

XLIX. Provided always, and be it enacted, that nothing in this act contained shall revive any right to tithes which now is or hereafter shall be barred by any law in force for shortening the time required in claims of modus decimandi or exemption from or discharge from tithes, or for the limitation of actions and suits relating to real property (*y*).

*Commissioners to award Total Sum to be paid for the Tithes of the Parish.*

L. And be it enacted, that as soon as all such suits and differences shall have been decided, or if there shall have been no suits or differences then as soon as the commissioners or assistant commissioner shall have ascertained and estimated as aforesaid the total value of all the tithes of the said parish, the commissioners or assistant commissioner shall frame the draft of an award (*z*), declaring that the sum ascertained as aforesaid shall be the amount of the rent-charge to be paid in respect of the tithes of the said parish, and every such draft shall contain all the particulars herein-before required to be inserted in any parochial agreement or any schedule thereto; Provided always, that no such award shall be made for giving land (*u*) instead of the tithes of the parish.

*Commissioners may hear and determine Objections to the Award.*

LI. And be it enacted, that as soon as the said draft shall have been made by the commissioners or assistant commissioner they or he shall deposit a copy of the same and of any special report thereunto annexed at some convenient place within the said parish for the inspection of all persons interested in the said lands or tithes, and shall forthwith give notice in such manner as to the commissioners shall seem fit where the said copy may be inspected, and shall

(*y*) 2 & 3 W. 4, c. 100. 3 & 4 W. 4, c. 27.

(*z*) Meeting to be held by commissioners to hear objections to the award, see s. 51. p. 24.

(*u*) Land may be given instead of tithes by a parochial agreement, see s. 29, p. 17. By sec. 62, p. 27, land owners may after the interference of the commissioners and before confirmation of the apportionment make an arrangement with the owners of ecclesiastical tithes to give twenty acres of land in lieu of tithes.

also in such notice appoint some convenient place and time (the first not earlier than twenty-one days from the first giving of such notice) for holding a meeting to hear objections to such intended award by any person interested therein; and the said commissioners or assistant commissioner at such meeting as aforesaid shall hear and determine any objections which may be then and there made to the said intended award, or adjourn the further hearing thereof, if they or he shall think proper, to a future meeting, and may, if they or he shall see occasion, direct any further valuation of the lands or tithes or any of them, and from time to time fix further meetings for the hearing and determining of objections, of which further meetings, when not holden by adjournment, notice shall be given in manner herein-before directed with regard to the original meeting; and when the said commissioners or assistant commissioner shall have heard and determined all such objections they or he shall amend the draft of such award accordingly, if they or he shall see occasion.

*Award to be confirmed by the Commissioners.*

LII. And be it enacted, that as soon as the commissioners or assistant commissioner shall have made such amendments in the draft of the award as to them or him shall seem necessary, they or he shall cause the same to be fairly written, and shall sign and send it to the office of the commissioners, and the commissioners shall satisfy themselves that all the proceedings incident to the making of such award have been duly performed, and if they shall think that the award ought to be confirmed shall confirm (b) the same under their hands and seal, and shall add to the award the date of such confirmation, and shall publish the fact of such confirmation and the date thereof in the parish, in such manner as to them shall seem fit; and every such confirmed award shall be binding on all persons interested in the said lands or tithes.

**VOLUNTARY APPORTIONMENT BY THE LAND OWNERS OF THE RENT-CHARGE COMPULSORILY AWARDED BY THE COMMISSIONERS.**

*Commissioners to summon a Parochial Meeting to appoint Valuers.*

LIII. And be it enacted, that as soon as the commissioners shall have confirmed any

such award, the commissioners or some assistant commissioner shall call a parochial meeting of the owners of land subject to tithes in the said parish, for the purpose of choosing valuers to apportion the amount so awarded among the lands of the parish, and shall give notice thereof in writing under their or his hand, to be fixed at least twenty-one days before such meeting on the principal outer door of the church or in some public and conspicuous place within the parish; and valuers or a single valuer may be chosen at such meeting by the land owners then present in like manner, and the valuers so chosen shall act with the same powers (c) and be subject to the same provisions, as if the rent-charge so awarded had been agreed to at a parochial meeting of the land owners and tithe owners of the parish, and the valuers had been thereupon chosen as aforesaid.

**COMPULSORY APPORTIONMENT BY COMMISSIONERS.**

*If Valuation not completed in Six Months Commissioners to apportion.*

LIV. And be it enacted, that if upon the expiration of six calendar months after the day of the date of the confirmation of any agreement or award no valuer or valuers shall have been appointed, or the apportionment by such valuers or valuer shall not have been made and sent to the office of the commissioners as herein-after provided, it shall be lawful for the commissioners or some assistant commissioner to apportion the rent-charge previously agreed or awarded to be paid among the lands of the said parish, having regard to the average titheable produce and productive quality of the said lands according to the discretion and judgment of the commissioners or assistant commissioner, but subject to the provisions herein-after contained, and so that the several lands may have the full benefit in each case of every modus, composition real, prescriptive and customary payment, and of every exemption from or non-liability to tithes relating to the said lands respectively, and having regard to the several tithes to which the said lands are severally liable.

**GENERAL FORM OF APPORTIONMENT.**

LV. And be it enacted, that a draught of every apportionment shall be made, and shall set forth the agreement or award, as

(b) The confirmation of the award is the same in effect as the confirmation of the parochial agreement.

(c) See sections 32, 33, 34, 35.

the case may be, upon which such apportionment is founded, and every schedule thereunto annexed; and the said draught or some schedule thereunto annexed, whether made by or under the direction of the valuers or commissioners or assistant commissioner, shall state the name or description and the true or estimated quantity in statute measure of the several lands to be comprised in the apportionment, and shall set forth the names and description of the several proprietors and occupiers thereof, and whether the said several lands are then cultivated as arable, meadow, or pasture land, or as wood land, common land, or howsoever otherwise, and shall refer, by a number set against the description of such lands, to a map or plan to be drawn on paper or parchment, and the same number shall be marked on the representation of such lands in the said map or plan; and the draught of the apportionment shall also state the amount charged upon the said several lands and to whom and in what right the same shall be respectively payable.

CONVERSION OF MONEY RENT-CHARGE INTO CORN RENT-CHARGE.—(See also s. 67).

*Comptroller of Corn Returns to publish Average Price of Corn.*

LVI. And be it enacted, that immediately after the passing of this Act, and also in the month of *January* in every year, the comptroller of corn returns for the time being, or such other person as may from time to time be in that behalf authorized by the Privy Council, shall cause an advertisement to be inserted in the *London Gazette*, stating what has been, during seven years ending on the *Thursday* next before *Christmas* day then next preceding, the average price of an imperial bushel of *British* wheat, barley, and oats, computed from the weekly averages of the corn returns.

*Rent-Charges to be valued according to the Average Price of Corn.*

LVII. And be it enacted, that every rent-charge charged upon any lands by any such intended apportionment shall be deemed at the time of the confirmation of such apportionment, as herein-after provided, to be of the value of such number of imperial bushels and decimal parts of an imperial bushel of wheat, barley, and oats as the same would have purchased at the

prices so ascertained by the advertisement to be published immediately after the passing of this act, in case one-third part of such rent-charge had been invested in the purchase of wheat, one-third part thereof in the purchase of barley, and the remaining third part thereof in the purchase of oats, and the respective quantities of wheat, barley, and oats so ascertained shall be stated in the draft of every apportionment.

GENERAL PROVISIONS APPLICABLE TO EVERY APPORTIONMENT.—(See also s. 68).

*Rent-Charge may be specially apportioned.*

LVIII. And be it enacted, that it shall be lawful for the valuers or commissioners or any assistant commissioner, upon the request of any land owner, at any time before (*f*) the confirmation of the apportionment, to apportion the whole rent-charge intended to be charged upon any lands of such land owner held under the same title and for the same estate in the same parish, specially (*g*) upon the several closes or portions of such lands or according to an acreable rate or acreable rates, upon lands of different quality, in such manner and in such proportion, and to the exclusion of such of them, as the land owner, with the consent of the person entitled to such rent-charge, may direct, and the particulars of every such special apportionment shall be included in the draught of the apportionment and taken to be a part thereof: Provided always, that the extra expences of every such special apportionment shall be borne by the party at whose instance the same shall have been made, and shall be recoverable as other costs of the apportionment are recoverable, and that no close of land shall be charged with any rent-charge or share of rent-charge on account of the tithes of any other lands, unless the value of such lands shall be at least three times the value of the whole rent-charge upon such lands.

*Commissioners may employ Surveyors.—Commissioners to have the power of Valuers as to Entry in Lands, &c.*

LIX. And be it enacted, that for the purpose of making any such apportionment

(*f*) See s. 72, as to the alteration of apportionment after confirmation.

(*g*) This is a most valuable enactment, as it will facilitate the redemption of tithes, by enabling landowners to charge particular lands of sufficient value with the rent-charge, payable out of the whole estate.

as well as for the purpose of making any award as herein-before provided, the commissioners and assistant commissioner may employ such land surveyors and tithe valuers as to them shall seem fit, and may order them to be paid for valuing, surveying, mapping, and planning after any rate not exceeding two guineas to every such person for every day that he shall have been so employed, and may assess the same as part of the expences of making their award or apportionment respectively; and the said commissioners and assistant commissioners, and the land surveyors and tithe valuers employed by them respectively, shall have all the powers and be subject to all the provisions herein-before enacted concerning the valuers appointed at a parochial meeting, except that they shall not be bound to adopt any principles of apportionment agreed to at any parochial meeting: Provided always, that it shall be lawful for such commissioners and assistant commissioners to make any agreement (*h*) with any such land surveyors or tithe valuers for the payment to the same of one sum for the whole duty or any part thereof to be performed by them respectively.

*Apportionment to be signed by the Person making it, and sent with the Plan to the Commissioners.*

LX. And be it enacted, that the draught of every apportionment, whether made by or under the direction of the commissioners or any assistant commissioner or by any valuer or valuers appointed as herein-before (*i*) is provided, shall be signed by the person by or under whose direction it shall have been made, and shall be sent (*j*), together with the map or plan therein referred to, by the person by whom it is signed to the office of the commissioners, or otherwise to some assistant commissioner, as the commissioners may direct, with such proof as the commissioners may require that every proceeding incident to the making of such draught or apportionment has been duly performed.

*Commissioners may hear and determine Objections to Apportionment.*

LXI. And be it enacted, that as soon as

(*h*) The provisions in this clause respecting payment to valuers only applies to such as are employed by the commissioners, land owners will of course make their own arrangements with valuers engaged by them.

(*i*) See sections 32, 33, 54 and 59.

(*j*) If not sent commissioners may apportion the rent-charge, see s. 54, p. 25.

the draught of any such apportionment, verified as aforesaid, shall have been sent to the commissioners they shall cause a copy of the same to be deposited at some convenient place within the said parish for the inspection of all persons interested (*k*) in the said lands or tithes, and shall forthwith cause notice to be given, in such manner as to them shall seem fit, where the said copy may be inspected, and shall also in such notice appoint some convenient place and such times as they shall think necessary (the first not earlier than twenty-one days from the first giving of such notice,) for holding a meeting to hear objections to the intended apportionment by any person interested therein, and the said commissioners or some assistant commissioner at such meeting as aforesaid shall hear and determine any objections which may be then and there made to the said intended apportionment, or adjourn the further hearing thereof, if they or he shall think proper, to a future meeting, and may, if they or he shall see occasion, direct any further valuation of the lands or any of them, and from time to time fix further meetings for the hearing and determining of objections, of which further meetings, when not holden by adjournment, notice shall be given in manner herein-before directed with regard to the original meeting; and when the said commissioner or assistant commissioner shall have heard and determined all such objections, they and he are and is hereby required to cause such apportionment to be amended accordingly if they or he shall see occasion.

*Owners of Lands chargeable with Rent-Charge may give Laud instead thereof.*

LXII. And be it enacted, that it shall be lawful for the owner of any lands chargeable with any such rent-charge to agree, at any time before the confirmation of any such instrument of apportionment, with any ecclesiastical person being the owner of the tithes thereof in right of any spiritual benefice or dignity, for giving land instead of the rent-charge charged or about to be charged upon his lands; and every such agreement shall be made under the hands and seals of the land owner and tithe owner, and shall contain all the particulars herein-before required to be inserted in a paro-

(*k*) By sec. 60, p. 28, after confirmation the award or apportionment cannot be questioned, it therefore behoves parties interested to inspect the draft of the apportionment at an early period so as to make any objection in due time.

chial agreement for giving land instead of tithes or rent-charge: Provided always, that no such tithe owner shall be enabled to take or hold more than twenty imperial acres of land in the whole by virtue of any such agreement or agreements made in the same parish; and the same consent and confirmation relatively to the lands and tithes comprised in the said agreement shall be necessary to any such agreement as in the case of a parochial agreement for giving land instead of tithes; and all the provisions herein-before contained concerning a parochial agreement for giving land shall be applicable to every such agreement as herein-before last mentioned, so far as concerns the lands and tithes comprised in the said agreement: Provided also, that any amendment which shall be made in the draft of apportionment before confirmation thereof, and subsequent to any such agreement for giving land instead of rent-charge, whereby the charge upon the lands referred to in such agreement shall be altered, shall be taken to annul the execution of such agreement for giving land, and any consent which may have been necessary thereunto.

*Confirmation by the Commissioners.*

LXIII. And be it enacted, that after such proceedings as aforesaid shall have been had, and all such objections, if any shall have been finally disposed of, the commissioners or assistant commissioner shall cause the instrument of apportionment to be ingrossed on parchment, and shall annex the map or plan thereunto belonging to the ingrossed instrument of apportionment, and shall sign the instrument of apportionment and the map or plan, and shall send both to the office of the commissioners, and if the commissioners shall approve the apportionment they shall confirm the instrument of apportionment (*l*) under their hands and seal, and shall add thereunto the date of such confirmation (*m*).

*Transcripts of the Award to be sent to the Registrar of the Diocese and to the Incumbent and Churchwardens.*

LXIV. And be it enacted, that two copies of every confirmed instrument of apportionment, and of every confirmed agreement for giving land instead of any tithes or rent-charge, shall be made and

sealed with the seal of the said commissioners, and one such copy shall be deposited in the registry of the diocese within which the parish is situated, to be there kept among the records of the said registry, and the other copy shall be deposited with the incumbent and church or chapel wardens of the parish for the time being, or such other fit persons as the commissioners shall approve, to be kept by them and their successors in office with the public books, writings, and papers of the parish, and all persons interested therein may have access to and be furnished with copies of or extracts from any such copy on giving reasonable notice to the person having custody of the same, and on payment of two shillings and sixpence for such inspection, and after the rate of three-pence for every seventy-two words contained in such copy or extract; and every recital or statement in or map or plan annexed to such confirmed apportionment or agreement for giving land, or any sealed copy thereof, shall be deemed satisfactory evidence of the matters therein recited or stated, or of the accuracy of such plan.

*Commissioners may require Notice of Agreements or Awards to be given to Reversioner.*

LXV. And be it enacted, that the commissioners, if they shall see fit, before confirming any agreement (*n*), award (*o*), or apportionment (*p*), may require notice thereof to be given in such manner as they shall direct to the person next in remainder, reversion, or expectancy of an estate of inheritance in any land or tithes, or any other person to whom they may think notice ought to be given, and may by themselves or by some assistant commissioner hear and determine any objection made to such confirmation by any person interested therein, and may direct any award or apportionment to be amended accordingly.

*Agreements &c. not to be questioned after Confirmation.*

LXVI. And be it enacted, that no confirmed agreement, award, or apportionment shall be impeached after the confirmation thereof by reason of any mistake or informality therein or in any proceeding relating thereunto.

CONVERSION OF CORN RENT-CHARGE INTO MONEY RENT-CHARGE.—(See also sections 56 and 57).

*Lands to be discharged from Tithes, and Rent-*

(*l*) Apportionment may be altered after confirmation by the commissioners of land tax, at the request of the owners of the land, see s. 72, p. 31.

(*m*) This is in fact the completion of the commutation.

(*n*) See s. 27, p. 16.

(*o*) See s. 51, p. 24.

(*p*) See s. 63, p. 28.

*charge paid in lieu thereof.*—Payment of *Rent-charge on Reclaimed Lands to be postponed until Tithes would have been due.*

LXVII. And be it enacted, that from the first day of *January* next following the confirmation of every such apportionment (*q*) the lands of the said parish shall be absolutely discharged from the payment of all tithes, except so far as relates to the liability of any tenant at rack rent dissenting as hereinafter (*r*) provided, and instead thereof there shall be payable thenceforth to the person in that behalf mentioned in the said apportionment a sum of money equal in value, according to the prices ascertained by the then next preceding advertisement, to the quantity of wheat, barley, and oats respectively mentioned therein to be payable instead of the said tithes, in the nature of a rent-charge issuing out of the lands charged therewith; and such yearly sum shall be payable by two equal half-yearly payments on the first day of *July* and the first day of *January* in every year, the first payment, except in the case of barren reclaimed lands as hereinafter provided, being on the first day of *July* next after the lands shall have been discharged from tithes as aforesaid, and such rent-charge may be recovered at the suit of the person entitled thereto, his executors or administrators, by distress and entry as herein-after (*s*) mentioned; and after every first day of *January* the sum of money thenceforth payable in respect of such rent-charge shall vary so as always to consist of the price of the same number of bushels and decimal parts of a bushel of wheat, barley, and oats respectively, according to the prices ascertained by the then next preceding advertisement, and any person entitled from time to time to any such varied rent-charge shall have the same powers for enforcing payment thereof as are herein contained concerning the original rent-charge: Provided always, that nothing herein contained shall be taken to render any person whomsoever personally (*t*) liable to the payment of any

such rent-charge: Provided always that the rent-charge which shall be apportioned upon any lands in the said parish which during any part of the said period of seven years preceding *Christmas* one thousand eight hundred and thirty-five were exempted from tithes by reason of having been inclosed under any Act of Parliament, or converted from barren heath or waste ground (*u*), shall be payable for the first time on the first day of *July* or first day of *January* next following the confirmation of the apportionment which shall be nearest to the time at which tithes were or would have become payable for the first time in respect of the said lands if no commutation thereof had taken place.

GENERAL PROVISIONS APPLICABLE TO EVERY APPOINTMENT.—(See also sections 55, 58 to 66 inclusive, and 68).

*Lands to be free from Tithes when Lands are given in lieu thereof.*

LXVIII. And be it enacted, that from the first day of *January* next following the confirmation of every parochial or other agreement for giving land instead of any tithes or rent-charge, the lands of the parish in which any such agreement shall be made shall be absolutely discharged (*v*) from the payment of the tithes or rent-charge for which it shall have been agreed that such land shall be given.

RENT-CHARGE LIABLE TO THE SAME RATES AND INCUMBRANCES AS TITHES.

LXIX. And be it enacted, that every rent-charge payable as aforesaid instead of tithes shall be subject to all parliamentary parochial, and county and other rates (*w*), charges, and assessments, in like manner as the tithes commuted for such rent-charge have heretofore been subject.

*How Rates and Charges are to be recovered.*

LXX. And be it enacted, that all rates and charges to which any such rent-charge is liable shall be assessed upon the occupier of the lands out of which such rent-charge shall issue, and in case the same shall not be sooner paid by the owner of the rent-charge for the time being may be re-

(*q*) The tithes will of course be payable up to the 1st *January*, and the first payment of the rent-charge will become due upon the 1st *July* following.

(*r*) In reference to dissent of tenants at rack-rent, see s. 79, p. 32.

(*s*) See sections 81, 82.

(*t*) The remedy for the recovery of rent-charge in arrear is by distress and entry only, and where lands are washed away by the sea, or otherwise destroyed by natural casualty, the rent-charge is gone: see s. 85, p. 34.

(*u*) Barren heath, or waste land, brought into cultivation, is exempt from tithes for the first seven years, by the 2 & 3 *Edw. 6*, c. 13; see also s. 43, p. 22.

(*v*) That portion of rent-charge for which the land is given will be deducted from the whole rent-charge of the parish, subject of course to special agreement, according to the circumstances under which the land has been given: see sections 29 and 62.

(*w*) See s. 37, p. 22.

covered from such occupier (*x*) in like manner as any poor rate assessed on him in respect of such lands; and any occupier holding such lands under any landlord and who shall have paid any such rate or charge in respect of any such rent-charge shall be entitled to deduct the amount thereof from the rent next payable by him to his landlord for the time being, and shall be allowed the same in account with his landlord; and any landlord (*y*) or owner in possession who shall have paid any such rate or charge, or from whose rent the amount of any such rate or charge in respect of any such rent-charge shall have been so deducted, or who shall have allowed the same in account with any tenant paying the same, shall be entitled to deduct the amount thereof from the rent-charge, or by all other lawful ways and means to recover the same from the owner of the rent-charge, his executors and administrators; Provided that the owner of every such rent-charge shall have and be entitled to the like right of demanding, inspecting, (*z*) and taking copies of every assessment containing such rate or charge, and of appeal against the same, and the like power of prosecuting such appeal, and the like remedies in respect thereof, as any occupier or rate-payer has or may have in the case of poor-rates, although such rate or charge is herein made assessable upon the occupier, and the owner of the rent-charge is not mentioned by name in such assessment.

*Rent-charge to be subject to the same Incumbrances and Incidents as Tithe before this Act.—Proviso.*

LXXI. And be it enacted, that any person having any interest in or claim (*a*) to any tithes, or to any charge or incumbrance upon any tithes, before the passing of this Act, shall have the same right to or claim upon the rent-charge for which the same shall be commuted as he had to or upon the tithes, and shall be entitled to have the

like remedies for recovering the same as if his right or claim to or upon the rent-charge had accrued after the commutation; Provided that nothing herein contained shall give validity to any mortgage or other incumbrance which before the passing of this Act was invalid or could not be enforced; and every estate for life, or other greater estate, in any such rent-charge, shall be taken to be an estate of freehold; and every estate in any such rent-charge shall be subject to the same liabilities and incidents (*b*) as the like estate in the tithes commuted for such rent-charge; and where any lands were exempted from tithe whilst in the occupation of the owner thereof by reason of being glebe or of having been heretofore parcel of the possessions of any privileged order, the same lands shall be in like manner exempted from the payment of the rent-charge apportioned on them whilst in the occupation of the owner thereof; and where by virtue of any Act or Acts of Parliament heretofore passed any tithes are authorized to be sold, exchanged, appropriated or applied in any way, the rent-charges for which tithes may be commuted under the provisions of this Act, or any part thereof, shall or may be saleable or exchangeable, appropriated and applied, to all intents and purposes, in like manner as such tithes, and the same powers of sale, exchange and appropriation shall in all such cases extend to and may be exercised in respect of the said commutation rent-charges (*c*); and the money to arise by the sale of such rent-charges shall or may be invested, appropriated, and applied to the same purposes and in like manner as the money to arise by the sale of any such tithes might have been invested, appropriated, and applied under such particular Act or Acts in case this Act had not been passed: and no such rent-charge shall merge or be extinguished in any estate of which the person for the time being entitled to such rent-charge may be seized or possessed in the lands on which the same shall be charged: Provided always, that it shall be lawful for any person seized in possession of an estate in fee simple or fee tail of any tithes or rent-charge in lieu of tithes, by any deed or declaration under

(*a*) The tenant should pay attention to this enactment, or he may, after having paid his rent, be compelled to pay the rates.

(*y*) The landlord has power to deduct the rates from the rent-charge, or if he omit so to do may recover by all other lawful means.

(*z*) The owner of the rent-charge should look to the assessment, as the occupier can deduct whatever he is charged without reference to the correctness of the charge.

(*a*) The object of this provision is to preserve to claimants, to tithes, and persons having charges upon them the same rights in respect to the rent-charge.

(*b*) As, for instance, in the case of ecclesiastical tithes liability to sequestration, &c. &c.

(*c*) That is, the powers of sale, exchange, &c., &c., given by local acts are continued by this act so far as concerns the tithes referred to in such acts.

his hand and seal, to be made in such form as the said commissioner shall approve, and to be confirmed under their seal, to release, assign, or otherwise dispose of the same, so that the same may be absolutely merged (*d*) and extinguished in the freehold and inheritance of the lands on which the same shall have been charged.

FUTURE ALTERATION OF APPORTIONMENT.

*Apportionment may be altered by Commissioners of Land Tax, if desired.*

LXXII. And be it enacted, that if at any time subsequent (*e*) to the confirmation of any such instrument of apportionment the owner of any lands charged with any such rent-charge shall be desirous that the apportionment thereof shall be altered, it shall be lawful for the commissioners of land tax for the county or place where the said lands are situate, or any three of them, to alter the apportionment in such manner and in such proportion and to the exclusion of such of the lands as the land owner, with the consent of two justices of the peace acting for the county, riding, division, or other jurisdiction in which the lands are situated, may direct; and such altered apportionment shall be made by an instrument in writing under the hands and seals of the said commissioners of land tax and of the said land owner and justices, of the like form and tenor as to the said lands as the original apportionment, and bearing date the day of its execution by the said commissioners of land tax, subject to the provision herein-before contained with respect to the value of lands in which any rent-charge may be charged on account of the tithes of any other lands (*f*); and every such altered apportionment shall be as valid as if made and confirmed by the title commissioners as aforesaid, and shall be taken to be an amendment of the original apportionment; and in every such case two counterparts of the instrument of altered apportionment, under the hands and seals of the said commissioners of land tax and justices and land owner, shall be sent, one to the registrar of the Diocese, and one to the incumbent and church or chapel wardens, or other person having the custody of the other copy of the original instrument

of apportionment; and one counterpart shall be annexed to the copy of the instrument of apportionment in the custody of the registrar and such other person respectively, and taken to be an amendment thereof; and thenceforward such lands shall be charged only according to such altered apportionment; and all expences of such alteration shall be borne by the land owner desiring the same.

EXPENSES, BY WHOM TO BE PAID, AND HOW RECOVERED.

*Expences of Witnesses to be paid under the Direction of the Commissioners.*

LXXIII. And be it enacted, that the commissioners or assistant commissioner, in any case were they or he may see fit, may order such expences of witnesses, and of the production of any books, deeds, contracts, agreements, accounts, or writings, terriers, maps, plans, and surveys, or copies thereof, and all other expences (except the salary or allowance to any commissioner or assistant commissioner) incurred in the settlement of any suit or difference or in the hearing and determining any Objection to any award or apportionment before the said commissioners or any assistant commissioner, to be paid by such parties interested in the production thereof respectively, or in the event of such suit, difference, or objection, and in such proportions, as the commissioners or assistant commissioner shall think fit and reasonable (*g*).

*Expences of making any Award to be paid by the Land Owners and Tithe Owners as the Commissioners may direct.*

LXXIV. And be it enacted, the allowances to, and expences of land surveyors and tithe valuers necessary for making any award (*h*), and all other expences of or incident to making the said award, except the salary or allowance to any commissioner or assistant commissioner, and except any expences which the commissioners or any assistant commissioner, or any court or arbitrator, may be authorized to order and may have ordered to be otherwise paid, shall be borne and paid by the land owners and tithe owners interested in the said award, in such

(*g*) Expenses may be charged upon estate or benefice for 20 years, see sections 77 and 78, p. 32.

(*h*) There is a distinction made as to the expences of the award and the expences of the apportionment, see s. 75, p. 32. The land-owners and tithe-owners are both interested in the award, and therefore both contribute; but the land-owners being alone interested in the apportionment, the charge of that proceeding is to be defrayed by them alone.

(*d*) As in the case of land-tax redeemed.

(*e*) If the land owner has not availed himself of the power of making a special apportionment given by sec. 58, he may at any subsequent time effect it in the manner prescribed in this section.

(*f*) See sec. 58, p. 26.

proportion, time and manner as the commissioners or assistant commissioner shall direct (i).

*Expences of Apportionment to be borne rateably by the Land Owners,*

LXXV. And be it enacted, that all the expences of or incident to making any apportionment (except the salary or allowance to any commissioner or assistant commissioner, and except any expence which the commissioners or assistant commissioner may be authorized and may have ordered to be otherwise paid,) shall be borne and paid by the owners of lands included in the apportionment in rateable proportion to the sum charged on the said lands in lieu of tithes by such apportionment (j).

*Expences may be recovered by Warrant of Distress.*

LXXVI. And be it enacted, that if any difference shall arise touching the said expences, or the share thereof to be paid by any person, it shall be lawful for the commissioners or some assistant commissioner to certify under their or his hand the amount to be paid by such person; and in case any person shall neglect or refuse to pay his share so certified to be payable by him, and upon the production of such certificate before any two justices of the peace for the county or other jurisdiction wherein the lands mentioned in the agreement or award or apportionment are situate, such justices, upon the nonpayment thereof, are hereby required, by warrant under their hands and seals, to cause the same and the costs of the distress to be levied by distress and sale of the goods of the person liable to pay the same, and to render the surplus (if any), after deducting the charges of the distress and sale, to the person distrained upon.

*Owners of particular Estates may charge the Costs on the Estate for Twenty Years.*

LXXVII. And be it enacted, that every owner of an estate in land or tithes less in the whole than an immediate estate of fee simple or fee tail, or which shall be settled upon any uses or trusts, may, with the consent of the commissioners, and in such manner as they may direct, charge so much of the expences of commutation as is to be defrayed by him, or any part thereof, and the interest thereon after the rate of four pounds by the hundred, upon the lands whereof the tithes are commuted, or upon

the rent-charge to be received by him instead of such tithes respectively, but so nevertheless that the charge upon such lands or rent-charge respectively shall be lessened in every year following such commutation by one-twentieth part at least of the whole original charge thereon.

*Costs of Ecclesiastical Tithe Owners may be charged on the Benefice for Twenty Years.*

LXXVIII. And be it enacted, that every ecclesiastical beneficed person who shall commute the tithes of his benefice under this act may advance or borrow the sum necessary to defray so much of the expences of commutation as is to be defrayed by him, or any part thereof, and as a security for repayment may charge or assign the rent-charge to be received instead of such tithes for twenty years, or until the principal sum advanced or borrowed, and the interest thereon after the rate of four pounds by the hundred, and the expences of such charge or assignment, shall be sooner paid; and every incumbent successively shall pay the interest of the sum advanced or borrowed, or of so much thereof as shall then remain unpaid, as the same shall become due, or within one calender month next following, and also an instalment at the rate of five pounds for every hundred pounds of the principal sum advanced or borrowed, and in default of such payment the ordinary may sequester the profits of the benefice until such payments shall be made, provided that the sum to be so advanced or borrowed shall be ascertained and certified under the hand of any commissioner or assistant commissioner, and shall be by him stated to have been the amount of such expences properly incurred by such ecclesiastical beneficed person in relation to such commutation.

PROTECTION TO TENANT PAYING RENT-CHARGE.

*If Tenant of Lands at Rack-Rent dissent from paying the Rent-Charge, the Landlord may take the Tithes during the Tenancy.*

LXXIX. And be it enacted, that any tenant or occupier who at the time of such commutation shall occupy at rack rent any lands of which the tithes shall be so commuted may, within one calender month next after the confirmation of the apportionment by the commissioners, signify, by writing under his hand given to or left at the usual residence of his landlord or his agent, his dissent from being bound to pay any rent-charge apportioned and charged on the said lands as aforesaid, and in that case such landlord shall be entitled, from the time

(i) And may be recovered by distress, see section 76.

(j) See sections 76, 77, and 78.

when the said apportionment shall take effect, and during the tenancy or occupation of such tenant or occupier, to stand, as to the perception and collection of tithes, or receipt of any composition instead thereof, in the place of the owner of the tithes so commuted, and to have all the powers and remedies for enforcing tender and payment of such tithes or composition which the tithe owner would have had if the commutation had not taken place.

*Tenant paying Rent-Charge to be allowed the same in Account with his Landlord.*

LXXX. And be it enacted, that any tenant or occupier at the time of such commutation who shall have signified his dissent from being bound to pay any such rent-charge as aforesaid or who shall hold his lands under a lease or agreement providing that the same shall be holden and enjoyed by him free of tithes, and every tenant or occupier who shall occupy any lands by any lease or agreement made subsequently to such commutation, and who shall pay any such rent-charge, shall be entitled to deduct the amount thereof from the rent payable by him to his landlord, and shall be allowed the same in account with the said landlord.

MODE OF RECOVERING RENT-CHARGE BY DISTRESS AND ENTRY.

*When Rent-Charge is in Arrear for Twenty-One Days after half-yearly Days of Payment, the Person entitled thereto may distrain.*

LXXXI. And be it enacted, that in case the said rent-charge shall at any time be in arrear and unpaid for the space of twenty-one days next after any half-yearly day of payment, it shall be lawful for the person entitled to the same, after having given or left ten days' notice in writing at the usual or last known residence of the tenant in possession, to distrain (*k*) upon the lands liable (*l*) to the payment thereof, or on any part thereof, for all arrears of the said rent-charge, and to dispose of the distress when taken, and otherwise to act and demean himself in relation thereto as any landlord may for arrears of rent reserved on a common lease for years; provided that not more than two years' arrears shall at any time be recoverable by distress.

*When Rent-Charges are in Arrear for Forty Days after half-yearly Days of Payment,*

(*k*) This is the usual remedy for recovering arrears of rent-charge.

(*l*) Powers of distress and entry extend to all lands within the parish, occupied by the owner, or under the same landlord, or holding, see s. 85, p. 34.

*and no sufficient Distress on the Premises, Writ to be issued directing Sheriff to summon Jury to assess Arrears.*

LXXXII. And be it enacted, that in case the said rent-charge shall be in arrear and unpaid for the space of forty days next after any half-yearly day of payment, and there shall be no sufficient distress on the premises liable to the payment thereof, it shall be lawful for any judge of his Majesty's courts of record at *Westminster*, upon affidavit of the facts to order a writ to be issued, directed to the sheriff of the county in which the lands chargeable with the rent-charge are situated, requiring the said sheriff to summon a jury to assess the arrears of rent-charge remaining unpaid, and to return the inquisition thereupon taken to some one of his Majesty's courts of law at *Westminster*, on a day therein to be named, either in term time or vacation; a copy of which writ, and notice of the time and place of executing the same, shall be given to the owner of the land, or left at his last known place of abode, or with his known agent, ten days previous to the execution thereof; and the sheriff is hereby required to execute such writ according to the exigency thereof; and the costs of such inquisition shall be taxed by the proper officer of the court; and thereupon the owner of the rent-charge may sue out a writ of habere facias possessionem, directed to the sheriff, commanding him to cause the owner of the rent-charge to have possession of the lands chargeable therewith until the arrears of rent-charge found to be due, and the said costs, and also the costs of such writ and of executing the same, and of cultivating and keeping possession of the lands, shall be fully satisfied: Provided always, that not more than two years' arrears over and above the time of such possession shall be at any time recoverable.

*Account how to be rendered.*

LXXXIII. And be it enacted, that it shall be lawful for the court out of which such writ shall have issued, or any judge at chambers (*m*), to order the owner of the rent-charge who shall be in possession by virtue of such writ from time to time to render an account of the rents and produce of the

(*m*) This is a most valuable amendment of the law affording by summary means, and at a small cost that redress which could only be obtained by means of a chancery suit, with all its incidents of expense and delay. Wherever such cases arise the party taking possession should keep his accounts accurately, or he may suffer considerable loss when called upon to render an account.

lands and of the receipts and payments in respect of the same, and to pay over the surplus (if any) to the person for the time being entitled thereunto, after satisfaction of such arrears of rent-charge and all costs and expences as aforesaid, and thereupon to order a writ of supersedeas to issue to the said writ of habere facias possessionem, and also by rule or order of such court or judge from time to time to give such summary relief to the parties as to the said court or judge shall seem fit.

*For Recovery of Rent-Charges from Quakers.*

LXXXIV. Provided always, and be it enacted, that in all cases in which it shall be necessary to make any distress under this Act in respect of any lands in the possession of any person of the persuasion of the people called Quakers (*n*), the same may be made upon the goods, chattels, or effects of such person, whether on the premises or elsewhere, but nevertheless to the same amount only and with the same consequences in all respects as if made on the premises; and that in all cases of distress under this act upon persons of that persuasion the goods, chattels, or effects which may be distrained shall be sold without its being necessary to impound or keep the same (*o*): Provided always, that no writ under the provision herein-before contained shall be issued for assessing or recovering any rent-charge payable under this Act in respect of any lands in the possession of any person of the persuasion aforesaid, unless the same shall be in arrear and unpaid for the space of forty days next after any half-yearly day of payment, without the person entitled thereto being able to find goods, chattels, or effects either on the premises or elsewhere liable to be distrained as aforesaid sufficient to satisfy the arrears to which such lands are liable, together with the reasonable costs of such distress.

*Powers of Distress and Entry to extend to all Lands within the Parish occupied by the Owner or under the same Landlord or Holding.*

LXXXV. And be it enacted, that whenever any rent-charge payable under the

provisions of this act shall be in arrear, notwithstanding any apportionment which may have been made of any such rent-charge, every part of the land situate in the parish in which such rent-charge shall so be in arrear, and which shall be occupied by the same person who shall be the occupier of the lands on which such rent-charge so in arrear shall have been charged, whether such land shall be occupied by the person occupying the same as the owner thereof, or as tenant thereof, holding under the same landlord under whom he occupies the land on which such rent-charge so in arrear shall have been charged, shall be liable to be distrained upon or entered upon as aforesaid for the purpose of satisfying any arrears of such rent-charge, whether chargeable on the lands on which such distress is taken or such entry made, or upon any other part of the lands so occupied or holden: Provided always, that no land shall be liable to be distrained or entered upon for the purpose of satisfying any such rent-charge charged upon lands which shall have been washed away by the sea, or otherwise destroyed by any natural casualty (*p*).

APPORTIONMENT OF RENT-CHARGE ON DEATH, REMOVAL, &c.

*Powers of 4 & 5 W. 4. to extend to Rent-Charges under this Act.*

LXXXVI. And be it enacted, that the several provisions of an Act passed in the fourth and fifth years of his present Majesty, intituled *an Act to Amend an Act of the Eleventh year of King George the Second, respecting the Apportionment of Rents, Annuities, and other Periodical Payments*, shall extend to all rent-charges payable under this Act (*q*).

SALE OF TITHE BARNS.

*Provision for the Sale of Buildings and the Sites thereof rendered useless or unnecessary by the Commutation of Tithes.*

LXXXVII. And be it enacted, that if any barns or buildings belonging to any tithe owner having a limited estate or interest therein which shall have been generally used for the housing of tithes paid in kind, shall be rendered in the whole or in part useless by reason of any commutation of tithes under this act, it shall be lawful for every such tithe owner (with the consent, nevertheless, of the commissioners, and sub-

(*n*) Any Quaker refusing to pay tithes may when the sum is under 10*l.*, by the 7 & 8 W. 3, c. 34, be summoned before two justices, and distrained upon for the amount, with power of appealing to the sessions. The sum is extended to 50*l.* by the 53 G. 3, c. 127.

(*o*) This course is manifestly advantageous to the person who distrains, and looking to the tenets of the Society of Friends will in all probability be more agreeable to them.

(*p*) In which case the claim to rent-charge is gone, there being no personal liability, see s. 57, p. 26.

(*q*) That is in cases of change by death &c., the rent-charge, will be calculated up to the day of the change taking place.

ject to such directions as they may give, to be signified under their hands and seal.) to pull down any such barns or buildings or any part thereof, and to sell and dispose of the materials, or to sell and dispose of all or any of such barns or buildings, and the site thereof, and either with or without any farm buildings or homesteads thereunto belonging, in such manner as the commissioners may direct; and upon payment of the consideration money it shall be lawful for every such tithe owner (with such consent as aforesaid,) to convey and deliver the premises sold as aforesaid to the purchaser thereof, or to such uses and in such manner as such purchaser shall direct; and the consideration money in each case shall be paid to such tithe owner, and his receipt shall be a good discharge to the purchaser; and such tithe owner shall lay out and invest the consideration money in such manner and for such trusts as the commissioners shall direct for the benefit of the persons entitled to the said rent-charge.

#### LEASES OF TITHES MAY BE SURRENDERED.

LXXXVIII. And be it enacted, that it shall be lawful for the lessee being in occupation of any tithes commuted under this act, by an instrument in writing under his hand and seal, to be made in such form as the commissioners shall direct, and confirmed under their seal, to surrender and make void the lease by which the said tithes are held or enjoyed by such lessee at the time of the commutation, so far as the same may relate to the said tithes; and it shall be lawful for the commissioners, by the same instrument, to direct what compensation (if any) shall be given by the immediate lessor of any lessee at rack-rent so surrendering any lease of any such tithes to such lessee, and what allowance (if any) shall be made by any lessee to his immediate lessor of any such surrendered lease, in consideration of the non-fulfilment of any conditions contained in such lease, and what deduction (if any) shall be made from the rent thenceforth payable by any lessee to his immediate lessor in respect of other hereditaments (*r*) which may have been included with the said tithes in any such lease: Provided always, that any intermediate lessor to whom any such lease shall have been surrendered shall as regards his immediate lessor be taken to be the lessee in occupation of the tithes included in the said lease.

(*r*) As in the case of lands and tithes let together.

#### TITHES DUE BEFORE COMMUTATION NOT TO BE AFFECTED.

LXXIX. And be it enacted, that nothing in this act contained shall affect any right to any tithes which shall have become due before the commutation.

#### EXCEPTIONS.

*Act not to extend to Easter Offerings, &c. or to Payments instead of Tithes in London, or to permanent Rent-Charges by Custom or Act of Parliament.*

XC. And be it enacted, that nothing in this Act contained, unless by special provision to be inserted in some parochial agreement and specially approved by the commissioners, in which case the same shall be valid, shall extend (*s*) to any *Easter* offerings, mortuaries, or surplice fees, or to the tithes of fish or of fishing, or to any personal tithes other than the tithes of mills, or any mineral tithes, or to any payment instead of tithes arising or growing due within the City of London, or to any permanent rent-charge or other rent or payment in lieu of tithes, calculated according to any rate or proportion in the pound on the rent or value of any houses or lands in any city or town under any custom or private Act of Parliament, or to any lands or tenements the tithes whereof shall have been already perpetually commuted or extinguished under any Act of Parliament heretofore made.

#### EXEMPTIONS FROM STAMP DUTY.

*Advertisements, Contracts, and Awards not to be liable to Stamp Duty.*

XCI. And be it enacted, that no advertisement inserted by direction of the commissioners or any assistant commissioner, or by any tithe owner or land owner, in the *London Gazette*, or in any newspaper, for the purpose of carrying into effect any provision of this Act, and no agreement, award, or power of attorney made or confirmed or used under this act, shall be chargeable with any stamp duty.

#### EXEMPTIONS FROM POSTAGE.

*Correspondence of Commissioners relating to this Act to be free of Postage.*

XCH. And be it enacted, that the said commissioners may receive and send by the general post from and to places in *England* and *Wales* all letters and packets relating exclusively to the execution of this Act free from the duty of postage, provided that such letters and packets as shall be sent to the said com-

(*s*) This section contained before the last amendment the following further exemption: "nor to the tithe of milk, or calves of any cows except those maintained by their owners on the produce of land occupied by themselves, and the tithe of which has been commuted under this act." It will be no easy task to adjust the tithes upon stall-fed cows, of which there are many kept in the neighbourhood of large towns, and fed partially upon land in the parish, but principally upon food purchased elsewhere. There may be five hundred cows kept in a parish at one period and none at all in a week after.

missioners be directed to the "Tithe Commissioners for *England* and *Wales*," at their office in *London*, and that all such letters and packets as shall be sent by the said commissioners shall be in covers, with the words "tithe commissioners for *England* and *Wales*," printed on the same, and be signed on the outside thereof under such words with the name of such person in his own handwriting as the said commissioners, with the consent of the lords commissioners of the treasury or any three or more of them, shall appoint, (such name to be from time to time sent to the secretary of the General Post Office in *London*;) and be sealed with the seal of the said commissioners, and under such other regulations as the said lords commissioners or any three or more of them shall think fit; and if the person so to be appointed shall subscribe or seal any letter or packet whatever, except such only concerning which he shall receive the special direction of his superior officer, or which he shall himself know to relate exclusively to the execution of this act, or if the person so to be appointed, or any other person, shall send or cause to be sent under any such cover any letter, paper, or writing, or any inclosure, other than shall relate exclusively to the execution of this Act, every person so offending shall forfeit and pay the sum of one hundred pounds and be dismissed from his office, one moiety of such penalty shall be paid to the use of his Majesty, his heirs and successors, and the other moiety to the use of the person who shall inform or sue for the same; and every such penalty may be sued for and recovered in any of his Majesty's courts of record in *Westminster*.

PENALTIES FOR GIVING FALSE EVIDENCE.

*False Evidence to be deemed Perjury; withholding Evidence a Misdemeanor.*

XCI. And be it enacted, that if any person under the provisions of this Act shall wilfully give false evidence he shall be deemed guilty of perjury; and if any person shall make or subscribe a false affidavit or declaration for the purposes of this Act he shall suffer the penalties of perjury; and if any person shall wilfully refuse to attend in obedience to any lawful summons of any commissioner or assistant commissioner, or to give evidence, or shall wilfully alter, withhold, destroy, or refuse to produce any book, deed, contract, agreement, account, or writing, terrier, map, plan, or survey, or any copy of the same, which may be lawfully required to be produced before the said commissioners or assistant commissioner, he shall be deemed guilty of a misdemeanor.

LIMITATION OF ACTIONS AGAINST COMMISSIONERS, ASSISTANT-COMMISSIONERS, JUSTICES, &c.

XCIV. And be it enacted, that no action or suit shall be commenced against any commissioner, assistant commissioner, justice of the peace, valuer, umpire, or surveyor, for anything done under the authority of this Act, until twenty-one days notice thereof shall have been given in writing to the party against whom such action or suit is intended to be brought, or after sufficient satisfaction or tender of amends have been made to any party aggrieved, or after three calendar months shall have expired from the commission of the act for which such action or suit shall be so brought; and every such action shall be brought, laid, and tried in the county or place where the cause of action shall have arisen, and not in any other county or place; and if it shall appear that such notice of action or suit was brought before twenty-one days notice thereof given as aforesaid, or that sufficient amends were made or tendered as aforesaid, or if any such action or suit shall not be commenced within the time before limited in that behalf, or such action shall be laid in any county or place other than as aforesaid, then the jury shall find a verdict for the defendant therein, or the court, upon summary application by motion in any such suit, may dismiss the same against such defendant; and if a verdict shall be found for such defendant, or such suit shall be dismissed upon application as aforesaid, or if the plaintiff in such action or suit shall become nonsuit, or suffer a discontinuance of such action, or if upon any demurrer in such action or suit judgment shall be given for the defendant therein, then such defendant shall have costs, charges, and expences as between attorney and client.

*Proceedings under this Act not to be quashed for Want of Form, nor to be removed by Certiorari.*

XCIV. And be it enacted, that no order, adjudication, or proceeding made or had by or before the commissioners or any assistant commissioner under the authority of this Act, or any proceeding to be had touching any offender against this Act, shall be quashed for want of form, or be removed or removeable by certiorari, or any other writ or process, into any of his Majesty's courts of record at *Westminster* or elsewhere.

*Limits of Act.*

XCVI. And be it enacted, that this act shall extend only to *England* and *Wales*.

*Act may be altered this Session.*

XCVII. And be it further enacted, that this act may be amended, altered, or repealed by any act or acts to be passed in this present Session of Parliament.

after confirmation of agreement, valuers to apportion the rent-charge, s. 33.  
if not made within six months after the date of the confirmation of any agreement or award, commissioners or assistant-commissioners to apportion the rent-charge, s. 54.  
how to be made by commissioners, s. 54.  
draft of, to set forth agreement or award upon which it is founded, and every schedule annexed, s. 55.  
to state the description, quantity, and nature of the

APPORTIONMENT—*Continued.*

- land, with the names and descriptions of the proprietors and occupiers, s. 55.
- to contain references to a map or plan, s. 55.
- to state the amount charged upon such lands, and to whom, and in what right payable, s. 55.
- to state the respective quantities of wheat, barley, and oats at which any rent-charge is valued, s. 57.
- special apportionment may be made at request of land-owner, s. 58.
- to contain particulars of special apportionment, s. 58.
- expenses of special apportionment to be borne by the party requiring it, s. 58.
- to be signed by the person under whose direction it shall have been made and sent to the office of commissioners, with such proofs as commissioners may require, s. 60.
- copy of, to be deposited by commissioners in some convenient place within the parish for the inspection of all persons interested in the land and tithes, s. 61.
- objections to be heard and determined by commissioners or assistant-commissioners, s. 61.
- when complete to be engrossed on parchment, and with the map or plan annexed, both being signed, to be sent by commissioners or assistant-commissioners to office of commissioners, s. 63.
- if approved by commissioners, to be signed by them, and dated on the day of confirmation, s. 63.
- not to be impeached after confirmation by reason of informality, s. 66.
- two copies of every confirmed instrument of, to be sealed with the seal of the commissioners, one copy to be deposited in the registry of the diocese, the other to be deposited and kept with the public books, writings, and papers of the parish, s. 64.
- persons interested to inspect and have copies, upon payment of 2s. 6d. for inspection, and after the rate of threepence for every seventy-two words, s. 64.
- every recital in map or plan annexed to such instrument of apportionment, or any sealed copy thereof, to be evidence of the matters therein recited, s. 64.
- lands to be discharged from tithes from the first of January, after confirmation of apportionment, unless tenant of rack-rent dissents, s. 67.
- expenses to be borne and paid by the owner of lands included in the apportionment in rateable proportion, s. 75.
- after confirmation, may be altered by commissioners of land-tax, with the consent of two justices of the peace, at request of owner of land, s. 72.
- altered apportionment must be under hands and seals of commissioners of land-tax, land-owner and justices, of the like form and tenor, as original apportionment, and bearing date the day of execution by said commissioners, s. 72.
- altered apportionment to be as valid as original apportionment, s. 72.
- counterparts to be made and deposited in the same places as the original apportionment, s. 72.
- expenses to be borne by land-owner, s. 72.
- expenses may be recovered by warrant of distress, s. 76.
- of rent-charge in case of death, &c., s. 86.

## APPEAL.

- persons dissatisfied with the decision of the commissioners or assistant-commissioners, may, if the yearly value of the sum to be paid or withholden exceed the sum of 20*l.* within three calendar months, cause an action to be brought in any of the courts at Westminster against the party in whose favour the decision shall have been made, s. 46.
- verdict shall be binding unless the court grant a new trial, s. 46.
- if the decision involve a question of law only, a case

APPEAL—*Continued.*

- may be submitted to the opinion of a court of law, s. 46.
- such verdict or decision of the court shall bind the commissioners, s. 46.
- proceedings not to abate by the death of any parties interested therein, s. 47.
- in case of any person being a minor, idiot, &c., s. 48.
- in case of death of parties, how to proceed, s. 48.
- the rights of all parties to be equally bound, s. 48.
- costs in discretion of court, s. 48.
- against rate assessed on rent-charge given to owner, s. 70.
- ARBITRATION. See COMMISSIONERS. REFERENCE. decision of in cases of reference final and conclusive, s. 24.
- ARBITRATOR. See REFERENCE. decision of final and conclusive, s. 24.
- ARREARS. See DISTRESS. ENTRY.
- ASSESSMENT. See INSPECTION. owners of rent-charge entitled to the like right of inspecting and taking copies of every assessment containing rates and charges as an occupier or rate-payer in the case of poor-rates, s. 70.
- ASSISTANT COMMISSIONERS. See ACTION, COMMISSIONERS. to be appointed by commissioners, s. 4. may be removed by, s. 4. number of, s. 4. not to be elected or sit as a member of the House of Commons, s. 5. appointment of limited to five years from passing of act, s. 6. salaries of, regulated by treasury, s. 7. allowance of, travelling and other expenses, s. 7. before entering upon execution of office to take oath, s. 9. notification of the appointment to be published in Gazette, s. 9. what powers may be delegated to by commissioners, s. 11. to attend parochial meetings, take part in discussion and advise upon the terms of agreement, s. 23. but whilst attending meeting not to have any of the powers given in case of an award or apportionment by the commissioners, s. 23. to administer declaration to valuer or umpire, countersign it, and send it to the office of the commissioners, s. 34. in cases of special adjudication to be specially appointed by commissioners, to hear and determine objections, s. 39. to hear and determine disputes, s. 45.
- ASSISTANT SECRETARY. to be appointed and removed by commissioners, s. 4. not to be appointed for more than five years, s. 6. salary to be regulated by treasury, s. 7. allowance of travelling and other expenses, s. 7.
- ATTORNEY. See LAND OWNER. PATRON. STAMP DUTY. TITHE OWNER. *Power of* form of appointing agent, s. 16. original or copy, attested by two witnesses, to be appended to every agreement, executed by agent, and sent with it to the office of commissioners, s. 16.
- AVERAGE. See AWARD. COMMISSIONERS.
- AWARD. See COMMISSIONERS. MEETING. STAMP DUTY. compulsory to be made after 1st Oct. 1838, s. 36. twenty-one days' notice of intention to make an award to be given by commissioners, s. 37. to contain all the particulars required to be inserted in any parochial agreement, s. 50. not to give land instead of tithe, s. 50. when commutation compulsory, tithes to be valued at the average value for seven years preceding Christmas, 1835, s. 37. prices of grain to be taken from corn returns, s. 57. expenses of collecting, marketing, &c. to be deducted, s. 37.

**AWARD**—*Continued.*

compositions to be calculated on annual valuer of the seven years, s. 37.  
 composition to be diminished where abatement has been made upon the ground of its having been higher than the value of the tithes, s. 37.  
 upon notice from the owner of one-half of the land, or of one-half of the tithes, commissioners may increase or diminish to the extent of one-fifth, s. 38.  
 certain cases to be reserved for special adjudication, s. 38.  
 special cases to be reported to secretary of state, s. 38.  
 how to estimate tithes of hops, fruit, and garden produce, s. 40.  
 provisions for charge of cultivation in hop grounds and market gardens, s. 42.  
 how to estimate tithes of coppice wood, s. 41.  
 how to estimate barren heath, glebe and lauds belonging to any privileged order, which may have been exempt at any time during the seven years preceding Christmas, 1835, s. 43.  
 modus composition, real, prescriptive or customary payments, how to be dealt with, s. 44.  
 disputes may be determined by commissioners, s. 45.  
 subject to appeal, s. 46.  
 meeting to be held to hear objections to, and to be determined by commissioners, s. 51.  
 may be amended by commissioners or assistant-commissioners, s. 51.  
 when examined by commissioners, if approved to be confirmed by them, s. 52.  
 then to be binding on all parties interested in the lands or tithes, s. 52.  
 not to be impeached after confirmation by reason of informality, s. 66.  
 money value of rent-charge to vary according to the alteration in the prices of grain during seven years preceding Christmas, 1885, s. 67.  
 expenses of hearing objections to be paid as commissioners direct, s. 73.  
 expenses incident to making award to be paid by the landowners and tithes-owners interested, in such proportion, time and manner as the commissioners may direct, s. 74.

**BARNES.** See BUILDINGS. COMMISSIONERS. TITHE OWNER.

**BARREN HEATH.** See EXEMPTIONS. RENT-CHARGE.

**BENEFACTICE.** See AGREEMENT. CROWN. PATRON.  
 patron of benefice if owner of tithes or lands, or both, may be dealt with in each of the several characters, s. 14.  
 consent under the hand of patron or person entitled to present requisite to an agreement for commutation of tithes, s. 26.  
 agreement relating to tithes belonging to any ecclesiastical person in right of any spiritual dignity or benefice to be transmitted to the bishop of the diocese for his direction and opinion, s. 28.  
 any ecclesiastical beneficed person may advance or borrow money to defray the expenses of commuting the tithes of his benefice, and charge the rent-charge for twenty years, or until the sum advanced with 4 per cent. interest be repaid, s. 78.

**BISHOP.** See AGREEMENT. COMMISSIONERS.  
 when tithes belong to, consent of crown to commutation requisite, s. 26.  
 notice of agreement in cases of ecclesiastical tithes to be sent to, s. 28.

**BOOK.**  
 production of on oath may be required, s. 10.  
 party wilfully altering, withholding, destroying, or refusing to produce, guilty of a misdemeanor, s. 93.

persons not required to travel more than ten miles in obedience to summonses of, s. 10.

may delegate powers to assistant-commissioners except the power to confirm agreements and awards, or to frame forms of agreements, and other instruments, or to do any act required to

COMMISSIONERS—*Continued.*

- be done under the seal of the commissioners, s. 11.
- may revoke such powers, s. 11.
- may act notwithstanding such delegation of powers, s. 11.
- to appoint guardians for persons labouring under legal disabilities, s. 15.
- to frame and cause to be printed forms of notices and agreements and such other requisite instruments, s. 22.
- to supply or send forms of notices, &c., to churchwardens and overseers for the use of land-owners or tithe-owners, s. 22.
- may attend parochial meetings, take part in discussions, and advise upon the terms of agreement, s. 23.
- but whilst attending meeting not to exercise any of the powers given in case of an award or apportionment, s. 23.
- may direct any person interested to be made party to reference, s. 24.
- to make or cause enquiry to be made, respecting and to require proof before confirmation of agreement, s. 27.
- to add date of confirmation to agreement and publish the fact within the parish, s. 27.
- to transmit any agreement relating to tithes belonging to any ecclesiastical person in right of any spiritual dignity or benefice to the bishop of the diocese before confirmation, s. 28.
- not to confirm agreement until four weeks from the date of the transmission to such bishop, unless he shall sooner signify his approbation, s. 28.
- to direct the form of, and particulars to be contained in agreement for giving land by way of commutation of ecclesiastical tithes, s. 29.
- to satisfy themselves of the title to the land proposed to be given in exchange for such tithes or rent-charge, that the same are of the description and value set forth in such agreement, s. 30.
- to fix the proportions of the expense of the agreement for giving land, and investigating the title in case of difference between the owners of land liable to the payment, s. 30.
- may administer declaration to valuer or umpire, and countersign it, s. 34.
- to proceed after the 1st Oct. 1838, to ascertain and award the total sums to be paid by way of rent-charge instead of tithes of any parish in England and Wales in which no agreement binding on the whole parish has been entered into, s. 36.
- may, if any proceeding shall be had towards making an agreement, refrain from acting after notice of intention given, if they shall think fit, s. 36.
- to give notice of their intention to make an award, s. 37.
- except in certain cases to ascertain the clear average value of tithes upon an average of seven years preceding Christmas, 1835, s. 37.
- how to ascertain average value, s. 37.
- to award the average annual value of the seven years ascertained as the sum to be taken for calculating the rent-charge to be paid as a permanent commutation of the tithes, s. 37.
- to estimate the value of tithes without making any deduction therefrom on account of any parliamentary, parochial, county, or other rates, charges, or assessments, s. 37.
- upon notice from the patron or from the land-owners or tithe-owners interested in not less than one half of the tithes that the average value so calculated will not fairly represent the sum which ought to be taken for commutation to diminish or increase the sum to be taken by a sum not amounting to more than one-fifth part of the average value so ascertained, s. 38.
- to make a report to one of the secretaries of state before the 1st May, 1838, how discretion should be exercised in special adjudications, s. 38.

COMMISSIONERS—*Continued.*

- to reserve cases involving special circumstances for separate adjudication, s. 38.
- to report to secretary of state all the cases reserved for separate adjudication, with reasons for reserving them, s. 39.
- in every such special case to award the rent-charge to be paid, s. 39.
- to hear and determine or appoint assistant-commissioners to hear and determine all objections to special award as in an ordinary case, s. 39.
- thereupon to amend such special award, if requisite, s. 39.
- to estimate the value of the tithes of hop-grounds, orchards, or gardens separately, upon notice given by the owners thereof, s. 40.
- before the 1st May, 1838, to make a report to the secretary of state containing rules for the guidance of the assistant-commissioners in estimating the value of the tithes of coppice woods, s. 41.
- to estimate the value of the tithe of coppice-woods separately upon notice given by the owners thereof, s. 41.
- upon notice given to estimate separately the value of the tithe of any lands which shall during any part of the period of seven years preceding Christmas, 1835, have been exempted from payment of tithes by reason of having been enclosed under any act of parliament or converted during that period from barren heath or waste ground, or by reason of being glebe land, or of having been heretofore parcel of the possessions of any privileged order, s. 43.
- to estimate the amount of any modus or composition real, or prescriptive or customary payment, as the value of the tithes, s. 44.
- to hear and determine disputes, s. 45.
- decision to be final, s. 45.
- as soon as they or the assistant-commissioners shall have ascertained the total value of all the tithes in a parish, and that all suits and differences, if any, are settled, to frame the draft of an award declaring the amount of rent-charge to be paid in respect of the tithes of the parish, s. 50.
- to deposit a copy of the draft award in some convenient place within the parish for the inspection of all parties interested in the lands or tithes, s. 51.
- to give notice where it may be inspected, s. 51.
- to appoint some time and place not earlier than twenty-one days from the first giving of notice for holding a meeting to hear objections, s. 51.
- to attend meeting and hear and determine objections, s. 51.
- may adjourn meeting, s. 51.
- direct further valuation of lands and tithes, &c., s. 51.
- may hold further meetings, s. 51.
- having heard and determined all objections may amend award if they shall see fit, s. 51.
- to examine award, and if they think it ought to be confirmed to confirm the same, s. 52.
- to add the date of confirmation and publish the fact of confirmation, and the date thereof in the parish, s. 52.
- to call a parochial meeting of the owners of land subject to tithes as soon as the award has been confirmed for the purpose of choosing valuers to apportion the amount, s. 53.
- to give notice thereof in the parish, s. 53.
- to apportion the rent-charge if no valuers shall have been appointed, or being appointed, if they have not made an apportionment and sent it to the office of the commissioners at the expiration of six calendar months after the day of the date of the confirmation of any agreement or award, s. 54.
- to make a special apportionment at the request of landowner, s. 56.
- to employ such land surveyors and tithe valuers as they may think fit, s. 59.

**COMMISSIONERS—Continued.**

- may order them to be paid at a rate not exceeding two guineas per day, s. 59.
- may make any agreement with land surveyor or title valuer for the payment to them of one sum for the whole duty to be performed by them, s. 59.
- may assess the same as part of expenses of award and apportionment s. 59.
- to have all the powers and subject to all the provisions concerning valuers appointed at any parochial meeting, s. 59.
- not bound to adopt principles of apportionment agreed to at any parochial meeting, s. 59.
- to cause a copy of draft of apportionment to be deposited at some convenient place within the parish for the inspection of all persons interested in the lands and tithes, s. 61.
- to give notice where it can be inspected, s. 61.
- to appoint some convenient place and such times for holding meetings as they shall think necessary to hear objections to the apportionment, s. 61.
- to hear and determine objections made, s. 61.
- to adjourn meetings if necessary, and fix other meetings, s. 61.
- having heard and determined all objections, to amend the apportionment if they shall see occasion, s. 61.
- to cause the instrument of apportionment to be engrossed, and with the map or plan annexed, both being signed to be sent to the office of the commissioners, s. 63.
- to confirm the apportionment under their hands and seals, and add the date of confirmation if approved, s. 63.
- to seal two copies of every confirmed instrument of apportionment and every confirmed agreement for giving land instead of tithes, s. 64.
- may require notice of agreements, awards, or apportionments, to be given to remainder man, reversioner or expectant of an estate of inheritance or to any other person, s. 65.
- may hear and determine objections from such persons, and amend any award or apportionment accordingly, s. 65.
- may order the expenses of witnesses, and the production of books, deeds, maps, surveys, or copies thereof, &c. &c., to be paid by such parties interested, and in such proportions as they may think fit, s. 73.
- to order payment of the expenses incident to making any award to be made by the land-owners and tithe-owners interested, in such proportion, time and manner as they may think fit, s. 74.
- to give directions respecting the sale and disposal of barns and buildings rendered useless by the commutation of tithes, s. 87.
- to direct in what manner and upon what trusts the proceeds should be invested for the benefit of the persons entitled to the rent-charge, s. 87.
- to direct what compensation, if any, shall be given by the immediate lessor to any lessee surrendering his lease, and what deduction, if any, shall be made by any lessee to his immediate lessor in respect to other hereditaments which may have been included in the lease, s. 88.
- COMMISSIONERS OF WOODS AND FORESTS.**  
See **CROWN.**
- COMMITTEE.** See **OWNER OF LAND. OWNER OF TITHE. PATRON.**

tithe of, how to be estimated, s. 41.  
tithe of, may be estimated separately upon notice to the commissioners or assistant-commissioners by the owner thereof, s. 41.  
rules for guiding the assistant-commissioners in estimating the value of the tithes of, to be made by commissioners, s. 41.
- COPY.** See **EVIDENCE. MISDEMEANOR.**  
of all books, deeds, contracts, agreements, accounts and writings, terriers, maps, plans, and surveys, relating to the commutation of tithes, may be called for by the commissioners, s. 10.  
of award, and of any special report therein contained, to be deposited at some convenient place within the parish, for the inspection of the parties interested, s. 51.  
of draft of apportionment to be deposited at some convenient place within the parish for the inspection of parties interested, s. 61.  
two copies of every instrument of apportionment to be made, one to be deposited in the registry of the diocese, the other with the parish books, s. 64.  
two copies of every altered apportionment to be deposited in the same places as the original, s. 72.  
of instrument of apportionment may be had by parties interested on payment after the rate of three-pence for every seventy-two words, s. 64.  
Any sealed copy of a recital or statement in a map or plan annexed to a confirmed apportionment, or agreement for land, deposited in the registry of the diocese, or with the parish books, to be evidence, s. 64.  
sealed copies of agreements, and other instruments, proceeding from the board of commissioners, to be evidence, s. 2.  
of every assessment may be had by owners of rent-charge, in like manner as in the case of poor-rates, s. 70.
- COPYHOLD.**  
land given in exchange for tithes must not be of copyhold tenure, s. 29.
- CORN RETURNS.** See **COMPTROLLER OF CORN RETURNS.**
- CORNWALL, DUCHY OF.** See **CROWN.**
- COSTS.**  
in every appeal to a court of law against the decision of the commissioners, the costs to be in the discretion of the court, s. 46.  
of commutation may be charged by owner of estate upon estate for twenty years, s. 77.  
by ecclesiastical persons upon benefice for twenty years, s. 78.  
of proceedings after tender of amends, s. 94.
- CROWN.**  
when ownership of lands or tithes vested in the first

## CROWN—Continued.

- commissioner of woods and forests to be substituted instead of the owner, s. 13.
- if in right of the Duchy of Lancaster the Chancellor of the Duchy of Lancaster to be substituted, s. 13.
- in right of the Duchy of Cornwall, the officers of the Duchy of Cornwall entitled to grant leases to be substituted, s. 13.
- when patronage of benefices vested in, the Lord Chancellor, Lord Keeper, or First Lord Commissioner of the Great Seal, to be substituted as patron, s. 13.
- when patronage vested, in right of the Duchy of Lancaster, the Chancellor of the Duchy to be substituted as patron, s. 13.

consent to an agreement for commutation of tithes of benefice belonging to bishop or archbishop to be signified by the Lord High Treasurer or First Lord Commissioner of the Treasury, s. 26.

## DECLARATION. See ASSISTANT-COMMISSIONERS. COMMISSIONERS. JUSTICE OF PEACE. VALUER. UMPIRE.

- valuers and umpire must make and subscribe to before acting, s. 34.
- to be countersigned by person administering, and sent to office of commissioners, s. 34.
- to the same purport and effect as the oath directed to be made by the commissioners, s. 34.
- may be made before commissioners, assistant-commissioners, or justice of the peace, s. 34.
- to be subscribed by party making it, and the signature and usual place of residence added, s. 34.

## DISTRESS AND ENTRY. See RENT-CHARGE.

- expenses may be recovered by distress, s. 76.
- if rent-charge in arrear for twenty-one days after any half-yearly day of payment, the person entitled may, having given ten days notice, distrain and dispose of the distress, and act as any landlord may for rent arrear on a common lease for years, s. 81.
- not more than two years' arrears to be recoverable by distress, s. 81.
- if no sufficient distress on the premises forty days after any half-yearly day of payment entry may be made, s. 82.
- for arrears due from Quakers may be made upon the premises or elsewhere, and may be sold without being impounded or kept, s. 84.
- may be made for arrears of rent-charge upon any portion of the lands in any parish belonging to the same landlord, and held by the same occupier, whether the arrears be charged on the lands on which such distress is taken or not, s. 85.
- but not for arrears due upon land washed away by the sea or destroyed by any natural casualty, s. 85.

## EASTER OFFERINGS. See EXEMPTIONS.

## ESTATE,

- no person possessing less than an immediate estate in fee-simple or fee-tail, shall by any reference, bind any person in reversion, remainder, or expectancy, without the consent of commissioners, s. 24.
- any estate for life, or other greater estate in any rent-charge, to be taken to be an estate of freehold, s. 71.
- in fee-simple or fee-tail of tithes, or rent-charge, may, with the consent of commissioners, be merged in the freehold of inheritance, s. 71.
- but not otherwise, s. 71.

## EVIDENCE,

- instruments under seal and sealed copies to be received in, s. 2.
- recitals, &c., when to be received in, s. 64.
- power of commissioners to call for deeds, papers, &c., s. 10.
- proof that agreement ought to be confirmed may be called for by commissioners, s. 27.
- persons giving false evidence guilty of perjury, s. 93.
- refusing to give, guilty of misdemeanor, s. 93.

## EXAMINATION,

- on oath, commissioners may require, s. 10.
- under authority of act if false evidence given party guilty of perjury, s. 93.

## EXEMPTIONS. See POSTAGE. STAMP DUTY.

- to be set forth in parochial agreement, s. 21.
- lands to have full benefit of in valuation, s. 33.
- of land from tithe by reason of having been inclosed under any act of parliament, or converted from barren heath or waste land, or by reason of having been parcel of the possessions of any privileged order, and exempt during some part of the seven years preceding Christmas, 1835, s. 43.

in cases of moduses, &c. s. 44.

commissions to hear and determine disputes respecting, s. 45.

commissioners to give full benefit of, to lands in their valuation, s. 54.

lands to have the same benefit of in case of rent-charge, as they had from tithe, s. 71.

and not to extend to Easter offerings, mortuaries, or surplice fees, the tithes of fish or fishing, or personal tithes, other than the tithes of mills, or any mineral tithes, or to any payment instead of tithes, arising or growing due within the city of London, or to any permanent rent-charge, or other payment in lieu of tithes, calculated according to any rate or proportion in the pound in the rent or value of any houses or lands in any city or town under any custom or private act of parliament, or to any lands or tenements, the tithe whereof shall have already been commuted or extinguished by act of parliament, s. 90.

## EXPECTANCY. See COMMISSIONERS. REFERENCE.

no person possessing less than an immediate estate of fee-simple or fee-tail in lands or tithes shall be empowered to submit to a reference so as to bind a party in expectancy of an estate of inheritance without consent of commissioners, s. 24.

person in expectancy of an estate of inheritance, may, upon notice from commissioners or assistant-commissioners, object to any award or apportionment, s. 65.

## EXPENSES. See COMMISSIONERS. LAND-OWNERS.

to be paid out of consolidated fund, unless otherwise provided for, &c. s. 8.

all expenses of agreement and investigating title to land given in exchange for tithes to be borne by the owners of land liable to tithes as they may agree, and in default of agreement as commissioners may direct, s. 30.

amount of, having been certified by commissioners, may be recovered by warrant of distress, s. 76.

expenses incident to making award to be paid by the land-owner and tithe-owner interested, in such proportion, time and manner as the commissioners may direct, s. 74.

of apportionment to be borne by land-owners, s. 75.

of special apportionment by party requiring it, s. 58.

of altered apportionment, by persons requiring it, s. 75.

may be recovered by distress, s. 76.

the owner of an estate in land or tithes less than fee simple or fee tail, or which is settled upon any uses or trusts, may, with the consent of commissioners, charge the expenses, or any part thereof, upon the lands or rent-charge, s. 77.

such charge to be lessened in every year following by one-twentieth part, s. 77.

any ecclesiastical beneficed person in commuting the tithes of his benefice may advance or borrow a sum of money to defray the expenses, and charge the rent-charge for 20 years, or until the sum advanced, with interest at 4 per cent. be repaid, s. 78.

every succeeding incumbent to pay the interest, and an instalment of 5 per cent. on the sum advanced, s. 78.

the amount to be certified under the hands of the commissioners, s. 78.

EXPENSES—*Continued.*

in default of payment, living to be sequestered, s. 78.

## EXTRA-PAROCIAL. See PARISH.

## FISH OR FISHING,

act not to extend to tithes of, unless specially provided for, s. 90.

## FRUIT,

tithe of, how to be valued, s. 40.

## GARDENS,

tithe of, how to be valued, s. 40.

tithe of, may be estimated separately, upon notice given to the commissioners or assistant-commissioners, by the owners, s. 40.

provision for the change of culture, s. 42.

## GAZETTE. See STAMP DUTY.

## GENDER,

any word importing the masculine, only, shall mean and include a female as well as male, s. 12.

## GLEBE

lands exempt from tithe whilst in the occupation of the owner by reason of being glebe, to be exempt from the payment of rent-charge apportioned on them whilst in the occupation of the owner, s. 71.

## GUARDIAN. See COMMISSIONERS. LEGAL DISABILITIES. OWNER OF LANDS. OWNER OF TITHES. PATRON.

## HEREDITAMENTS,

designated by the word LANDS, s. 12.

## HOPS,

how valued, s. 40.

provision for charge of culture of hop-grounds, s. 42.

## HOUSES,

act not to extend to, unless specially provided for, s. 90.

## HUSBAND. See COMMISSIONERS. OWNER OF LANDS. OWNER OF TITHES. PATRON.

## IDIOT. See COMMISSIONERS. OWNER OF LANDS. OWNER OF TITHES. PATRON.

## INCUMBRANCES,

rent-charge, liable to, in like manner as tithes were, s. 71.

## INSPECTION. See ASSESSMENT.

## INTEREST

of the owners of lands or tithes to be estimated according to the sum at which such lands or tithes shall be rated to the relief of the poor, or if there shall be no such rate, according to rules by which such property is rateable to the relief of the poor, s. 19.

## INTERPRETATION CLAUSE, s. 12.

person, s. 12.

singular number, s. 12.

masculine gender, &c. s. 12.

lands, s. 12.

tithes, s. 12.

parish and parochial, s. 12.

land-owner, s. 12.

tithe-owner, s. 12.

joint-owners, s. 12.

## JOINT-OWNER.

for meaning of this term see interpretation clause, s. 12.

## JUSTICE OF PEACE. See ACTION. VALUER. UMPIRE.

to administer declaration to valuer or umpire, countersign and send it to the office of the commissioners, s. 34.

consent of two, requisite with commissioners of land-tax in altering an apportionment of rent-charge at the request of the owner of land, s. 72.

## KING. See CROWN.

## LANCASTER, DUCHY OF. See CROWN.

## LAND. See AGREEMENT. APPORTIONMENT. COMMISSIONERS. RENT-CHARGE.

any quantity, not exceeding in the whole 20 acres, may by agreement be given by way of commutation with owner of ecclesiastical tithes, s. 29.

land so given to be free from incumbrances, except leases at improved rent, land-tax, or other

LAND—*Continued.*

usual out-goings, not of leasehold tenure, nor of copyhold or customary tenure, subject to arbitrary fine, or the render of heriots, s. 29.

title of land so given to be investigated by commissioners, s. 30.

expenses of investigating title to be borne by the owners of land in the parish liable to the payment of tithes, s. 30.

award of commissioners not to give land, s. 50.

land-owner may agree to give twenty acres after apportionment, but before confirmation, s. 62.

in what case such agreement to annul former agreement for land, s. 62.

having been exempt from tithe during any part of the period of seven years preceding Christmas, 1835, to be valued separately upon notice given, s. 43.

how to be valued, s. 43.

to be discharged from the payment of tithes, from the first day of January next following the confirmation of every apportionment, s. 67.

unless any tenant at rack-rent dissent, s. 67.

thenceforward to be liable to a rent-charge, s. 67.

to be discharged from payment of tithes or rent-charge from the first day of January next following the confirmation of any parochial or other agreement for giving *land* instead of tithes or rent-charge, s. 68.

where exempt from tithes, whilst in the occupation of the owner, shall be exempt from rent-charge, s. 71.

act not to extend to lands, the tithes whereof shall have been already perpetually commuted under any act of parliament heretofore made unless specially provided for, s. 90.

distress and entry for arrears of rent-charge may be made upon any portion of the lands belonging to the same landlord, and held by the same occupier, whether the arrears be chargeable on the lands on which distress is taken or not, s. 85.

but not for rent-charge due upon lands washed away by the sea, or destroyed by any natural casualty, s. 85.

## LAND, OWNER OF. See AGENT. AGREEMENT. BENEFICE. COMMISSIONERS. CROWN. INTEREST. JOINT-OWNER. PAROCIAL MEETING. PATRON. REFERENCE. TITHE-OWNER. VALUERS.

for meaning of this term, see Interpretation clause, s. 12.

owner of lands, being also owner of tithes, may be dealt with in each character, s. 14.

or if patron of benefice, s. 14.

if a minor, idiot, lunatic, feme covert, beyond the seas, or under any other legal disability, the guardian, trustee, committee of the estate, husband or attorney to be substituted, s. 15.

may appoint agent by power of attorney, s. 16.

owner of one quarter value of land with the owners of great and small tithes to the like extent, may call parochial meetings, s. 17.

shall bear their own expenses of attendance, s. 17.

land-owners and tithe-owners present at meetings, if interested in not less than two-thirds of the land subject to tithes, two-thirds of the great tithes, and two-thirds of the small tithes, may make and execute parochial agreement, for the payment of an annual rent-charge in lieu of tithes, s. 17.

agreement so made, and duly confirmed, to be binding on all parties interested in tithes in the parish, s. 17.

if interest of parties present at meeting not sufficient, may make a provisional agreement, s. 18.

interest of land-owners to be estimated according to the sum at which the lands are rated to the relief of the poor, or if there be no such rate according to the rules by which such property is rateable, s. 19.

if suit depending, or dispute existing with respect to liability to tithes, boundary of lands, or any

**LAND, OWNER OF—Continued.**

other matter impeding agreement, owners or claimants of lands and tithes may submit the matters in difference to reference, s. 24.

no person possessing less than an immediate estate of fee-simple or fee-tail shall by reference bind any person in reversion, remainder or expectancy, without consent of commissioners, s. 24.

commissioners may direct any person interested to be made a party to reference, s. 24.

liable to the payment of tithe within the parish, to bear the expense of agreement for giving land by way of commutation for tithes or rent-charge, and also of investigating the title thereto, s. 30.

may before or after confirmation of agreement, appoint valuers at parochial meeting, s. 32.

if majority in respect of number, and majority in respect to interest, shall not agree, then two or any other even number of valuers to be appointed by the majority of land-owners in respect to number, and an equal number by the majority in respect to interest, s. 32.

three-fourths of land-owners at a meeting in number and value may agree upon the adoption of ad-measurement, plans, and valuations previously made, which agreement shall be binding on the valuers, s. 35.

interested in half the lands in any parish, may give notice to the commissioners that the value of tithes, ascertained upon the average of 7 years, will not fairly represent the sum which ought to be taken for calculating a permanent commutation of the tithes of the parish, whereupon the commissioners shall have power to diminish or increase the sum to be taken by one-fifth of the average value so ascertained, s. 38.

may before confirmation of apportionment agree with any owner of tithes in right of any spiritual benefice or dignity to give land not exceeding 20 acres, instead of rent-charge, s. 62.

interested in award to pay the expenses incident to making it, in such proportion, time and manner as the commissioners shall direct, s. 74.

to pay the expenses of making any apportionment in rateable proportions, s. 75.

having an estate less than fee-simple or fee-tail, or which is settled upon any uses or trusts, may, with the consent of the commissioners, charge the expense, or any part thereof, upon the lands for twenty years, s. 77.

such charge to be lessened in every year following by at least one-twentieth part, s. 77.

if tenant at rack-rent dissent from rent-charge, land-owner to stand in place of tithe-owner, and have all the powers for enforcing payment which tithe-owners have, s. 79.

**LAND-SURVEYORS. See MEETING. VALUERS. COMMISSIONERS.**

may be employed by commissioners, s. 59.

to have all the powers and be subject to all the provisions enacted concerning valuers appointed at a parochial meeting, s. 59.

**LAND-TAX, COMMISSIONERS OF. See APPORTIONMENT.**

at the request of land-owner, and with the consent of two justices to alter apportionment, s. 72.

**LEGAL DISABILITIES. See AGREEMENT. COMMISSIONERS. OWNERS OF LANDS. OWNERS OF TITHES. PATRON.**

whenever the patron of any benefice or the owner of any tithes or lands, or any person interested in any question as to tithes, shall be under any legal disabilities, the guardian, trustee, committee of the estate, husband, or attorney, may be substituted, s. 15.

and in default thereof, commissioners may substitute a person in the place of such patron, owner or person so interested, s. 15.

provisions respecting legal disabilities to apply to every person party to an agreement for giving land by way of tithes or rent-charge, or in whom any such land shall be vested, and whose

**LEGAL DISABILITIES—Continued.**

concurrence or consent may be necessary to the perfecting thereof, or of the title to such land, s. 31.

**LESSOR AND LESSEE. See AGREEMENT. COMPENSATION. TENANT. RACK-RENT.**

of tithes commuted may, under the direction of the commissioners surrender and make void his lease, so far as relates to the tithes, s. 88.

commissioners may direct compensation, deductions, &c., s. 88.

when joint owners, s. 12.

**LETTERS**

and packets, to and from commissioners, to be free of postage, s. 92.

**LIMITATION.**

statutes of, not to be affected by this act, s. 49.

**LOCAL ACTS. See EXEMPTIONS.**

the rent-charge of tithes commuted under this act and which might have been sold, exchanged, &c., under any local act to be saleable, &c., in like manner, s. 71.

proceeds to be invested in same manner as under such acts, s. 71.

**LONDON. See EXEMPTIONS.****MAP. See AGREEMENT. APPORTIONMENT. EVIDENCE. MEETING. VALUERS.****MATERIALS. See BARNS. TITHE OWNERS. COMMISSIONERS.****MEETING, PAROCHIAL. See AGENT. AGREEMENT. ASSISTANT-COMMISSIONERS. COMMISSIONERS. LAND-OWNERS. NOTICE. TITHE-OWNERS. VALUERS.**

land-owners or tithe-owners, whose interest respectively shall not be less than one-fourth of the whole value of the lands subject to tithes, or one-fourth part of the whole value of the tithes in any parish, may call a meeting, s. 17.

meeting to be held within the parish, s. 17.

twenty-one days' notice in writing, signed by parties calling the meeting, to be affixed on outer-door of church, or some conspicuous place within the parish, s. 17.

notice to be inserted twice, during twenty-one days in some newspaper generally circulated within the county, s. 17.

majority of land-owners and tithe-owners present to elect a chairman, who shall proceed to ascertain the interest of land-owners and tithe-owners then present in person or by their agents, s. 18.

interest of land-owners to be estimated according to the sum at which the lands are rated to the relief of the poor, or if there be no such rate, according to the rules by which such property is rateable, s. 19.

land-owners and tithe-owners present at meetings, if interested in not less than two-thirds of the land subject to tithes, two-thirds of the great tithes, and two-thirds of the small tithes, may make and execute parochial agreement, for the payment of an annual rent-charge in lieu of tithes, s. 17.

agreement so made, and duly confirmed, to be binding on all parties interested in tithes in the parish, s. 17.

persons attending to bear their own expenses, s. 17.

if interest of parties present not sufficient, may make a provisional agreement, which shall be binding if executed within six calendar months from the date thereof, by land-owners and tithe-owners, whose interest in the lands and tithes of the parish, shall not be less than two-thirds of the lands subject to tithes, two-thirds of the great tithes, and two-thirds of the small tithes respectively, s. 18.

may be adjourned by chairman to a time and place then by him to be declared, if majority require it, and so from time to time, s. 20.

notice of every adjourned meeting, signed by chairman, to be affixed outside the building, where last meeting shall have been holden, s. 20.

**MEETING, PAROCHIAL**—*Continued.*

business transacted at adjourned meetings as valid as if done at original meeting, s. 20.

commissioners or assistant-commissioners may attend, take part in discussion, and advise on the terms of agreement, but not to have any of the powers given in case of an award or apportionment, s. 23.

land-owners may before or after confirmation of agreement, appoint valuers, s. 32.

if majority of land-owners in respect of number, and majority in respect to interest, shall not agree, then two or any other even number of valuers to be appointed by the majority of land-owners in respect to number, and an equal number by the majority in respect to interest, s. 32.

three-fourths of land-owners at a meeting in number and value may agree upon the adoption of ad-measurement, plans, and valuations previously made, which agreement shall be binding upon valuers, s. 35.

of owners of land subject to tithes to be called by commissioners, as soon as an award is confirmed, for the purpose of choosing valuers, s. 53.

twenty-one days' notice of meeting so called must be given, s. 53.

**MERGER,**

rent-charge not to merge, except in certain cases, and with the approval of the commissioners, s. 71.

**MESSENGERS OF BOARD,**

to be appointed and removed by commissioners, s. 4, appointment limited to five years from passing of act, s. 6.

amount of salary to be regulated by treasury, s. 7, allowance of travelling and other expenses, s. 7.

**MILLS, TITHES OF.**

act extends to s. 90.

**MINERAL TITHES.** See EXEMPTIONS.**MINOR.** See COMMISSIONERS. OWNER OF TITHES. OWNER OF LANDS. PATRON.**MISDEMEANOR.**

party wilfully refusing to attend in obedience to summons of commissioners or assistant-commissioners, or to give evidence, or wilfully altering, withholding, destroying of, or refusing to produce any books, deed, contract, agreement, account, or writing, terrier, map, plan, or survey, or copies of the same, guilty of, s. 93.

**MODUS.** See REFERENCE. ARBITRATION. COMMISSIONERS. VALUERS.

disputes respecting, may be submitted to reference, s. 24.

in all cases lands to have the full benefit of, s. 33.

to be estimated as the value of the tithes payable in respect to lands over which it extends, s. 44, decisions upon, made by competent authority, to be acted upon by commissioners, s. 44.

act not to revive any right to tithes which now is or hereafter shall be barred by any law in force for shortening the time required in claims of modus decimandi or exemption from or discharge from tithes, s. 49.

**MORTGAGE.** See RENT-CHARGE.

not to give validity to any mortgage which before the passing of this act was invalid, and could not be enforced, s. 72.

**MORTUARIES.** See EXEMPTIONS.**NEWSPAPER.** See STAMP DUTY.**NOTICE.** See APPOINTMENT. AWARD. COMMISSIONERS. COPPICE-WOOD. DISTRESS AND ENTRY. HOP-GROUNDS. LAND-OWNERS. MEETING. TENANT AT RACK-RENT. TITHES-OWNERS.

twenty-one days' notice in writing signed by the parties calling a parochial meeting requisite, s. 17.

of adjournment, s. 20.

to be inserted twice during the twenty-one days in some newspaper circulating generally within the county, s. 17.

**NOTICE**—*Continued.*

forms of, to be framed by commissioners, and supplied or sent to churchwardens and overseers for use of land and tithe-owners, s. 22.

**NUMBER.**

any word importing the singular number only shall mean and include several persons or parties as well as one person or party and several things as well as one thing respectively, and the converse, s. 12.

**OATH.**

to be taken by commissioners and assistant-commissioners, s. 9.

commissioners may administer, s. 10.

may examine upon, s. 10.

may require production of books, &c. upon, s. 10.

**OFFICERS OF BOARD.**

to be appointed and removed by commissioners, s. 4.

not to be appointed for more than five years, s. 6.

**PRODUCTION OF WRITINGS.** See **COMMISSIONERS. EVIDENCE. MISDEMEANOR. WITNESS.****QUAKERS.** See **DISTRESS FOR RENT. RENT-CHARGE. RACK-RENT, TENANT AT.** See **LAND OWNER. LANDS. RENT CHARGE. TENANT.**

may, by notice to the landlord or his agent, within one calendar month after confirmation of the apportionment, dissent from paying the rent-charge, s. 79.

in which case landlord shall stand in place of the owner of the tithes, and have all the powers for enforcing payment thereof which title-owner had, s. 79.

**RATES.**

tithes to be valued in all cases of compulsory commutation as liable to, s. 37.

on rent-charge to be assessed upon occupiers, s. 70.

if not paid by owner may be recovered from occupier in like manner as poor-rate, s. 70.

occupier may deduct same from rent, s. 70.

landlord or owner in possession having allowed rates to tenant may deduct same from rent-charge, s. 70.

or may recover same by any other lawful means against the owner of rent-charge, his executors and administrators, s. 70.

**REFERENCE.** See **COMMISSIONERS. TITHE OWNERS.**

suit depending or disputes existing with respect to liability to tithes, boundary of lands or any other matter impeding agreement, may be submitted to reference, s. 24.

reference to be made a rule of court and binding upon all parties, s. 24.

decision to be final, s. 24.

no person possessing less than an immediate estate of fee simple or fee tail shall by such reference bind any person in reversion, remainder or expectancy, without the consent of commissioners, s. 24.

commissioners may direct any person interested to be made a party to reference, s. 24.

**REMAINDER MAN.** See **COMMISSIONERS. REFERENCE.**

no person possessing less than an immediate estate of fee simple or fee tail in lands or tithes shall be empowered to submit to a reference so as to bind remainder man without consent of commissioners, s. 24.

may upon notice from commissioners or assistant-commissioners object to any award or apportionment, s. 65.

**RENT-CHARGE.** See **AGREEMENT. TITHES. TENANT AT RACK RENT.**

agreed to be paid by any agreement pending at the time of the passing of this act, and which agreement shall have been executed within the same time and by the same parties as required in the case of a provisional parochial agreement, and also confirmed by the commissioners, shall be apportioned and charged among and upon the lands as if the agreement had been made at a parochial meeting, s. 25.

tithes may be commuted for by parochial agreement, s. 17.

**RENT-CHARGE—Continued.**

any quantity of land not exceeding twenty acres, may, by agreement, be given to any owner of rent-charge for which tithes may have been commuted in discharge of or exchange for the whole or an equivalent part of any rent-charge agreed to be paid instead of such tithes, s. 29.

if the land given does not extend to the whole of the tithes an award or agreement may and shall be made for the payment of a rent-charge in satisfaction of the remainder, s. 29.

to be apportioned on all the lands in the parish except the land given by way of commutation unless otherwise agreed upon by the parties to the parochial agreement, s. 29.

charged upon lands by any apportionment to be valued according to the average price of corn to be ascertained by advertisement inserted in the Gazette, in the proportions of one-third wheat, one-third barley, and one-third Oats, s. 57.

may be apportioned specially, s. 58.

on account of tithes of one close not to be charged on other lands unless the value of such lands shall be at the least three times the value of the whole rent-charge upon such lands, s. 58.

payable in lieu of tithes on the first of January after confirmation of apportionment to the person therein mentioned, s. 67.

how estimated, s. 67.

payable by two equal half-yearly payments on the first day of July and first day of January in every year, s. 67.

first payment on the first day of July next after the lands discharged from tithes, s. 67.

except in the case of barren or reclaimed lands, s. 67.

to be recovered by person entitled thereto, his executors or administrators by distress and entry, s. 67.

to vary after every first day of January so as always to consist of the price of the same number of bushels of wheat, barley and oats respectively, according to the prices ascertained by the next preceding advertisement, s. 67.

future owners of to have the same powers of enforcing payment as given on the original rent-charge, s. 67.

no person to be personally liable for the payment of, s. 67.

to be liable to all parliamentary, parochial, county, and other rates, charges and assessments, s. 69.

owner of entitled to the like right of inspecting and taking copies of assessment containing rates and charges in respect to such rent-charge, and to enjoy the same remedies as any occupier or rate-payer has in case of poor-rates, s. 70. although name of owner not inserted in the assessment, s. 70.

to be subject to the same incumbrances as the tithes were liable to before commutation, s. 71.

not payable where lands were previously exempt from tithe whilst in the occupation of owner, s. 71.

may be sold, exchanged or appropriated in like manner as the tithes commuted might have been, s. 71.

money arising from sale of, may be invested or applied as money arising from sale of tithes, from which it has been commuted, might have been, s. 71.

not to merge in, or be extinguished in any estate of which the person for the time being entitled to such rent-charge may be seized or possessed in the lands on which the same may be charged, s. 71.

may be merged with consent of commissioners, s. 71.

tenant at rack-rent may, by notice to the landlord or his agent, within one calendar month after the confirmation of apportionment dissent from paying, s. 79.

**RENT-CHARGE**—*Continued.*

if in arrear for twenty-one days after any half-yearly day of payment the person entitled may, having given ten days notice, distrain and dispose of the distress as any landlord may for rent arrear on a common lease for years, s. 81.

not more than two years' arrears to be recoverable by distress, s. 81.

if in arrear forty days after any half-yearly day of payment and no sufficient distress on the premises, writ may issue directed to the sheriff to assess arrears, s. 82.

whereupon inquisition being returned to some one of the Courts at Westminster, a copy of the writ having been given to the owner of the land, or left at his last place of abode, and ten days' notice of execution given, sheriff to execute writ, s. 82.

owner of rent-charge may thereupon take possession of and retain the lands until the arrears of rent-charge, with all costs and charges, together with the expenses of keeping possession, and cultivating the lands, shall be satisfied, s. 82.

not more than two years' arrears to be recoverable, s. 82.

Court or Judge may order an account to be rendered from time to time, and upon satisfaction of the arrears, with all costs and charges, may direct restitution, s. 82.

Court or Judge may also afford summary relief, s. 83. distress for arrears due from Quakers may be made upon the premises or elsewhere, and may be sold without being impounded or kept, s. 84.

no writ for assessing arrears and taking possession to issue against Quakers unless rent-charge in arrear, for more than forty days after any half-yearly day of payment, and sufficient goods to satisfy the arrears and costs not to be found either on the premises or elsewhere, s. 84.

provisions of the 4 & 5 W. 4, entitled "An Act to amend the 11 G. 2, respecting the apportionment of rents, annuities, &c." to extend to all rent-charges payable under this act, s. 86.

**REPORT**

of proceedings of commissioners to be submitted once in the year to secretary of state, s. 3.

to be laid before parliament, s. 3.

containing rules for the guidance of assistant-commissioners, to be submitted to secretary of state before the 1st May, 1838, and to be laid before parliament, s. 36.

**REVERSIONER.** See REFERENCE. COMMISSIONERS.

no person possessing less than an immediate estate of fee-simple or fee-tail in lands or tithes shall be empowered to submit to a reference so as to bind reversioner without consent of commissioners, s. 24.

may, upon notice from commissioners or assistant-commissioners, object to any award or apportionment, s. 65.

may be made party to reference, s. 24.

**RULE OF COURT.**

submission to reference to be made, s. 24.

**RULES.**

for the guidance of assistant-commissioners to be framed by commissioners before May 1, 1838, s. 38.

for the guidance of assistant-commissioners in estimating the value of the tithes of coppice-wood to be framed by commissioners, and included in their report to the secretary of state, before 1st of May, 1838, s. 41.

such rules to be afterwards observed, unless parliament shall otherwise direct, s. 41.

**SALARIES.**

of commissioners, assistant-commissioners, secretary, &c., &c., to be paid out of consolidated fund unless otherwise provided for, s. 8.

HOP-GROUND. LAND-OWNERS. MODUSES.

NOTICE. ORCHARDS. REFERENCE. TITHING-OWNERS.

any agreement for the commutation of tithes into a rent-charge, pending at the time of the passing of this act, which shall be executed within the same time, and by the same parties as required in the case of a provisional parochial agreement, and also confirmed by the commissioners, shall be as valid as if made at a parochial meeting, s. 25.

consent of patron, under the hand of person giving the same requisite, s. 26.

any quantity of land, not exceeding 20 acres, may by agreement be given to any owner of tithes by way of commutation for the whole, or an equivalent part of the tithes of any parish, or of any rent-charge agreed to be paid instead of such tithes, s. 29.

if no agreement for commuting tithes into a rent-charge, binding upon the whole parish be entered into before the 1st of October, 1838, commissioners shall proceed to ascertain and award the total sum to be paid, s. 36.

to be calculated upon the clear average value during seven years, except in certain cases, s. 37.

to be estimated without making any deduction on account of any parliamentary, parochial, county, or other rates, charges, or assessments, s. 37.

**TITHES, COMMUTATION OF—Continued.**

whenever tithes might have been sold, exchanged, or appropriated, before commutation, rent-charge may be sold, exchanged, appropriated in like manner, s. 71.

right to tithes due before the commutation by this act not to be affected, s. 89.

**TITHE-OWNERS.** See **AGENT.** **ASSISTANT-COMMISSIONERS.** **BENEFICE.** **COMMISSIONERS.** **CROWN.** **INTEREST.** **JOINT-OWNER.** **LAND.** **LAND-OWNER.** **MEETINGS.** **PATRON.** **REFERENCE.**

for meaning of this term, see Interpretation clause, s. 12.

owner of tithes being also owner of lands may be dealt with in each character, s. 74.  
or if patron of benefice, s. 14.

if a minor, idiot, lunatic, feme covert, beyond the seas, or under other legal disability, the guardian, trustee, committee of the estate, husband, or attorney respectively, to be substituted, s. 15.  
may appoint agent by power of attorney, s. 16.  
may call parochial meetings, s. 17.

shall bear their own expenses of attendance, s. 17.  
land-owners and tithe-owners present at meeting, if interested in not less than two-thirds of the land subject to tithes, two-thirds of the great tithes, and two-thirds of the small tithes, may make and execute parochial agreement for the payment of an annual rent-charge in lieu of tithes, s. 17.

if interest of parties present at meeting not sufficient may make provisional agreement, s. 18.  
as to form of parochial agreement, s. 21.

interest of tithe-owners to be estimated according to the sum at which tithes are rated to the relief of the poor, or, if there be no such rate, according to the rules by which such property is rateable, s. 19.

if suit depending or dispute existing with respect to liability to tithes, boundary of lands, or any other matter impeding agreement, may submit matters in difference to reference, s. 24.

possessing less than an immediate estate of fee-simple or fee-tail, shall not, by such reference, bind any person in reversion, remainder, or expectancy, without consent of commissioners, s. 24.

may give notice to commissioners that the value of tithes ascertained upon an average of seven years, will not fairly represent the sum which ought to be taken for calculating a permanent commutation of the tithes of the parish, whereupon the commissioners will have power to diminish or increase the sum to be taken by one-fifth of the average value so ascertained, s. 38.

interested in award to pay the expenses incident to making it, in such proportion, time and manner as the commissioners shall direct, s. 74.

possessing an estate in tithes less than an immediate estate of fee-simple or fee-tail, or which shall be settled upon uses and trusts, may, with the consent of the commissioners, charge the expense, or any part thereof, upon the rent-charge, s. 77.

such charge to be lessened in every year following, by at least one-twentieth part, s. 77.

may sell barns or buildings, generally used for the housing of tithes, and rendered useless by the commutation of tithes, or may pull down the same, sell the materials, dispose of the site, with the consent and under the direction of commissioners, s. 87.

may convey and deliver to purchaser, and his receipt be a good discharge, s. 87.

the proceeds to be laid out in such manner, and upon such trusts, as commissioners may direct, s. 87.

**TREASURY.** See **APPOINTMENTS.** **CROWN.** **PATRON.**

**TRUSTEE.** See **COMMISSIONERS.** **LEGAL DISABILITY.**  
**OWNER OF LANDS.** **OWNER OF TITHES.** **PATRON.**

**VALUERS.** See **ACTION.** **ASSISTANT-COMMISSIONERS.** **COMMISSIONERS.** **DECLARATION.** **JUSTICE OF PEACE.** **LAND-OWNERS.** **LANDS.** **MEETING.** **UMPIRE.**

owners of lands subject to tithes, or agents, may appoint valuers at any parochial meeting, either before or after the confirmation of the agreement, s. 32.

in case of disagreement, the majority in respect to number to appoint two or any other even number, and the majority, in respect to interest, to appoint an equal number, s. 32.

after confirmation of agreement, valuers to apportion total sum agreed to be paid according to the principles of apportionment agreed upon at the meeting, s. 33.

how to act if no principle for the guidance of the valuers shall have been agreed upon, s. 33.

to give to all lands the full benefit of exemption, as moduses, compositions, &c. s. 33.

when even number of valuers chosen, may by writing under their hands appoint an umpire before they proceed upon the business of apportionment, s. 33.

decision of umpire to be binding on valuer, s. 33.  
before acting to subscribe a declaration, s. 34.

may, with their agents and servants, enter upon lands to be included in the apportionment, s. 34.

may make admeasurement, plan, and valuation, without being subject to any action or molestation, s. 34.

may use admeasurement, plans, or valuations, previously made, if agreed upon at meeting, s. 35.

if chosen at a meeting called by the commissioners after award confirmed, to act with the same powers, and subject to the same provisions as if chosen at a parochial meeting called by the land-owners and tithe-owners, s. 53.

if apportionment not made and sent to the office of commissioners within six calendar months, commissioners or assistant-commissioners to apportion the rent-charge, s. 54.

to make a special apportionment upon request of land-owners, s. 58.

not to charge any land with the tithes of any other lands, unless the value of such land shall be at least three times the value of the whole rent-charge upon such land, s. 58.

employed by commissioners to have all the powers and subject to all the provisions enacted concerning valuers appointed at a parochial meeting, s. 59.

if employed by commissioners not bound to adopt any principles of apportionment agreed upon at any parochial meeting, s. 59.

not to be paid more than two guineas per day, s. 59.  
commissioners may make any agreement for the payment of one sum for the whole duty to be performed by, s. 59.

**UMPIRE.** See **ACTION.** **ASSISTANT COMMISSIONERS.** **COMMISSIONERS.** **DECLARATION.** **JUSTICE OF PEACE.** **LANDS.** **MEETING.** **VALUERS.**

when even number of valuers chosen they may appoint an umpire, whose decision will be binding on them, s. 33.

before acting to subscribe a declaration, s. 34.  
may, with his agents and servants, enter upon lands to be included in apportionment, s. 34.

make admeasurement, plans, &c. without being subject to any action or molestation, s. 34.

may use admeasurement, plans, &c. previously made if agreed upon at parochial meeting, s. 35.
